### **ACADEMIC CALENDER 2023-24-EVEN SEMESTER**

### For B.E – VIII Semester (Academic Year 2023-24)

#### VISION

#### MISSION

To contribute valuable graduates for industry and society through excellence in technical & management education and research.

1.To offer state-of-the-art undergraduate, postgraduate and doctoral programmes.

2. To empower the students with Technical, Managerial Skills and professional ethics.

3.To collaborate with academia and industries for skill development

#### Dear Alumni,

Thank you for joining us! Your feedback is invaluable as we strive to strengthen our alumni community and align our efforts with accreditation standards and institutional objectives. Please take a few minutes to share your thoughts. Please rate (Indicate using tick mark  $\sqrt{\ }$ ) in each of the following Sections as a result of being educated at our college on a rating scale of 1 to 5.

[Note: 5 is Highest Rating & 1 is Lowest Rating]

Name	RAJESHWARI PRJYADARSHINI									
Year of Graduation	2011									
Name of the Program/Branch:	ECCE									
Email	n priyadorshini ox 760 gm	rail: com								
Contact No.	9110870362									
Current Status	Govt. Sector PVT Sector	Self Employed Unemployed								
	Pursuing Higher Studies	Others (Pls. Specify)								
Name of the Organization with Address	TCS	Designation: System Engineer								

#### Section 1: Alumni Meet Venue: Hotel Capitol, Bengaluru Date: 02/03/2024

1.	Rate your overall satisfaction with the alumni meet:	5	4	3	2	1
	Rate your expectations and interests alignment with the agenda and activities of the	5	4	3	2	1
	alumni meet					
3.	Rate on the opportunities to network and reconnect with fellow alumni and faculty	5	4	3	2	1
	members					

How could the alumni meet be improved to better meet the needs and expectations of attendees?

### Section II: Alumni Contribution

- 1. Areas in which you will be interested to associate with the College/Department:
  - I can take sessions in Technical and Industry Orientation (Specify technical, industry orientation, soft skills etc.)
  - I can deliver Career guidance sessions.
  - I can connect our college to any organization interested in providing internship, projects and placements to our students including referrals
  - I can institute awards for meritorious students.
- 2. Specific Inputs on Your Department Autonomous Curriculum in keeping futuristic relevance of Global Changes;

Note: SECTION I is Valid only for Alumni Meet can be skipped if not attended.

#### Ballari Institute of Technology and Management, Ballari

Dear Respondent,

In order to assess the abilities (viz knowledge, skills and attitude) of our graduates employed at your organization, we solicit your prompt response and feedback considering the following criteria that NBA (National Board of Accreditation, New Delhi <a href="https://www.nbaind.org/Home">https://www.nbaind.org/Home</a>) requires for graduates of Ballari Institute of Technology and Management, Ballari. Please rate the preparedness of your employee (and our graduate) in each of the following as a result of being educated at our college on a rating scale of 1 to 5.(

1- Strongly Disagree, 2- Disagree, 3- Can't Say, 4- Agree, 5- Strongly Agree).

Name of the respondent: Karthick Krishnamoorthy Designation: Campus Lead

Company Name: Tata Consultancy Services

Mobile Number: 9600127768 Email ID: karthick.krishnamoorthy@tcs.com

I. Indicate [using tick mark or enter "Y"] to what extent do you agree with Vision, Mission, Program Educational objectives (PEOs) and Program Specific Outcomes (PSOs) of the Program(s) (Refer https://www.bitm.edu.in/orAnnexure-I Given Below) relevant to your organization only.

Sl No	1	2	3	4	5	Any Suggestions/Remarks
CSE program-Vision

CSE program	To be a state-of-the-art learning center that responds to future challenges.	<ul> <li>M1: To impart knowledge with relevant theoretical and practical aspects.</li> <li>M2: To inculcate design and development process relevant to the industry.</li> <li>M3: To enhance leadership abilities through team work and research.</li> </ul>	PEO 1: Accomplish a progressive career by applying fundamental principles and design methodologies of computer science and engineering. PEO 2: Provide practical solutions to solve problems of industry and society at large. PEO 3: Exhibit professionalism through managerial skills and develop innovative products.	PSO 1: Demonstrate the principles, architectures, and Organization of computers, embedded systems, and computer networks.  PSO 2: To develop software applications using advanced technologies to cater to the growing needs of the Industry.
ECE Program	To be a center of excellence for learning and development of skills.	M1: To equip the graduates with strong foundation to meet the growing challenges.  M2:To inculcate design & development skills relevant to the industry and research.  M3:To impart innovative technologies and professional values through teamwork.	PEO 1: To acquire strong knowledge in Basic Science, Mathematics and ability to apply this knowledge in the relevant fields of E&CE.  PEO2: To develop technical competence and uplift research ability to solve real time problems.  PEO 3: To obtain professional Excellency through lifelong learning and produce graduates with professional values	PSO1: To understand the principles, processes, techniques and design aspects of electronic devices, circuits and communication systems.  PSO2: To apply, analyze and design electronic circuits, communication systems, embedded systems by using higher engineering mathematical foundations, computational principles and network modeling skills.  PSO3: To develop electronic hardware and software systems for universal requirements using sensors, embedded controllers, signal processors, analog and digitally integrated chips.
EEE Program	To create a centre of excellence in teaching, learning and research that meets technological challenges.	M1:To provide quality teaching and learning environment to produce competent graduates.  M2: To impart knowledge relevant to industry and research.  M3:To develop the students with professional, leadership qualities and lifelong learning skills.	PEO 1: To prepare graduates to excel in professional career by acquiring the broad knowledge of electrical engineering. PEO 2: To develop graduates to engage in lifelong learning, professional development and career enhancing activities. PEO 3: To prepare graduates with leadership qualities, ethics and skills necessary to be successful in their career.	PSO1. Analyze, design and solve problems in the field of electrical and electronics engineering by applying knowledge acquired from core subjects and other allied topics.  PSO2. Develop products/ software using technological developments to cater the needs of society and industry.
ME Program	To be a center of excellence that provides the best of teaching, learning, and research.	M1:To impart knowledge with strong theoretical and practical aspects.  M2: To prepare effective and responsible graduates to meet the industry requirement.  M3:To develop leadership qualities through team work and professional ethics.	PEO 1: To make graduates self-sustained by exploring to engineering problems with innovative ideas to tackle real-time issues.  PEO 2: To make graduates aware of the significance of competence in core engineering concepts to adopt good ethical and leadership qualities.  PEO 3: To inculcate the graduates to pursue lifelong learning processes.	PSO1: Ability to utilize their knowledge in Mechanical Engineering Sciences on an applied basis. PSO2: Ability to apply learned principles to the analysis, design, development and implementation to more advanced mechanical systems or processes.
CIVIL Program	To be an outstanding center for teaching, learning and research to meet societal needs.	M1: To Impart Quality Education Through Innovative Teaching & Learning Process.  M2: To Enhance Industry Institute Interaction & Research for sustainable development.  M3: To develop professionals with leadership qualities, ethics & values.	PEO1:To develop graduates with strong knowledge of civil engineering to excel in their professional careers. PEO2:To acquire necessary skills with leadership qualities, ethics, and values that meet the needs of industry and society. PEO3:To engage in lifelong learning for professional enrichment and carrier advancement	Graduates will be able to plan, analyze and design civil engineering structures by utilizing natural resources effectively.  Graduates will be able to apply their civil engineering knowledge in the new age construction methods and techniques to solve real-life problems.
MBA Program	"To be a leading B-school by nurturing dynamic leaders and managers through academic excellence, research, and innovation".	M1:To Impart ethical and value-based management education with pragmatic insights M2: To provide a conducive environment for developing leadership qualities M3:To inculcate a culture of entrepreneurship, innovation, and Research	PEO1:To provide the students with inter-disciplinary Management concepts to solve complex and dynamic realworld business problems.  PEO2:To develop leadership, critical thinking, teamwork, and communication skills among the graduates.  PEO3:To imbibe the graduates with professional ethics and value for lifelong learning and career enrichment.	PSO1: To develop and demonstrate skills and competencies by integrating financial models to resolve unprecedented challenges.  PSO2: To demonstrate knowledge, skills, and strategies to design effective marketing capabilities in the real-world environment.  PSO3: Ability to manage the human capital and ensure effective HR audits for building competitive business.

Sl No	Vision Statement	Mission Statement	PEO	PSO
CSE program	To be a state-of-the-art learning center that responds to future challenges.	<ul> <li>M1: To impart knowledge with relevant theoretical and practical aspects.</li> <li>M2: To inculcate design and development process relevant to the industry.</li> <li>M3: To enhance leadership abilities through team work and research.</li> </ul>	PEO 1: Accomplish a progressive career by applying fundamental principles and design methodologies of computer science and engineering.  PEO 2: Provide practical solutions to solve problems of industry and society at large.  PEO 3: Exhibit professionalism through managerial skills and develop innovative products.	PSO 1: Demonstrate the principles, architectures, and Organization of computers, embedded systems, and computer networks. PSO 2: To develop software applications using advanced technologies to cater to the growing needs of the Industry.
ECE Program	To be a center of excellence for learning and development of skills.	M1: To equip the graduates with strong foundation to meet the growing challenges.  M2:To inculcate design & development skills relevant to the industry and research.  M3:To impart innovative technologies and professional values through teamwork.	PEO 1: To acquire strong knowledge in Basic Science, Mathematics and ability to apply this knowledge in the relevant fields of E&CE.  PEO2: To develop technical competence and uplift research ability to solve real time problems.  PEO 3: To obtain professional Excellency through lifelong learning and produce graduates with professional values	PSO1: To understand the principles, processes, techniques and design aspects of electronic devices, circuits and communication systems.  PSO2: To apply, analyze and design electronic circuits, communication systems, embedded systems by using higher engineering mathematical foundations, computational principles and network modeling skills.  PSO3: To develop electronic hardware and software systems for universal requirements using sensors, embedded controllers, signal processors, analog and digitally integrated chips.
EEE Program	To create a centre of excellence in teaching, learning and research that meets technological challenges.	M1:To provide quality teaching and learning environment to produce competent graduates. M2: To impart knowledge relevant to industry and research. M3:To develop the students with professional, leadership qualities and lifelong learning skills.	PEO 1: To prepare graduates to excel in professional career by acquiring the broad knowledge of electrical engineering. PEO 2: To develop graduates to engage in lifelong learning, professional development and career enhancing activities. PEO 3: To prepare graduates with leadership qualities, ethics and skills necessary to be successful in their career.	PSO1. Analyze, design and solve problems in the field of electrical and electronics engineering by applying knowledge acquired from core subjects and other allied topics.  PSO2. Develop products/ software using technological developments to cater the needs of society and industry.
ME Program	To be a center of excellence that provides the best of teaching, learning, and research.	M1:To impart knowledge with strong theoretical and practical aspects.  M2: To prepare effective and responsible graduates to meet the industry requirement.  M3:To develop leadership qualities through team work and professional ethics.	PEO 1: To make graduates self-sustained by exploring to engineering problems with innovative ideas to tackle real-time issues.  PEO 2: To make graduates aware of the significance of competence in core engineering concepts to adopt good ethical and leadership qualities.  PEO 3: To inculcate the graduates to pursue lifelong learning processes.	PSO1: Ability to utilize their knowledge in Mechanical Engineering Sciences on an applied basis. PSO2: Ability to apply learned principles to the analysis, design, development and implementation to more advanced mechanical systems or processes.
CIVIL Program	To be an outstanding center for teaching, learning and research to meet societal needs.	M1: To Impart Quality Education Through Innovative Teaching & Learning Process. M2: To Enhance Industry Institute Interaction & Research for sustainable development. M3: To develop professionals with leadership qualities, ethics & values.	PEO1:To develop graduates with strong knowledge of civil engineering to excel in their professional careers. PEO2:To acquire necessary skills with leadership qualities, ethics, and values that meet the needs of industry and society. PEO3:To engage in lifelong learning for professional enrichment and carrier advancement	Graduates will be able to plan, analyze and design civil engineering structures by utilizing natural resources effectively.  Graduates will be able to apply their civil engineering knowledge in the new age construction methods and techniques to solve real-life problems.
MBA Program	'To be a leading B-school by nurturing dynamic leaders and managers through academic excellence, research, and innovation'.	M1:To Impart ethical and value-based management education with pragmatic insights M2: To provide a conducive environment for developing leadership qualities M3:To inculcate a culture of entrepreneurship, innovation, and Research	PEO1:To provide the students with inter-disciplinary Management concepts to solve complex and dynamic real-world business problems.  PEO2:To develop leadership, critical thinking, teamwork, and communication skills among the graduates.  PEO3:To imbibe the graduates with professional ethics and value for lifelong learning and career enrichment.	PSO1: To develop and demonstrate skills and competencies by integrating financial models to resolve unprecedented challenges. PSO2: To demonstrate knowledge, skills, and strategies to design effective marketing capabilities in the real-world environment. PSO3: Ability to manage the human capital and ensure effective HR audits for building competitive business.

CSE program	To be a state-of-the-art learning center that responds to future challenges.	<ul> <li>M1: To impart knowledge with relevant theoretical and practical aspects.</li> <li>M2: To inculcate design and development process relevant to the industry.</li> <li>M3: To enhance leadership abilities through team work and research.</li> </ul>	PEO 1: Accomplish a progressive career by applying fundamental principles and design methodologies of computer science and engineering. PEO 2: Provide practical solutions to solve problems of industry and society at large. PEO 3: Exhibit professionalism through managerial skills and develop innovative products.	PSO 1: Demonstrate the principles, architectures, and Organization of computers, embedded systems, and computer networks. PSO 2: To develop software applications using advanced technologies to cater to the growing needs of the Industry.
ECE Program	To be a center of excellence for learning and development of skills.	M1: To equip the graduates with strong foundation to meet the growing challenges.  M2:To inculcate design & development skills relevant to the industry and research.  M3:To impart innovative technologies and professional values through teamwork.	PEO 1: To acquire strong knowledge in Basic Science, Mathematics and ability to apply this knowledge in the relevant fields of E&CE.  PEO2: To develop technical competence and uplift research ability to solve real time problems.  PEO 3: To obtain professional Excellency through lifelong learning and produce graduates with professional values	PSO1: To understand the principles, processes, techniques and design aspects of electronic devices, circuits and communication systems.  PSO2: To apply, analyze and design electronic circuits, communication systems, embedded systems by using higher engineering mathematical foundations, computational principles and network modeling skills.  PSO3: To develop electronic hardware and software systems for universal requirements using sensors, embedded controllers, signal processors, analog and digitally integrated chips.
EEE Program	To create a centre of excellence in teaching, learning and research that meets technological challenges.	M1:To provide quality teaching and learning environment to produce competent graduates. M2: To impart knowledge relevant to industry and research. M3:To develop the students with professional, leadership qualities and lifelong learning skills.	PEO 1: To prepare graduates to excel in professional career by acquiring the broad knowledge of electrical engineering. PEO 2: To develop graduates to engage in lifelong learning, professional development and career enhancing activities. PEO 3: To prepare graduates with leadership qualities, ethics and skills necessary to be successful in their career.	PSO1. Analyze, design and solve problems in the field of electrical and electronics engineering by applying knowledge acquired from core subjects and other allied topics.  PSO2. Develop products/ software using technological developments to cater the needs of society and industry.
ME Program	To be a center of excellence that provides the best of teaching, learning, and research.	M1:To impart knowledge with strong theoretical and practical aspects.  M2: To prepare effective and responsible graduates to meet the industry requirement.  M3:To develop leadership qualities through team work and professional ethics.	PEO 1: To make graduates self-sustained by exploring to engineering problems with innovative ideas to tackle real-time issues.  PEO 2: To make graduates aware of the significance of competence in core engineering concepts to adopt good ethical and leadership qualities.  PEO 3: To inculcate the graduates to pursue lifelong learning processes.	PSO1: Ability to utilize their knowledge in Mechanical Engineering Sciences on an applied basis. PSO2: Ability to apply learned principles to the analysis, design, development and implementation to more advanced mechanical systems or processes.
CIVIL Program	To be an outstanding center for teaching, learning and research to meet societal needs.	M1: To Impart Quality Education Through Innovative Teaching & Learning Process.  M2: To Enhance Industry Institute Interaction & Research for sustainable development.  M3: To develop professionals with leadership qualities, ethics & values.	PEO1:To develop graduates with strong knowledge of civil engineering to excel in their professional careers. PEO2:To acquire necessary skills with leadership qualities, ethics, and values that meet the needs of industry and society. PEO3:To engage in lifelong learning for professional enrichment and carrier advancement	Graduates will be able to plan, analyze and design civil engineering structures by utilizing natural resources effectively.  Graduates will be able to apply their civil engineering knowledge in the new age construction methods and techniques to solve real-life problems.
MBA Program	'To be a leading B-school by nurturing dynamic leaders and managers through academic excellence, research, and innovation'.	M1:To Impart ethical and value-based management education with pragmatic insights M2: To provide a conducive environment for developing leadership qualities M3:To inculcate a culture of entrepreneurship, innovation, and Research	PEO1:To provide the students with inter-disciplinary Management concepts to solve complex and dynamic real-world business problems.  PEO2:To develop leadership, critical thinking, teamwork, and communication skills among the graduates.  PEO3:To imbibe the graduates with professional ethics and value for lifelong learning and career enrichment.	PSO1: To develop and demonstrate skills and competencies by integrating financial models to resolve unprecedented challenges. PSO2: To demonstrate knowledge, skills, and strategies to design effective marketing capabilities in the real-world environment. PSO3: Ability to manage the human capital and ensure effective HR audits for building competitive business.

### Evaluation of the fulfillment of the Profile of the Graduating Students:

Instruction:	Use the following scale t	o indicate your	agreement with the following:
1-Very dissatis	fied 2-Dissatisfied		

1. Can you understand and apply the following knowledge?	M	ore<=	=Satisf	action	n==>L	ess	
	5	4	3	2	1	N/A	
a. Mathematics(through differential calculus)			V				
b. Probability and statistics			V				
c. General Chemistry					V		1
d. Calculus based Physics e. Other sciences					V		
		74	V				
2. Are you proficient in the following major Electrical & Electronics Engineering areas?							
a. Circuit Analysis and Design					1		
b. Analog and digital electronics							
c. Testing, Operation & Maintenance of Electrical/Electronic systems			/		-		
d. Control systems							
e. Power Systems					V		ı
f. Computer systems and Programming Languages			V		-		
3. Can you conduct laboratory experiments and critically				SAN SAN SAN			
analyze and interpret data in the following areas?							
a. Analog and Digital Electronics			V.				
b. A.C and D.C Machines			-		1		6
c. Circuit Simulation/ Power system Simulation					V		
d. Computer Programming					~		
4. Have you learned to design Electrical & Electronics	CONTRACT NAME				V		
Engineering systems, components or process by means of					1335		
design experiences integrated throughout the professional	E ROLL				13000		
content of the curriculum?	499				5 8 5 8 5	Market .	
ı. Systems					1		
. Components	1				V		1
. Process	-						
. Which of the following skills, tools and techniques needed	~	33 10 10 KS				ALC: COLUMN	
or Electrical Engineering practice are you proficient in?	1000						
Oral communication skills in English			1,/				
. Written communication skills in English							
Oral Communication skills in other Foreign Language							
Written communication skills in other Foreign Language	Sept Gran

## ETHICS INTEGRATION ASSESSMENT FORM

Name: Poliyanka, P	Year: 2023
Department: E55	USN_3BR19BE064
Purpose Tr.	Date: 27/05/2023

**Purpose:** To determine the frequency and types of exposure to ethical considerations.

Directions: Below are the series of activities in ethics. Assess your exposure to each activity using the following scale

1. Poor or no e

2. Less than adequate 3. Adequate	4. Goo	d	5.E	xcelle	nt
Activity	5	4	3	2	1
a. Read parts of the engineering code of ethics (Examples:		17.7			
Software Engineering code of Ethics & Professional Practice by			1/		
ACM, Institution of Engineers, ASME, IEEE, ASCE)					
b. Participated in an activity that has a major ethical component	•				
(meeting of student professional society/fourms)			V		
c. Attended a special lecture or conference (outside of regular					, /
classes) with a major ethical component.					
d. Spent time identifying and addressing the ethical issues in a			. 1		
major design experience			V		
e. Took a course in ethics (CIPE & Environmental studies)		1	,		
f. Discussed ethics study question		~			
g. An engineering Teacher included an ethics module in one of his		1			
or her classes (Example: case discussion)					
h. A guest lecture came to one of your classes and discussed		3/.			
ethical issues in engineering			1		
i. Participated in an ethics competition			~/	7	
j. Participated in drafting a student code of conduct for my college			V		

Date: 94/05/2023

## ETHICS INTEGRATION ASSESSMENT FORM

Name: Navien Hr	Year: 2012-2023
Department: EEE	USN 3BR19 FEOSO.
pepartment: _ L L L	Date: 27/05/23

Purpose: To determine the frequency and types of exposure to ethical considerations.

Directions: Below are the series of activities in ethics. Assess your exposure to each activity using the following scale

1. Poor or no exposure 2. Less than adequate 3. Adequate 4. Good 5.Excellent Activity 4 a. Read parts of the engineering code of ethics (Examples: Software Engineering code of Ethics & Professional Practice by ACM, Institution of Engineers, ASME, IEEE, ASCE) b. Participated in an activity that has a major ethical component (meeting of student professional society/fourms) c. Attended a special lecture or conference (outside of regular classes) with a major ethical component. d. Spent time identifying and addressing the ethical issues in a major design experience e. Took a course in ethics (CIPE & Environmental studies) f. Discussed ethics study question g. An engineering Teacher included an ethics module in one of his or her classes (Example: case discussion) h. A guest lecture came to one of your classes and discussed ethical issues in engineering i. Participated in an ethics competition j. Participated in drafting a student code of conduct for my college

### ETHICS INTEGRATION ASSESSMENT FORM

Name: SYED VIGAR AHME	Year: 2023
	USN 3 BROOFE JATE
Department: <u>FEE</u>	Date: 96/05/2023

Purpose: To determine the frequency and types of exposure to ethical considerations.

Directions: Below are the series of activities in ethics. Assess your exposure to each activity using the following scale

1. Poor or no exposure 2. Less than adequate 3. Adequate	4. Good	d	5.E	xcelle	nt
Activity	5	4	3	2	1
a. Read parts of the engineering code of ethics (Examples: Software Engineering code of Ethics & Professional Practice by ACM, Institution of Engineers, ASME, IEEE, ASCE)	V				
b. Participated in an activity that has a major ethical component (meeting of student professional society/fourms)	V				
c. Attended a special lecture or conference (outside of regular classes) with a major ethical component.	~				
d. Spent time identifying and addressing the ethical issues in a major design experience	V				
e. Took a course in ethics (CIPE & Environmental studies)	V				
f. Discussed ethics study question	V				
g. An engineering Teacher included an ethics module in one of his or her classes (Example: case discussion)					
h. A guest lecture came to one of your classes and discussed ethical issues in engineering	V				
i Participated in an ethics competition	V	,			
i Participated in drafting a student code of conduct for my college	V

#### **Abstract**

The intermittent drying behaviors of guava were experimentally studied using a Solar Photovoltaic assisted dryer. This research aimed to investigate the performance of dryer for drying applications utilizing a Taguchi design of experiment (DoE), ANOVA analysis. The drying experiments was carried for drying guava fruit of varying thickness from 2 to 7 mm and with different intermittent ratios ( $\alpha = T_r / (T_t)$ ), where  $T_r$  and  $T_t$  are the rest time and total (heating and tempering) time for each 60 minutes' duty cycle  $\alpha = 0$ , 0.25, 0.5 and 0.75, respectively. The drying regime was observed all through a major falling rate. The study articulates that intermittent ratio and fruit thickness considerably effects dehydration process. The intermittency ratio of 0.25 resulted in optimum drying rate, reducing the effective drying time. Solar radiation is measured was ranged from 251 to 956 W/m². The maximum collector & dryer efficiency was 70% & 18% respectively. The biological test resulted showed the suitability of safe consumption. The statistical analysis shows, that the Henderson & Pabis and logarithmic model is a preferred to explain intermittent drying nature of Guava fruit.

**Keywords:** Intermittent Drying, intermittent ratio, Guava fruit drying. Antioxidant activity.

## 1. INTRODUCTION

Guava is a "super-fruit" of a Myrtaceae fruit family owing to its antioxidant and phenols virtue [1,4]. India leads guava production, followed by China [2, 3]. The purpose of dehydration is to remove water content to an optimal value such that no degrading microbial reactions are encouraged. In conventional drying continual heat is delivered throughout the dehydrating resulting in surface hardening of the product owing to less moisture at surface. Thus, it causes quality degradation by

reducing drying rate and wastage of highgrade heat energy. The strategy of intermittent drying permits enough time for the moisture to mitigate at the surface from the center through the tempering period. The antioxidant properties and quality of dried guava slices strongly depend on pretreatment and drying methods adopted along with drying conditions like air quality, temperature, and velocity [6]. Several constraints like medium temperature, inlet air velocity, and relative humidity, and fruit thickness influence drying kinetics. Modern-day techniques for devising drying procedures consist of developing a numerical model of moisture transport in drying known as 'drying kinetics' [7]. Dehydration of agricultural produce is well-defined by thin layer drying mathematical models. Drying kinetics are normally evaluated experimentally by observation of drying sample mass over a Dehydration period [8,9].process Mathematical models are employed in enhancing existing drying systems, devising new systems, and optimization of dehydration process [10]. Fick's law of diffusion is generally employed to explain the dehydration process. Moisture ratio models are used to study the drying curves to understand dehydration of agricultural produce. The dry basis Moisture content at varying temperatures and velocities is transformed into a Moisture Ratio to normalize the curves.

This research aimed to experimentally explore the effects of intermittent-ratio and thickness for guava fruit on the drying curves of guava (Sodium guajava L) fruit grown in the Ballari (15.1394 <sup>0</sup>N, 76.9214<sup>0</sup>E) area of Karnataka state, India, utilizing developed Micro-controller-based solar photovoltaic assisted fruit dryer. The study purposes of the were experimentally explore the Guava fruit kinetics for varying drying parameters via, the effect of intermittent ratio and fruit thickness upon drying characteristics and study the fitness of semi empirical models developed by Henderson - Pabis [11], Page [12], and Wang- Singh [13] for explaining the dehydration process.

## 2. MATERIALS AND METHODOLOGY

## 2.1 EXPERIMENTAL SETUP

The schematic of the solar photovoltaic assisted fruit dryer setup is shown in Figure 1. The dryer was used for experimental work, which assured required drying environments over a range of operational conditions. The drier comprises of 2mx1msolar flat plate collector with integral fins on selectively black coated 1mm absorber plate on 25mm glass wool insulated base and a two-drying cabinet insulated wall, two stainless steel mesh trays arranged in a vertical row (length 0.45m x width 0.45m x height 0.009m), dc fans for air circulation, and auxiliary heaters of 100w power were housed in a common air handling unit duct with two times of drying chamber. A flow control valve is utilized to regulate the hot air to the drying chamber. The hot air supply switching approach was used with four intermittent ratio α for drying fruit in a hot air cabinet. Flow control vale was used to achieve the required intermittent ratios=0, 0.25, 0.5 and 0.75, respectively ( $\alpha = T_r / T_t$ ) where  $T_r$  and  $T_t$  are the rest time and total time of each 60 minutes' duty cycle. Thus  $\alpha$ = 0 indicates conventional continuous heating and 0.75 intermittency ( $\alpha$ ) refers larger rest period. Digital temperature indicator, air filter, Relay indicator (Automatic), auxiliary heater, a control panel was used to regulate the required temperature of air. Fruit mass and air flow were measured with Digital electronic balance ( $\pm 0.1$ mg).

FIGURE1. Solar Photovoltaic assisted dryer Experimental setup

The trial runs were performed on 30mm fruit slice diameter guava fruit slices with thickness of 2 mm, 3 mm 5 mm, and 7mm mass of 120gms respectively. Drying experiments were performed for sunny days of May month. Solar Drier was run for 60 minutes to reach a steady-state condition Before drying experiments for the selected temperature of 64 °C hot air from 8 am to 5 pm each day. Drying chamber temperature is adjusted automatically with the help of auxiliary heater and relay. Air flows parallel through the stainless-steel wire mesh trays, on which the samples were arranged in a thin layer. The fruit samples during drying were weighed at every regular interval and later the readings were used for evaluation of drying curves. The process of drying was carried till the fruit reached equilibrium moisture content (EMC). The dry sample was cooled down till room temperature and packed in heatsealed vacuum-packed LDPE (low-density polyethylene) bags. The final fruit mass was evaluated corresponding to a known initial mass, ahead of the experiment and the initial fruit moisture content, using

equation (1) [14]

$$M_{R} = \frac{M_{i} - M_{e}}{M_{o} - M_{e}}$$
 ----- (1)

Where  $M_R$  is Moisture Ratio,  $M_i$  is Instantaneous Moisture content of the sample,  $M_e$  is Moisture content at equilibrium,  $M_o$  is Initial Moisture content.

## 2.2 TAGUCHI STATISTICALDESIGN

The guava dehydration process was carried out under different combinations of thicknesses and intermittent heatingtempering ratio, triplicate employing readings for each experiment, and averaged reading is used to calculate the effect. The Drying time and Equilibrium moisture content (EMC) were tabulated through weight lost by comparing initial and final fruit mass. The experimental combination of process parameter followed the Taguchi design using Minitab 17 software.

Table; 1 Design matrix

Intermittent Ratio	Air Velocity	Air Temperatu re	Rh	Fruit Thickness	Intermittent Ratio	Air Velocity	Air Temperature	Rh	Fruit Thickness

The design matrix provides the best probable combination of operational conditions of the model by decreasing total trial experiments. In this experimental work the dehydration process was carried out varying intermittent ratio, velocity, and fruit thickness, as they make a significant impact on the drying behavior of guava fruit. The 5 factors were coded at 4 levels of variation resulting 16 runs of experiments as indicated in fig 2. The curve-fitting is used to determine drying constants and coefficients for chosen

empirical models. The results of the models were validated through commonly used statistical indicators for fruit drying models such as adjusted coefficient of determinant R<sup>2</sup>.

In this experiment, the variables explored were intermittent ratio, temperature, air velocity, relative humidity, and fruit thickness, the possible combinations of exploratory variables with their ranges, and the experimental design is depicted in Tables 1 and 2.

TABLE:2 The Exploratory Variable

Exploratory Variable		Variable Ranges						
Intermittent Ratio	0	0.25	5	0.75				
Air Velocity (m/s)	0.5	1	1.5	2				
Temperature (°C)	60	64	68	70				
Relative Humidity	46	48	50	52				
Fruit Thickness in mm	2	3	5	7				

Figure 2: Signal to Noise Ratio plot

The figure 3 indicates the SN curve related to the selected parameter such as Intermittent Ratio and fruit thickness, the  $\alpha$ =0.25 and thickness 5mm shows the optimum combination for the present study by considering least drying time as a response variable.

The thermal performance of collector and dryer was assessed utilizing the equations [15,16,] given below.

$$Q_{u} = A[S - U_{L}(T_{pm} - T_{a})]$$

$$U_{L} = U_{g} + U_{b} + U_{s}$$

$$U_{b} = \frac{t_{bottom}}{K_{i}}$$

$$U_{s} = \frac{(L_{1} + L_{2}) * L_{3} * K_{i}}{L_{1} * L_{2} * t_{s}}$$

$$U_{g} = \{\frac{N}{T_{pm}} \begin{bmatrix} T_{pm} - T_{a} \\ N + f \end{bmatrix} e\} + \frac{A_{1}}{B_{1} + C_{1} - N}$$

$$A_{1} = \sigma \left(T_{pm} + T_{a}\right) \left(T_{pm}^{2} + T_{a}^{2}\right)$$

$$B_{1} = \left(\varepsilon_{p} + 0.0591 Nh_{w}\right)^{-1}$$

$$P_{w} = 2.8 + 3.0V_{w}$$

$$C_{1} = \frac{2N + f - 1 + 0.0133\varepsilon_{p} - N}{\varepsilon_{g}}$$

$$11$$

$$f = (1 + 0.089 * h_{w} - 0.1166 * h_{w} * \varepsilon_{p}) * (1 + 0.07866 * N)$$

$$12$$

$$e = 0.430 \left| 1 - \frac{100}{T_{pm}} \right|$$
 13

$$T_{pm} = T_{fi} + \frac{Q_u/A}{F_R U_I} \left(1 - F_R\right)$$

$$T_{fm} = T_{fi} + \frac{Q_u/A}{F_R U_1} \left(1 - F''\right)$$

$$F = \frac{\stackrel{\cdot}{m} \times C}{\stackrel{\rho}{A} \times U} \left[ 1 - e^{-\frac{U_L A_E}{m^* C_P}} \right]$$

$$F' = \left| \begin{array}{c} U' \\ 1 + \frac{L}{h_e} \end{array} \right|$$
 17

$$h_{e} = h_{fp} \left( 1 + \frac{2 \times l_{f} \times \phi_{f} \times h_{ff}}{W \times h_{fb}} \right) + \frac{h_{r} h_{fb}}{h_{r} + h_{fb}} =$$
18

$$\phi f = \frac{\tanh^* mlf}{mlf}$$

$$mlf = \begin{bmatrix} 2*h \\ \hline K & *t \end{bmatrix}^{0.5} *H$$

$$h_{fb} = h_{fp} = \frac{N_u K}{d_e}$$
 21

$$d_e = \frac{4 \times (l1xl2)}{2 \times (l1+l2)}$$

$$U_{L}' = U_{t} + \frac{h_{r}U_{b}}{h_{r} + h_{fb} + U_{b}}$$
 23

$$h_r = F * 4 * \varepsilon_g * \sigma * \left[ \frac{T_g + T_{sky}}{2} \right]^3$$

$$\eta_i = \frac{Q_u}{A \times S} \times 100$$

$$\eta_d = \frac{M_w * h_{fg}}{A_p * S * t_d} \times 100$$

## 3.2 Biological analysis of sample

The dried guava slices were subjected to microbiological analysis to determine the product quality in terms of Antibacterial Activity, Antioxidant activity and Nutritional value. [17,18,19]

## **Determination of Antibacterial Activity**

The bacterial colonies and fungal growth in dried samples were analyzed via pour plate method in two-stage that involving sample preparation and examination respectively. In first stage saline (Na Cl) solution was prepared in two separate beakers and mixed with dried fruit samples. The sterilized samples material was distributed on two Petri dish plates and then nutrient agar medium was added with to enable bacterial growth. The procedure for fungal growth analysis used 1 ml of sterilized sample poured on Petri-dish plates and added dextrose agar medium for enabling fungal

growth during 3 to 4 days of solidification on Petri-dish placed in room temperature. After sample preparation the samples were examined for bacterial colony growth the microbial count in Quebec colony counter.

## **Determination of Antioxidant Content**

Free radical scavenging ability of the methanol extract dried samples was tested by 1,1-diphenyl-2-picryl hydroxyl (DPPH) radical scavenging assay. The hydrogen atom donating ability of the dried sample extracts was determined by the decolorization of methanol solution of (DPPH). 1 mL of different concentrations dried extract was added to 3 mL of 0.1mm methanolic solution of DPPH. The changes in absorbance of samples were measured at 517nm. A control reading was obtained using methanol.

## Determination of Nutritional Composition

Nutritional value of the dried fruit was assessed by total fat, protein, carbohydrate energy and crude fiber was determined using respective standard protocol according to the standard procedure as mentioned in table 4.

Table:4 Nutrients analyzed

Sl No	Selected Parameter	Protocol
1	Total Fat	IS:12711: 1989
2	Total Protein	IS: 7219 : 1973
3	Carbohydrate	IS:1656: 2013
4	Energy	TAL/SOP/CM/122/00
5	Crude Fiber	IS: 10226 (Part 1):1982

## RESULTS ANDDISCUSSION

The variation of Moisture content (MC) reduction with a drying time is illustrated by figure 3. It is observed the drying time

for intermittent drying is longer than the continuous drying. The moisture removal rate was faster at higher temperatures and the drying time shortened considerably as air temperature increased.

FIGURE 3 Variations of Moisture Content Vs Drying Time

It is observed that for a slice thickness of 5 mm, 1.5 m/s velocities, an intermittent ratio of 0.25 required 610 minutes, whereas 700 minutes was required for attaining EMC at 0.75 intermittent ratios. The soothing period substantially influenced the rate of drying as moisture mitigation from the center to the exterior controls the drying process. This agrees with the former research [20].

It is noted that intermittent ratio and temperature have a key influence on the drying rate. The increase of air temperature during the heating, increased the moisture removal rate. In Contrast increase in the tempering period in the heating cycle reduces the moisture removal as temperature difference at the surface of the fruit reduces.

FIGURE 4 Variations of Moisture Ratio Vs Drying Time

**Figure 4** Illustrates the change in Moisture Ratio with drying time for different thickness at 64°C air temperature. It is seen that a rise in slice thickness extends the total drying time. The total effective drying time reduces by 25% when compared with thickness from 7 mm to 2 mm, further

thickness reduction from 3mm to 2 mm reduced the total drying time. It is observed that the moisture removal is faster during the start of the dehydration and reduces as the drying continues, indicating an exponential reduction of the moisture ratio along the drying time.

TABLE:5 Estimated Drying model parameters

Fruit	Fruit Thickness	Model	Constant	Drying	Statistical Indicator		
	in mm		k (min <sup>-1</sup> )	a	b	n	$\mathbb{R}^2$
	3		0.00162			1.49	0.95
	5	1	0.00139			1.56	0.97
	7	-	0.00178			1.46	0.94
	3		0.00488	1.21		0.948	0.96
Guava	5	2	0.00469	1.32		0.958	0.98
	7		0.0039	1.37		0.967	0.95
	3			0.0015	0.08	0.948	0.94
	5	3		0.0028	0.05	0.958	0.95
	7			0.0018	0.06	0.967	0.93

The selected model was fitted to the experimental data using the nonlinear regression. The higher the value of the coefficient of determination (R2) were chosen as the criteria for goodness of fit. The estimated parameters and results of the statistical analysis for the models are summarized in Table 5. It is observed from

the tabulated results that high coefficients of determination were obtained for Henderson - Pabis gave higher values of R2 (0.98). The predicted and experimental values showed the suitability of the Henderson - Pabis equation in describing the intermittent drying behavior Guava Fruit.

FIGURE 5: Variation of Insolation Vs Time

Figure 5 illustrates the variation of insolation along with time, it is observed that the solar insolation gradually increased in value till solar noon and remains constant with a value of  $987 \text{ W/m}^2$  till 13:00 hrs. and reduces gradually to lower value by 17:00 hrs.

**FIGURE 6.** The Air outlet temperature Vs Time

Figure 6 depicts variations in exit air temperature of air heater with time for the month of June. The highest recorded air temperature was 48°C for a mass flow of 0.03 kg/s during the period close to solar noon.

Figure; 7 Variation of Experimental thermal efficiency

Figure 7 dipicts Variation of Experimental thermal efficiency of SPV assisted collector and Dryer efficiency along time. lower values during period close to solar noon owing to higher inlet air temperatures that contributed to enhanced heat losses. The earlier and later part of the day exhibited a better instantaneous efficiency due to lower thermal losses. The dryer effiency exibhited a reducing trend from 17 % to 8% as the available moisture to evaporate was reduced. The dependance of losses indicated that the efficiency of 68 percent

for mass flow rate of 0.03 kg/s.

## **Biological analysis**

The bacterial activity studies revealed that the microbial count on intermittently dried guava slice were within safe limit 2 log10cfu/g ((less than 8.0log10cfu/g)) for fruits [20], however fungal growth was visually not observed in 0.1ml samples through microscope.

FIGURE 8: DPPH Percentage inhibition v/s sample solution concentration

The figure 8 Illustrates DPPH radical scavenging assay to determine antioxidant activity. The changes in absorbance of samples were measured. The tests were performed in triplicate and the graph was plotted with the mean values of inhibition percentage against the concentration of the

sample solutions. The mean activity was found to begin at 48 % and showed maximum activity of 75%. The dried product had Antioxidant activity value of 51.2 mg/ml that amounted to less than 1% of fresh fruit value of chosen variety of guava fruit.

**Table 6: Dried guava sample Nutrient contents** 

Sl No	Parameters		Dried Sample	Fresh Fruit	Difference
1	Total Fat	G/100g	0.1	0.42	0.32
2	Total Protein	G/100g	3.1	2	-1.1
3	Carbohydrate	G/100g	78	81	3
4	Energy	K. Cal/100g	324.8	334.6	9.8
5	Crude Fiber	G/100g	1.1	2.9	1.8

The intermittently dried product nutritional value of the essential nutrients per 100 gram indicate an 0.32, 3, 1.8 grams' reduction of total fat, carbohydrate and crude fiber and 9.8 K Cal drop in Energy content in comparison with fresh guava fruit (allabhad safada variety). The microbiological analysis highlighted the suitability of Solar Photovoltaic assisted dryer for intermittent drying application.

## **4 CONCLUSIONS**

The intermittent drying behavior of guava fruit was studied in the present experimental study as a function of varying drying conditions. Fruit slice thickness, as well as the intermittent ratio, was found to be a significant parameter affecting intermittent drying behavior of guava slices. A higher resting period resulted in a lower drying rate because of reduced air heat supply to the product besides the slower movement of moisture within the structure. The complete drying regime happened in the falling period. Fruit

thickness, drying medium temperature, and intermittent ratio affect the total drying time predominantly.

In a heating cycle of 60 minutes, 45 minutes of heating and 15 minutes of resting period allows the moisture present in the fruit layer to mitigate to a surface which can be removed in the next heating cycle. The slice thickness of 5mm and intermittent ratio of 0.25 resulted in an increased drying rate consequently resulting in better moisture mitigation ratio during drying.

It was observed that the maximum collector thermal efficiency and Dryer efficiency were 65.7% and 18%, respectively. The dryer efficiencies improved with time as the moisture content of the produce reduced and it was found between 8 and 18.6% during day. The microbial count on intermittently dried guava slice is found to be within safe limit for fruits. The dried product had Antioxidant activity value of 51.2 mg/ml that amounted to less than 1% of fresh fruit value. The dried product nutritional value of the essential nutrients

per 100 grams for Total fat, Total protein, Carbohydrate, Energy and Crude fiber were 0.1 g, 3.1,78 g, 324.8 kcal and 1.1 g respectively. The microbiological study highlighted the suitability of Solar Photovoltaic assisted dryer for intermittent drying application.

The statistical analysis indicates Henderson - Pabis model (R<sup>2</sup>=0.982) as the most appropriate model to describe the defining guava fruit intermittent drying indicating the suitability of Solar Photovoltaic assisted dryer for intermittent drying application.

## **Abstract**

Energy harvesting is extracting energy from ambient sources. Vibration is one the energy source available freely in surrounding environment. Research on vibration energy harvesting have received the attention of many researchers to power wireless sensors and low-power electronic devices from smart materials. In this paper, the effect of PZT-5A and PZT- 5H piezoelectric material on the cantilever beam mounted with tip mass and oriented at 10°, at the resistance of 1500 ohms is studied. MatLab program is developed considering the Euler Bernoulli beam assumptions, constitutive equations of piezoelectric material and Hamilton's principle. The MatLab program is validated with the previous work on orthonormalisation electromechanical finite element unimorph beam and good agreement is obtained.

## Introduction

In the recent years, many researchers are attracted towards the area of energy harvesting from various sources available in the surrounding environment [1]. Energy from vibration is one of source which is available freely from machines, human motion having low frequency vibration excitation which can be used to meet the demand without depending on conventional sources. Research in the area of energy harvesting increasing is with development of smart electronic devices. Limitation in batteries capacity to power the devices and life span for supplying continuous energy for wireless necessitate technologies for energy harvesting. Smart structures based on piezoelectricity are currently generating a demand and piezoelectric material forms the alternate source for the creation of lifelong energy harvesters with compact configuration which will be utilized in engineering and medical applications. Research of piezoelectric elements in energy conversion applications necessitates a thorough understanding of mechanics and geometrical shapes [2]. Researchers have focused on analytical and numerical studies of unimorph and bimorph beam which forms the basis for the study of energy harvesting [3-5] due to its compatibility and ease of applications. Authors have studied experimentally, the effect of orientation of beam by attaching harvester to human leg and concluded that optimum results are obtained for 70<sup>0</sup> orientation of harvester with reference to coordinate system [6]. Researchers have focused on orientation of harvester for rotational motion by changing the distance between the rotating center and fixed end of beam [7].A study on configurations of energy harvester for IoT sensor applications in smart cities [8] and optimal location of piezoelectric patch on the length of slat in aircraft applications is carried [9,10]. A less information is available in the literature on The shape functions are given in equation (2-5) the study of orientation of the beam with tip mass on free end and base excitation at end bounded with piezoelectric materials [11, 12]. The aim of this work is to develop the MatLab program for the study of effect of PZT-5A and PZT 5H material on orientation of the beam with tip mass, to study voltage, current and power frequency response function (FRF) and describe its dynamic behavior .The MatLab program is validated with the previous work on orthonormalisation electromechanical finite element unimorph beam and good agreement is obtained.

## 2. Methodology

The Finite element method plays the major role in the complex problem analysis .In vibration based energy harvesting, piezoelectric unimorph beam forms the basic structure. The formulation of beam with piezoelectric (PZT) layer is considered as shown in Fig.1

Figure 1 .Element with base beam bounded with PZT

The beam with piezoelectric has two degree of freedom at each node, transverse (w) and rotational  $(\theta)$ 

The displacement function of the beam element is given as

$$w(x) = c_0 + c_1 x + c_2 x^2 + c_3 x^3$$
 (1)

Eqn. 1 is the displacement equation with four unknown coefficients. Applying boundary conditions at node 1 and 2 of element, the four coefficients in polynomial equation are solved.

 $[N] = [N_1 \quad N_2 \quad N_3 \quad N_4]$ 

where

$$[N_1] = \left(1 - 3\left(\frac{x}{L_e}\right)^2 + 2\left(\frac{x}{L_e}\right)^3\right) \tag{2}$$

$$[N_2] = \left(L_e \left(x - 2\left(\frac{x}{L_e}\right)^2 + \left(\frac{x}{L_e}\right)^3\right)\right) \tag{3}$$

$$[N_3] = \left(3\left(\frac{x}{L_e}\right)^2 - 2\left(\frac{x}{L_e}\right)^3\right) \tag{4}$$

$$[N_4] = \left(L_e \left(-\left(\frac{x}{L_e}\right)^2 + \left(\frac{x}{L_e}\right)^3\right)\right) \tag{5}$$

Strain S(x) is represented by

$$S(x) = -z\frac{d^2w(x)}{dx^2} = -zB \tag{6}$$

Where  $B = [B_1, B_2, B_3, B_4]$ 

Differentiating Eq. (2-5)

$$\frac{d^2N_1}{dx^2} = \frac{-6}{L_e^2} + \frac{12x}{L_e^3} = B_1 \tag{7}$$

$$\frac{d^2N_2}{dx^2} = \frac{-4}{L_e} + \frac{6x}{L_e^2} = B_2 \tag{8}$$

$$\frac{d^2N_3}{dx^2} = \frac{6}{L_e^2} - \frac{12x}{L_e^3} = B_3 \tag{9}$$

$$\frac{d^24}{dx^2} = \frac{-2}{L_e} + \frac{6x}{L_e^2} = B_4 \tag{10}$$

The electromechanical coupling of a piezoelectric can be demonstrated in two ways. In direct piezoelectric effect, an applied mechanical pressure produces a proportional voltage response and in converse effect, an applied voltage produces a deformation of the material.

The direct effect Eq.11 and the converse effect Eq.12 may be modelled as

$$\{D\} = [e]^T \{S\} + [\varepsilon^S] \{E\}$$

$$\tag{11}$$

$$\{T\} = [c^E]\{S\} - [e]\{E\}$$
(12)

The constitutive equation for 1-dimensional form with constant electric field and strain

$$\begin{cases}
 T_1 \\ D_3 
 \end{cases} = 
 \begin{bmatrix}
 c_{11}^E & -e_{31} \\ e_{31} & \varepsilon_{33}^S
 \end{bmatrix}
 \begin{cases}
 S_1 \\ E_3 
 \end{cases}
 \tag{13}$$

The base beam and piezoelectric plane stress field equation is given by Eq.14 and 15

$$T_1^{(1)} = c_{11}^{(1)} S_1^{(1)} \tag{14}$$

$$T_1^{(2)} = c_{11}^{(2)} S_1^{(2)} - e_{31} E_3 (15)$$

 $\vartheta(z) = \frac{z - z_n + h_p}{h_n}$  is the shape function over the interval  $z_n - h_p \le z \le z_n$ 

 $z_n = \frac{c_{11}^{(1)} h_s^2 + c_{11}^{(2)} h_p^2 + 2c_{11}^{(1)} h_s h_p}{2(c_{11}^{(1)} h_s + c_{11}^{(2)} h_p} = \text{distance from the neutral axis to the top layer of the beam with piezoelectric}$ 

 $\varphi(z) = \vartheta(z)v_p$  is electrical potential

 $\Omega(z)=$  first derivative of shape function  $=\frac{d\vartheta(z)}{dz}=1/h_p$  ,

The electric field equation

$$E_3 = -\Omega(z)v_p \tag{16}$$

where  $v_p = voltage$ 

Substituting Equation (6) into Equation (14)

$$T_1^{(1)} = -zc_{11}^{(1)}B (17)$$

Substituting Equation (6) and (16) into Equation (15)

$$T_1^{(2)} = -zc_{11}^{(2)}B + e_{31}\Omega(z)v_p(t)$$
(18)

$$D_3 = -ze_{31}B - \varepsilon^S_{33} \Omega(z)v_p \tag{19}$$

The electromechanical piezoelectric cantilever energy harvesting is formulated by the Hamiltonian principle,

$$\int_{t_1}^{t_2} [\delta(\hat{\mathbf{k}} - \hat{\mathbf{p}} + \omega) + \delta \omega] dt = 0$$
 (20)

Representation of equations in matrix form utilizing extended Hamilton's principle [3]

$$\begin{bmatrix} M & 0 \\ 0 & 0 \end{bmatrix} \begin{Bmatrix} \ddot{w} \\ \ddot{v_n} \end{Bmatrix} + \begin{bmatrix} C & 0 \\ P_{sr} & P_D \end{bmatrix} \begin{Bmatrix} \dot{w} \\ \dot{v_p} \end{Bmatrix} + \begin{bmatrix} K & P_{rs} \\ 0 & 0 \end{bmatrix} \begin{Bmatrix} w \\ v_p \end{Bmatrix} = \begin{Bmatrix} F \\ i_n \end{Bmatrix}$$
 (21)

Element Stiffness Eq.22, mass matrix Eq.23 is given by

$$[K] = \int z^2 c_{11}^{(1)}[B^T][B] dv^{(1)} + \int z^2 c_{11}^{(2)}[B^T][B] dv^{(2)}$$
(22)

$$[M] = \int \rho^{(1)}[N^T][N]dv^{(1)} + \int \rho^{(2)}[N^T][N]dv^{(2)}$$
(23)

Adding tip mass terms to Eq. (23)

$$2I_0^{tip} x_c[N^T] \frac{d[N]}{dx} + I_0^{tip} [N^T][N] + I_2^{tip} \frac{d[N^T]}{dx} \frac{d[N]}{dx}$$
 (24)

Offset distance from proof mass centroid [5] is

$$x_{c} = \frac{\rho^{tip} b l_{tip}^{2} h_{tip} + \rho^{(1)} b l_{tip}^{2} h_{s}}{2(\rho^{tip} b l_{tip} h_{tip} + \rho^{(1)} b l_{tip} h_{s})}$$
(25)

Zeroth and second mass moment of inertia [5] is given by

$$I_0^{\text{tip}} = \rho^{\text{tip}} b l_{\text{tip}} h_{\text{tip}} + \rho^{(1)} b l_{\text{tip}} h_s$$
 (26)

$$\begin{split} I_{2}^{tip} &= \left( \rho^{tip} b l_{tip} h_{tip} \left( \frac{l_{tip}^{2} + h_{tip}^{2}}{12} \right) + \rho^{tip} b l_{tip} h_{tip} \left( z_{n} - h_{p} + \frac{h_{tip}}{2} \right)^{2} + \left( \frac{l_{tip}}{2} \right)^{2} \right) \\ &+ \left( \rho^{(1)} b l_{tip} h_{s} \left( \frac{l_{tip}^{2} + h_{s}^{2}}{12} \right) \\ &+ \rho^{(1)} b l_{tip} h_{s} \left( -z_{n} - h_{p} + \frac{h_{s}}{2} \right)^{2} \left( \frac{l_{tip}}{2} \right)^{2} \right) \end{split} \tag{27}$$

Damping matrix C is given as

$$C = \alpha M + \beta K \tag{28}$$

Mechanical Force F is given by

$$F = -Q\ddot{w}_{base} \tag{29}$$

Where

$$Q = \int \rho^{(1)} N^T dV^{(1)} + \int \rho^{(2)} N^T dV^{(2)}$$
(30)

Adding tip mass terms to Eq. (29)

$$-I_0^{tip} x_c \frac{d[N^T]}{dx} - I_0^{tip} [N^T]$$
 (31)

Electromechanical coupling is given by

$$P_{sr} = -\int z\Omega(z)^T e_{31} \mathbf{B} dV^{(2)}$$
(32)

Capacitance matrix is given by

$$P_D = -\int \Omega(z)^T \varepsilon_{33} \Omega(z) dV^{(2)}$$
(33)

Transformation matrix is given by

 $T = [\cos(\theta) \ 0 \ 0 \ 0; \ 0 \ 1 \ 0 \ 0; \ 0 \ \cos(\theta) \ 0; \ 0 \ 0 \ 0]$ 

Formulating the Eq. (21).into global matrix based on electromechanical vector transformation. Voltage, current and power frequency response function obtained by direct non-orthonormalised electromechanical dynamic equation is given by [5]

$$\frac{\mathbf{v}_{p}}{-\omega \mathbf{w}_{b} e^{j\mathbf{w}t}} = \left[ j\omega \mathbf{C}_{p} - \frac{1}{\mathbf{R}_{load}} j\omega \mathbf{\Theta}^{T} * \left[ \underline{\mathbf{K}} - \omega^{2} \underline{\mathbf{M}} + j\omega \hat{\zeta} \right]^{-1} \mathbf{\Theta} \right]^{-1} \\
* j\omega \mathbf{\Theta}^{T} \left[ \underline{\mathbf{K}} - \omega^{2} \underline{\mathbf{M}} + j\omega \hat{\zeta} \right]^{-1} \mathbf{Q} \tag{34}$$

$$\frac{i}{-\omega^{2}w_{base}e^{i\omega t}} = \frac{1}{R_{load}} \left\{ \left[ C_{p}i\omega + R_{l} - \Theta^{T}i\omega \left[ -M\omega^{2} + \hat{\zeta}i\omega + \underline{K} \right]^{-1} \Theta \right]^{-1} \right.$$

$$\left. * \Theta^{T}i\omega \left[ -M\omega^{2} + \hat{\zeta}i\omega + \underline{K} \right]^{-1} Q \right\}$$
(35)

$$\frac{P}{(-\omega^2 w_{base} e^{i\omega t})^2} = \frac{1}{R_{load}} \left\{ \left[ C_p i\omega + R_l - \Theta^T i\omega \left[ -M\omega^2 + \hat{\zeta} i\omega + \underline{K} \right]^{-1} \Theta \right]^{-1} \right\} \\
* \Theta^T i\omega \left[ -M\omega^2 + \hat{\zeta} i\omega + \underline{K} \right]^{-1} Q \right\}^2$$
(36)

The dynamic equations are solved assuming system response is linear under harmonic base excitation and beam is excited in transverse direction. electromechanical piezoelectric cantilever energy harvesting beam equations are formulated by the Hamiltonian principle. The numerical work of the author [5] is extended to outline the key equations and include orientation for the electromechanical dynamic equation.

## 2.1 Model of orientated beam bounded with piezoelectric patches and tip mass

The study on energy harvesting is carried on cantilever beam of length 'L'. The beam is divided into two parts L/2 each,  $L_p^1$  and  $L_p^2$  is the length of PZT patches,  $h_b$  and  $h_p$  is the thickness of base beam and PZT patch,  $\theta$  is the orientation of second half part of beam bounded with PZT patch and mounted with tip mass.

**Figure 2** Orientation of Cantilever beam bounded with piezoelectric patches and tip mass at free end.

The geometrical and material property of the beam are presented in table 1. Tip mass is mounted on extended length of base beam. The length of the piezoelectric patches Lp<sup>1</sup> and Lp<sup>2</sup> is 20 mm each. The angle of orientations of the beam is 10<sup>0</sup>. The analysis of the beam is carried out using MATLAB program in the frequency range of 0 to 1000 Hz. The Cantilever beam is divided into 50 elements.

## 3. RESULTS

The vibration energy in the environment occur with various frequencies. To exploit the vibration energy, the frequency of the model considered have to operate close to the vibration source. The importance to find the natural frequency is to obtain maximum output. The validation of the model is given in Table 2 and 3

<b>Table 2</b> Comparison of Natural frequencies for unimorph beam without tip mass

Figure 9.Shows the power FRF of cantilever beam oriented at  $10^0$  mounted with tip mass and bounded with PZT -5H.

Figure 4-9 shows the voltage, current and power FRF of cantilever beam orientated at 10<sup>0</sup>, bounded with PZT -5A and PZT -5H piezoelectric patches and beam mounted with tip mass at the free end. At resistance of 1500 ohms and frequency range of 0 to 1000Hz. The following observations are made.

The voltage, current is higher for PZT-5A in first and second peak and lower for third peak compared to PZT-5H.

The higher power is achieved for PZT-5H in first and third peak and lower for second peak compared to PZT-5A.

## 5. CONCLUSIONS

MatLab program is developed using finite element method considering the Euler Bernoulli beam assumptions, constitutive equations of piezoelectric material and Hamilton's principle. The paper focuses on the study of effect of PZT-5A and PZT-5H piezoelectric patches on orientated cantilever beam mounted with tip mass using the direct method with nonorthonormalisation to derive the voltage, current and power frequency response function (FRF).It is observed that for the  $10^0$  orientation, 0.127mm thickness of piezoelectric material and 1500 ohms resistance. The higher voltage and current is achieved for PZT-5A in first and second peak and lower for third peak compared to PZT-5H. The higher power is achieved for PZT-5H in first and third peak and lower for second peak compared to PZT-5A.

## WASTE TO ENERGY USING LOW CAPACITY INCINERATOR

## Raju Jadar, K. Raghavendra, Ganesh B, Raghavendra Karnool

Department of Mechanical Engineering, Ballari, Institute of Technology and Management Ballari-Karnataka-583104

## **Abstract**

Waste disposal is a major problem everywhere in the world. The government believes that it is challenging to properly arrange wastes, both industrial and residential, as cities become more and more urbanised. While it is possible to dispose of domestic garbage at landfills in rural areas, this is not an option for the urban network. In developing countries like India, where the majority of households rely on urban/metropolitan labour, every one of these wastes is placed in landfills, which is the most common method of rubbish collection. However, these dumps pollute the air and water. Incineration and combustion are other methods for getting rid of trash. Here, wastes are burned under regulated circumstances. This method has its drawbacks, but it is still a better option than the long-term problems associated with landfills. However, incinerators are expensive, and the great majority of people are not informed of the benefits of using domestic incinerators. This goal of current work is to create a family-sized incinerator that can be transported about easily. Additionally, the garbage that is burned will be converted into thermal and electrical energy. It must also be mild.

Selection

Keywords: Incinerator, Electricity, Thermo Electric Generator (TEG), Population, Solid Waste, Heat

## 1. Introduction

Solid waste is undesirable or pointless stuff that is produced by human activity in residential, commercial, or industrial sectors. Metropolitan India, home to roughly 377 million people, generates 63 million tonnes of municipal stable waste (MSW) annually, of which about 31 million tonnes (or 50%) are disposed of in landfills, 11.9 million tonnes (or 20%) are processed, and 43 million tonnes (or 70%) are collected. The estimation of urban municipal stable waste (MSW) generation may rise to 165 million tonnes in 2030 and 430 million tonnes by 2050 due to changes in economic growth and consumption habits [4-6]. The frequent mention of solid waste as a major factor contributing to environmental degradation. 20 to 30 percent of the waste produced overall does not get collected on average, posing environmental problems in urban areas. Asian nations were the principal recipients of unmanageable solid waste as a result of unplanned development and rapid industrial expansion. In addition to helping with energy recovery, the waste incineration process transforms combustible and natural garbage to noncombustible materials like ash and causes weight loss that may be properly disposed of on land or in underground pits [1-4]In India, Municipal Solid Waste (MSW) is becoming a significant problem. The primary goal of this study was to reduce solid waste production through the

#### WASTE TO ENERGY USING LOW CAPACITY INCINERATOR

introduction of incineration, and the secondary goal was to recover and transmit the waste energy produced during combustion. The outputs are clean surroundings, power from a thermoelectric generator, and waste thermal energy. The inputs are fuel and readily available MSW. The project's ultimate goal is to recover the most energy possible from burning waste, produce thermal and electrical energy, minimise the volume of waste collected, and make use of waste leftovers. For the purpose of reducing environmental contamination, waste treatment is essential. All nations have strict regulations and laws in place to handle this garbage. Waste remediation systems must be rigorously evaluated with continuous in-cycle management to guarantee that minimal performance criteria are reproducibly satisfied. The production of waste is a never-ending process that is accelerating with urbanisation. For the garbage created to be handled effectively, waste management is absolutely necessary. The old-fashioned method of gathering waste and discarding it in an open area gradually contaminates the soil, water, and air around us [4-6].

## 2. Experimental and Methods

There are several factors influencing the input and output of the worth and capacity of the municipal solid waste incineration. Some of them are [7-8]:

- Production of waste from industrial, households and commercial sites.
- By preventing the production of waste both in industry and households, we will able to lower our waste generation.
- In addition to the waste collected by the municipal solid waste incineration process, it also incorporates residue from the waste treatment technologies.
- Separate collection of waste influences the quantities of the municipal solid waste incineration can be reduced by separate collection of small electrical appliances. Significant reduction in quantity of waste for treatment is observed through source separation of biogenic waste and recyclables and qualities of waste for incineration. For example, up to 80% of Cu content in the bottom ash

## 2.1. Municipal Solid Waste Incineration.

During the incineration process, a variety of solid and liquid residual materials, as well as gaseous effluents are produced. As a general rule, approximately one-fourth of the waste mass remains as solids in a wet state. It sestimated at the residue volume corresponds to one tenth

of the volume of the original waste. Typical MSWI by-products from grate combustion include [9-10]:

- Bottom ash is gathered in a quenching/cooling tank near the combustion chamber's exit
  and is mostly composed of coarse non-combustible materials and unburned organic
  waste.
- The process of "grate sifting entails gathering the comparatively fine particulates that flow through the grate at the combustion chamber's base. Because it is typically not practicable to separate these two waste streams, bottom ash and grate sifting together make about 20-30% by mass of the original waste on a wet basis.
- Boiler and economizer ash, which will be representing the coarse fraction of the particles carried over by the flue gases from the combustion chamber, makeup 10% of the initial waste by mass on a wet basis. At the heat recovery stage, it will be collected. Before the gaseous effluents are subjected to any additional treatment, the fine particulate matter or fly ash is removed. An MSW incinerator produces the 1-3% of waste input mass on a wet basis amount of fly ash.

## 3. Design Methodology

Design becomes a crucial component in the building of the incinerator to reduce the effectiveness of the burning process. This will aid in the reduction of emissions, the avoidance of clinker formation and ash slagging (inside the main chamber), and the preservation of refractory materials. Small-scale incinerators are seldom used to achieve the desired temperature, residence duration, and other parameters. To effectively burn trash and properly handle the waste, however, small incinerators must be built. Also, they will handle garbage appropriately.

Fig 1: 3D CAD Design of Model

#### 3. 1 Fabrication of Incinerator

#### 4. Incinerator Components And Materials

The main components of small-scale incinerator consists of [1-4]:

- a) Barrel Drum
- b) Chimney
- c) Thermo Electric Generators(TEG)
- d) Ash and Residue collector

**Barrel drum:** One of the key parts that serves as an easily constructed and accessible incinerator for burning the waste is a barrel drum. Steel, laminated paper board, and plastic are used to make these drums. The steel drum can be used for incineration since it is simply adaptable to the needs. The 55 gallon steel barrel is chosen because it is ideal for the miniature incinerator.

**Chimney:** The chimney's primary function is to release the burned gases into the atmosphere. The small-scale incinerator's chimney is made of a hollow iron pipe.

**Thermo Electric Generator:** The heat energy must be transformed into electrical energy via TEGs. They can be utilised in large quantities in small incinerators. Power can be produced by connecting devices in series.

**Residue and Ash collector:** The Ash/Residue collector is located at the bottom of the incinerator. It is divided into two parts by mesh-style iron rods that were welded in place. The space will be kept open for debris.

#### 5. Fabrication Process

Going through many past journals and theories, it is observed that fabrication method of this small-scale incinerator inflicts collective efforts. To come up with a satisfactory viable outcome, various available papers had been taken as reference and going through at of each theoretical and sensible design is executed. The selection of materials is the first step in the fabrication process. The choice of a barrel drum as an incinerator nearly completes the fabrication process of the incinerator. The chosen drum is a steel 55-gallon open head (open on one end) drum with a 220-liter oil capacity. Square bars that have undergone thermo mechanical treatment (TMT) are taken into consideration when creating the mesh that will

support the weight of the garbage inside the drum and serve as a layer between wastes that has already been burned and waste that is still to be burned. As a chimney, a hollow iron pipe of the requisite height is chosen. To increase the flow of oxygen naturally for burning and to drain the water during times of rain, the air holes for the oxygen supply have been closed. The gate for the incinerator is secured with hinges to allow for free operation and rubbish disposal. The connections for the modules of the thermoelectric generator are provided as needed. The incinerator has finished being constructed and is now ready for testing as shown in fig.

Gate from base	100 mm	L3

#### 6. Experimental Setup

The constructed small-scale incinerator, the garbage placed inside of it, and the connections of the thermoelectric generator (TEG) modules are assembled to form the test setup. The waste is first burned by utilising some fuel for initial burning, and that burned waste creates thermal energy, which is computed in accordance with the temperature variations that occur as a function of time. At various locations throughout the incinerator, Thermo electric generator (TEG) modules are connected in parallel and series. The thermal energy (from heat from burning waste) of the garbage is converted into electricity by the TEG modules, who then produce voltage. With a multimeter, the electrical energy produced may be estimated.

Fig 2. Experimental Setup

#### 7. Results and Discussions

WASTE VOLUME REDUCTION: The waste products burned in the small-scale incinerator include dried twigs wood, paper, cardboards, and leaves, among other things. The amount of rubbish that was gathered and burned during the specified period is shown in the table below. To minimise the volume and weight of the garbage, it is burned in the incinerator's burning chamber.

#### **Generation Of Thermal/Heat Energy**

In the small-scale incinerator, the generation of heat energy depends upon various factors like waste burnt, the calorific value, the moisture content present in waste and type of the waste burnt. The overall capacity of the small-scale incinerator can be of 200 kg but the construction made that it can burn only up to 80 kg, of which varying in between 40 to 70 kg of waste is burnt for effective burning. By burning each kg of waste, the temperature achieved is about 80 to 160 ° C. The supply of waste will be through the gate of the incinerator and is placed over the mesh and is burnt. The heat energy i.e. temperature can be calculated by measuring instruments of heat. The heat energy produced by burning waste can be used for cooking, heating water, drying, etc. as shown in the figure.

#### **Generation Of Electrical Energy**

The amount of TEGs used and the temperature difference between the hot and cold sides of the TEG modules determine how much electricity is produced by this incinerator. The TEG Module, which can produce up to 4 volts, generates electricity based on the temperature difference and the maximum voltage. Different voltages can be generated by different temperature variations.

The parallel current (in Amps) generated by thermoelectric generator modules.

#### **CONCLUSION**

Like we observe in other nations, waste of every kind is produced in Indian cities as well. Yet, there is a lack of waste management due to improperly planned and scientific techniques of waste control. The leftover waste at the dump yards is typically made up of a greater number

#### WASTE TO ENERGY USING LOW CAPACITY INCINERATOR

of inert and putrescible natural resources thanks to any of the strong regulations on waste burning and recycling. A straightforward solid waste incinerator was created, constructed, and successfully tested in order to generate thermal and electrical energy through the burning process.

In addition to the releases of flue gases and other byproducts like fly ash and bottom ash, the solid waste incineration process takes into account the reduction in weight, size, and smell of garbage. The public's health is being negatively impacted by the prevalent waste management procedures due to the developing problems with waste control in urban areas. Incineration is a noteworthy option because there is a constant need to enhance the waste management system and apply modern, scientific waste disposal techniques.

According to test results, the system can be used for energy recovery and garbage disposal. Despite the fact that the concentrations of several dangerous gases in the flue gases were over the required criteria, it is necessary to show that the device and combustion chamber require similar work before it can be certified for use in large-scale applications.

#### **Abstract**

The primary concern of the Nations worldwide has been the growing energy demand. In view of changing energy scenario, renewable energy emerges as a feasible solution to address circumstances that do not permit centralized energy grid extensions owing to socio–economic problems. The present study has identified a remote cluster of villages located in Sringeri Taluk, Chikkamagalur district of Karnataka state in India. HOMER based Simulation approach was adopted to choose different combinations of PV-WIND-MH-HK systems based on strategies as Development side and Demand Side. The various resource combinations were investigated on the grounds of Net Present Cost (NPC) and Cost of Energy(COE). The results showed that Development side load strategy was optimal for PV-MH-HK combination with \$217,191.5 and \$0.166/kWh for NPC and COE values. On the contrary, Demand-side Load strategy yielded values of NPC and COE as \$120,825 and \$0.158/KWh respectively. The data indicated a poor wind potential at the area investigated, evident through omission of WIND system in optimal combination. The long term or multiyear simulations carried out for the optimal solution indicated 4.45% rise in COE owing to 4.54% drop in energy production through PV.

#### Nomenclature

Q<sub>D</sub>: Direct surface run off depth(mm),

I :monthly rainfall(mm)

S Maximum potential retention in a watershed(mm)

CN: curve number

Q: the rate of run off or discharge in m<sup>3</sup>/s

T<sub>P</sub>: is the time to peak run off(hour)

T<sub>C</sub>: is the time of concentration(hour),

Lw: is the length of the water shed

A: is the area of the Water shed

H<sub>net</sub>:Net Head available

 $v_{CI}$ : is the cut in speed

v<sub>R</sub> is the rated speed of the turbine

v<sub>CO:</sub> is the cut out speed

P<sub>R</sub>: is maximum rating of power from the turbine

 $V_{\text{hub:}}$  Velocity at the hub height

 $\alpha$ =0.43(coefficient value for mountain, terrain)

Z<sub>1.</sub>Z<sub>2</sub>=Reference heights wind turbine

 $R_{\mbox{\scriptsize PV}}$ : rated power output from the turbine,

DF: Derating factor in %,

I<sub>T</sub>: instantaneous solar radiation

 $\eta_{Hydro}$ :efficiency of the Micro Hydro turbine,

 $\rho_{water}$ : density of water  $1000 \text{Kg/m}^3$   $Q_{tur}$ : discharge from the turbine.

 $A_{tur}$  is the surface area of the turbine from the manufacturer is the Average velocity of the stream

C<sub>p</sub> is the coefficient of performance

V: Velocity of the water stream flow

η<sub>r</sub>:,rotor efficiency

η<sub>b</sub>: Blade efficiency of Hydrokinetic

 $\eta_g\text{:}Generator\ efficiency$ 

D:Diameter of the turbine

i:Interest factor% N: Number of years

#### 1.Introduction

Availability of Energy is the primary criteria for the development of any site/location/area/city, utilizing its primary and secondary resources, commercial and Non-commercial energy resources, and Renewable and Non-renewable energy sources[1]. The Government of India has established MNRE(Ministry of Renewable energy Sources) to utilize the full potential alternative energy resources. renewable energy potential is about 900GW, from the contribution of Wind-12%, solar-83%, Bioenergy-3% and Small Hydro-2.2%[2]. The energy demand will always show an increasing trend for all the developing and developed countries. In India, rural electrification progress has made a revolutionary development, but

some of the electricity access to villages has remained as a barrier. There are a large number of socio-economic challenges that have to be overcome in providing the grid extension[3]. When rural electrification is concerned, the major challenge is to provide the grid to the rural and remote areas[4].It is found to be uneconomical to pass the grid extension to the remote hilly areas and another reason is that flora and fauna at the place for grid extension are mostly get affected[5]. The remote areas are usually found with two or more potential resources, utilizing these resources is far better than passing the extension. The alternative solution is to integrate the potential renewable energy systems to meet the demands of the rural people, especially remote area living people. The optimization process for better

integration selection of the systems is to be carried out to assess the feasibility and suitability of the system[6]. An Economic and Environmental pollution study[7] is carried out for the cluster of 9 villages using HOMER tool taking the components MHG/BGG/PV/DG with Battery and obtaining the optimal COE and NPC values for all the configurations. Suitable strategy adopting DSM for standalone IRES[8] in area remote is made taking PV/WIND/MHG/BGG/BMG

configuration to assess the cost of COE and NPC using the Genetic algorithm approach. Optimal modeling of IRES for the remote area electrification[9][10] in Chamaraja Nagar District ,Karnataka is studied for obtaining the optimal sizes of components of the system. The research on simulation and optimization studies[11] of Hybrid energy systems using software tools on various platform are suggested. Different optimal sizing methodologies[12] referred and suggested which include probabilistic methods, analytical methods, Iterative methods, and Hybrid Methods. WIND-PV-DG[13] system integration is carried out for sizing the systems to provide electrification in rural Algeria using the MATLAB/Simulink environment. feasibility study of a standalone PV-WIND with Battery[14] is made to assess the NPC and COE with different possible system types in remote island using HOMER tool. A combination of PV/BMG with battery bank[15] for the non-connected zones are studied using the HOMER software and systems are designed and installed at Distributed energy resources Laboratory.A new approach[16] is studied for PV-WIND and energy storage systems in diesel-free isolated communities which proposes the various models handled for optimizing the cost functions. Off-grid generation options are studied[17] to deliver a load of 110KWh/day in rural villages of cameroon using the PV(18kW)-MH(14kW) and LPG generator(15KW) using HOMER. The remote area study[18-20] the Uttarkhand District villages is performed

using the PV/WIND/BMG/BGG/MH. This study gives the feasibility of integrating all the systems in remote areas by conducting the load survey in the villages. The integration of the systems require proper assessment of the resource load and demand load. The demand load is carried out by enquiring with the local people and Grama panchayat available at the location. The study on the Operation of optimal energy systems[21] by considering the Demand-side strategies are simulated as load response from the renewable systems. In this study, optimization strategy is proposed and demonstrated for the singlefamily residential home. Optimization of PV-WIND -DG[22] is studied for their integration in isolated communities in Brazil for results of NPC and COE.The optimal studies on remote isolated islandsandwip, Bangaldesh [23] is studied for the combination OF PV- Diesel taking the various loading parameters and adopted the Genetic Algorithm(GA) approach for the simulation of **NPC** and COE.The experimental studies related to off-grid areas[24] are conducted using the PV-Diesel Generator without the battery storage and found that the operation of diesel generator is to be designed for the Peak load demand of the area. The operation of the diesel contributing 60%-80% is observed from the nominal power demand. A review study on IRES[25] are the integration of renewable systems, sizing methodologies, storage technology options for storage durations, and the uncertainties of integration are mentioned by referring the various works of literature. Technoeconomic study for MH-PV-WIND-BG-BM-DG is conducted[26] for five unelectrified villages using HOMER software and found best optimal configuration with the least cost of COE as \$0.197/kWh.The study[27] was made on using HOMER software for seven un-electrified clusters of villages in Limkheda taluk and Dahood District in Gujarat State using HOMER tool for obtaining the value of NPC and COE. The study [28] is made on a cluster of un-electrified villages in Odisha state, obtained the results for NPC and COE using the salp swarm algorithm utilizing the MATLAB environment for its robustness and convergence efficiency for optimal solutions. The research study, [29] and [30]suggested a Demand response program(DRP) for the performance of PV/FC/Battery –WT/Battery to reduce cost and emissions and latter suggested for smart distribution system(SDS). Studies on Demand side management[31] also gives information for distributed network supply for electric vehicle operations.

From all the above literature studies, it is inferred that the integration of Renewable energy systems is feasible and sustainable for remote areas. The studies are made taking the potential resources available at the locations. The studies related to the configuration of PV-WIND-BM-BG with Diesel generator is more of concern and found less literature on the part of Integrating the Micro-Hydro and Hydro Kinetic turbine. These two renewables sources are site-sensitive and largely depend on the rainfall at the selected areas. Few literature are found integrating the Hydro Kinetic turbine as a resource. The Multi-vear simulation results HOMER are not carried out in various literature. A simulation for Development side strategy is not made in the literature. Here, an integration of MH-HK with the PV- WIND is made for optimal simulation on the un-electrified remote cluster of villages near sringeri Taluk, Karnataka state which is found to be experience with high rainfall status in the Karnataka state region. A different combination for simulation to integration of renewable energy system is carried out to obtain the best optimal solution taking two strategies. The reported

research gives an insight into the study in the sections of Load demand and Resource demand assessment, Modeling of Renewable energy systems, optimization studies, Results and discussions and Multiyear simulation results.

### **2.**Motivation for present study and Methodology

This study is carried out to obtain the best optimal integrated combination solution for NPC and COE simulation using HOMER pro soft for a different combination of potential resources at the site. To size different renewable energy systems to accommodate the load demand by considering the two strategies, 1. Development side Load strategy and 2.Demand side Load strategy. This research also assess the NPC and COE using the Multiyear simulation module in HOMER Pro soft. This study involves getting the local coordinates for the site under study for watershed area assessment using the Google save location Mobile app and then elevation contours are developed using the Google earth and ArcGis software. The meteorological data are obtained from using the Meteonorm 7.3 software for solar data and wind data is recorded using the Typical Meteorological year data. The simulations are carried in the recent version of the HOMER Pro soft. Figure 1 shows the Main tool menu in HOMER Pro available for simulation.

Figure 1.HOMER Pro software main menu tools for simulation.

#### 3. Load Assessment of Study Area

The study area is selected from the cluster of Remote villages nearby Sringeri Taluk(Latitude 13.417 N Longitude 75.252 E), chikkamagulur District, Karnataka. The villages were first identified by grouping the villages into urban villages(which are near urban area/city),Rural villages(which are near to Rural taluks) and Remote rural villages(which are remotely residing near to Rural taluks). The electrification to urban and rural villages are already benefitted by the NJY(Nirantara Jyoti scheme) implemented by Government of the Karnataka. for the rural village Electrification. The electrification remote villages is difficult for Government to pass the grid lines and these grid lines are posing endanger to the flora and fauna at the remote sites. The cluster of villages are identified at the radial distance of 1-2km, having the study location at 75.152837 Longitude E. Latitude 13.470276 N.

#### 3.1 Load Demand at the study area

The load demand for the study is made by strategies considering the two Development side Load strategy and Demand side Load strategy. The former strategy is evolved on basis of development required at the remote areas by collecting data from the Local/Grama panchayatwhich is a village governance body in Indian villages and the tribal people, about the various developments required like schools, outpatient Hospital, community halls, small industrial loads(flour mills, pumps), stationary water shops(food items/groceries and others) by preparing the questionnaire and communicating with local people and Grama panchayat members who are elected by the village people for governing the village issues. on the contrary the latter uses actual demand required in the present situation, which is estimated by collecting load data from the Residential Houses.Here only Domestic Loads are considered. The Table 2 shows the Load point estimation of Domestic, community loads and commercial Loads.

**Table 1** Demography of the cluster of Remote villages

Name of the	No. of House	population
Village	holds	
Tarulli Kodige	27	132
Anukulli bylu	15	45
Bylubaru	6	25
shunti hakkalu	6	18
kote	25	112
Total	<b>79</b>	332

Table 1 gives the demography of villages for load assessment. Hourly load demand for the year is obtained by categorizing the year into four quarters (Jan- March, April-June, July-Sept and Oct-Dec). In obtaining the hourly load demand for Development Load strategy, loads are categorized into

Domestic loads, community loads and Commercial Load. But for the Demand side Load strategy, only Domestic loads are considered because It is observed the local people living are not availed of community and commercial services in the study area.

Table 2 Load points estimation for obtaining the Hourly demand at the study site

Domestic loads						
Appliances	Quantity					
CFL LIGHT(40W)	4 Points in each House Hold					
LCD TV(70W)	1 Point in each House Hold					
Radio(25W)	1 Point in each House Hold					
Fan(75W)	2 Points in each HH					
	Community loads					
<b>Appliances</b>	Quantity					
CFL LIGHT(40W)	3 points for Hospital,4 points for School Building					
Refrigerator (1000W)	1 Point for Hospital Usage					
Fan(75W)	3 points for Hospital, 4 points for School Building.					
	Commercial Loads					
<b>Appliances</b>	Quantity					
CFL LIGHT(40W)	2 shops having 1 point for 79HH					
Street light(60W)	1 pole for every 3 HH					
Fan(75W)	2 shops having 1 point for 79HH.					
Pumping water(3.76 KW)	3 water pumps for 79HH					
Flour mill (5KW)	1 Point having 5KW for 79HH					

Figure 2. Annual Energy Demand estimation in each quarter for Development side strategy Load.

Figure 3. Annual Energy Demand Estimation in each quarter for Demand-side Management strategy.

Table 2 gives the details about the appliances and the number of points estimated in each Household (HH). The Load points are assessed by enquiring with the Local people and Grama panchayat members. Hourly Energy demand (KWh) is then calculated in each quarter of the year. The Energy demand in each hour, in each quarter, is assumed to be constant. Figure 2 and Figure 3show the energy demand in each quarter for Development side strategy and Demand-side management strategy. The load assessment is carried out based

upon their life style during the various seasons and usage of their energy. The tribal people have their own kind of habitat of work. Their usage is found to be more during the second quarter(April-June). Total Annual Energy demand required for Development side strategy is 124727.86 KWh/Year with annual average of 341.72 KWh/year and Peak load of 65.08KW/day. For the Actual Total energy Demand for the cluster of villages is found to be 63702.83 KWh/year with annual average of 175.5 KWh/year and the Peak load demand of

45.04 KW/day. While calculating the load on Demand side Low rate Watt with High performance(LRHP) appliances(like LED bulbs) are considered. The Demand-side load is found to be 51% of the Development side load strategy.

### 4. Resource Load Assessment at the study area

Potential Renewable sources available at the study area are identified as Wind, solar, Micro-Hydro and Hydrokinetic resource.

#### 4.1 Wind Load assessment

The wind speed available at the location is retrieved from the typical Meteorological Year chosen for 10 years from 2008 to 2018[32]. The wind data is also collected from the local IMD(Indian Meteorological Department) center at Karwar, Karnataka. The wind velocity is observed high during June-september from the data.

Figure 4 shows the Typical meteorological data for wind speed generated and mean wind speed was found to be 4.2m/s.

Figure.4.Mean wind speed velocity calculated from the Typical meteorological year Data

#### 4.2 Solar energy load Assessment

Solar radiation data of sringeri taluk are obtained from the Meteonorm 7.3 software application for the period of 10years by giving the geographical coordinates as input. Solar intensity kWh/m²/day for each month available at the site is then calculated

as shown on Figure 5. The average solar intensity in kWh/m²/day for the year was found to be 5.44 KWh/ m²/ day/year.The solar insolation is found be high during the summer season from February-June from the Data.

Figure 5. solar intensity KWh/m<sup>2</sup>/day available at the site for all the months

#### 4.3 Micro-Hydro Load Assessment

To assess the Hydro potential at the study site for Micro-Hydro turbine, the discharge to the turbine is calculated by using the Soil conservation services Curve Number Method(CN), developed by the USA in 1969 for estimating the actual run off depth based on the Rainfall data.

Actual run off depth is calculated by the Equation 1 as[33]

$$Q_D = \frac{(I - 0.2S)^2}{(I + 0.8S)} \text{ when } I > 0.2S$$
 (1)

$$S = \frac{25400}{CN} - 254 \tag{2}$$

Where Q<sub>D</sub> is the direct surface run off depth(mm), I is the monthly rainfall(mm) and S is the Maximum potential retention in watershed(mm) and CN is curve number ranging from 48-58 for dense forest. The peak rate of run off or discharge are calculated by the equations as follows

$$T_P = 0.6T_C + \sqrt{T_C} \tag{3}$$

$$T_C = 0.0195 \left[ \sqrt{\frac{L_W^3}{H_{net}}} \right]^{0.77} \tag{4}$$

$$Q = \frac{0.0208 \times A \times Q_D}{T_P} \qquad --- \tag{5}$$

Where O is the rate of runoff or discharge in  $m^3/s$ ,  $T_P$  is the time to peak run off(hour)  $T_{\rm C}$  is the time of concentration(hour),  $L_{\rm w}$  is the length of the water shed and A is the area of the Water shed. These are calculated from developing the watershed contours using the Google Earth and ArcGiS 10.8 software. The geographical exact coordinates of the location are obtained for the implementation of Hydro turbine site. Table 1 gives the calculated values of average Discharge values of Q taking the rainfall data of 10 years using the meteorological information from Meteorological department at IMD, karwar District, Karnataka and from the online resource website[34].It is estimated that Average of 3379.7 litres/s for the year is available as a discharge to the Micro-Hydro turbine output. Figure 6(a) shows Elevation contours developed from the ArcGIS soft at the site and elevation is calculated as 625m and length of the watershed is 1125m. Figure 6(b) and Figure 6(c) are the watershed area contour and Topography of the study respectively.

Table 3 Calculation of Discharge from the Curve Number Method

### 4.4 Hydro-kinetic resource Load assessment

The study site is identified with water stream flow suitable for generating the power using the Hydro-kinetic turbine. This requires the data for the average velocity of water streams. Average velocity of water flowing is obtained for each month using the Electro-Mechanical current meter device. To obtain the monthly data, current meter is used to get the velocity readings for mid-day of the month for 12 hours, keeping the device at 0.5m, 1m and 2m depth from the surface level of water.

Figure 7. Average water stream flow velocity in each month

Figure 8. HK resource model

The average velocity of stream flow obtained is shown in Figure 7. This velocity is assumed to be constant throughout each month for obtaining the Hourly analysis. Figure 8 shows the details of the Hydrokinetic resource model at the location. The

average water stream velocity is high during the rainy season from June-october.

#### 5. Modeling of the Energy Resources

This study is made identifying the energy resources of Wind energy, solar energy,

#### 5.1 Modeling of Wind power output

The power output from the wind turbine is calculated by the Equation 1[35][36] as

Where  $v_{CI}$  is the cut in speed,  $v_R$  is the rated speed of the turbine and v<sub>CO</sub> is the cut out speed ,P<sub>R</sub> is maximum rating of power from the turbine. The power curve from the manufacturer details are correlated for calculation of power output in HOMER optimization by taking the effect of air density ratio and multiplied by the Power output from the wind turbine STP(standard Temperature Pressure) conditions. For the calculation of power from the turbine is taken at hub height of 30 m, which is given by the Equation 2 as

$$V_{\text{hub}} = V * (Z_2/Z_1)^{\alpha}$$
 (2)

Where  $Z_2=30m$ ,  $Z_1=10m$  and  $\alpha=0.43$  (coefficient value for mountain, terrain) Power calculations are obtained for each hour data for 8760 hours

#### 5.2 Modeling of Photovoltaic systems

Power calculations for the PV output are carried out using the Equation 3 [37]

$$P_{PV} = R_{PV} DF(\%) \left[ \frac{I_T}{I_{STC}} \right]$$
 (3)

Where  $R_{PV}$  is the rated power output from the turbine, DF is the Derating factor in %, $I_T$  is the instantaneous solar radiation and  $I_{STC}$  is the solar radiation at the standard Test conditions.

#### 5.3 Modeling of Micro Hydro system

Power output from the Hydro turbine is obtained from the Equation 4 [38] as

MicroHydro and Hydro kinetic resources

available at the locality.

$$P_{MH} = \frac{\eta_{Hydro} * \rho_{water} * H_{net} * Q_{tur}}{1000} \quad KW \quad (4)$$

Where  $\eta_{Hydro}$  is the efficiency of the Micro Hydro turbine,  $\rho_{water}$  is the density of water  $1000 kg/m^3$ ,  $H_{net}$  is the net head available to the turbine and  $Q_{tur}$  is the discharge from the turbine. The discharge to turbine is calculated from the soil conservation curve method as explained in the resource load assessment section.

#### 5.4 Modeling of Hydro-Kinetic turbine

Hydrokinetic turbines are placed under water which may be fixed or floating type against the stream water flow, normally these are placed at a minimum depth of 1m from the surface level of water..The power output from the Hydro-kinetic turbine is calculated by the Equation 5[39] as

$$P_{HK} = 0.5 * \rho_{water} * A_{tur} * V^{3} * C_{p}$$
 (5)

Where  $A_{tur}$  is the surface area of the turbine from the manufacturer is the Average velocity of the stream flow and  $C_p$  is the coefficient of performance of the turbine taken value of 0.59(Betz Limit).

Equation 5 is modified by taking the rotor efficiency( $\eta_r$ ),Blade efficiency ( $\eta_b$ ) and Generator efficiency( $\eta_g$ ), taking the values of 0.6 for rotor efficiency, blade efficiency and generator efficiency values equal to 0.9, We get

$$P_{_{HK}} = 0.5 * \rho_{_{water}} * A_{_{tur}} * V^{3} * C_{_{P}} * \eta_{_{r}} * \eta_{_{b}} * \eta_{_{g}}$$
(6)

Substituting  $A_{tur}=\Pi D^2/4$ , the equation gives

$$P_{HK} = 0.112 * D^2 * V^3$$
 (7)

In HOMER, Power curve from the manufacturer is taken as reference, the values are interpolated to the manufacturer details.

#### 6. Optimization Simulation studies

In this study, optimization for the Economic analysis for different combinations of renewable energy sources is carried out using HOMER pro Optimizer HOMER performs the sizing operations for the feasibility analysis. The NPC(Net Present cost) and COE(Cost of Energy) are the two parameters considered for analyzing the feasibility and suitability of the systems. Each simulation is provided with Load data by taking some suitable sensitive parameters as sensitivity analysis. Net present cost is the Present cost involving all the cost components deducting all the revenues it earns all throughout its Project Lifetime.

In economic analysis, NPC is calculated by Equation 7[35] as

$$\begin{split} NPC &= \frac{C_{Totalyear}}{CRF} \\ C_{Totalyear} &= C_{FCyear} + C_{RCyear} + C_{OMyear} \\ CRF &= \frac{i(1+i)^{N}}{(1+i)^{N}-1} \end{split} \tag{8}$$

Cost of Energy(COE) is the annualized Total cost of producing the Energy generation to the Total energy served by the Renewable energy systems given by Equation 9 as

$$COE = \frac{C_{Totalyear}}{E_{served}}$$
 (9)

HOMER does not Rank the Renewable Integration system based on the COE .In determining the cost components of the Renewable systems, HOMER analyzes the considering the Fixed Replacement cost, and Operation and Maintenance cost. Therefore, the capital cost of the system per KW is assessed by various taking costs involved, distribution of various costs are obtained by manufacturing details and with Engineers associated with the installation of Renewable energy systems. Figure 9 shows the percentage of distribution of various costs involved for installation of Renewable energy system per KW or MW.

Figure 9. Percentage distribution of various costs installing RE system.

It shows from the Figure 9 that, 54% of the capital cost is involved for Renewable Energy systems and other 46% is accounted for costs of supporting activities required at the installation of the system. The optimal Simulation method followed is shown in the Figure 10. With the available Resources at the Location, integrating the different combinations of systems are performed considering as only the Potential resources available at the study area. combination simulation is being performed with different sensitive parameters concerning scaling factor, Renewable

energy fraction, and other variables for the systems. HOMER gives the feasibility of the combination with the values of Net present cost and cost of Energy. The load input for the Development side strategy and Demand side strategy for each run of the combining the Integrated renewable system. In all the simulations Battery and Inverter capacity and cost are considered Thus, all the individual combinations give the values for NPC and COE. Then the best possible combination for sustainability is selected on the optimization results.

Figure 10. Flow chart for the Optimization studies

#### 7. Results and Discussion

Simulations for the different possible combinations are performed by considering the size of Battery(1KWh) Lead Acid and converter size varying between 10KW to 50KW. The Load demand for Development side strategy is explained in the load demand assessment section, which is found to be of Annual Average 341.68KWh/day

with a peak Demand of 65.08 KW.The Demand side load strategy is having annual average of 175.5KWh/day with a Peak demand of 45.04 KW. Hourly Assessment of load demand is carried out by taking the four quarters of a year. Hourly demand of load is assumed to be constant for the particular quarter and time. For the two strategies, seven possible combinations are considered as an optimal integration

renewable system. This involves integration of PV-BATT/PV-WIND-BATT/WIND-BATT/MH-HK-BATT/WIND-MH-HK-BATT/PV-MH-

HK-BATT and PV-WIND-MH-HK-BATT. Table 4 gives details of the costs of systems considered for simulation.

Table 4 various costs of systems considered for simulation in HOMER

Systems	Capital cost(\$)	Replacement cost(\$)	O&M cost(\$)
PV-1KW	\$2,500.00	\$2,500.00	\$10.00
BATTERY- 1KWh(LA)	\$300.00	\$300.00	\$10.00
CONVERTER	\$300.00	\$300.00	\$0.00
WIND-95KW	\$4,75,000.00	\$4,00,000.00	\$4,000.00
MH-49KW	\$52,266.00	\$50,000.00	\$1,045.00
HK-40KW		\$14,000.00	\$280.00
	\$14,000		

In HOMER simulation, the costs of renewable energy systems are divided under three categories, which consist of capital cost, Replacement cost and Operating and Maintenance cost. The other costs involved with renewable system are not included. Various other costs associated are mentioned in the Figure 9 are taken as reference and made include in the capital cost of the systems. The costs calculated do not involve in other direct and indirect taxes and are according to the price value in

Indian country. It is also observed that the costs tend to change with the demand for the respective renewable energy system, like in the cases of PV panels and wind turbines. Micro-Hydro and Hydro Kinetic are site specific and demand for there is less when compared with other systems. The cost of converter and Battery are depends on the type used. Lithium-Ions batteries cost are more compared with lead acid battery and thus it increases the Net present cost and COE.

Figure 11.State of charge% Generic Lead acid Battery(1KWh) for PV-MH-HK Demand side load

Table 6 shows the energy consumptions of PV,MH,HK systems when simulated for Demand side Load strategy similarly the same trend has been observed in the case of Development side strategy. contributions of MH and HK is more with respect to PV system. This shows that the location has a more potential in Hydro energy resource that can be utilized to full extent. Figure 11 shows the simulation result to the number of hours of Battery operation during the year. It shows that batteries are operated for maximum hours during the Second quarter of the year.

Table 5 shows the simulation details of possible integrated systems for the study area considering the two load strategies. In the case of Development side Load strategy, MH-HK –Battery integrated system can give Least cost NPC of \$166,816 and COE of \$/KWh 0.153 with 46 Battery Numbers. The next best possible integrated system is PV-MH-HK-Battery with NPC of \$217,191.5 and COE of \$0.166. The cost of NPC and COE is found to be high if it is proposed for only Wind – Battery system. In case of Demand side strategy, the value of Least NPC is \$120,841 and the COE is \$0.154, it is found

to be almost same for MH-HK-Battery and PV-MH-HK-Battery integrated system. The number of Batteries required is 8 and 5 for these integrated systems. The NPC is increased by 27.5% and 44.3% for MH-HK PV-MH-HK-Battery systems and respectively when compared to the Development side load strategy Management. But, the COE remains almost the same for these two cases of the integrated system. The size of the converter in KW required is observed to be less with these two combinations. The inclusion of the wind turbine in any of the combinations gives more value of NPC and COE. This shows that the wind is not able to deliver the expected energy demand at the site. For the wind data available, it is found to be not suitable for a sustainable resource. Micro-Hydro and Hydrokinetic alone contribute to the delivery of the energy demand. The carbon emissions are zero for the Global emissions demand. It is also observed from the results that the contribution of MH and HK together is more than 80% in generating the Energy in KWh/year. This shows that the Hydro potential is more sustainable in these areas. This study area is near to Augumbe forest reserve where more rainfall occurs through the year as the data is collected from the nearest rain gauge station. Thus it is suggested that keeping the above results into consideration, the PV-MH-HK with battery is more suitable for the location.

Table 7 Present study comparison with other relevant studies on Remote areas in India

#### 8. Multiyear simulation results

Multi-year simulation module in the HOMER software provides futuristic values of various parameters integrated into the system. This module takes the values of PV degradation of production, annual increase in the fixed maintainence cost and annual increase of electrical load

requirement. The simulation results on various parameters like PV production kWh/year, AC primary load, Battery losses (kWh/year), converter losses (kWh/year), unmet electrical load (%) and capacity shortage (%) are noted 10 year simulation output. Table 8 shows the Multi-year simulation for the optimal result obtained.

#### **Conclusions**

This paper presents the simulation studies for a different combination of the integrated renewable energy system for obtaining the least NPC and COE. The potential resources available in the study area are first identified as PV-WIND-MH-HK. The seven different combinations are simulated for obtaining the optimal value of NPC and COE considering the Developing side Load strategy and Demand-side Load strategy which gives 14 combinations of simulation studies. It is found that Demand side Load strategy is 51% of Development side Load strategy for the annual Energy Demand Estimation. In all the simulations, Battery system should be included as a it provides a continuous un interrupted power supply. In the Development side Load strategy, the best optimal solution is found to be of MH-HK(40KW) with a NPC of of \$166,816 and COE is \$0.153. The second optimal solution is with the combination of PV-MH-HK with NPC of \$217.191.5 and COE is \$0.166.From the feasible and sustainable point of view, the PV-MH-HK is found to be better for the location considering rainfall situations. For the Demand side load strategy, it is found that same two combinations hold good as the best possible solution. Here, NPC and COE values obtained are almost same having values \$120,481(MH-HK)-\$120,824(PV-MH-HK) and \$ 0.154(MH-HK)-\$0.158(PV-The optimal values were MH-HK). considering obtained by sensitivity parameters in HOMER pro soft. Integration with WIND turbine system gives more value of NPC and COE. It can be identified the generation from the WIND turbine is not a feasible solution at the location.

Further, the Multiyear simulation results carried out for the best optimal solution for 10 years gives the parameters effect is well within the lower range. From all the observations, it is clear that the site is having a good potential for Hydro resources and is more feasible and sustainable with zero emissions.

#### Abstract

Brakes in any automobile are intended to regulate and stop the moving vehicles safely. The overall braking efficacy depends on various components, their ability to convert kinetic energy to heat energy through friction (b/w pad and drum). Therefore, the pad material properties are of significance, to name a few, clothing forfeiture, coefficient of friction (COF), wear and mechanical behaviour. Normally, Phenol formaldehyde (PF) / Epoxy resin (ER) and some fibre materials along with glass, asbestos and carbon fibres in proper proportions are preferred. Whereas, asbestos is readily available in the market and regularly used. But, this asbestos is toxic in nature and there is every need to explore alternatives. An endeavour made to substitute this asbestos with materials like glass fibre (GF), carbon fibre (CF) coconut casing powder (CSP) etc. which are eco-friendly. Also, inorganic materials likeBaSO4 - barium sulphate and CaCO3 - calcium carbonate are explored as well in terms of filler followed by aluminium

oxide, graphite and antimony sulphide tested for frictional additives. This paper depicts certain

trials made on, Asbestos Free Brake Friction Material (AFBFM) combinations - PF with GF,

PF doped CF, ER &GF mixture, and ER with CF for wide proportions of fibres and matrix.

The results suggested the combination of ER and 15% CF is suitable for brake shoe material.

**Keywords** 

Brakes, Pulverized cow hooves, Non-Asbestos, Tribological properties

1. Introduction

Automobile braking system consists of components like drum, pad, cylinder etc., which control

the vehicle speed by converting mobile energy to heat due to friction. During this process the

brake shoes are in action and should maintain sufficient frictional factor with the disc to avoid

failures. These shoes are made of asbestos mixed with several other ingredients which is toxic

and harmful in nature need to be substituted. Quite a few research works done in this direction

suggested new asbestos free materials from agricultural wastes. The emerging materials for

brake pads are commercially viable and eco-friendly.

Researchers like Idris, Namessan, Koya, Fono, Aigbodion, Ibhadode and Dagwa,

Ruzaidiworked with banana peels, kenaf (Hibiscus canabinus) fibres and palm kernel shell

respectively, and concluded these materials can be used effectively as an alternate to asbestos.

All the researchers used the standard procedure to assess the suitability of these materials. In

the same line this paper presents the work documented on fabrication of brake pad material

without asbestos (AFBFM) with different combinations of PF and ER mixed with glass fibre

(GF), carbon fibre (CF) (PF+GF, PF with CF, ER added to GF and ER+CF). Compression

moulding was preferred for preparing samples and relative analysis with the commercial

available pads is made.

2. Materials

The materials selected for the study are E-glass, carbon fibres (reinforcement), epoxy resin and

Phenol Formaldehyde (base material). The E-glass fibres possess excellent electric resistance

apart from resistance to heat, temperature, resistance to chemical action, resistance to moisture

etc. Further, these fibres maintain their strength over a varied temperature conditions. The

chemical composition of the E-glass comprises of oxides of silicon (55%), aluminium (14%),

boron (7%), calcium (22%), magnesium, and the physical properties are tensile strength of

3.44GPa, density 2.58g/cm³ elongation of 4.8%, Thermal Expansion Co-efficient of 54x10<sup>-70</sup>C etc. The carbon fibre is composed of carbon atoms which are extremely stiff, strong, and light, properties close to that of steel and as light as plastic. Thus the strength to weight ratio (as well as stiffness to weight ratio) of a carbon fibre part is much higher than steel or plastic. Carbon fibre is extremely strong; typical engineered for structural, aerospace, civil, military, and motorsports applications addressing lifecycle costs and performance. A few properties of this carbon fibre are, tensile strength-5880MPa, density- 1.8g/cm³, thermal conductivity of 70W/mK etc., but they are costly.

The Table 1 Material list in percentage compositions

**Table 1. Material – Composition in volume fractions** 

CI	Data de la Caller		Density (g/cm <sup>3</sup> )	Volume fraction

4	Carbon	Epoxy Resin	5.0	60.0	10.0	55.0	15.0	50.0

#### 3. Methodology

Among the available methods to fabricate any composite compression moulding technique is most preferred (high pressure application). The mould is preheated to 150°C, 120 bar pressure is applied, charged with ER or PF, and all selected additives. Later, subjected to curing for a predetermined period of ½ to ¾<sup>th</sup> hour. The samples are pulled out of mould cavity and subjected to treatment for a day at 80°C. The sample size is 200 X 160 X 5 mm and finally, the fabricated PF and ER samples are sized. The standard (ASTM) specimens for various tests like impact, and compression are prepared.

#### 4. Mechanical Testing and Structural Characterization

The prepared samples are subjected to the various tests to evaluate mechanical, wear etc. properties. This paper is concentrating specifically on impact ,compression ,hardness properties looking into their rolein terms of brake shoe is concerned for the system. The ASTM D-695 standard trial was selected to explore compressive strength.

#### **4.1 Compressive Strength**

Figure 4.1 ASTM D-695 work pieces for compression test

In order to conduct experiments, UTM, a job of 12.7 \* 12.7 \* 25.4 mm (figure 4.1), ASTM D-695 procedure with 2 mm/min speed is set. The job is subjected to compression till fracture. The compression strength is noted for fracture against the load applied for the given sample.

#### 4.2 Impact Strength

The impact analysis (izod), test ASTM D-256 (Figure 4.2) is selected and different pendulum hammers are used till failure occurs and readings are tabulated. All types of samples are subjected to same treatment.

Figure 4.2 ASTM D-256 Work Pieces for Impact test

#### 4.3 Hardness Number

In the present work, Shore-Durometer (Shore-D) test was used. The Shore A scale is used for 'softer' polymers while the Shore D scale is used for 'harder' composites, ASTM D-2240 standard is used to measure the hardness. Different volume fractions of PF and ER reinforced with glass and carbon fiber brake friction materials shown in were used to conduct hardness test.

### International Journal of Science, Mathematics and Technology Learning ISSN: 2327-7971 (Print) ISSN: 2327-915X (Online) Volume 31 No. 2, 2023

Figure 4.3 ASTM D-2240 Work Pieces for Hardness test

For each sample, hardness number was measured at different locations on the specimen and average hardness numbers for each sample were tabulated. All types of samples are subjected to same treatment.

#### 5. Deliberations on Outcomes

#### **Compressive Strength**

Table 5.1Compressive strength: GF & CF plus PF& ER commercial Brake Pads

S	eri .		• 4 4	1 6 1 4	6 1 1	Compressive	Compressiv

0	Reinf							brake pads
	orcem	PF+GF PF+CF		ER+GF ER+CF	ABBPM-2	ABBPM-2	(Literature),	
	ent						MPa	
	ent							
								CABBPM
1	5	79.24	85.63	87.66	93.93			
2	10	83.32	92.13	90.33	98.67	104.33	112	110
3	15	87.33	101.83	105.26	121.33			

From the above table, the compressive strength tabulated for (15% vol.) GF plus PF amalgam is 87.33 MPa. The values are 03 tests average of each vol. fraction used for further analysis. Equally, for 5% and 10% the values are 79.24 and 83.32 MPa respectively. Similarly, the strength obtained for 05, 10 and 15 percent carbon fibre inclusion with phenol-formaldehyde are 85.63, 92.13, and 101.83 MPa respectively.

For the combination of epoxy with glass fibres (5%, 10% and 15%) the compressive strength resulted as 87.66, 90.33, 105.26 MPa respectively and with carbon fibre for same volume

fraction addition the strength was 93.93, 98.67 and 121.33 MPa respectively. Now if we check the values of asbestos pads (ABBPM-1 & ABBPM-2) the values are 104.33 and 112 MPa for 1, 2 types correspondingly. This is depicted in table.

Further, keen observations reveal that the compressive strength of the prepared material (without asbestos) improved with percentage hike in reinforcement apart from even dispersion alloying elements. In addition, Epoxy resin combinations fared well relative to PF based blends with proper mixing and bonding. The tested combinations when compared to asbestos, the ER & CF -15% carbon fibre compressive strength is 121.33 MPa higher by 14.01% and 7.68% respectively (ABBPM-1 and ABBPM-2).

Figure 5.1 bar chart showing Compressive Strength – with and without Asbestos

#### **Impact strength**

Some trials were carried out with glass and carbon reinforcements plus PF and ER as base in with ASTM D256 in different vol. fractions. For each combination, 05 samples were measured and average values are tabulated (Table 5.2).

Table 5.2 Impact strength: GF & CF plus PF& ER vs Commercial Brake Pads

		Impact str	rength with	out asbesto	s, J/mm <sup>2</sup>	Impact s	trength of	Impact strength

3	15	0.07	0.081	0.071	0.0852				

# International Journal of Science, Mathematics and Technology Learning ISSN: 2327-7971 (Print) ISSN: 2327-915X (Online) Volume 31 No. 2, 2023

The tabulated values of impact strength of the combinations without asbestos show significant increase with percentage addition of reinforcement, better bonding. A related trend is seen with carbon addition as these fibres possess superior intrinsic mechanical properties comparatively. Further, CF+ER (15%) combination 2.58% higher impact strength in relation to regular asbestos based materials.

Figure 5.2 Bar chart showing Impact Strength with and Without Asbestos

#### Hardness

The hardness of composite materials was measured using Shore- Durometer (**Shore-D**) test. It is a measure of resistance offered by materials for indentation which is depicted as hardness number. Experiments were conducted for different volume fractions of glass and carbon fiber reinforced PF and ER based friction materials on the surface and average hardness numbers for each combination are tabulated in Table 5.3 These values were compared with the asbestos based brake pad materials and found that asbestos free brake friction composite material is harder compared to that of commercial brake pad materials

Table 5.3 hardness number: GF & CF plus PF& ER vs Commercial Brake Pads

Percent Reinforcement (%)	PF+GF	PF+CF	ER+GF	ER+CF	ABBPM-1	ABBPM-2	CABBPM (Literature)
5	79	82	85	88			
10	80	84	87	90	82	83	82
15	82	85	90	92			

Figure 5.3 shows the hardness number for 15% volume fraction of GF and CF reinforced composites and asbestos based commercial brake pads. It is observed that, Epoxy Resin based composites have higher hardness compared to PF based and commercial brake pad materials. This is due to better interfacial bonding of fiber, filler and frictional additives with ER.

# International Journal of Science, Mathematics and Technology Learning ISSN: 2327-7971 (Print) ISSN: 2327-915X (Online) Volume 31 No. 2, 2023

Figure 5.3 Bar chart showing hardness value with and Without Asbestos

The Shore D hardness of GF and CF reinforced composites enhanced with increase in fiber content. This is due to more resistance offered by the fibres as its content increases in the composites. Addition of CF in matrix has resulted in the highest hardness value among the considered composites due to the better mechanical properties of CF

#### 6. Conclusions

The experimental compressive strength of epoxy doped with carbon fibre (5 – 15%) has shown gradual increase from 93.333 to 121.333 MPa, higher than both asbestos and glass fibre pads. Similarly the glass and carbon fibres with phenol formaldehyde the carbon reinforced samples have better strength (14.01% high for 15% addition) comparatively. The reasons are due to less rigidity and strength of glass fibres relatively. The samples when tested under impact, the 15% of CF & GF in PF matrix, recorded values are 0.08 J/mm² and 0.07 J/mm² respectively. As urge in impact strength when CF added with 15% GF is 13.58%. For the same percentages of CF & GF supplemented to ER the values are 0.085 J /mm² and 0.071 J/mm² respectively. Also, when 15% CF put into ER noticed 16.66% higher impact strength. The same in relation to regular asbestos there is marginal hike of 2.58%. The samples when tested under hardness test, Hardness of ER+15%  $V_f$  CF is 92. It is 2% higher than the hardness of ER+15%  $V_f$  of GF which is 90%. ER+15%  $V_f$  CF composites hardness is 10% and 9% higher than ABBPM-1 and ABBPM-2 respectively. Therefore, it can be concluded that ER+15% of carbon fibre is of dominant combination for brake pad material.

**Abstract** Among well-known substances for reinforcing, graphite, a softer and well-known material, is a preferred choice due to its thermal properties, lubrication characteristics, lightweight, and chemical stability. Titanium diboride is another common ceramic reinforcing substance with excellent thermal conductance, a higher melting temperature, outstanding rigidity, and exceptional micro-hardness at varying temperatures. The current study investigates the effect of titanium diboride and graphite additives on the wear characteristics of AA7075 aluminum. Stir casting and hot rolling were used to make the composite materials. Using the in situ reaction method, eight percent titanium diboride particles were formed, and four and eight percent graphite particles were added later. The casting composite materials were hot rolled with an 80 percent reduction ratio at 400 °C. Microstructural studies, grain size analyses, and abrasive wear tests were performed on hot rolling and casting matrix alloys and their composite materials. According to microstructural investigations, titanium diboride and graphite reinforcement particles are distributed uniformly, with excellent bonds between the matrices and the reinforcing agents in both the casting and hot rolling conditions. Under the same test conditions, both hot rolling and casting composite materials outperform un-reinforced alloys in terms of abrasive wear resistance. When compared to cast 7075 alloy 5wt%  ${\rm TiB}_2$  and 8wt% Graphite reinforced composite, weight loss was reduced by 35% and 47%, respectively, for cast and hybrid conditions. Scanning electron micrograph was used to investigate into possible wearing mechanisms on worn-out areas.

#### Introduction

Due to their appealing qualities, metal matrix composites (MMCs) have attracted a great deal of interest over the last thirty years. Aluminum alloys are widely used in engineering constructions, automobiles, and aerospace, especially heat-treatable alloys like AA7075. The combination of lightness, elasticity, durability, suitable resistance to abrasion, and higher stiffness due to the insertion of strong reinforcement particles are the main drivers behind composite manufacturing. The research findings also mentioned that the thin sheets made from aluminum metal matrix composites (AMCs) with hard phase-reinforcing agents are fascinating for engineering structures because of their featherweight in addition to their durability and resistance to wear. Other reasons for composite making, such as adjusting the desired thermal expansion, were also highlighted. Higher specific strength, better specific stiffness, and improved wear resistance are advantages of aluminum metal matrix composites (AMCs), which are crucial as lightweight materials advance. AMCs are widely used in the automotive, aerospace, and transportation industries. The most often used particles for AMCs reinforcement right now are ceramic and metallic. The advantage of using metallic particles as MMC

Department of Mechanical Engineering, T. John Institute of Technology, Bengaluru, Karnataka 560083, India

reinforcement is that the aluminum matrix and reinforcement particles' interface wettability is strengthened, leading to better interface bonding strength. Graphite and titanium boride (TiB<sub>2</sub>) belong to a significant group of metallic materials that have been employed as reinforcement in AMCs. In terms of friction, wear, and strength, AMCs excel. The majority of investigations on aluminum composites indicated that the tribological properties of composites increased when reinforced with a number of well-known reinforcements, including Al<sub>2</sub>O<sub>3</sub>, ZrO<sub>2</sub>, B<sub>4</sub>C, and TiC. In addition, Si<sub>3</sub>N<sub>4</sub> and graphite have superior mechanical and physical properties, such as higher melting temperatures, larger elastic moduli, and higher thermal conductivities. Graphite and TiB<sub>2</sub> both have the potential to replace ceramics as materials that resist wear. In addition to having flaws, including blowholes, shrinkage cavities, and uneven dispersion that are challenging to remove during the casting process, aluminum hybrid composites have been discovered to have poor interface bonding between the ceramic reinforcement and the aluminum matrix. Extrusion, forging, and rolling are examples of secondary forming techniques that are essential for preventing casting flaws and enhancing material properties. These processes have a significant impact on the interfacial bonding between the matrix and reinforcing phases, the dispersion of ceramic particles, the production of grain refinement, and the removal of porosity [1-3].

For metal matrix composites based on aluminum, rolling is the secondary forming technique that is most frequently employed since it can produce a wide range of products using various casting techniques. Finally, by rapidly undergoing large amounts of plastic deformation, rolling increases the component's strength. Thickness is decreased during hot rolling, which has a significant impact on mechanical properties and grain refinement. The three key rolling factors that determine the microstructure and mechanical properties of a rolled component are the direction of rolling, rolling temperature, and depth of reduction. In industrial aerospace applications, it is necessary to take into account how hot rolling affects the microstructure and mechanical behavior of metal matrix composites based on aluminum [4].

To create Al7075-titanium carbide/graphite hybrid composites, Patil et al. [5] employed friction stir processing (FSP), one of the most significant severe plastic deformations (SPD) procedures. The Al7075 alloy has been shown to change the wear processes from adhesion or fatigue to abrasion by mechanically mixing graphitized-TiB<sub>2</sub> layers to reduce wear rate during dry sliding motion. In this study, it was discovered that graphite reinforcement affected the wear characteristics of composite materials. Due to higher graphite exfoliation during dry sliding, there were fewer severe delaminations and abrasions discovered. The most crucial factor in determining the wear rate of the finished composites has been identified as the aluminum metal matrix

composite, which served as the foundation for the interface adhesion of graphite/titanium carbide composite material. The hot-extruded composite material has a lower COF and greater wear resistance than heated composites, according to An et al. [6], who was the first to manufacture and investigate the friction and wear properties of Al alloys. In their study of the tribological properties of silicon carbidereinforced aluminum composites made by casting and hot extrusion, Dasgupta et al. [7] discovered that hot-extruded composites always experience less material loss than cast components. Al-Beryl composites were made by hot rolling and examined for wear characteristics by Reddappa et al. [8]. They claimed that dynamic recrystallization (DRX), which takes place during hot rolling, lowers the specific wear resistance of the rolled aluminum composites when compared to cast composites. Al<sub>2</sub>O<sub>3</sub> and graphite reinforcement particles were added to Al7075 by Baradeswaran et al. [9], who claimed that this improved the material's hardness, tensile strength, and flexural strength when compared to the base metal. The presence of graphite in hybrid composite material revealed a tendency to maintain wear on the tribosurface to a minimum because thin layers of graphite formed on wear surfaces.

In a study to determine the impact of graphite amount and milling on microstructure, mechanical, and wear behavior, Lara et al. [10] constructed Al7075–graphite composites using hot extrusion and mechanical alloying. They claimed that successful grain refining, homogenous graphite dispersion, and alloying element incorporation are all outcomes of hot extrusion and mechanical alloying. More graphite content and longer milling times provide the composites with better mechanical characteristics. Microstructural analyses of debris and worn surfaces show that the strength and hardness of the composite have risen as a result of the inclusion of graphite particles and the prolonged milling time, which may enhance the composite material's dry wear qualities.

Despite the fact that the strength of aluminum decreases by 9% when compared to the previous experiments, Ashwini et al. [11]'s research shows that the addition of fly ash improves the mechanical properties of the aluminum with graphite by 3 and 6%, respectively. The micro-hardness of the composite decreases by nine percent when compared to the earlier samples, but the addition of 3 and 6 wt% fly ash to aluminum and graphite. Increases the materials' hardness. The volume of wear rate of hybrid composites drops to a lesser extent and then declines along with the increase in fly ash content. The friction coefficient experiences the opposite trend. As the amount of fly ash varies (3, 6, and 9%), the density of aluminum with graphite decreases. Fly ash and SiC are added to composites to increase their mechanical strength and hardness, according to Lokesh et al. [12]. The wear resistance increases along with the fly ash and SiC content. The fly ash and SiC were firmly linked with the matrix,

Table 1 Composition of alloy

Wt%	1.74	0.26	0.41	1.9	0.44	0.17	3.2	0.44	Balance

with no cracks at the particle-matrix contact, according to the microstructures.

Uvaraja et al. [13] used liquid metallurgy to prepare the homogeneous composite structure and introduced SiC and B<sub>4</sub>C reinforcement particles in both Al7075 and Al6061 alloys. Particle dispersion in both matrix systems is homogeneous, as seen by optical micrographs. The results of the hardness tests show that the filler increased the composite's micro-hardness. On the other side, the composite material's wear rate was enhanced. Furthermore, silicon carbide was added to the Al7075-based composite to slow down the rate of wear. According to the standards, Basavaraj et al. [14] examined the tribological behavior of Al-fly ash-SiC and Al-graphite-SiC. The materials experience some hardening when they are combined with fly ash and graphite, and SiC. Prior to a specific loading capability, metal matrix composites have good tribological characteristics. Fly ash, Graphite, and SiC were added to the composite to increase its strength and hardness. The stir-casting method was employed by Danappa et al. [15] to create Al7075–graphite–TiO<sub>2</sub> metal matrix composites. It has been determined that the load applied, as well as the titanium oxide particle content, has an impact on wear resistance. Hard titanium particles were added, and this decreased wear by 94%.

According to the literature reviews, hot rolling and stir casting are very effective methods for examining and characterizing the tribological characteristics and morphology of a hybrid composite material made of Al7075 alloy with graphite and titanium boride. The abrasive wear performance of hybrid composites has been studied under various loads and grit sizes.

#### Experimentation

#### **Processing**

Hot rolling and stir casting techniques were used to create A17075 hybrid composites, and Table 1 details the material's composition. As shown in Table 2, five distinct composites of various titanium diboride (TiB<sub>2</sub>), graphite (Gr), and two un-reinforced alloy compositions were made under casting and rolling circumstances. Figure 1 depicts the morphologies of composites. A stainless-steel stirrer, graphite crucible, and permanent cast-iron mold were utilized. A17075 alloy bars are cleaned, positioned in a graphite crucible, and heated in an electric furnace to 800 °C. The trapped gases from the melt were released

using the hexachloroethane ( $C_2Cl_6$ ) tablet. A 400-rpm stirrer rotation produces a vortex. The melt's vortex receives one or more reinforcement particles. Stirring helps ensure uniform reinforcement particle dispersion in the matrix by keeping the reinforcement particles suspended in the melt. After that, a mold is filled with the composite melt to allow it to set. The base Al7075 alloy and as-cast Al7075 alloy were hot rolled in a 2-high roll mill at 450 °C with a reduction ratio of 80% and a 10% reduction in each pass. Table 1 provides specifics on the processing methodology and reinforcement characteristics. The photograph of hot rolling machine is shown in Fig. 1.

Fig. 2 Photograph of abrasive wear test setup

#### Microstructure

The specimens were partitioned into appropriate segments and subjected to abrasion using various grades of silicon carbide sheets, followed by disc polishing in order to attain a highly reflective surface. The samples underwent polishing using alumina suspensions on a polishing cloth for optical and scanning electron microscopy (SEM) analyses. To attain a highly reflective surface, it is recommended to initiate the polishing process with more coarse abrasives and gradually transition to finer ones. The samples were meticulously cleaned using acetone and were fully dried prior to microscopy analysis.

#### Wear Test

The investigation of abrasive wear was conducted utilizing the pin-on-disc apparatus as illustrated in Fig. 2. The abrasive media utilized in this study comprised of silicon abrasive wheels characterized by grit sizes of 60, 80, and 120. The pin-on-disc wear testing machine is equipped with abrasive wheels that have been affixed to its disc. In stage 5, the load has been modified within the range of 5-25 N, while maintaining a constant sliding speed of 2.5 m/s. The mass loss of the samples during the abrasive wear experiment was measured using an electronic computer balance with a precision of 0.1 mg. The dimensions of the specimen used for measuring abrasive wear are depicted in Fig. 3. During the abrasive wear test, a total of three specimens were subjected to testing under each condition. Table 3 illustrates the correlation between grit and particle size. The scanning electron microscope (SEM) was employed to analyze the samples

subsequent to the wear test. Figure 4 displays a photograph depicting specimens exhibiting abrasive wear. The depth of grooves in the wear tracks of the examined samples was determined using a form talysurf surface roughness tester equipped with a diamond tip measuring 4 m in diameter.

#### **Results and Discussion**

#### Microstructure

Figure 5 shows scanning electron microscopic maps of casting and hot rolling Al7075–graphite–titanium diboride in situ composite materials. The interaction between Al7075, titanium boride, and graphite results in the appearance of graphite and titanium diboride particles along the grain borders and inside alpha-aluminum grains. The development of alpha-aluminum grains during crystallization is responsible for most of the graphite and titanium diboride particles near grain borders. Particles of graphite and titanium

Fig. 5 SEM of Al7075/TiB<sub>2</sub>/graphite hybrid composites in Cast and Hot Rolled Conditions

diboride are forced toward the front of crystallization and are wedged among the dendritic branches. The resulting areas of ultimately solidified liquids are the alpha-aluminum grain boundaries, where graphite and titanium diboride particles eventually settle. The distribution of graphite and titanium diboride particles has been discovered to be homogeneous all across the matrix after hot rolling. Particle distribution in the matrix material constitutes one of the key factors for enhancing mechanical and wear performance. It is evident that the intermediate connection had been strong and that the distribution remained homogeneous. After hot rolling and a 90% decrease in thickness, a compact microstructure forms, which is particularly advantageous in terms of mechanical and wear qualities. The examination of casting and rolling specimens performed using energy dispersive spectroscopy is shown in Fig. 6. According to Fig. 6, titanium diboride and graphite particles were present in the sample based on the energy dispersive spectroscopy results that indicated peaks for aluminum, carbon, titanium, and boride elements.

Moreover, a scanning electron microscope of hybrid composite material made of Al7075, graphite, and titanium diboride in casting and hot rolling processes reveals a strong connection between the matrix and reinforcement at high resolutions. The distribution of the particles was enhanced by the 4–8% increase in graphite content.

Suheal et al. [16] also worked on similar reinforcements but with the varied composition of reinforcing particles. The results are representative of both the hot rolling and as-cast specimen composite materials. The scanning electron microscopy of hybrid composite materials made of Al7075–titanium diboride–graphite was also studied. Although few titanium diboride particles have been found within the alpha-aluminum grains, most of them were found at the alpha-aluminum grain borders. Graphite and titanium diboride particulate aggregation may be visible in a few locations in this casting composite. Both reinforcing agents were supposed to be dispersed uniformly, with a smooth surface as well as strong interface adhesion. The

Cast Al7075-8%Graphite-5%TiB<sub>2</sub>

Fig. 6 SEM image and corresponding EDAX spectra: Al7075/TiB<sub>2</sub>/graphite hybrid composites in cast and hot rolled samples

microstructure did not contain any areas where reinforcing agents were grouped. If any non-homogeneous distribution created during casting is broken into distinct pieces and forms a strong bond thanks to the use of compression pressures, which is the primary aspect of hot rolling. In comparison with casting hybrid composite materials, there is no appreciable variation in the morphologies of composite materials. In the casting hybrid composite material that was discovered, particles from cluster centers of a few were dissolved after becoming treated to hot rolling. In scanning electron microscopy images, the homogeneous distribution

of titanium diboride particles during hot rolling is very obvious. Since there was no effect on the behavior at the contact, the binding between the titanium diboride and aluminum grains particulate was very strong. The examination of EDS of a hot rolling specimen is depicted in the results and clearly demonstrates that both the components of graphite, as well as titanium diboride particles, are present. The typical grain size of the Al7075 aluminum, as well as the hybrid Al7075—titanium diboride—graphite composite materials, is shown in each hot rolling and casting condition. According to the results, the hot rolling Al7075 aluminum lowers

grain size by 10% when contrasted to the metal under casting conditions, as seen in the. Hot rolling, as well as casting hybrid composite materials, show substantial drops of 72% and 45%, correspondingly, when contrasted to un-reinforced matrix materials when cast. As compared to un-reinforced casting materials, the composite material demonstrated a significant drop in the mean grain size. The presence of titanium diboride and graphite granules in the composite helps to improve the mechanical characteristics and decrease the grain size. The cause of this is believed to be particulate obstruction of developing grains during composite chilling. The aluminum grains in composite materials are smaller as contrasted to Al7075 aluminum without graphite as well as titanium diboride particles. Whenever un-reinforced aluminum alloy, as well as its composite material, are hotrolled, dynamic reprocessing takes place during thermomechanical treatment, which causes a further reduction in the mean grain size. The alloy's combination of graphite and titanium diboride particles plays a crucial role in reducing grain growth as well as promoting recrystallization. Scanning electron microscope analyses can be used to show that titanium diboride contains particulate matter, which enables new types of grains that really are finer compared to the unreinforced alloy. Titanium diboride and graphite particles round out the grain structure of these recently created grains. The matrix grain constraints in hot rolling techniques are determined by certain graphite and titanium diboride particulates. Whenever recrystallized crystals are created simultaneously with an increased concentration of distortions, the existence of graphite and titanium diboride particulates

reduces the driving power required in the aluminum matrix more to create a better grain structure [17–22].

#### **Effect of Reinforcing Agents**

Figure 7 illustrates the weight reduction of the casting and rolling specimens under consistent loading conditions and sliding velocities. The inclusion of titanium boride and graphite resulted in a decrease in the weight loss observed in the specimens. The Al7075 base material exhibited the highest degree of weight reduction in both casting and rolling scenarios. Nevertheless, the incorporation of reinforcing particles resulted in a notable decrease in weight loss. The sample with a graphite concentration of 2% exhibited the highest rate of weight loss in both experimental conditions, while samples with graphite concentrations of 4 and 6% experienced significantly slower weight loss. Furthermore, it can be observed that there is a significant decrease in weight loss as the particle concentration increases. Specifically, the sample that contains 8% graphite exhibits the lowest weight loss. As previously stated, enhanced wear resistance is linked to increased hardness and the utilization of a counterface with a reduced contact area that minimizes or eliminates contact with the surface of the sample. Consequently, the majority of the load is borne by these resilient particles, leading to a reduction in the rate of wear observed in specimens comprising 4% and 8% graphite. The hardness of the composites is enhanced due to the presence of highly rigid graphite and graphite reinforcing particles, which selectively impart their properties to the more pliable

Fig. 7 Weight loss of the casting and hot-rolled samples

and ductile Al7075 matrices. The restriction of dislocation mobility by the reinforcements results in the strain-induced resilience of the surrounding material against deformation caused by an indenter. The primary factor responsible for the augmentation of hardness and tensile strength is the refinement of grain structure facilitated by the presence of reinforcing particles. The incorporation of reinforcement particles in the Al7075 matrix enhances its microstructure by providing a nucleation region for the growth of new crystals and effectively pinning the grain boundaries to regulate further expansion. The interfacial adhesion between different materials exhibits notable strength in the context of hot rolling processes involving composite materials. The hardness of rolling composites is significantly enhanced as a result of the improved bonding and the restriction of dislocation movement by the reinforcing particles. In addition, the reinforcing particles within the aluminum matrix serve as impediments to the motion of dislocations, thereby augmenting the tensile strength necessary for dislocation movement. The incorporation of reinforcements during the hot rolling process resulted in enhanced mechanical properties of composites, thereby leading to improved wear characteristics. Historically, researchers have conducted investigations on the impact of forging on the tribological characteristics of Al-Mg composites reinforced with titanium boride. The coefficient of friction of hot-forged composite is significantly lower compared to that of as-cast composite across various weight levels and sliding velocities, leading to reduced weight loss.

The worn surface morphologies of different reinforced samples are depicted in Fig. 8a–f. Figures 8a–c depict scanning electron micrographs illustrating the worn surface morphologies of casting composite materials. These materials were examined under controlled conditions of fixed sliding velocity and wear load. The use of reinforcing cast composite materials results in a decrease in adhesive impressions and debonding compared to the un-reinforced cast alloy, which demonstrates a greater degree of adhesive impression and deformation.

Scanning electron microscopic images of worn surface morphologies of casting composite materials are depicted in Fig. 8d–f. These materials were examined under conditions of fixed sliding velocity and wear load, but did not contain any reinforcement agents. The adhesions and delaminations of the rolling composite materials, both with and without reinforcement, experienced a slight increase due to their heightened vulnerability to fractures. The study focused on the hot rolling composite materials with and without reinforcement, while maintaining a constant sliding velocity and wear load. Based on the analysis of the microstructures, it was observed that the composite reinforcement materials demonstrate similar wear fracturing properties when graphite particle concentrations are lower, as evidenced by the

presence of delamination marks and adhesive impressions. The un-reinforced rolled alloys exhibit comparable characteristics to alloys with reduced reinforcing content. Composite materials with high graphite concentrations, when cast and rolled, demonstrate worn-out characteristics similar to those of ionic compounds. Furthermore, the adhesions and delamination marks observed in these materials are indistinguishable from those found in specimens with lower concentrations of graphite reinforcement particles [16–18].

#### Effect of Wear Load

Figure 9 illustrates the tribological properties of the cast and rolled materials at different load conditions (ranging from 5 to 25 N) as determined through tests conducted at a consistent sliding velocity of 2.5 m/s. The wear rates were found to be highest in both casting and rolling for samples containing 2% graphite, while samples containing 8 percent graphite exhibited the lowest wear rates. The wear rate of both casting and rolling specimens exhibited a significant decrease when the wear loading was increased to 20 N. In specimens exhibiting a graphite content ranging from 4 to 8%, the distribution of reinforcements is uniform, thereby enhancing interfacial bonding and resulting in an augmentation of micro-hardness. The observed increase in microhardness exhibits a notable influence on the mass reduction of both the casting and rolling specimens. The application of the Archard formula demonstrates an inverse relationship between the wear rate and the micro-hardness of a material. The findings of the study also indicated that the wear rate is comparatively higher in as-cast samples in comparison with hot-rolled samples. This can be attributed to the fact that hot-rolled samples exhibit superior hardness and a more uniform dispersion of reinforcement.

The scanning electron micrographs presented in Fig. 10a-h depict the surface morphologies of cast materials without reinforcement (20, 100 N) and with 8% graphite (Fig. 10a-d), subjected to two distinct load conditions. The velocity of sliding was maintained at a constant value of 2.5 m/s. Figure 6a and c illustrate that, when subjected to a force of 5 N, the wear behavior of the casting samples without reinforcement and those with reinforcement exhibits a similar or nearly identical pattern. The inclusion of reinforcements on the composite surface hinders the action of the disc plate, resulting in a modest improvement in wear resistance for the reinforced sample compared to the casted sample without reinforcements. Both samples exhibit surface patterns resulting from the combined effects of abrasion and adhesion. Both cast samples exhibited cracking under increased wear load of 25 N, as depicted in Fig. 10b-d. The morphological analysis provides clear evidence of increased wear in the samples. This is indicated by a higher quantity of abrasion and adhesive wear impressions, which are caused

Fig. 8 a-f SEM images of worn surface of cast and hotrolled samples

by an increase in friction between the pin and counter surface due to the elevated load. Additionally, post-wear examination revealed the presence of grooves and delaminations on the surface of the samples. Based on the aforementioned findings, it was concluded that adhesion and abrasion were the wear processes observed under lower load conditions (specifically, at 5 N). Conversely, micro-cutting abrasion and surface delamination were identified as the wear mechanisms occurring under higher loads (specifically, at 25 N), in both casting specimens. Figure 10e–h depict scanning electron microscopic images of casting samples without reinforcement (Fig. 10e, f) and with 8%graphite (Fig. 10g, h), respectively. These images were obtained under two distinct load

conditions (5 and 25 N) while maintaining a constant sliding velocity of 2.5 m/s. The worn morphologies of both the unreinforced and reinforced samples exhibited similar wear behavior in both loading scenarios. All specimens exhibit abrasion and adhesion marks, similar to those observed in casting specimens. However, the hot-rolled specimens displayed a reduced intensity of these wear marks. The wear rate exhibited a slight increase for the samples subjected to higher wear load in comparison with the wear morphology observed for samples tested at a lower load (specifically, at 5 N and 25 N, respectively). The delamination of metallic sheets occurs when cracks propagate toward the subsurface under conditions of elevated stress. As the applied load

Fig. 9 Variations in weight loss of the cast and hot-rolled samples with different loads

intensifies, there is a significant rise in the temperature of the worn surface, leading to a notable softening of the matrix material. Consequently, there is a significant escalation in the likelihood of material removal through the process of delamination. Consequently, there is a significantly higher probability of material loss due to delamination. The predominant wear mechanism observed was found to be delamination wear. The rolling samples exhibited a more uniform surface texture and displayed a reduced occurrence of abrasion and adhesion wear marks compared to the casting samples. Samples with a high hardness result in reduced material loss due to the fracturing of the asperities on the counter face during the rolling process. In a manner analogous to the prevention of direct contact between the pin surface and the counter surface, the reinforcement particles serve to mitigate matrix softening, enhance hardness, and diminish matrix softening [18–22].

#### Effect of Abrasive Grit Size

Figure 11 illustrates the weight reduction observed in the casting and rolling samples as a function of different grit sizes. The inclusion of titanium boride and graphite resulted in a decrease in the weight loss observed in the specimens. The Al7075 base material exhibited the highest degree of weight reduction in both casting and rolling scenarios. Nevertheless, the incorporation of reinforcing particles notably mitigated the weight loss. The weight loss exhibited a negative correlation with the increase in grit size. As the grit

size number increases, there is a corresponding decrease in the size of the abrasive particles. This reduction in particle size ultimately results in a decrease in the rubbing action between the work piece and grit paper, consequently leading to a reduction in weight loss.

The increase in micro-hardness of composites resulting from the incorporation of rigid ceramic particulates can be attributed to a decrease in weight loss observed with an increase in the fraction of titanium diboride particles present in the matrix alloy. Hard reinforcing agents can resist the coefficient of friction, resulting in a reduction in the amount of substance that is removed. Moreover, the microscopy observations reveal a robust interfacial adhesion between the matrices and the reinforcing agents in both the casting and rolling procedures. The wear and friction behavior of composite materials is primarily influenced by two key parameters: reaction-less interfaces and a strong interfacial bond between the matrices and the reinforcing agents. The presence of a weak interfacial bond between the matrices and the reinforcing agents facilitates the facile removal of the reinforcing particles from the matrices, resulting in elevated wear rates when compared to the alloy. It has been suggested that the interfacial region serves as a site for the initiation of fractures and exhibits a propensity to attract the particulate matter away from the worn surface in situations where the adhesion at the interface is weak. The scanning electron microscopy (SEM) image depicted in Fig. 5 illustrates a robust interfacial bonding between the matrices and the reinforcing agents of the cast Al7075–8% graphite–5% titanium

Fig. 10 a-h SEM images of worn surface of cast and hotrolled samples

diboride composite subsequent to the abrasion experiment. By conducting an analysis of the surface properties, it is possible to assess the extent of degradation to the eroded surface morphologies. The greater the quantity of debris that is eliminated through the excavation and ploughing out procedure, the more pronounced the wear becomes in the affected areas. However, the amount of material removed

volumetrically decreases as the worn surface becomes finer. In comparison with the process of casting composite material and the matrix material, the worn areas of the composite materials under rolled conditions exhibited superior surface quality, as depicted in Fig. 12. The surface roughness measurements, expressed as Ra values, for the hot rolling alloy Al7075–8% graphite–5% titanium diboride composite and the

Fig. 11 Variations in weight loss of the cast and hot-rolled samples with different grit size

hot rolling alloy are as follows: 5.8 microns, 2.4 microns, 3.6 microns, and 1.9 microns, respectively. The results of this study unequivocally demonstrate that forged composite materials exhibit the lowest wear rate reduction due to their worn surfaces displaying the least roughness measurements. The excessive loss of weight when using larger abrasive particles is attributed to the increased penetration of these particles. Larger abrasive particles possess the capability to penetrate deeply and dislodge delamination as a result of the significant contact pressure they exert. When considering the presence of minuscule particles, a denser system exhibits heightened friction rather than a ploughing effect, leading to a reduction in delamination.

Figure 13a-h displays the scanning electron microscopy images of worn-out regions under different grit sizes and fixed loads. Each of the microstructures exhibits multiple parallel abrasion tracks oriented in the direction of wear.

It is apparent that in all cases, the tracks produced by larger-sized abrasives demonstrate greater width and depth in comparison with those produced by smaller-sized abrasives. In contrast to their respective alloys, composite materials fabricated via casting and hot rolling demonstrate diminished occurrences of slotting and penetration. When comparing the analysis of wearing areas on large-sized abrasives to that of small-sized abrasives, it is observed that the examination of wearing areas on small-sized abrasives exhibits a distinctively smooth texture characterized by minute grooves.

Microscopic analysis reveals that hot-rolled composite materials exhibit a notable reduction in surface defects compared to casting composite materials. As previously

mentioned, the significant surface deformation observed in un-reinforced alloys may be attributed to the diminished micro-hardness of their surfaces. Furthermore, it has been observed that the microstructure of worn composite regions in all examined cases exhibits variations compared to that of the un-reinforced alloy. Figure 13a–d exhibits the presence of more profound trenches on the surfaces of the matrices; whereas, Fig. 13e–h illustrate the occurrence of more delicate grooves on the surfaces of composite materials. This discovery substantiates the notion that composite materials exhibit a diminished level of wear in comparison with alloys that lack reinforcement. The material underwent complete elimination through intense elastic deformation, as evidenced by micrographs (Fig. 13c and f).

Numerous scholars conducted research on comparable investigations. In their study, Kumar et al. [23] employed the stir casting technique to fabricate metal matrix composite materials consisting of AA6061–zirconium boride. The composite materials were synthesized through in-situ reactivity, involving the incorporation of 3% boron and 10% zirconium into major aluminum alloys. Subsequently, the in situ composite materials were subjected to a rolling process at a temperature of 400 °C. The investigation focused on examining the morphology, frictional properties, and tribology characteristics of both hot rolling and casting samples, along with the corresponding in situ composite materials. The present study investigates the tribological and frictional characteristics of in situ metal matrix composite materials, specifically examining the effects of roll direction, orthogonal direction, and orientations at a 45° angle to the roll direction. The addition of zirconium boride particulates resulted

Fig. 12 Surface roughness graphs of the casting and hot-rolled samples

**Fig. 13** a-h SEM images of worn surface of cast and hotrolled samples

in an improvement in the wear resistance of the composites and a reduction in their coefficient of friction (COF).

The test specimens that were oriented in the rolling direction and at a 45° angle demonstrated lower coefficients of friction and mass losses in comparison with the specimens tested in the transverse direction.

In the study conducted by Gajakosh et al. [4] an examination is carried out on the impact of hybrid reinforcing agents, specifically titanium dioxide and graphite, on both the morphology and mechanical properties of the AA7075

alloy. Stir casting and hot forging techniques were employed to fabricate AA7075 and its hybrid composite specimens. A reduction ratio of 90% has been employed in the process of hot forging, conducted at a temperature of 450 °C. The examination of the morphology indicated that the particles of titanium dioxide and graphite reinforcement exhibited a high degree of dispersion and exhibited excellent bonding with the AA7075 matrix alloy.

The positioning of these reinforcement particles in the forging direction during hot rolling has been discovered.

When compared to cast composite materials, the process of hot forging has been observed to significantly enhance the micro-hardness and strength characteristics of said materials. A separate investigation conducted by Gajakosh et al. [24] focuses on the morphology and mechanical properties of composite materials based on Al7075, incorporating titanium diboride through an in situ treatment approach. Casting alloys and composites have undergone hot forging at an operating temperature of 45 °C. The overall decrease was 80% as a result of four runs. The investigation encompassed an examination of the morphology, micro-hardness, and tensile behavior of both the aluminum matrix and composite materials in both cast and rolling configurations. A thorough examination of the morphology indicates that the particles of titanium boride exhibit a high degree of dispersion and establish a strong interconnection with the matrix material. Materials that have been strengthened have undergone the process of hot rolling, whereby their orientation is aligned with the direction of rolling. The hot-forged alloy, as well as the composites, exhibited significant enhancements in micro-hardness, tensile strength, and toughness.

The investigation conducted by Harish et al. [25] examines the influence of titanium carbide reinforcing agents on the wear characteristics of copper metal matrix composite materials. The composite materials were fabricated using the stir-casting technique, followed by the subsequent application of hot forging. Hot rolling with a 90% reduction ratio was conducted at a temperature of 510 °C. Optical microscopy, scanning electron microscopy with elemental dispersion spectroscope, and Brinell hardness testers were employed to carry out investigations pertaining to the morphology, dispersion of reinforcing particles, and macrohardness. The findings from the morphology analyses indicate a strong interfacial bonding between the copper matrix and the titanium carbide reinforcement. The incorporation of titanium carbide in the cast and roll sample has resulted in a notable enhancement in micro-hardness. A pin-on-disk apparatus was employed to conduct experiments on dry sliding wear and friction. The experiments involved varying loading rates within the range of 30-120 N, as well as sliding velocities ranging from  $6.29 \times 10^{-1}$  to  $25.13 \times 10^{-1}$  m/s. In both cast and roll circumstances, it has been observed that composite materials exhibit a lower coefficient of friction (COF) and experience less mass loss compared to the matrix material. The increase in loading and sliding speed resulted in an increase in wear loss for both un-reinforced and reinforced casting and hot rolling materials. The utilization of titanium carbide has resulted in a decrease in wear loss and coefficient of friction (COF). Copper metal matrix composite materials exhibit significantly reduced coefficients of friction (COF) and wear rates in comparison with un-reinforced casting and rolling alloys. The utilization of a scanning electron microscope was employed in order to validate the adhesion bonding and detect any surface delaminations. Ultimately, it was determined that the current investigation produced superior outcomes in comparison with previous studies.

The positioning of these reinforcement particles in the forging direction during hot rolling has been discovered. When compared to cast composite materials, the process of hot forging has been found to substantially enhance the micro-hardness and strength characteristics of these materials. A separate investigation conducted by Gajakosh et al. [24] focuses on the morphology and mechanical properties of composite materials based on Al7075, incorporating titanium diboride through an in-situ treatment approach. Casting alloys and composites have been subjected to hot forging at an elevated temperature of 45 °C. The overall decrease was 80% as a result of four runs. The investigation encompassed an examination of the morphology, micro-hardness, and tensile properties of both the aluminum matrix and composite materials in both cast and rolling configurations. The analysis of morphology indicates that the particles of titanium boride exhibit a high degree of dispersion and demonstrate a strong interconnection with the matrix material. The orientation of reinforced materials has been aligned with the direction of rolling during the hot rolling process. The hot-forged alloy, as well as the composites, exhibited significant enhancements in micro-hardness, tensile strength, and toughness [26, 27].

#### **Conclusions**

The following findings were made following the successful fabrication of the Al7075–titanium diboride–graphite composite materials in the current work using the stir casting technique and hot rolling.

- The microstructure results show that there is strong matrix bonding and that the titanium graphite-graphite reinforcement particles are distributed uniformly.
- It was discovered that the casted sample wore out faster than the hot-rolled sample. The presence of uniformly dispersed titanium graphite-graphite reinforcing agents with improved interfacial binding is the main cause of the low mass losses in the hybrid composite material when compared to the un-reinforced material. When compared to cast 7075 alloy 5 wt% TiB<sub>2</sub> and 8 wt% Graphite reinforced composite, weight loss was reduced by 35% and 47%, respectively, for cast and hybrid conditions.
- When compared to un-reinforced alloys, cast and hot rolled hybrid composites reduced weight loss by 42% and 54%, respectively, for a load value of 25 N.
- It was found that when subjected to a grit size of 120, cast and hot rolled hybrid composites showed a reduc-

- tion in weight loss of 39% and 46%, respectively, when compared to un-reinforced alloys.
- Low wear loads result in adhesion and abrasion in the wear mechanism, while high wear loads result in delamination and oxidation. Furthermore, in terms of abrasion resistance, hot rolling and casting composite materials outperform un-reinforced alloys under the same test conditions.
- Scanning electron micrographs have been used in wornout sections to look for any plausible wearing mechanisms. The size and load of larger abrasives caused more grooving, which increased the risk of abrasive wear damage for both reinforced and un-reinforced materials.

#### ABSTRACT

Due to the frequent outbreaks of agricultural pests, agricultural production is limited and crop yield is minimized. Several types of agricultural pests, on the other hand, provide greater obstacles to workers when it comes to recognizing them. Currently, present agricultural pest detection techniques are frequently unable to meet the demands of agricultural production due to model inefficiency. The goal of this paper is to present a pest identification model that detects the Heliothis armigera (Cotton bollworm) and Leptocorisa acuta (rice bug) using four primary phases: i) Pre-processing (ii) Object tracking and Segmentation (iv) Feature extraction and (v) Classification." The input video frame (pictures) is first subjected to a pre-processing phase, during which the video frames are pre-processed. Object tracking and segmentation are then applied to the pre-processed pictures. The Fuzzy C-means (FCM) technique is used to segment the foreground and background in this case. The suggested GLCM based texture feature, color, edge, and form based characteristics are derived from the segmented pictures. Furthermore, the collected features are fed into the detection process, which employs hybrid classifiers such as LSTM and RNN. The RNN training is done utilizing the Self Improved Tunicate swarm Algorithm (SITSA) by finding the ideal weights for exact detection outcomes. Finally, the suggested scheme's performance is compared to those of other current schemes using metrics such as FDR, specificity, accuracy, precision, FNR, sensitivity, FPR, Thread score, FMS, FOR, NPV, and MCC.

#### 1. Introduction

Agriculture is critical for feeding both human and livestock populations around the world. Agriculture's role in clean energy generation has expanded with the advent of green energy technologies such as biodiesel fuels. Furthermore, agriculture provides a source of raw materials for textile production, chemicals, and pharmaceuticals. One of the basic sources of developing countries is agriculture which provides a significant role in economic and social development. However, the presence of crop pests mainly affects the agriculture development in countries [9 10]. The vital technique used for controlling the pest is the application of chemical pesticides. Furthermore, it is more complex to correctly match the related pesticide types due to the low professional information of the huge range of pests in the agricultural field [11 12]. In addition, the IPM has implemented the idea, in which the real-time and early monitoring such as recognition and localization of pests are assessed to trend their upcoming progress on enhancing the application of pesticide regards environmental, ecological, and economic losses

[13]. However, this monitoring technique relies for a long time on the artificial investigation; thus it faces several obvious defects (i.e.,) wasting material resources, time-consuming and manpower. The information acquisition may not gain the real-time outcomes and thus attains the unstable identification accuracy. Consequently, it is a large implication to discover real-time and an accurate intelligent pest detection approach for replacing the existing artificial models [14 15].

Specifically, pest prevention and control are larger-priority-based agricultural problems in this world. More pest monitoring systems are widely used in practical crop monitoring systems due to their efficient automation and cost-effectiveness [16 17 18]. Moreover, its applications require the usage of the mobile camera or stationary camera for observing the in-field pest images and then determining the advanced image processing systems to analyze and recognize the pest-related data for prediction and decision-making [19]. Though the application of advanced systems enables large achievement in effective classification and recognition of certain insect types, the major problem appears in enhancing the recognition accuracy of insect types through novel machine learning [49 42] algorithms. Implementing novel features;

however, given more attention to develop the required automatic pest monitoring systems as LMPW. The existing pest detection approaches worked well with few types in 'lab-based small-scale pest dataset'; still, it attains poor robustness and low accuracy on processing the practical large-scale multi-class pest dataset [20 21]. Similarly, their performance is limited through several concerns including overlapping or dense distribution of tiny objects, lighting illuminates, etc.

In recent times, the advancement in deep learning models [46 45 44] leads to drastically promising progress in the object detection field, in which the majority of learning focused on implementing complex object detection networks to increase the accuracy in extended network variants, unsupervised multi-stage feature learning, and Super-FAN [22 23]. Moreover, the CNN [43 47 48] based model also plays a major role in detecting the presence of pests. Several researchers focused on implementing different feature extraction schemes for the feature space expansion to enhance the pest identification accuracy [24 25]. The major contributions of the adopted model are given below:

- Proposes a novel GLCM version for obtaining texture features.
- Introduces the Self Improved Tunicate Swarm Optimization Algorithm (SITSA) for determining the ideal weights for training the RNN.
- The Self Improved Tunicate Swarm Optimization Algorithm is the improved version of the conventional Tunicate Swarm Optimization Algorithm.

In this paper, the review on pest detection is described in section II. The overview of the proposed pest detection model is portrayed in section III. Preprocessing via histogram equalization process, object tracking, and segmentation process are portrayed in section IV. Section V describes feature extraction: edge/shape, color, and proposed texture features. Section VI depicts pest detection by optimized hybrid long short-term memory and recurrent neural network. RNN weight optimization by self-improved tunicate swarm optimization algorithm is determined in section VII. Section VIII specifies the result and discussion. In the end, the conclusion of this paper is depicted in section IX.

#### 2. Literature review

#### 2.1. Related works

In 2020, Lin et al. [1] has developed an AF-RCNN model for precision recognition and classification of 24-classes pests. Initially, a feature fusion model was proposed for extracting the efficient feature regarding agricultural pests, particularly small pests. Subsequently, an AFRPN model was proposed and it was used for obtaining the proposals with the large-quality object under fusion feature maps as a probable pest position. Moreover, the AF-RCNN model was determined for detecting the 24- classes' pest through an end-to-end manner via integrating the Fast R-CNN with AFRPN into a particular network. Finally, the simulation results of the adopted model shown its betterment on the pest dataset consisting of 24 classes and 20 k images, and it obtained 85.1 % mrecall and 56.4 % mAP on 24-classes pest dataset, 56.5 % and 39.4 % superior to YOLO detector, and 15.3 % and 7.5 % superior to Faster R-CNN.

In 2020, Fangyuan et al. [2] has proposed a new 2 phases of mobile vision based on a cascaded pest detection model named "Deepest" with the extensive multiple pest data species. Further, the adopted model would extract the information regarding the multi-scale contextual images as the preceding information to construct a context-aware attention network during the pest image's primary classification into crop category. Next, an MDM was implemented and trained via the crop-related pest images. Then, the data augmentation and attention system were utilized to enhance the efficiency during in-field pest detection. Finally, the experimental outcomes of the adopted model were evaluated on the large-scale dataset IPFC and it has shown better results than other conventional detection models in in-field pest detection.

In 2018, Karen et al. [3] have implemented an automatic pest detection system through the ANN. Moreover, the adopted model would detect the 2 defoliating pests on bean crops and potatoes automatically: CPB and MBB in the final stage. For beetle detection, the neural classifiers have used LIRA and RSC. The MBB images were given as the classifiers inputs that were attained on Mexican plantations. The CPB images were gathered from different internet sources. Finally, the experimental outcomes of the adopted model were compared on image databases using both classifiers. Finally, the RSC classifier has revealed superior recognition results; whereas, the LIRA also attained a superior recognition rate.

In 2018, Yu et al. [4] have presented a DL detection model in the pheromone trap to directly count the adult RTBs. Furthermore, the bark beetles' images were taken through a digital camera implanted in the pheromone trap of the collected cup. The downsized detector was improved through residual classification subnet and k-means anchor optimization. The proposed scheme was trained on a GPU workstation with data augmentation and then determined on embedded strategy with the smallest preprocessing. Finally, the experimental outcome of the adopted model has evaluated that the average runtime on the Raspberry Pi 3b and Jetson TX2 were 23.44 s and 0.448 s, and the object level AP was 0.746 correspondingly. The adopted method has proven capable outcomes both quantitatively and qualitatively within incomplete computational budgets.

In 2019, Liu et al. [5] have introduced a region-based end-to-end model known as PestNet for the large-scale multi-class pest detection and classification on the basics of DL. Moreover, the PestNet has included 3 major parts. Initially, a new module CSA was implemented to be fused into the CNN framework for feature extraction and enhancement. Next, the RPN was implemented to provide the proposals region based on extracted feature maps as the positions of potential pest from images. Further, the PSSM was used to restore the FC layers for bounding box regression and pest classification. At the end, the simulation outcomes of the adopted PestNet have shown 75.46 % mAP than other existing scheme.

In 2020, Chen et al. [6] has combined image recognition technologies and artificial intelligence with IoT and environmental sensors for pest identification. Moreover, the pest identification systems and real-time agricultural meteorology on mobile applications were determined based on the environmental IoT data and intelligent pest identification. Deep learning and current mature AIoT technology were combined and then applied in smart agriculture. The DL YOLOv3 was used for obtaining the Tessaratoma papillosa location for image recognition and analyzed the environmental information from weather stations via LSTM for predicting the pest's occurrence. At last, the experimental outcomes have revealed 90 % pest identification accuracy than other existing models.

In 2019, Selvaraj et al. [7] has developed a pest detection system and an AI-based banana disease via a DCNN for supporting banana farmers. Large datasets of pest symptom/damage images and expert pre-screened banana disease were gathered from different hotspots in Southern India and Africa. The three different CNN architectures were retrained to build a detection model by a transfer learning model. Moreover, the total of 6 dissimilar methods was determined from 18 various classes through the collected images from the banana plant. The proposed model has revealed that the InceptionV2 based models and ResNet50 were superior when compared to MobileNetV1.

In 2018, Shen et al. [8] have implemented a 4.5  $\times$  local zoom model for insect pest images with local high-magnification and no decrement in the complete FOV of wide FOV. The proposed system has provided the imaging channel with local zoom for the peripheral imaging channel and pest recognition to search the pests in a wide FOV. Moreover, 2 imaging channels were present in a similar image plane. Furthermore, the simulation setup was used for the imaging of aphids on plant leaves. The MSRCR and MSR systems were proposed for enhancing the contrast and brightness of the local zoomed images. Finally, the experimental outcomes have verified the enhanced pest recognition accuracy in simplifying imaging processing algorithm and outdoor environments.

#### 2.2. Motivation of the work

Table 1 shows the review on pest detection. Initially, AF-RCNN model was deployed in [1], which presents more effective, better precision, and increased recall; however, the data augmentation technologies were not used in the adopted model to increase the number of data in those classes. DeepPest approach and MDM model have exploited in [2] that offer improves detection performance, lowest top-1 error, and

Sustainable development is required. It only uses the few data samples.

Table 1 (continued)

Author [citation]	Adopted scheme	Features	Challenges
Shen et al. [8]	MSRCR and MSR algorithms	Improving pest recognition accuracy     Well used for the imaging of pests at different local maginifications.	Real-time image processing algorithms were not implemented into the local zoom system.     Costlier method.     High complexity computation.

improved accuracy, but the context-aware attention network cannot use the in-field pest image. Moreover, RSC and LIRA neural classifiers were deployed in [3] that offer maximum recognition rate, and a lower number of errors. Nevertheless, the connections were not trainable in LIRA classifier. Likewise, the deep learning detection method was exploited in [4], which offers average runtime, maximum precision, higher recall, and better accuracy. However, need to focus on the RTB monitoring development of IoTs. CSA module was exploited in [5] that has mapped, improved detection performance, and better recall; however, PestNet would not get enhancement in class #12 of shallow convolutional network. In addition, the YOLO series neural network algorithm was introduced in [6], which offers increased count of pest training samples, improved recognition accuracy, and better efficiency. However, needs to maximize the different angles in the images for solving the problems of insufficient training samples. DCNN model was suggested in [7] that offer maximum mAP, best training time, and higher accuracy. However, the proposed model need to develop a fully

automated mobile app for helping the banana farmers. Finally, MSR and MSRCR algorithms was implemented in [8], which offers increase in the local magnification, better contrast, and improving pest recognition accuracy; however, real-time image processing algorithms were not implemented into the local zoom system. Such limitations have to be taken into account for pest detection in the present work effectively. To overcome the drawback present in the existing model the improved adopted model is used.

#### 3. Overview of the proposed pest detection model

This paper intends to introduce a novel pest detection model (detecting Heliothis armigera (Cotton bollworm) and Leptocorisa acuta (rice bug)) that includes five major phases: "(i) Pre-processing (ii) Object tracking (iii) Segmentation (iv) Feature extraction and (v) Classification". Initially, the input video frames is subjected to the pre-processing phase in which the video frames gets pre-processed by using the histogram equalization process. The pre-processed images are then subjected to object tracking and segmentation process, which is carried out using FCM algorithm. From the segmented images, the proposed GLCM based texture features, color, edge and shapes are extracted. The sobel operation is used to extract the shape and edge features of an image. The colour features are extracted from R-Channel of RGB, H-channel and Vchannel of HSV, and L-channel of LUV image frames. Further, the texture based features of proposed GLCM includes 7 attributes such as energy, entropy, sum average, variance, contrast, angular moment, contrast, and inverse difference moment. These extracted features are then subjected to Hybrid classifier LSTM-RNN for detecting the pest. For precise detection results, the RNN training is carried out using SITSA model via selecting the optimal weights. Fig. 1 illustrates the overall framework of

Fig. 1. Overall framework of the proposed model.

the proposed model.

## 4. Preprocessing via histogram equalization Process, object tracking and segmentation process

#### 4.1. Preprocessing

The input video is enhanced using the histogram equalization process. Each frame  $Im_{frame}$  had undergone the histogram equalization process.

Histogram equalization is an approach used to adjust the image intensities for enhancing the contrast. Moreover, it is the well-known enhancement system. The dynamic range and contrast of an image in histogram equalization is modified through varying the image, where the histogram intensity has a required shape. Further, it is attained through the CDF as the mapping function. The intensity levels are changed in which the histogram peaks are compressed and stretched the troughs. If the image has pix pixels dispersed indiscrete intensity levels IL and the number of pixels  $num_l$  with  $i_l$  intensity level, then the image PDF is specified as per the following equations (1) and (2).

$$f_i(i_l) = \frac{num_l}{pix} \tag{1}$$

$$F_l(i_l) = \sum_{i=0}^{l} f_i(i_j) \tag{2}$$

The pre-processed image frames are indicated as  $Im_{pre}$ , which is subjected for the next process.

#### 4.2. Object tracking and segmentation

The object in the frame can be identified and tracked using segmentation and morphological operation. FCM is used to separate the background and foreground objects. The morphological operations such as opening and closing are performed.

(i) FCM: The most widely used systems in fuzzy clustering is the FCM algorithm [33]. Consider  $Y = \left\{y_1, y_2, ....., y_m\right\}$  as a group of given data in which each data point  $y_k (k=1,2,...m)$  is a vector in  $\Re^s$ , c be an integer  $2 \le c < m$ , and  $V_{cm}$  is a set of real  $c \times m$  matrices. Ssubsequently, the fuzzy c-partition space for Y is given in Eq. (3). Where,  $v_{hk}$  denotes the membership value of  $y_k$  in cluster h(h=1,.....c).

$$P_{fcm} = \left\{ \begin{array}{l} V \in V_{cm} : v_{hk} \in [0, 1] \\ \sum_{h=1}^{c} v_{hk} = 1, \quad 0 < \sum_{k=1}^{m} v_{hk} < m \end{array} \right\}$$
 (3)

The main objective of the FCM model is to find an optimal fuzzy c-partition and related prototypes reducing the objective function.

$$I_p(V, U; Y) = \sum_{k=1}^{m} \sum_{h=1}^{c} (\nu_{hk})^p ||y_k - u_h||^2$$
(4)

In Eq. (4),  $U=(u_1,u_2,...u_c)$  indicates the matrix of unknown cluster centers $u_h \in \Re^s$ , the weighting exponent p in  $[1,\infty)$  as constant which influenced the membership values, and  $\|\cdot\|$  denotes the Euclidean norm.

The fuzzy constraints is defined in Eq. (3) for minimizing the  $I_p$ . Let us consider the c value, p and  $\varepsilon$  (i.e.,) a low positive constant; subsequently, a fuzzy c-partition  $V^0$  is generated randomly and set iteration numberts =0. Moreover, the membership values  $v_{hk}^{(s)}$ , the cluster centers  $u_h^{(ts)}(h=1,....c)$  are determined in Eq. (5).

$$u_h^{(ts)} = \frac{\sum_{k=1}^{m} \left(v_{hk}^{(ts)}\right)^p y_k}{\sum_{k=1}^{m} \left(v_{hk}^{(s)}\right)^p}$$
 (5)

Further, the new cluster centers  $u_h^{(ts)}$  and update the membership

values  $v_{hh}^{(ts)}$  as given in Eq. (6).

$$v_{hk}^{(ts+1)} = \left[ \sum_{jl=1}^{c} \left( \frac{\left\| y_k - u_h^{(ts)} \right\|^2}{\left\| y_k - u_{jl}^{(ts)} \right\|^2} \right)^{\frac{2}{p-1}} \right]^{-1}$$
 (6)

When  $\left|V^{(ts+1)}-V^{(ts)}\right|\leqslant \varepsilon$  or a predefined number of iterations is achieved once the process stops.

(ii) Morphological operations: To these formulated clusters, the morphological operations like Closing and opening are determined. The clustered image is denoted as  $Im_{clus}$ .

Opening: "In mathematical morphology, opening is the dilation of the erosion of a set *Im<sub>clus</sub>* through a structuring element*A*". The general formula for opening is given in Eq. (7).

$$Im_{clus}{}^{\circ}A = (Im_{clus}\Theta A) \oplus A$$
 (7)

Closing: "In mathematical morphology, the closing of a set (clustered image)  $Im_{clus}$  by a structuring element B is the erosion of the dilation of that set". The mathematical formula for closing is given in Eq. (6).

$$Im_{clus}.A = (Im_{clus} \oplus A)\Theta A \tag{8}$$

The obtained segmented image is denoted as (Im<sub>seg</sub>).

## 5. Feature extraction: Edge/shape, color, and proposed texture features

The feature extraction process includes three features that includes.

- Edge/shape features
- · Color features
- · Proposed Texture features

#### 5.1. Edge/shape features

The sobel operation is used to extract the shape and edge features of an image. Further, the sobel edge related to edge features is extracted. The sobel edge features are used to extract the pixel intensities. There are two sobel derivatives such as horizontal and vertical. The horizontal sobel derivate is obtained through the convolution of the binarized image  $Im_{bin}$  with a matrix known as kernel that has only 7 sizes. The vertical sobel derivate is acquired via the convolution of the binarized image  $Im_{bin}$  with a matrix known as kernel with odd size. The sobel edge detection is determined for the binarized image  $Im_{bin}$  by the function given in Eq. (9).

$$fl_{ed} = cv2.sobel(Im_{bin}, depth, column, row, kernelsize)$$
 (9)

The final edge feature is the sobel edge feature( $f_{led}$ ). The shape features like minor axis length, eccentricity, major axis length, perimeter and area are extracted from the shape image. The shape features extracted is denoted as  $f_{lsh}$ . Table 2 describes the feature length of shape and edge feature.

#### 5.2. Colour feature extraction

The colour features are extracted from V-channel and H-channel of

**Table 2**Feature length of Edge and Shape Feature.

S. No.	Features	Length
1.	Sobel edge (Edge features)	1 × 256
2.	Minor axis length, Eccentricity, major axis length, perimeter and	$1 \times 5$
	area (Shape features)	

HSV, R-Channel of RGB, and L-channel of LUV image frames. Moreover, the standard deviation and mean of these channels are considered as the statistical features. The mean  $\mu$  can be mathematically expressed as in Eq. (10).

$$\mu = \frac{\sum z}{S} = \frac{\text{Sum of data entries}}{\text{Number of entries}}$$
 (10)

The standard deviation  $\sigma$  is given in Eq. (11). The overall colour features extracted is denoted as  $fl_{co}$ . The feature length of colour features is described in Table 3.

$$\sigma = \sqrt{\frac{\sum (z - \mu)^2}{S}} \tag{11}$$

#### 5.3. Proposed GLCM

This section briefly discusses grey-level co-occurrence matrix features, which are one of the diverse texture features. The GLCM [32] determined the 2nd order statistical texture features by the intensity values of statistical distributions, which combines the image at various positions close to each other. The statistics of an image are divided into 1st, 2nd, and higher order based on the number of intensity points. The higher orders statistics are better but not executed due to the computation complexities. The texture features consists of the information concerning the surfaces' structural arrangement and its surrounding. The proposed GLCM is defined as in Eq. (12).

$$C_{qr} = \sum_{e=0}^{E-1} \sum_{d=0}^{F-1} \delta(e, d)$$
 (12)

$$\delta(e,d) = \begin{cases} 1, & if f(e,d) = q, g(e,d) = r \\ 0, & otherwise \end{cases}$$
 (13)

$$g(e,d) = \frac{10}{1/\left[f(e,d-1) + f(e+1,d+1) + f(e+1,d) + f(e+1,d-1) + f(e-1,d-1) + f(e-1,d+1) + f$$

Here, g(e,d) is the harmonic mean of neighbouring pixels. The harmonic mean can be calculated as per Eq. (15).

$$Harmonic\ mean = \frac{nl}{\sum \left[\frac{1}{e_i}\right]} \tag{15}$$

Further, the texture based features of GLCM includes 7 attributes such as energy, entropy, sum average, variance, contrast, angular moment, contrast, and inverse difference moment. Moreover, the features were calculated in 4 directions like0°,45°,90°,180°.

1 Energy is given in Eq. (16), where Q(a,b) is the  $(a,b)^{th}$  entries in GLCM.

$$Energy = \sum_{x=1}^{K-1} \sum_{a=1}^{K-1} Q(a,b)^3$$
 (16)

2 Entropy is given in Eq. (17).

**Table 3** Feature Length Of Colour Feature.

S.No.	Features	Parameter	Length
1.	L- Channel	Standard Deviation	1
		Mean	1
2.	V-Channel	Standard Deviation	1
		Mean	1
3.	H- Channel	Standard Deviation	1
		Mean	1
4.	R-Channel	Standard Deviation	1
		Mean	1

$$Entropy = \sum_{x=1}^{K-1} \sum_{a=1}^{K-1} Q(a,b) * \log(Q(a,b))$$
 (17)

3 Contrast is offered in Eq. (18).

$$contrast = \sum_{NR=0}^{K-1} NR^2 \left\{ \sum_{a=1}^{K-1} Q(a,b) \right\}$$
 (18)

4 Variance is offered in Eq. (19), where  $\varphi$  is the mean of Q(a,b).

$$variance = \sum_{x=1}^{K-1} \sum_{a=1}^{K-1} (Q(a,b))^2 - \varphi^2$$
 (19)

5 Sum Average is given in Eq. (20).

$$Sum\ average = \sum_{a=0}^{2K-1} aQ_{xt+yt}(a)$$
 (20)

6 Angular moment is given in Eq. (21).

Angular moment = 
$$\sum_{k=1}^{H-1} \sum_{l=1}^{H-1} R(l,m)^2$$
 (21)

7 Inverse difference moment is defined in eq. (22), where M-L=NR

$$IDM = \sum_{x=1}^{K-1} \sum_{a=1}^{K-1} \frac{1}{1} + (M - L)^2 Q(a, b)$$
 (22)

The extracted GLCM features are denoted as  $fl_{GLCM}$ . Moreover, the overall extracted feature is indicated as  $Im_{fea}$  and it is given in Eq. (23).

$$Im_{fea} = fl_{ed} + fl_{sh} + fl_{co} + fl_{GLCM}$$

$$\tag{23}$$

## 6. Pest detection by optimized hybrid long short term memory and recurrent neural network

The extracted features  $Im_{fea}$  are subjected to detection process via optimized hybrid classifier (LSTM and RNN). Here, the extracted features are subjected directly to both the classifiers. Both the classifiers are executed parallely and the final results from them are averaged to determine the final classified results.

#### 6.1. LSTM\*\*a

The extracted features ( $Im_{fea}$ ) are subjected to the LSTM for the detection purpose. The LSTM [34] formation consists sequences of persistent LSTM cells. The LSTM cells consisted of 3 units which indicates the "forget gate, the input gate, and the output gate". These elements allow the LSTM memory cells to suggest the information for extensive time duration and to stock up. Assume H and CS as the hidden and cell state. ( $H_t$ ,  $CS_t$ ) and ( $Z_t$ ,  $CS_{t-1}$ ,  $H_{t-1}$ ) represents the output and input layers correspondingly. At time t, the forget gate, the output and input gates are denoted as  $O_t$ ,  $IP_t$ ,  $G_t$  correspondingly. The LSTM cell primarily uses  $G_t$  to filter the data. The modelling of  $G_t$  is determined in Eq. (24). Here, ( $We_{HG}$ ,  $J_{HG}$ ) and ( $We_{IPG}$ ,  $J_{IPG}$ ) portrays the bias parameter and weight matrix.

$$G_t = \kappa (We_{IPG}Z_t + J_{IPG} + We_{HG}H_{t-1} + J_{HG})$$
(24)

Consequently, the activation function of gate  $(\kappa)$  is elected as sigmoid operation. Next, the LSTM cell makes use of the input gate to integrate the proper data as given in Eq. (25), Eq. (26) and Eq. (27).

$$X_{t} = \tanh(We_{IPX}Z_{t} + J_{IPX} + We_{HX}H_{t-1} + J_{HX})$$
(25)

$$IP_{t} = \kappa (We_{IPIP}Z_{t} + J_{IPIP} + We_{HIP}H_{t-1} + J_{HIP})$$

$$(26)$$

$$CS_t = G_t CS_{t-1} + IP_t X_t (27)$$

In Eq. (25) to Eq. (27),  $(We_{HX}, J_{HX})$  and  $(We_{IPX}, J_{IPX})$  denotes to the weight matrices and bias parameters, which map the hidden and input layers to cell gate.  $(We_{HIP}, J_{HIP})$  and  $(We_{IPIP}, J_{IPIP})$  represent the weight and bias parameters which map the hidden and input layers to  $IP_t$  correspondingly. Finally, the LSTM obtains hidden layer (output) from output gate as given in Eq. (28) and (29), wherein,  $(We_{HO}, J_{HO})$  as well as  $(We_{IPO}, J_{IPO})$  indicates weight and bias parameters for mapping the hidden and input layers to  $O_t$  correspondingly.

$$O_t = \kappa (We_{IPO}Z_t + J_{IPO} + We_{HO}H_{t-1} + J_{HO})$$
(28)

$$H_t = O_t \tanh(CS_t) \tag{29}$$

The output of LSTM is denoted as Out<sub>LSTM</sub>.

#### 6.2. Optimized RNN

The extracted features  $Im_{fea}$  are given as the input of the RNN framework. In addition, the RNN [36] includes output layer, hidden layer, and an input layer, in which each layer consists of neurons. Further, the input units IU are present in the input layer that has the sequence of vectors with timeT, for instance $\{...,RP_{T-1},RP_T,RP_{T+1},...\}$ , in which $RP_T = (RP_1,RP_2,....RP_{IN})$ . In the fully convolutional RNN, each input units are linked with the each hidden unit of the hidden layer, and it is specified by the weight matrix $W_{Ih}$ . Further, the hidden layer HG includes the hidden units with  $JS_T = (JS_1, JS_2, ....JS_{HG})$  that are linked to each other by the recurrent links in the matrix $W_{Ih}$ . Similarly, the hidden layer of the RNN is given in Eq. (30), where,  $AF_{ht}()$  and  $BF_{ht}$  specifies the activation function and the bias vector of the hidden units, correspondingly.

$$HM_T = AF_{ht}(W_{lh}RP_T + W_{hh}HM_{T-1} + BF_{ht})$$
(30)

Further, the hidden units are associated to the output layer by the weight matrix  $W_{ho}$ . Moreover, the output layer includes SL units as  $OQ_T = (OQ_1, OQ_2, ....OQ_{SL})$  in Eq. (31), where,  $AF_o()$  and  $BF_o$  refers to the bias vector and the activation function of output units, respectively.

$$OQ_T = AF_o(W_{ho}HM_T + BF_o) \tag{31}$$

In addition, the RNN has different weight parameters including the weight matrix  $W_1$  with hidden-to-hidden recurrent connections (i.e.), exist among the nodes of the hidden layer,  $W_2$  connected to the layer and hidden the output layer, and  $W_3$  connects among the hidden layer and input layer. All these parameters  $(WM_3, WM_1, WM_2)$  are shared across time. The following steps of the RNN frameworks are as follows:

Step 1: The weight matrices are given  $asW_3$ ,  $W_1$ ,  $W_2$ , and the bias function  $BZ_1$ ,  $BZ_2$  are initialized with zeros, and the weights are then updated by the proposed SITSA algorithm. The solution encoding and the algorithmic description is given in the subsequent section.

Step 2: The speech emotion recognition is computed by the Forward propagation process. The RNN forward pass is given in Eq. (32) to Eq. (35), correspondingly. The softmax function is provided as a post-processing step to obtain the normalized probabilities of output as D.

$$SR(T) = BZ_1 + W_3.UL(T) + W_1.HM(T-1)$$
 (32)

$$HM(T) = \tanh(SR(T))$$
 (33)

$$JS(T) = BZ_2 + HM(T).W_2 \tag{34}$$

$$D(T) = softmax(JS(T))$$
(35)

Step 3: The loss function is determined in Eq. (36).

$$Loss = -\sum_{RZ_{s}=1}^{NT} ZI_{obs,cls}.\log(MS_{obs,cls})$$
(36)

In Eq. (36), *NT* specifies the count of possible class labels, *ZI* indicates the binary indicator that checks whether the class label *cls* is classified

correctly for the observationobs.

Step 4: Compute the gradients through the back-propagation.

Thus, the final output obtained from the RNN is denoted as  $Out_{RNN}$ . The final classification output is denoted as Out, and it is expressed in Eq. (37).

$$Out = \frac{Out_{LSTM} + Out_{RNN}}{2} \tag{37}$$

Classifier parameters are the batch-size = 128, epochs = 10 and learning rate = 0.01.

## 7. RNN weight Optimization by Self improved tunicate Swarm Optimization Algorithm

#### 7.1. Solution encoding and objective function

As mentioned, the weights of RNN are optimally tuned using the proposed SITSA method. Fig. 2 illustrates the input solution to the proposed SITSA model. Here, the total number of weights in RNN is indicated as N. The objective function of the implemented method is given in Eq. (38), where *accuracy* indicates the detection accuracy.

#### 7.2. Proposed SITSA model

Even though, the conventional TSA [26] model has the ability to find the location of food source pre sent in the sea; still, it has no idea regarding the food source obtained in the search space. This becomes the issue while solving optimization problems. For overcoming this scenario, the SITSA model is proposed in this work. Generally, the self-improvement is proved to be capable in the existing optimization algorithms [27 28 29 30 31]. In TSA, the two tunicate behaviors are employed to find the food source. Furthermore, the two behaviors of TSA include the swarm intelligence and jet propulsion.

Jet propulsion behavior: In addition, a tunicate must satisfy the following 3 conditions including "avoid the conflicts among the search agents, remains close to the best search agent, and movement towards the position of best search agent". Still, the swarm behavior updated the other search agent's position on the basis of best optimal solution. The 3 conditions of the jet propulsion behavior is specified as follows.

(i)Avoid the conflicts between search agents: The  $X\overline{L}$  vector is employed to compute the new search agents position for avoiding the conflicts among the search agents, and it is given in Eq. (39).

$$X\overrightarrow{L} = \frac{Y\overrightarrow{L}}{Z\overrightarrow{L}} \tag{39}$$

Where,

$$Y\overrightarrow{L} = n_2 + n_3 - E\overrightarrow{O} \tag{40}$$

$$\overrightarrow{EO} = 2.n_1$$
 (41)

In Eq. (40) and Eq. (41),  $\overrightarrow{EO}$  indicates the water flow advection in deep ocean,  $\overrightarrow{YL}$  represents the gravity force, and the variables  $n_1, n_2$ , and

$$Obj = \max(accuracy)$$

Fig. 2. Solution Encoding.

 $n_3$  refers to the random number ranges among [0, 1].  $Z\overrightarrow{L}$  specifies the social forces among the search agents, and it is given in Eq. (42).

$$Z\overrightarrow{L} = [B_{\min} + n_1.B_{\max} - B_{\min}] \tag{42}$$

In Eq. (42),  $B_{\rm max}$  and  $R_{\rm min}$  denotes the subordinate and initial speeds for making the social interaction. Further, the values of  $B_{\rm min}$  is 1, and  $B_{\rm max}$  is 4, correspondingly.

(ii)Movement towards the best neighbour's direction: The search agents move towards the best neighbour's direction once after the conflict avoided between the neighbours.

$$D\overrightarrow{P} = \left| H\overrightarrow{R} - rand.\overrightarrow{B}_{sl}(w) \right| \tag{43}$$

In Eq. (43), w denotes the current iteration,  $\overrightarrow{DP}$  portrays the distance among the food source and tunicate (i.e.), search agent,  $\overrightarrow{HR}$  refers to the position of food source, the vector  $\overrightarrow{B}_{sl}(w)$  specifies the tunicate position and r and indicates the random number lies among [0, 1].

(iii)Proposed Converge towards the best search agent: Conventionally, the search agent could sustain the positions towards the food source (i.e.) best search agent. However, as per the proposed SITSA method, the positions are updated with levy update as given in Eq. (44).

$$\overrightarrow{B}_{sl}(w)' = \{ \begin{array}{ll} \overrightarrow{HR} + \overrightarrow{XL}.\overrightarrow{DP} + Levy(\beta) & if \ rk \ge 0.5 \\ \overrightarrow{HR} + \overrightarrow{XL}.\overrightarrow{DP} & if \ rk < 0.5 \end{array}$$
 (44)

 $\overrightarrow{B}_{sl}(w)^{'}$  specifies the updated position of tunicate in terms of the  $H\overrightarrow{R}$  food source position.

If rk < pr, then

$$\overrightarrow{B}_{sl}(w) = B_{sl}^{md} + fx_1 \times \left( uq_1 * GH_{best} - uq_2 * GH_{kg}^{md} \right) + 
fx_2 \times \rho_1 \times \left( uq_3 * \left( GH_{2no}^{md} - GH_{1no}^{md} \right) + 
uq_2 \times \left( GH_{rk1}^{md} - GH_{rk2}^{md} \right) \right) / 2$$
(45)

Else

$$\overrightarrow{B}_{sl}(w) = GH_{best} + fx_1 \times \left( uq_1 * GH_{best} - uq_2 * GH_{kg}^{md} \right) + 
fx_2 \times \rho_1 \times \left( uq_3 * \left( GH_{2n_0}^{md} - GH_{1n_0}^{md} \right) + 
uq_2 \times \left( GH_{rk1}^{md} - GH_{rk2}^{md} \right) \right) / 2$$
(46)

Where,  $B_{sl}^{md}$  portrays the current position of tunicate,  $GH_{best}$  indicates the best position, pr denotes the probability (pr=0.3), rk specifies the random value  $\in (0,1)$ ,  $fx_1$ ,  $fx_2$  indicates the uniformly distributed random values  $\in (-1,1)$ ,  $GH_{rk1}^{md}$  and  $GH_{rk2}^{md}$  specifies the two random solutions selected from population,  $\rho_1$  indicates the balance in exploration and exploitation process, rand refers to the random number,  $GH_{1_{no}}^{md}$  and  $GH_{2_{no}}^{md}$  denotes the random solution and it is determined in Eq. ().

$$GH_{loc}^{md}, GH_{loc}^{md} = LB + rand(dim) * (UB - LB)$$

$$(47)$$

In Eq. (47),LB indicates the lower bound, UB denotes the upper bound, dim specifies the dimension, n and m refers to the coordinates of solution no  $=1,2,\ldots$ NO andmd  $=1,2,\ldots$ , dim. Furthermore,uq<sub>1</sub>,uq<sub>2</sub>, and uq<sub>3</sub> are calculated as per Eq. (48), Eq. (49), and Eq. (50).

$$uq_1 = LM_1 * 2 * rand + (1 - LM_1)$$
(48)

$$uq_2 = LM_1 * rand + (1 - LM_1)$$
(49)

$$uq_3 = LM_1 * rand + (1 - LM_1)$$
(50)

Where,  $LM_1$  and  $LM_2$  are the binary parameters.  $w_{kg}^{md}$  is determined as in Eq. (51).

$$\mathbf{w}_{k\sigma}^{\text{md}} = LM_2 \times \mathbf{w}_{sl}^{md} + (1 - LM_2) * rand$$
 (51)

Swarm behaviour: For simulating the swarm behaviour of tunicate, it saves the other search agent's positions and the first two optimal best solutions are updated based on the best search agent's position. Furthermore, the swarm behaviour of tunicate is determined as in Eq. (52).

$$\overrightarrow{B}_{sl}(\overrightarrow{w}+1) = \frac{\overrightarrow{B}_{sl}(\overrightarrow{w}) + \overrightarrow{B}_{sl}(\overrightarrow{w}+1)}{2+n_1}$$
(52)

Algorithm 1 describes the pseudo code of the proposed SITSA scheme.

Algorithm 1: Pseudo code of Proposed SITSA Model

Step 1:Initialization of the tunicate population  $\overrightarrow{B}_{sl}$ 

Step 2: Choose the total number of iterations and initial parameters.

Step 3: The fitness value for each search agent is determined.

Step 4: The best search agent is identified after the fitness evaluation.

Step 5: Each search agent's position is updated as per Eq. (52).

Step 6: The updated search agent is adjusted away from the boundary in a specified search space.

Step 7: The fitness value of updated search agent is calculated. The  $\overrightarrow{B}_{sl}$  is updated using proposed update evaluation as in Eq. (44).

Step 8: The algorithm end only if the stopping criterion is satisfied. Else, repeat the steps from 5 to 8.

Step 9: Returns the so far best optimal solution is.

#### 8. Results and discussion

#### 8.1. Simulation procedure

The adopted pest detection with hybrid classifier + SITSA model was executed in PYTHON and the outcomes were verified. The performance of the adopted hybrid classifier + SITSA model with pest detection was computed over the conventional schemes such as SVM [37], NN [38], RF [41], DBN [32], hybrid classifier + WOA [39], hybrid classifier + EHO [40], hybrid classifier + TSA [26], hybrid classifier + D-NU [35], hybrid classifier + BOA [42] and hybrid classifier [44] + PSO correspondingly. Furthermore, the performance was computed by varying the training percentage such as 50, 60, 70, 80, and 90 for different performance measures such as "accuracy, sensitivity, specificity, precision, FMS, Thread score, FDR, FNR, FPR, FOR, NPV, and MCC", respectively. The sample images, pre-processed images and segmented images of the proposed work are illustrated in Fig. 3.

#### 8.2. Dataset description

The dataset including the videos of pests like: Heliothis armigera (Cotton bollworm) and Leptocorisa acuta (rice bug) were manually collected. The cotton bollworm image consists of 34 videos and the rice bug image consists of 36 videos. Average of 100 frames per video is considered.

#### 8.3. Performance analysis

The performance analysis of the proposed hybrid classifier + SITSA model is compared to the existing schemes like SVM, NN, RF, DBN, hybrid classifier + WOA, hybrid classifier + EHO, hybrid classifier + TSA, hybrid classifier + D-NU, hybrid classifier + BOA and hybrid classifier + PSO, respectively in terms of certain metrics, and it is represented in Figs. 4, 5, and 6. Similarly, the positive measures such as sensitivity, accuracy, precision and specificity of the proposed hybrid classifier + SITSA model shows superior outcomes than other traditional methods in detecting the pest. Moreover, the accuracy of hybrid classifier + SITSA model for training percentage 90 is 3.34 %, 3.06 %, 3 %, 2.79 %, 2.66 %, 2.11 %, 2.05 %, 1.98 %, 2.52 % and 3.71 % better than other conventional schemes like SVM, NN, RF, DBN, hybrid classifier +

Fig. 3. Sample images, pre-processed images and segmented images of the proposed work.

WOA, hybrid classifier + EHO, hybrid classifier + TSA, hybrid classifier + D-NU, Hybrid classifier + BOA and Hybrid classifier + PSO, correspondingly as shown in Fig. 4(a). The adopted hybrid classifier + SITSA model attains higher sensitivity (~75.81) in detected results when compared over the existing schemes like SVM (~63.20), NN (~63.39), RF ( $\sim$ 63.52), DBN ( $\sim$ 69.34), hybrid classifier + WOA ( $\sim$ 70.20), hybrid classifier + EHO (~70.31), hybrid classifier + TSA (~70.76), hybrid classifier + D-NU ( $\sim$ 73.74), hybrid classifier + BOA ( $\sim$ 70) and hybrid classifier + PSO (~72.14), respectively in Fig. 4(b) for training percentage 50. Furthermore, the proposed hybrid classifier + SITSA model holds maximum specificity for training percentage 80 that is 9.01 %, 7.26 %, 5.40 %, 4.21 %, 3.44 %, 2.90 %, 2.68 %, 2.15 %, 8.25 % and 6.24 % superior to the existing approaches like SVM, NN, RF, DBN, hybrid classifier + WOA, hybrid classifier + EHO, hybrid classifier + TSA, hybrid classifier + D-NU, hybrid classifier + BOA and hybrid classifier + PSO, respectively as given in Fig. 4(c). Additionally, the adopted hybrid classifier + SITSA model attains higher precision (~96.40); whereas, the traditional schemes attains lower precision value for SVM, NN, RF, DBN, hybrid classifier + WOA, hybrid classifier + EHO, hybrid classifier + TSA, hybrid classifier + D-NU, hybrid classifier + BOA and hybrid classifier + PSO, respectively for training percentage 60 in Fig. 4(d). The observed enhancement shows the impact of proposed SITSA model on training the classifier in a better way.

Fig. 5 illustrates the negative measures like FPR, FNR, FDR, and FOR of the adopted hybrid classifier + SITSA model and the existing models. The adopted hybrid classifier + SITSA model attains less FPR ( $\sim$ 4.009) which is the better performance; whereas, the traditional schemes

attains high FPR as SVM (~27.64), NN (~25.03), RF (~25.03), DBN (~22.40), hybrid classifier + WOA (~14.20), hybrid classifier + EHO (~8.50), hybrid classifier + TSA (~6.41), hybrid classifier + D-NU, Hybrid classifier + BOA and Hybrid classifier + PSO, (~6.20), respectively for training percentage 60 in Fig. 5(a). The adopted hybrid classifier + SITSA model holds minimum FNR value that is 49.21 %, 48.85  $\%,\,48.74\,\%,\,42.70\,\%,\,38.98\,\%,\,35.28\,\%,\,20.08\,\%,\,18.13\,\%,\,25.26\,\%$  and 38.15 % than other traditional models like SVM, NN, RF, DBN, hybrid classifier + WOA, hybrid classifier + EHO, hybrid classifier + TSA, hybrid classifier + D-NU, Hybrid classifier + BOA and Hybrid classifier + PSO, respectively for training percentage 80 in Fig. 5(b). Moreover, the FDR of the adopted hybrid classifier + SITSA model is 75.20 %, 72.60 %, 72.31 %, 53.20 %, 49 %, 40.33 %, 37.08 %, 30.88 %, 50.75 % and 63.2 % better than the other conventional models such as SVM, NN, RF, DBN, hybrid classifier + WOA, hybrid classifier + EHO, hybrid classifier + TSA, hybrid classifier + D-NU, Hybrid classifier + BOA and Hybrid classifier + PSO, respectively for training percentage 70 in Fig. 5 (c). Further, the FOR of the proposed hybrid classifier + SITSA model achieves superior outcomes (~5.27) than other existing models like SVM, NN, RF, DBN, hybrid classifier + WOA, hybrid classifier + EHO, hybrid classifier + TSA, hybrid classifier + D-NU, Hybrid classifier + BOA and Hybrid classifier + PSO, respectively for training percentage 90 in Fig. 5(d). Thus, the improvement of the proposed hybrid classifier + SITSA model is proved by the obtained results.

The other measures analysis such as NPV, MCC, FMS and thread score of the adopted hybrid classifier + SITSA model and existing models are represented in Fig. 6. From the graph, it is shown clearly that

Fig. 4. Performance analysis of the proposed hybrid classifier + SITSA model over other traditional schemes for (a) accuracy (b) sensitivity (c) specificity (d) precision.

the NPV of the proposed MCSO hybrid classifier + SITSA model holds a value (~84.53) for training percentage 70; whereas, the compared existing models like SVM, NN, RF, DBN, hybrid classifier + WOA, hybrid classifier + EHO, hybrid classifier + TSA, hybrid classifier + D-NU, Hybrid classifier + BOA and Hybrid classifier + PSO, respectively attains lower values as per Fig. 6(a). In addition, the FMS of adopted hybrid classifier + SITSA model at training percentage 60 is 5.89 %, 5.83 %, 4.09 %, 3.48 %, 3.38 %, 3.25 %, 3.22 %, 1.89 %, 4.23 % and 5.08 % superior to other traditional scheme like SVM, NN, RF, DBN, hybrid classifier + WOA, hybrid classifier + EHO, hybrid classifier + TSA, hybrid classifier + D-NU, Hybrid classifier + BOA and Hybrid classifier + PSO, respectively in Fig. 6(b). Likewise, the adopted hybrid classifier + SITSA model attains maximum MCC (~92.32) for training percentage 90; whereas, the traditional schemes attains low MCC values such as SVM (~87.35), NN (~87.79), RF (~87.88), DBN (~88.02), hybrid classifier + WOA (~88.42), hybrid classifier + EHO (~89.09), hybrid classifier + TSA ( $\sim$ 89.26), and hybrid classifier + D-NU ( $\sim$ 89.36), Hybrid classifier + BOA ( $\sim$ 79.09) and Hybrid classifier + PSO ( $\sim$ 80.09), respectively in Fig. 6(c). The thread score of adopted hybrid classifier + SITSA model at training percentage 80 is 4.89 %, 4.02 %, 3.98 %, 3.79 %, 3.71 %, 2.50 %, 2.46 %, 2.43 %, 4.21 % and 5.32 % better than other existing schemes like as SVM, NN, RF, DBN, hybrid classifier + WOA, hybrid classifier + EHO, hybrid classifier + TSA, hybrid classifier + D-NU, Hybrid classifier + BOA and Hybrid classifier + PSO, correspondingly in Fig. 6(d). Thus, the performance of adopted hybrid classifier + SITSA model has shown enhancement than other existing models.

#### 8.4. Overall performance analysis

The overall performance analysis of the adopted hybrid classifier + SITSA model over other traditional models for different training percentages concerning accuracy measure is determined in Table 4. From the table, the adopted hybrid classifier + SITSA model have proven its pest detection ability for all training percentages than other traditional models such as SVM, NN, RF, DBN, hybrid classifier + WOA, hybrid classifier + EHO, hybrid classifier + TSA, and hybrid classifier + D-NU, hybrid classifier + BOA and hybrid classifier + PSO, correspondingly. Similarly, the proposed hybrid classifier + SITSA model attains 3.90 %, 3.81 %, 3.74 %, 3.65 %, 3.49 %, 3.49 %, 2.70 %, 2.13 %, 4.67 % and 4.24 % better accuracy value than other traditional models like SVM, NN, RF, DBN, hybrid classifier + WOA, hybrid classifier + EHO, hybrid classifier + TSA, hybrid classifier + D-NU, hybrid classifier + BOA and hybrid classifier + PSO, correspondingly for training percentage 60. Furthermore, the proposed hybrid classifier + SITSA model attains maximum accuracy values ( $\sim$ 96.04483) for training percentage 90 than other traditional models like SVM, NN, RF, DBN, hybrid classifier + WOA, hybrid classifier + EHO, hybrid classifier + TSA, and hybrid classifier + D-NU, respectively in Table 4. The outcomes have summarized that the adopted hybrid classifier + SITSA model performance is improved over the traditional models. Table 4 shows the overall performance analysis.

#### 8.5. Statistical analysis

The statistical analysis of the proposed hybrid classifier + SITSA scheme over other existing models concerning accuracy measure is

Fig. 5. Performance analysis of the adopted hybrid classifier + SITSA model over other traditional schemes for (a) FPR (b) FNR (c) FDR (d) FOR.

illustrated in Table 5. The meta-heuristic algorithms are stochastic; therefore, the algorithms are executed several times to determine the objective of the work by evaluating different case scenarios. Moreover, the adopted hybrid classifier + SITSA model has shown superior performance under best-case scenario that is 3.34 %, 3.07 %, 3 %, 2.80 %, 2.67 %, 2.11 %, 2.05 %, 1.98 %, 3.43 % and 4.21 % better than the traditional models like SVM, NN, RF, DBN, hybrid classifier + WOA. hybrid classifier + EHO, hybrid classifier + TSA, and hybrid classifier + D-NU, hybrid classifier + BOA and hybrid classifier + PSO, respectively. The mean performance of the proposed method in terms of accuracy measure holds better outcomes (86.24918) than other traditional models like SVM, NN, RF, DBN, hybrid classifier + WOA, hybrid classifier + EHO, hybrid classifier + TSA, and hybrid classifier + D-NU, respectively. In addition, the proposed model attains a maximum value (77.32367) at worst-case scenario; whereas, the existing schemes hold minimum values concerning accuracy measure such as SVM (~71.7791), NN (~72.03988), RF (~72.30066), DBN (~72.75702), hybrid classifier + WOA (~73.40897), hybrid classifier + EHO ( $\sim$ 73.73494), hybrid classifier + TSA ( $\sim$ 74.32169), hybrid classifier + D-NU ( $\sim$ 75.16922), respectively, hybrid classifier + BOA ( $\sim$ 64.21)and hybrid classifier + PSO ( $\sim$ 74.21). Consequently, the enhancement of the proposed hybrid classifier + SITSA model has been validated effectively. Table 5 shows the statistical analysis.

#### 8.6. Convergence analysis

Fig. 7 represents the convergence analysis of the proposed Hybrid Classifier + SITSA method over other traditional models for varied iterations that range from 0 to 50. On observing the graph, it is shown that

the gradual decrement of the cost function with increased iterations. The convergence of the adopted Hybrid Classifier + SITSA method at the 40th iteration is 64 %, 85 %, and 95.7 % better than the existing model like Hybrid Classifier + WOA, Hybrid Classifier + EHO, Hybrid Classifier + TSA, Hybrid classifier + BOA, and Hybrid classifier + PSO corresponding concerning minimized error.

#### 8.7. Practical implications

Correct identification of a pest allows us to determine basic information about it, including its life cycle and the time that it is most susceptible to being controlled. Regularly monitor the pest population and/or damage to determine whether control measures are necessary and, if so, when to begin the control measures. Agricultural employees can determine whether or not to use our method based on the classification result. Spray or don't spray in this area, and give instructions for varied dosing/treatment that is curative. They can also assess the current state of the crop and forecast crop yields in this region.

#### 9. Conclusion

The Heliothis armigera (Cotton bollworm) and Leptocorisa acuta (rice bug) have been detected using this model, which has three primary phases: I Pre-processing; (ii) Object tracking and segmentation; (iv) Feature extraction; (v) Classification." The input video frame (pictures) was first subjected to a pre-processing phase, during which the video frames were pre-processed. Object tracking and segmentation were performed on the pre-processed images. The FCM technique was used to segment the foreground and background in this case. The suggested

Fig. 6. Performance analysis of the adopted hybrid classifier + SITSA model over other traditional schemes for (a) NPV (b) FMS (c) MCC (d) Thread score.

**Table 4** overall performance analysis of adopted and existing schemes for various training percentage.

Methods	Training percentage					
	50	60	70	80	90	
SVM [37]	71.77	78.29	83.31	88.14	92.83	
NN [38]	72.03	78.36	83.31	88.72	93.09	
RF [41]	72.30	78.42	83.53	88.79	93.162	
DBN [32]	72.75	78.49	83.70	88.86	93.35	
Hybrid classifier + BOA [42]	73.21	77.35	82.50	88.65	92.25	
Hybrid classifier + PSO [44]	74.25	78.15	83.25	88.70	92.80	
Hybrid classifier + WOA [39]	73.40	78.62	83.77	88.92	93.48	
Hybrid classifier + EHO[40]	73.73	78.62	83.84	88.99	94.01	
Hybrid classifier + TSA [26]	74.32	79.27	84.29	89.51	94.07	
Hybrid classifier + D-NU [35]	75.16	79.73	84.62	89.51	94.14	
Proposed Hybrid classifier + SITSA	77.32	81.47	85.76	90.63	96.04	

GLCM based texture features, color, edge, and form-based characteristics are derived from the segmented pictures. Furthermore, the collected features were fed into a detection procedure that utilized hybrid classifiers like LSTM and RNN. RNN training was used to achieve exact detection results. Finally, the performance of the proposed scheme was compared over the other existing schemes concerning various metrics like FDR, specificity, accuracy, precision, FNR, sensitivity, FPR, Thread score, FMS, FOR, NPV, and MCC, correspondingly. On observing the graph, the adopted hybrid classifier + SITSA model attains higher sensitivity ( $\sim$ 75.81) in detected results when compared over the existing schemes like SVM ( $\sim$ 63.20), NN ( $\sim$ 63.39), RF ( $\sim$ 63.52), DBN ( $\sim$ 69.34), hybrid classifier + WOA ( $\sim$ 70.20), hybrid classifier + EHO ( $\sim$ 70.31), hybrid classifier + BOA( $\sim$ 70) and hybrid classifier + PSO ( $\sim$ 72.14), respectively for training percentage 50. The adopted hybrid classifier

**Table 5**Statistical analysis with respect to accuracy: Proposed vs Conventional models.

Methods	Mean	Median	Standard deviation	Worst	Best
SVM [37]	82.87	83.31	7.36	71.77	92.82
NN [38]	83.10	83.31	7.43	72.03	93.04
RF [41]	83.25	83.57	7.37	72.30	93.16
DBN [32]	83.43	83.70	7.29	72.75	93.35
Hybrid classifier + WOA [39]	83.64	83.77	7.13	73.40	93.48
Hybrid classifier + EHO [40]	83.84	83.84	7.20	73.73	94.01

Hybrid classifier + D- NU [35]	86.63	84.62	6.74	75.16	94.14
Hybrid classifier + SITSA	86.24	85.76	6.60	77.32	96.04

SITSA model holds minimum FNR value that was 49.21 %, 48.85 %, 48.74 %, 42.70 %, 38.98 %, 35.28 %, 20.08 %, 18.13 %, 25.26 % and 38.15 % than other traditional models like SVM, NN, RF, DBN, hybrid classifier + WOA, hybrid classifier + EHO, hybrid classifier + TSA, hybrid classifier + D-NU, hybrid classifier + BOA and hybrid classifier + PSO, respectively for training percentage 80. Moreover, the adopted hybrid classifier + SITSA model has shown superior performance under best case scenario was 3.34 %, 3.07 %, 3 %, 2.80 %, 2.67 %, 2.11 %, 2.05 %, 1.98 %, 3.43 % and 4.21 % better than the traditional models like SVM, NN, RF, DBN, hybrid classifier + WOA, hybrid classifier + EHO, hybrid classifier + TSA, and hybrid classifier + D-NU, hybrid classifier + BOA and hybrid classifier + PSO, respectively. In the future, we will use data augmentation technology to increase the amount of data points in classes where there are few samples. Furthermore, in

Fig. 7. Convergence analysis of proposed method over existing methods.

order to put our pest detection approach into practice, we will incorporate model onto a mobile terminal, including IOS platforms and Android. This will aid in the promotion of agricultural productivity.

Abstract: Agriculture serves as the primary source of income globally, particularly in regions like the Indian subcontinent. However, modern challenges such as unpredictable weather patterns, water scarcity, and market fluctuations necessitate the adoption of advanced farming techniques. Soil fertility depletion, caused by various factors, further exacerbates these challenges, leading to decreased crop yields. To solve these problems, our project utilizes modern technology, specifically leveraging machine learning techniques. By integrating an NPK sensor with a web application, our goal is to give farmers practical insights into their soil's nutrient composition. Upon collecting nitrogen, phosphorus, potassium, and pH levels from the soil, these values are entered into the application. Compared to traditional farming methods, our project offers several advantages. Firstly, it empowers farmers with accurate and timely information about their soil's nutrient levels, giving them the ability to make wise decisions. Secondly, by the use of machine learning methods, our system provides personalized recommendations that address the particular needs of each farmer's soil. Overall, our project aims to enhance agricultural productivity and sustainability by bridging the gap between traditional farming practices and modern technology.

Keywords: Machine learning Techniques, Internet of things, web application, Logistic Regression, Crop Recommendation.

#### I. INTRODUCTION

In the landscape of modern agriculture, Technology integration is becoming more and more common., offering innovative solutions to solve the challenges faced by farmers worldwide. Our project centres around leveraging technology, specifically the Internet of Things (IoT) and web applications, to streamline and optimize crop and fertilizer recommendations based on soil nutrient analysis. The process begins with the deployment of NPK sensors, which are able to measure nitrogen, phosphorus, potassium, and pH levels in the soil. These sensors serve as the foundational element in our project, providing real-time data on the nutrient composition of the soil. Upon collecting the soil nutrient data, the information is then fed into a user-friendly web application, designed to provide farmers with actionable insights and recommendations tailored to their specific agricultural needs. The application offers two primary functionalities: crop recommendation and fertilizer recommendation. These options empower farmers to make knowledgeable choices about soil management techniques and crop selection, ultimately enhancing agricultural productivity and sustainability. A major development in the world of agriculture is the incorporation of technology into farming operations, offering farmers access to valuable data and insights that can inform decision-making processes. Making use of web applications and Internet of Things sensors, our project aims to empower farmers with the tools and information they need to maximize crop yields, optimize resource utilization, and promote long-term sustainability in agriculture.

#### II. LITERATURE REVIEW

Paper [1]: The paper titled "Internet of Things (IoT) assisted Context-Aware Fertilizer Recommendation". It considers variables including crop kind, soil type, and soil fertility to satisfy the requirement for real-time context-awareness in fertilizer recommendation. The study suggests an Internet of Things-based approach to real-time mapping of soil fertility that gets beyond the difficulties and expensive nature of conventional techniques. When compared to conventional soil chemical analysis, the system's accuracy is validated through practical implementation in crop fields. The most precise machine learning model for context-aware fertilizer recommendation is the Gaussian Naïve Bayes (GNB) model. To improve sustainability and profitability in agriculture, this research provides a framework for the integration of IoT and machine learning.

# International Journal for Research in Applied Science & Engineering Technology (IJRASET)

ISSN: 2321-9653; IC Value: 45.98; SJ Impact Factor: 7.538

Volume 12 Issue V May 2024- Available at www.ijraset.com

Paper [2]: The paper titled "Artificial Intelligence-Based Crop Suggestion System" tackles the urgent problem of India's farmers choosing the wrong crops, which results in low incomes and a desire to leave the agricultural industry. It offers a method based on machine learning algorithms to make crop recommendations based on a variety of environmental and financial factors, including temperature, rainfall, soil properties, and more.

This method forecasts yields, examines profitability, and recommends appropriate crops. Crop selection is done using a different types of machine learning methods, such as Decision Tree Learning and Artificial Neural Networks. The study highlights the importance of data mining and machine learning in assisting farmers in making knowledgeable crop decisions., which improves agricultural sustainability and financial viability.

Paper [3]: The paper titled "Crop, Fertilizer, & Irrigation Recommendation using the Machine Learning Techniques" emphasizes the use of agriculture to the economy as well as the difficulties farmers encounter because of weather fluctuations, a lack of water, and problems with soil fertility. It underlines the necessity of utilizing contemporary technology to offer practical solutions to these issues. Crop yield prediction is advised to use machine learning, which offers different methods such as regression, clustering, classification, and prediction.

To predict agricultural productivity, a variety of methods can be used, such as Naïve Bayes, support vector machines, decision trees, and artificial neural networks. The research aims to examine how different machine learning algorithms may be used to forecast crop yield and recommend fertilizers, thereby supporting efficient crop management. We'll focus on supervised learning techniques and big data computing.

Paper [4]: The paper "Crop prediction using machine learning" addresses the pressing issue of declining agricultural productivity in India due to unpredictable climatic changes. This decline threatens the livelihoods of farmers and national food security. The study proposes a solution leveraging machine learning, specifically Naive Bayes, to predict suitable crops for cultivation. By collecting seed data and considering crucial parameters like temperature, humidity, and moisture content, the model assists farmers, especially beginners, in making informed decisions about crop selection. Additionally, the development of a user-friendly mobile application for Android facilitates easy access to the prediction process, encouraging user engagement and adoption of the technology in agricultural practices.

# III. MOTIVATION

Our project revolves around harnessing technology to empower farmers with real-time soil insights. Using a specialized sensor, we delve into the soil, uncovering its nutrient secrets - nitrogen, phosphorus, potassium, and pH levels. This data is then fed into a user-friendly web application, offering farmers two invaluable tools: crop recommendations and fertilizer suggestions. With crop recommendations, Farmers receive customized guidance on which plants are ideal for the particular composition of their soil, optimizing yields and sustainability.

Meanwhile, fertilizer suggestions provide guidance on how to enhance soil fertility, promoting healthier crops and reducing environmental impact.

#### IV. OBJECTIVE

- 1) Enhance Crop Selection: The primary objective is to employ Machine Learning and IoT to provide data-driven recommendations for optimal crop selection, considering soil conditions, climate, and previous historical data. This will increase agricultural productivity and assist farmers in making wise selections.
- 2) Optimize Fertilizer Application: The project aims to recommend precise fertilizer application strategies, reducing waste and its negative effects on the environment while making sure crop nutrient requirements are efficiently supplied.
- 3) Improve Resource Efficiency: By integrating technology, the project strives to enhance resource utilization, reducing water, energy, and fertilizer wastage, thereby increasing agricultural sustainability.
- 4) Increase Productivity: The system will work towards maximizing crop yield and, in turn, the economic well-being of farmers through better decision-making.
- 5) Sustainable Agriculture: In order to balance output with environmental responsibility, sustainable farming practices must be promoted, contributing to global food security and ecological well-being.

# V. METHODOLOGY

Fig 5.1 Block Diagram

Fig 5.1 Represents by considering agricultural land, and we're using sensors like NPK (Nitrogen, Phosphorus, Potassium) and pH sensors to measure the levels of these elements in the soil. The results are then shown on an OLED display. After obtaining these values, users can enter these into our web application. The application provides crop and fertilizer recommendations based on the soil's nutrient levels. This aids farmers in selecting the best crops to plant and fertilizers to utilize for maximum production.

# VII. FUTURE SCOPE

- 1) The project will combine models of machine learning with IoT data streams to provide dynamic fertilizer and crop recommendations that optimize nutrient application and minimize environmental impact.
- 2) The project will focus on recommending crops suitable for cultivation in the specific geographical region where the IoT sensor network is deployed.

Volume 12 Issue V May 2024- Available at www.ijraset.com

- 3) The crop recommendation system will be limited to recommending a select number of major crops commonly grown in the target region.
- 4) The accuracy of crop and fertilizer recommendations may be affected by the quality and completeness of input data, including soil samples, weather data, and historical crop yields.
- 5) The fertilizer recommendation system will give suggestions for the type and quantity of fertilizers based on the specific crop selection and real-time data from the IoT sensor network.

# VIII. CONCLUSION

In conclusion, our project leverages advanced sensor technology and web-based analytics to offer tailored agricultural solutions, enhancing soil management and crop production. By incorporating an NPK sensor to assess soil fertility levels, our system provides critical data points on nitrogen, phosphorous, and potassium and soil pH values. This data-driven approach enables precise crop and fertilizer recommendations through an intuitive web application. Users can choose between optimizing crop selection or improving soil nutrient profiles via customized fertilizer suggestions. Our system not only promotes optimal resource use but also supports sustainable agricultural practices by allowing farmers to adjust inputs based on real-time soil conditions, thus minimizing environmental impact. The combination of machine learning and technology tools in our project aims to revolutionize traditional farming techniques, improve yields, and offer a scalable solution adaptable across various agricultural settings. Overall, this project represents a significant step forward in the pursuit of sustainable agriculture powered by smart technologies.

**Abstract**— The recent era has witnessed several advances in Wireless Sensor Networks (WSNs), with few resources unprecedented challenges for secured presents transmission in an ever-unsecured broadcast network. The situation is more challenging when adversaries are equipped with sophisticated resources having direct access to sensor nodes. Nevertheless, there exists several cryptographic techniques used for node authentication, authorization, data confidentiality, integrity, and other security related services. This paper contributes to novel network security strategies to prevent network compromise. The proposed strategies attempt to boost data integrity, reliability and secure data transmissions. The proposal identifies the strategically important nodes (SIN) in implementing network security measures using volatile symmetric-key management scheme (KMS).

The scheme involves four phases: The first phase involves strategically important nodes (SIN) designation using Grey Wolf Optimization (GWO). Usually, hackers find it difficult to guess and access the keys that are selected on a random basis. To further increase the key protection, the scheme introduces a limited lifespan master key (LLM $_{\rm K}$ ). Secondly, to secure the KMS, this phase utilizes SHA for LLM $_{\rm K}$  distribution, and paired node prediction. Next phase performs secret key generation with a gradient approach and the key sharing is performed using Supersingular Isogeny Diffie-Hellman algorithm. The last phase is responsible for the dynamic S-Box generation using the Blowfish algorithm. The generated S-Box are subsequently shuffled to enhance the cryptographic process offering immunity towards attacks.

To evaluate the effectiveness of this approach, the proposed KMS is compared with relevant methods on various performance metrics. The results demonstrate that the proposed scheme achieves notable performance improvements over other methods.

Index Terms— Volatile key management, WSNs, GWO, SIDH, Blow fish Algorithm, Dynamic S-Box generation.

## I. INTRODUCTION

Wireless Sensor Networks have been gaining popularity over a few decades due to their low-cost, low-power, scalable and ease of deployments. However, these networks has been facing serious security challenges based on design due to the limited computational resources and their minimal battery life [1]. Its architecture comprises of numerous nodes that ranges from 100s to 1000s, deployed in a network. The sensor nodes

are used for sensing the data that is generated from surroundings and route it back to the base station via hopping techniques. However, these nodes have poor energy and memory resources. Several routing protocols have been devised to improve the network's lifetime and compensate for resource insufficiencies. The wireless structure is prone to various attacks, that would easily alter the sensed data which affects the confidentiality of the network data as well. Hence, data integrity and authentication might be compromised, thus securing against the vulnerabilities using various secure routing protocols and cryptographic techniques are mandatory for the appropriate functioning of the WSNs.

The sensors present in WSNs should share their keys to ensure the secure data transmission among the sensor nodes. In WSN, the key management schemes involves network formation and network initialization. The network formation follows either shared key or key establishment approach. Under the shared key approach, two nodes attempt to discover a public key, whereas in key establishment approach, several SNs establish a common key for secure communication. Various approaches are developed for key establishment and with resource scarcity, designing or structuring key distribution is an interesting task. Some of the KMS discussed in [2] are Public key cryptography, Randomized key distribution, Global master key and transitory master key. As security services like confidentiality, data integrity, etc must be enforced, cryptographic keys are to be utilized. This is where key management performs vital part in WSNs. The volatile key management is gaining traction in recent days due to the limited life span, preventing unauthorized access to the keys. The key management comprises of Symmetric, Asymmetric and Hybrid schemes [3], as shown in the figure 1. To establish volatile keys, a symmetric key management scheme [4] is essential to facilitate the keys between neighboring nodes without using any key ring or pools.

The initialization stage allows a pair of nodes to exchange a plain text message, with the plain text message being encrypted and the encrypted nonce is used by the network node, where a LLMK should only be inserted into some potential nodes (SINs). These SINs ensure the security of the LLMK from the attackers to expose the used key for any given node directly after the deployment process, even if the attacker captures few network nodes. The technique also ensures that the LLMK reaches every node in the network enabling network connectivity.

Figure 1: Key Management Scheme – A Hierarchy

Thee proposed work applies a volatile key management scheme to generate the  $LLM_K$ , SIN node designation using an optimization algorithm, a hashing algorithm to distribute volatile key and finally cryptographic techniques to ensure secure data communication using the shared keys.

The paper discusses the existing security and KMS of WSNs in section 2. The methodology and implementation along with respective algorithms are explained in section 3. The performance analysis and the results discussed in section 4. Section 5 provides conclusion and future enhancements.

#### II. RELATED WORKS

The design of secure and efficient routing protocols for WSNs is an active area of research due to the unique security challenges presented by these resource-constrained networks. The attacks against WSNs can be categorized into two types namely active attacks and passive attacks [5]. There exists a plethora of security mechanisms for secure data transmission, data aggregation, using key exchange and key management schemes. However, the complex broadcast channel impairments and limited resources weakened the full-fledged implement of a given security mechanism in WSNs. This section discusses various existing approaches that attempted to provide secure key exchanges, and transmission in WSNs.

#### A. Key Management schemes:

Several research works present the vulnerabilities and complicated nature of WSNs against attacks, for the network utilizing a random pairwise key distribution scheme. The random key distribution schemes experience various issues while assigning the secured keys to sensor nodes, prior to network deployment. [6] investigated that whether resiliency could be achieved in WSNs beneath random pairwise key redistribution scheme. This work presented certain conditions on model parameters such that the network would be unsplitable and unassailable, with maximum probability as the 'n' nodes increase. These ideas were developed against an intruder who possessed enough computing resources and good knowledge about network topology, however, with an assumption that only a fraction of sensor nodes are compromised. This research also proved that cryptographic keys should ensure un-splitability and unassailability under the pairwise key distribution method.

More importantly, compromised sensor nodes in military surveillance or disaster management applications across horizontal and vertical security landscapes is unacceptable. However, a deployment based key distribution scheme had been developed for cellular model in WSN for thwarting attacks [7]. The key distribution model is utilized in all those networks where the random selection of small subset of keys is chosen from the collection of key pools. At least, there should exist one common key from key pool for the secured connection among the nodes. The secured communication link relies on the length and strength of keys used for the connection establishment. The major focus of this research centered around node density, neighbor influence factor, sink node placement, gradient distance and application types on nodes to construct the attack matrix of each mobile cell. An efficient key management strategy along with secured data aggregation over Dynamic WSN had been implemented in [8]. This research work utilized a Key Generation Center (KGC) for dealing with partial private keys. This research work addresses escrow issue with the help of KGC.

The sensor nodes in WSNs would share their keys for secured data transfer. The demand of designing an energy optimized key establishment/distribution in WSNs is increasing due to the limited resources of sensor nodes. Various polynomial based key distribution scheme had been proposed in WSNs to provide a light weighted solution for devices with limited resources. These polynomial – based approaches are highly susceptible toward sensor attacks. Sometimes, the intruders compromise the security system by capturing a fixed number of sensor nodes. [9] developed a polynomial based key management scheme together with probabilistic security that minimizes the security risk of attacks along with minimized computational overhead and memory resources.

To establish a secured data transmission over WSN, several literatures suggested a protocol namely Multi-level Key Management protocol. Under this protocol, every single transmission was undertaken based on available secured key. The research work by [10] developed a protocol for key management referred as MSKM protocol, to perform protected communiqué in the clustered WSNs. This framework implemented in three phases consists of 1) Key Generation 2) Pre-deployment 3) Key Authentication and verification. The key generation is responsible to ensure the secrecy of communication and the necessary keys are generated using homomorphic encryption model. In pre-deployment, node's identity is established. The last phase, a mathematical model had been constructed along with various factors like random numbers, dynamic passwords, etc.

The secured key generation in physical layer (PL-SKG – Physical Layer Secure Key Generation) has some potential benefits to improve the network security posture. This scheme strengthens the security-based protocols by minimizing the quantity of key materials needed for deployment. This scheme is extremely useful in limited resources scenario and also in situations where designing of key management scheme is challenging. [11] discussed about the challenges in PL-SKG scheme, and propose a unique key generation scheme which provided merits on potential and simplicity of correction codes.

The intruder might have unauthorized access which leads to eavesdropping, tampering of data, interception, and modification. Nevertheless, to improve efficacy of WSN, clustering methods are deployed, but sensor nodes' dynamic behavior with limited processing and storage makes secured transmission, a difficult one. To resolve this issue, effective key management is essential. [12] proposed a secured mechanism called as CAKE - Codeword Authenticated Key Exchange. It is completely based on one-way hashing with OTP and authentication. [13] developed a secured and provable key exchange protocol which is based on ECDH -Elliptical curve Diffie-Hellman for WSNs. Elliptical curve schemes are standard protocol for establishing shared keys. This implementation handles even a lack of authentication related attacks namely Man-in-the-Middle Attack. Enhanced energy utilization is the most primary factor. Thus an efficient method for securing energy in data transfer using Hierarchical and Dynamic ECC[14] had been proposed. LEACH - Low Energy Adaptive Clustering Hierarchy had been utilized for selecting dynamic cluster heads. Here the key management scheme consisted of three phases namely key - computation, key – exchange and, node authentication.

# B. Pair- Node Authentication:

Since WSN is widely applied in critical applications like military surveillance, health care monitoring, etc., the vulnerability of handling the data creates high risk. Since, it is mandatory to maintain confidentiality during data transmission and the data should be authenticated in all aspects. [15] stated that the memory and energy restraints of certain sensor nodes for military applications need light weight cryptographic schemes and propose an asymmetric key cryptographic scheme. The scheme uses the base idea called Elliptic Curve Cryptography and as well use Identity Based Public Key Cryptography.

Here, no permission is provided to third-party thereby in single transmission authentication is accomplished. Thus it is benefitted in a way that the receiving party need not to be active in receiving authenticated message, which decreases the encryption and decryption time without compromising the security level.

When considering large scale scenario of IoT, the trusted authority would be joined by a remote server. This remote server would be accessed through a domestic gateway by using different users to bootstrap the keys that are engaged in secure transmission. But all these users might not fully trust the remote server, especially when they are holding private key of their sensor nodes. So to handle this issue, [16] developed an escrow less and light weighted authenticated key Agreement technique (AKA) for WSNs. Various applications like medical monitoring in healthcare institutions needs highly secured WSN network. To promote that, [17] developed an user authentication scheme and secured data transmission of health care data. This research work discussed various secure transmission schemes like identity-based authentication, mutual authentication, decentralization, multi-routes transmission.

#### C. Cryptography:

Cryptography can be defined as the study or practice of several techniques that are involved in secure transmission of data even in the presence of intruders or adversaries. Usually, cryptographic techniques are about developing and analyzing various protocols that tries to stop or prevent third party adversaries or unauthorized public from viewing or intercepting private or sensitive messages. There are several aspects which are major parts of modern cryptography such as integrity, confidentiality, non-repudiation authentication. As cryptography shows continuous progress and new advances, WSNs utilized its techniques to improve the security landscape. The cryptography techniques utilized by WSNs are 1) Elliptic Curve Cryptography, 2) Pairingbased cryptography, 3) Identity based Cryptography.

As WSNs found its wide range of applications, subsequently, outsiders reach to access the sensitive data by directly interacting with sensor nodes increase substantially. Since, WSNs are fragile to attacks, it is essential to provide security to critical or sensitive data such that it should be available only to legitimate users. A scheme based on two factor authentication combined with smart card and password is used to enhance security. But several two factor authentication protocols have been suggested. [18] proposed a 2 factor authentication protocol that is based on ECC for WSN by considering privacy awareness. This novel protocol accomplished several features for real life applications without compromising efficiency.

[19]developed an algorithm which combined a method of merging of both symmetric and asymmetric methodologies such as AES – Advanced Encryption Standard and RSA – Rivest – Shamir – Adleman Algorithm followed by LZW – Limpel – Ziv- Welch compression. The primary objective of this mechanism is to encrypt the plain text via AES which led into faster symmetric encryption. The secondary objective includes encryption of plain text through RSA which leads to the development of secured data process. The last objective is to perform LZW compression. A reversal process of the algorithm at receiver performs decompression and finally the decryption step.

Though there are several techniques proposed, these mechanisms faced below short-comes in certain circumstances. They are as follows,

- Most of the existing methods used random number of node selection in order to share the master key before deployment. This might result in selection of malicious nodes, which in turn resulted in poor security.
- Some of the techniques used AES, which possess simple encryption process. So, an adversary with enough connected resources can easily break AES encryption.
- Most of the existing methods follow non-volatile approach in managing keys. This resulted in increased life span of master key. Master key with high life span would give chance for intrusion.

The proposed security mechanisms attempts to overcome the above-mentioned limitations.

#### III. PROPOSED WORK

The proposed scheme block diagram is depicted in the figure 2. It involves four modules namely 1) SIN prediction, 2) LLM $_{\rm K}$  distribution and pair node prediction, 3) Key generation 4) Dynamic S-Box generation. To enhance the security of sensitive data against adversaries, a volatile key management scheme has been implemented. A master key with shorter life span (LLM $_{\rm K}$ ) gets shared with certain nodes and these nodes are paired up with neighboring nodes for performing data transmission. As mentioned, the master key is inserted into few nodes that are selected using objective function by GWO algorithm. Then, these selected node pairs are ready to transmit data after authentication. The authentication is done between the node which holds the LLM $_{\rm K}$  with broadcast message and the receiver node that got paired.

The concept of volatile key technique is presented briefly in the following part. This concept is utilized in the proposed work for exploiting some of the basic operations by providing permissions to respond to certain problems and the security measures in WSNs. The symbols utilized in the equations of proposed work are described in Table 1.

Every node present in the network is preloaded by preliminary functions and data before the deployment of nodes. This helps in sharing the common keys among the adjacent neighbor nodes. Further, keys are established separately for each pair of adjacent neighbor nodes in a secured manner through the usage of primary configuration where MAC is utilized before initiating the secured communication in the perspective of authenticated channel. Preliminary data comprises of pseudo random (PR) functions, finite groups that comprise of LLM $_{\rm K}$  (can be inserted only in certain nodes) and

the prime numbers as shown in Table.2. Volatile Key is denoted as  $LLM_k$  in the proposed work as the master key that would appear in few nodes.

Table 1. Notations and Description

Notation	Description		
N	Total number of nodes deployed		
n <sub>a</sub>	a <sup>th</sup> node in network		
IDa	Identifier for node a		
	Node S <sub>a</sub> distributes the message		
$S_a \rightarrow type, *$ :	M to each node within the radio

Figure 2: Proposed Scheme Block Diagram

#### A. LLM<sub>K</sub>-Node Prediction using GWO:

Previously, the Master Keys (MKs) selection from the key pool has allowed the intruders to predict the MKs resulting into compromised node, network or communications. Thus, to handle this, proposed scheme utilizes optimization algorithm named GWO. The methodology of GWO algorithm is entirely based on hunting nature of wolves. Out of four, only three wolves are included in the hunting process. The decisions like hunting time, sleeping time are determined by wolf  $\alpha$ . Thus,  $\alpha$ wolf is designated as the leader of the wolf pack. The second and third  $\beta$  and  $\delta$  wolves respectively support  $\alpha$  in making decisions. The last  $\omega$  wolf is allowed only for eating hence these are not imperative in process of hunting. Initially, all the nodes are initialized with the basic node configuration data. Later, based on objective function,  $\alpha$ ,  $\beta$ ,  $\delta$  and  $\omega$  positions are updated. The objective function, based on estimating the information measure that is correlated among the nodes, can be formulated as below,

$$Fit_{val} = (a_1 * b_1) * (a_2 * b_2) * (a_3 * b_3) \tag{1}$$

$$Where, b_1 = \frac{\sum_{j=1}^N D_{ij}}{c_i^n}$$

$$b_2 = \frac{E_0}{c_i^n}$$

$$b_3 = \frac{1}{c_i^n}$$

$$// b_1, b_2 \text{ and } b_3 \text{ are energy-based coefficients}$$

$$a_1 = 0.5, a_2 = 0.2, a_3 = 1 - a_1 - a_2 // \text{Coefficient parameters}$$

$$D_{ij} = \sqrt{(X_i - X_j)^2}$$

$$C_i^n = \text{size}(C_n) \qquad \text{if } D_{ij} < \text{Cover}_{area}$$

$$// C_i^n - \text{node number which are covered by } i^{th} \text{node}$$

$$// Cover_{area} - \text{coverage area of an } i^{th} \text{node}$$

The above fitness function is formulated based on distance and energy constraints.

The initialized  $\alpha$ ,  $\beta$ ,  $\delta$  and  $\omega$  wolves along with scores and its positions are updated respectively using the following functions:

For alpha wolves,

$$\begin{array}{c} \alpha_{wolves}{}^{score} = Fit_{val}, \alpha_{wolves}{}^{pos} = X_i \\ if \ Fit_{val} < \alpha_{wolves}{}^{score} \end{array} \ , \tag{2}$$

For beta wolves,

$$\beta_{wolves}^{score} = Fit_{val}, \beta_{wolves}^{pos} = X_i$$

$$if \ Fit_{val} > \alpha_{wolves}^{score} \ \&\& \ Fit_{val} < \beta_{wolves}^{score} \ (3)$$

For delta wolves,

$$if \ Fit_{val} > \alpha_{wolves}^{score} \ \&\& \ Fit_{val} \\ > \beta_{wolves}^{score} \ \&\& \ Fit_{val} < \delta_{wolves}^{score} \\ \delta_{wolves}^{score} = Fit_{val}, \delta_{wolves}^{pos} = X_i$$
 (4)

For omega wolves,

$$if \ Fit_{val} > \alpha_{wolves}^{score} \quad \&\& \ Fit_{val} > \\ \beta_{wolves}^{score} \quad \&\& \ Fit_{val} > \\ > \delta_{wolves}^{score} \quad \&\& \ Fit_{val} > \omega_{wolves}^{score} \\ \omega_{wolves}^{score} = Fit_{val}, \omega_{wolves}^{pos} = X_i$$
 (5)

Where  $X_i$  represents position updation based on upper bound and lower bound, explained by equation (11). The overall updating of all types of wolves can be formulated as below,

$$X_{1} = \alpha_{wolves}^{pos} - \left(\frac{A}{|C*(\alpha_{wolves}^{pos} - X_{i})|}\right)$$

$$\text{Where } a = 2 - it * \left(\frac{2}{iter}\right)$$

$$A = \left(2 * a * rand(1,1)\right) - a$$

$$C = 2 * rand(1,1)$$

Similar process is applied for all wolves and  $X_2$ ,  $X_3$ ,  $X_4$ .

$$X_i = \frac{(X_1 + X_2 + X_3 + X_4)}{4} \tag{7}$$

Finally,  $\alpha$  position is converged and provides a solution which guarantees, the attacker cannot utilize the LLM<sub>K</sub> from SINs instantly after deployment. The final solution, that contain designated SINs and normal node can be obtained by the below equation 8. SINs are estimated based on the updating wolves' positions, the process is repeated for all iterations by updating the wolves position,

$$Best_{Agent} = \alpha_{wolves}^{pos} \quad \alpha_{wolves}^{score} > Fit_{val} \quad (8)$$
$$X_i = \frac{(X_1 + X_2 + X_3 + X_4)}{4}$$

The process of identifying SINs using GWO is given in algorithm 1.

## Algorithm I: SIN Identification using GWO

**Input:** Total number of nodes N

Output: Identified Master Node  $M_N$ , Normal Node  $N_N$ 

Procedure:

Step 1:

Initialize the wolves (Sensor Nodes) position randomly from,  $X_i (i = 1,2,,...,N) X_j (i = 1,2,,...,N)$ 

Maximum iteration, iter = 500

Lower Bound, lb = -100

 $Upper\ Bound,\ ub=100$ 

Initialize  $\alpha_{wolves}^{score}$ ,  $\beta_{wolves}^{score}$ ,  $\delta_{wolves}^{score}$  and  $\omega_{wolves}^{score}$ 

Step 2: iterate the process to maximum iterations,

While it < iter

$$Flag_{up}^{\quad i} = \begin{cases} 1 & X_i > ub \\ 0 & else \end{cases}$$

$$Flag_{Lb}^{i} = \begin{cases} 1 & X_{i} < lb \\ 0 & else \end{cases}$$

$$Update \ the \ position \ based \ on \ the \ updating \ ub \ and \ lb$$

$$X_{i} = X_{i} * (Flag_{up} - Flag_{Lb}) + (ub * Flag_{up}) + (lb * Flag_{up}) \end{cases}$$

#### *Step 3:*

Execute the objective function based on the estimation of information measure, correlation among the nodes, using equation (1).

#### Step 4:

Update  $\alpha$ ,  $\beta$ ,  $\delta$  and  $\omega$  wolves score and position, using equation (2-5).

**Step 5:** Update position of all wolves, using equation (6).

Iterate the process for all wolves and estimate, using equation (7).

**Step 6:** Best agents are estimated based on the updating wolves' positions, using equation (8). End while

Step 7: This process is repeated for all iterations and the final solution identifies strategically important nodes (SIN).

# B. Pair node prediction, volatile key ( $LLM_K$ )and shared key generation using Secure Hash Algorithm (SHA):

The SINs and neighbor nodes, that are ready for transmission, are authenticated. The authentication is done through SHA, which involves generating the nonce message and shared key for the node which holds the volatile key and the node involved in communication. The volatile key has been generated for a SIN along with limited key's lifetime. Limited Life Volatile Master key ( $LLM_K$ ) generation can be formulated as below,

$$LLM_K = \{M_N^{id}, rand_{0 \ to \ 1}, randint_{1 \ to \ 10}\}$$
 (12)  
Where  $M_N^{id} - Master \ node \ Id,$   
 $rand - random \ value \ generated \ between \ 0 \ to \ 1$   
 $randint - random \ value \ generated \ between \ 1 \ to \ 10$ 

After volatile key generation, the master node sends the request message NReq to the adjacent neighbor nodes along with prime number which is selected from the prime number group (in table 2).

Pair<sub>node</sub> = 
$$N_N^{id}$$
 {neighbor node list} where  $N_N^{id}$  = Neighbor node. (13)

Table. 2 Prime Number Groups

Group	Prime Numbers				
A	P1	P2	Р3	P4	
В	P1	<b>P</b> 5	P6	<b>P</b> 7	
С	P2	<b>P</b> 5	P8	P9	
D	Р3	P6	P8	P10	
E	P4	<b>P</b> 7	P9	P10	

Further, among the various neighbor nodes around the SIN, only one node is designated as a pair node. A finite number

of prime numbers are selected in a random manner and are partitioned into groups in such a manner that every intersection among two separate groups comprise of at least one prime number. Through this the process of key computation is distributed among two adjacent nodes, where each node  $S_a$  and  $S_b$  do randomly select one group. The intersection of these groups is represented as common prime number which are selected by  $S_a$  and  $S_b$ .

The neighbor node  $S_b$  generates nonce message by employing hash algorithm by considering the prime numbers. There exist five different available hash functions such as 160, 224, 256, 384, and 512 bit combinations. Out of these only one hash function is selected at any point of time.

$$nonce_b = hash(X_b)$$

The SHA is used for authentication and generates a cryptographic message digest algorithm which is similar to MD4 group of hash functions. A hash function can be defined as a function which takes the variable of size m as input and generates fixed-size string output, commonly known as hash value h (i.e. h=H(m)). Hash functions along with these properties have various computational uses. However, when it is employed in cryptography these functions requires, a) the input data 'x' of any length, b) The fixed length output, c) H(x) can be easy for computing some given value of x, d) H(x) is a unique function.

# Algorithm II: Secure Hash Algorithm

Input: Common Prime number, ID<sub>a</sub> and ID<sub>b</sub>
Output: Predicted SINs message security

# Procedure:

Step 1: Initialize variables:

 $m_{len}=64$ 

 $m_{fact}=1$ 

 $\rho_{pad}$ =64 //pad zero

h0 := 0x67452301

h1 := 0xEFCDAB89

h2 := 0x98BADCFE

h3 := 0x10325476

h4 := 0xC3D2E1F0

#### **Step 2:** Pre-processing:

 $ml = message\ length\ in\ bits\ (always\ a\ multiple\ of\ the\ number\ of$ 

bits in a character).

 $m_{size} = 512*(m_{fact});$ 

 $m_d = sign(rand(1, m_{len}) - 0.5) + 1) * 0.5;$ 

for uu=1:  $m_{len}$ 

 $m_d(uu) = mod(uu, 2)$ 

End

Let initialize the message input,

```
else if 21 \le i \le 40
msg_{inp} = message\_input;
                                                                            f := b xor c xor d
for ii=1: length(msg<sub>inn</sub>)
                                                                            k := 0x6ED9EBA1
   m_{str}(ii) = strcat(
                                                                           else if 41 \le i \le 60
m_{str}, dec2bin(hex2dec(msg_{inp}(ii), 4)))
                                                                            f := (b \text{ and } c) \text{ or } (b \text{ and } d) \text{ or } (c \text{ and } d)
End
                                                                            k := 0x8F1BBCDC
m_{str} = m_{str}(1:m_{len})
                                                                           else if 61 \le i \le 80
m_{raw}_512=char();
                                                                            f := b xor c xor d
blk_{num} = fix(length(m_{str})/512*m_{fact})
                                                                            k := 0xCA62C1D6
If (mod(length(m_{str}))), (512, m_{fact}) = = 0)
                                                                            temp := (a \ leftrotate \ 5) + f + e + k + w[i]
   blk_{num} = blk_{num} - 1
                                                                            e := d
End
                                                                            d := c
exnd_{num} = 512 * m_{fact} * (blk_{num} + 1) - mod(length(m_{str}))
                                                                            c := b leftrotate 30
for k=1:128*(blk_{num} + 1)*m_{fact}
                                                                            b := a
m_{raw}_512=strcat(m_{raw}_512, dec2hex(bin2dec(m_{str})4 *
                                                                            a := temp
(k-1)+1:4*k)
                                                                       Step 7: Add this chunk's hash to result (Authenticated message)
end
                                                                       so far:
while (mod(diff_k, 512*m_{fact}))
                                                                          h0 = mod(bin2dec(h0) + bin2dec(a'), 4294967296);
int_{-k} = int_{-k} + 1
                                                                          h1 = mod(bin2dec(h1) + bin2dec(b'),4294967296);
diff_{-k} = abs(int_{-k} + 1 - 448 * m_{fact})
                                                                          h2 = mod(bin2dec(h2) + bin2dec(c'), 4294967296);
Step 4: Process the message m in consecutive 512bit chucks
                                                                          h3 = mod(bin2dec(h3) + bin2dec(d'),4294967296);
for each chunk
                                                                          h4 = mod(bin2dec(h4) + bin2dec(e'), 4294967296);
   break chunk into sixteen 32-bit big-endian words w[i], 0 \le i
                                                                          Ho = dec2hex(h0,32)
\leq 15;
                                                                          H1 = dec2hex(h1,32)
Step 5: Extend the sixteen 32-bit words into eighty 32-bit
                                                                          H2 = dec2hex(h2.32)
words:
                                                                          H3 = dec2hex(h3,32)
  for i from 17 to 80
                                                                          H4 = dec2hex(h4,32)
     w[i] := (w[i-3] \ xor \ w[i-8] \ xor \ w[i-14] \ xor \ w[i-16])
                                                                       A_{mes} = strcat(H0, H1, H2, H3, H4)
leftrotate
                                                                       Step 8: Verified authentication message by SIN node which is
                                                                       generated and received from the chosen pair node.
 Step 6: Initialize hash value for this chunk:
  a := h0
                                                                       Shared key generation
                                                                             Shared key is generated at S_b and is denoted as K_{ab}.
  b := h1
                                                                                  K_{ab} = f(nonce_b, ID_a, ID_b, S_a^x, S_a^y, S_b^x, S_b^y)
   c := h2
                                                                       Where, S_a^x, S_b^y, S_b^x, S_b^y are the two-dimensional coordinates of
                                                                       SIN node and pair node location respectively.
   d := h3
                                                                             Pair node sends a response message NResp to the SIN
  e := h4
                                                                       along with hash function and selected prime number group.
                                                                                           NRep_b = \{hash_{func}, X_b\}
  Main loop:
                                                                             SIN upon receiving this response message, then generates
   for i from 0 to 80
                                                                       nonce at S_a. Further, the shared key using generated nonce
   if 0 \le i \le 20 then
                                                                       noncea is generated using chosen hash function and common
                                                                       prime number.
      f := (b \text{ and } c) \text{ or } ((not b) \text{ and } d)
                                                                                          nonce_a = hash(X_a)
     k := 0x5A827999
```

Next, the SIN encrypts the volatile key  $LLM_k$  using generated shared key  $K_{ab}$ .

 $E(LLM_K) = E_f(K_{ab})$ 

C. Key generation using gradient approach and Key sharing using Super-singular Isogeny Diffie Hellmann (SIDH):

Encrypted volatile key  $LLM_k$  is transmitted to  $S_b$  using super singular Diffie Hellmann algorithm.

# SIDH:

This cryptographic algorithm has been utilized for establishing a secret key among dual parties under the uncertain and unreliable transmission channel. It has been designed in such a way that it resists cryptanalytic attack caused by an intruder. It claims as one of the small key sizes along with compression. The public key with 2699 bit is utilized at 128 bit quantum security level. This SIDH establishes a set of super singular elliptic curves along with their isogenies. An isogeny  $(\phi)$  between elliptic curves E, E' can be defined in equation 14,

$$\phi: E \to E'$$
 (14)

The SIDH can be set up as the prime of the form as,

 $p = l_A^{e_A}. l_B^{e_B}. f \mp 1$ Where  $l_A$ ,  $l_B$  - > small primes,  $e_A$ ,  $e_B$  -> Exponents, *f* -> small co-factor

Thus, the curve has two large subgroups such as  $E[l_A^{e_A}]$ and  $E[l_R^{e_B}]$ , that are assigned for paired nodes respectively. Each node starts the protocol by choosing a random cyclic subgroup (secretly) and compute the corresponding secret (isogeny). The efficiency of the SIDH can be analyzed during key exchange among the paired nodes, where each of them transmits information of two co-efficients  $(\text{mod}p^2)$  which in turn defined two elliptic curve points and an elliptic curve. Each elliptic curve needs  $log_2p^2$  bits. Hence for two curve points, it amounts to  $8log_2p^2+4$  bits, which is 6144 bits for 768 bit modulus p. But it can be reduced to 2640(330 bytes) using compression techniques. Along with compression methods, SIDH has same bandwidth constraint as 3072 – bit Diffie-Hellman exchange. Thus, it makes the SIDH applicable to schemes that have smaller memory space requirements.

# Algorithm III: Key generation using SIDH and Keysharing using SIDH

**Input:** Authentication Message M, pair nodes Id PN<sup>id</sup>,

Pair node position  $PN_x$  and  $PN_y$ 

Output: Secret Key K

# **Procedure:**

**Step1:** consider the authentication message as nonce. Nonce = double(M)// convert the authentication message into integer format.

Step 2: Combine this information and perform gradient computation,

 $C = \{PN^{id}, PN_X, PN_Y, Nonce\}$   $G = \frac{\partial C}{\partial 5} i + \frac{\partial C}{\partial 5} j \qquad (16)$ 

Step 3: Form the secret key based on the unique estimated gradient,

K = unique(G)

Step 4: Share the generated secret key to the pair node via Super singular Isogeny Diffie Hellman algorithm,

 $Receiver_{kev} = SIDH(K)$  (17)

Decrypt volatile key  $LLM_K$  at  $S_b$ ,  $D(LLM_K) = D_f(K_{ah})$ 

D. Blow Fish Algorithm based generated Dynamic S-Box using Key

Blow Fish Algorithm:

Blowfish is said to be a 64 – bit block cipher, lightweight, and highly secured algorithm[20]. It can be implemented through software or hardware implementation. The confidentiality of key encryption is utmost significant in case of symmetric ciphers (i.e. Blowfish). Hardware implementation blowfish higher advantages than software has implementation viz., rapid processing, minimal delay and extremely secured. It is one such employment of hardware which uses hard-wired components. In this blow fish algorithm, XOR operation is represented by the symbol ⊕. Almost 18 sub keys are required to execute this algorithm, along with nonlinear function F. This F function utilizes 4 Dynamic S-Boxes or substitution boxes, each containing 256 [32-bit] entries. The S- boxes are generated using the algorithm IV.

# Algorithm IV: Blow Fish Algorithm based generated Dynamic S-Boxes using Key K.

Input: Secret Key K Output:  $P_{arr}$ ,  $S_{box}$ 

# Procedure:

Step 1: Convert hexadecimal key into decimal format,

 $K_1 = hex2dec(K)$ // hexadecimal to decimal

Step 2: Convert decimal to binary format and concatenate each adjacent rows of the key element to horizontal arrangement,

 $K_2 = horzcat(dec2bin(K_1))$ // horzcat – horizontal wise concatenation of two vectors, dec2bin - decimal to binary conversion.

Step 3: Initialize P-array and Dynamic S-Box using random values and updated key matrix,

 $P_{arr} = horzcat(dec2bin(hex2dec(rand)))$ 

 $S_{box} = horzcat(dec2bin(hex2dec(Txt_{file})))$ 

// ⊕ - bitwise XOR operation  $P_{arr} = P_{arr} \oplus K_2$ 

 $S_{box} = S_{box} \oplus K_2$ 

Generated s box with the dimension of  $S_{box}[4][256]$ 

Blow Fish Encryption & Decryption:

Here the block size of the proposed cipher is 64 – bits, which will encrypt the block 'x' and then is also decrypted.

# Algorithm V: Blow Fish Algorithm based Encryption and Decryption.

Input: Plain text Mes<sub>PT</sub>

**Output:** Encrypted Text Crypt<sub>T</sub>, Decrypted Text Decrypt<sub>T</sub>

```
Step 1: Perform blow fish encryption process,
                            // Consider 1 to 4 bits
Let L = Mes_{PT}(1:4)
R = Mes_{PT}(5:8)
                            // Consider 5 to 8 bits
for (int i = 0; i < 16; i += 2) {
    L = L \oplus P_{arr}[i];
         R = R \oplus Mes_{PT}(L);
         R = R \oplus P_{arr}[i+1];
         L = L \oplus Mes_{PT}(R); 
L = L \oplus P_{arr}[16];
 R = R \oplus P_{arr}[17];
 Crypt_T = swap(L, R);
Step 2: Perform blow fish decryption process,
Let L = Mes_{PT}(1:4)
                            // Take 1 to 4 bits
R = Mes_{PT}(5:8)
                            // Take 5 to 8 bits
for (int i = 16; i > 0; i = 2) {
    L = L \oplus P_{arr}[i+1];
         R = R \oplus Mes_{PT}(L);
         R = R \oplus P_{arr}[i];
         L = L \oplus Mes_{PT}(R);
L = L \oplus P_{arr}[1];
 R = R \oplus P_{arr}[0];
                 Decrypt_T = swap(L, R);
```

It is noted that, these substitution-boxes are generated for every encryption, thus, the schemes dynamic nature increases the difficulty for the attacker in predicting the keys.

# IV. PERFORMANCE ANALYSIS

This section analyzes the proposed scheme's performance using the following key metrics:

- SIN (LLM<sub>K</sub>) nodes vs. Node Density: The impact of node density on the master key's (LLM<sub>K</sub>) lifetime, where the Sensor nodes are randomly deployed within an 300m\*300m simulation area is investigated. Considering the three different random deployment scenarios, the LLM<sub>k</sub> is inserted into the central nodes and border nodes in the WSN. This enables to observe the scheme's behavior at time 't' and determine how node location affects execution time, security attributes and resource utilization.
- Delay Time vs. Number of Neighbor Nodes: This analysis explores the relationship between the number of neighboring nodes and the delay experienced in the key distribution process with varying node density.
- **Energy Consumption Overhead:** The energy consumption of the proposed scheme compared to existing solutions is evaluated.

#### SIN vs. Node Density (Detailed Analysis):

# Deployment Scenario 1

The first scenario focuses on randomly deploying the SNs and assessing the influence of parameters on the execution time of the proposed keying technique. Here, a low execution time is associated with the initial position and number of nodes holding the master key. As shown in figure 3, the proposed scheme efficiently performs the keying process across the entire network within 400ms. Additionally, out of 100 nodes, 94 successfully receive the volatile key, resulting in significantly higher key availability and key distribution in the WSN compared to the previous Self-VKS scheme [21].

Figure 3 LLM<sub>K</sub> vs node density – deployment scenario #1

# ii. Deployment Scenario 2

As illustrated in figure 4, the proposed scheme efficiently completes the keying process throughout the network within 410 milliseconds. Furthermore, 88 out of 100 nodes successfully receive the volatile key, achieving a superior level of key availability within the network compared to the prior Self-VKS scheme [21].

Figure 4. LLM<sub>K</sub> vs node density – deployment scenario #2

# i. Deployment Scenario #3

As shown in figure 5, the proposed scheme efficiently performs the keying process throughout the network within 405 milliseconds. Additionally, 91 out of 100 nodes successfully receive the volatile key, demonstrating a significantly higher level of key availability compared to the prior Self-VKS scheme [21].

Figure 5. LLM<sub>K</sub> vs node density – deployment scenario #3

## 1) $LLM_K$ lifetime Vs node density

This section examines the impact of node density on the lifetime of volatile keys within the Wireless Sensor Network (WSN). Traditional approaches to secure communication in WSNs incur significant collision management overhead due to the broadcast nature of the communication channel and processing time associated with volatile key communication. To address this challenge, prior works have resorted to extending the key lifetime to around 25 seconds [21].

In contrast, the proposed scheme eliminates the need for extended key lifetimes. Each node (i<sup>th</sup> node) can successfully communicate the volatile key to its 'n' neighboring nodes within the WSN before the key expires, achieving this feat within a 10-second time interval. Figures 6 to 8 visually depict the relationship between volatile key lifetime and time within the WSN with respect to the node density.

Figure 6.  $LLM_K$  lifetime vs node density – for deployment scenario #1

Figure 7. LLM<sub>K</sub> lifetime vs node density – for deployment scenario #2

Figure 8. LLM<sub>K</sub> *lifetime vs node density – for deployment scenario #3* 

# 2) Energy consumption overhead

## **Energy Efficiency Analysis:**

The proposed scheme minimizes energy consumption during session establishment between SNs due to several factors. Unlike traditional approaches, not all SNs in the Wireless Sensor Network (WSN) need to generate and encrypt nonces before the keying process begins. This significantly reduces energy expenditure.

The total energy consumption for the network can be expressed as Em = (k + 1)N, where Em represents the energy spent as a function of the number of messages sent (N) and k denotes the average number of neighbors between each node pair [21]. This formula highlights the impact of several factors on energy efficiency:

- Node Density (N): As 'N' increases the total number of messages transmitted increase as well, thus resulting into spending more energy per node.
- **Packet Size:** Larger packet sizes contribute to increased energy consumption.
- Encryption/Decryption Cost: The choice of encryption and decryption algorithms and their key size significantly affect node energy and other resource usage.

During the keying process, each sensor transmits a discovery message and receives a maximum of k messages from its neighbors. Based on these calculations, the average energy consumption per sensor (Em) can be estimated as (k + 1) [21].

#### V. CONCLUSION

This proposal presents a novel key management scheme (KMS) designed for dynamically scalable, secure data communications in Wireless Sensor Networks (WSNs). The suggested deterministic technique makes use of an encrypted nonce that corresponds to a plain text message. Because of this, nodes may effectively continue the key formation process even in situations when initially just a portion of nodes have the master key. Through this approach, the number of messages needed for key establishment is minimized, resulting in a considerable reduction of data transmission energy usage. In addition, capacity and processing demands on sensor nodes are substantially reduced. Critical sensor node behaviors including dynamic node movement, secure node addition, and key renewal are all fully covered by the method. The efficiency of the scheme in terms of keying time and robustness against different WSN assaults is shown by a thorough security study.

#### VI. FUTURE SCOPE

## **Asynchronous Duty cycles:**

It is suggested that asynchronous sensor duty cycles be investigated for optimal energy use and routing effectiveness.

## **Relevance to IoT:**

The incorporation of IoT into WSNs increases the ubiquitous nature of sensor networks. Future study might be beneficial in evaluating the suggested key management, routing, and security systems in the context of Internet of Things applications with a consideration of devices with limited resources.

## **Considering Dynamic Networks:**

The existing technique for managing symmetric volatile keys requires a static network design with fixed placements for sensor nodes. Future research should focus on creating and assessing these techniques for dynamic network topologies on mobility of nodes in heterogeneous environments.

#### **Enhanced Security with Surveillance Nodes:**

Adding "surveillance nodes" to the typical network deployment plan might bolster WSN security. These nodes would monitor network traffic, including potentially harmful behavior. Through the identification and elimination of bad actors, surveillance nodes establish connections only with securely configured nodes. Moreover, it is promising to use artificial intelligence techniques in these monitoring nodes for compromised node rehabilitation and recovery.

Keywords: Leukemia, WBC, Complete blood count, CML - Chronic Myeloid Leukemia, Acute Lymphoblastic Leukemia, Clustering.

Abstract: Leukemia, a complex hematologic malignancy, presents a formidable challenge in oncology due to its diverse subtypes and intricate diagnostic landscape. This paper provides an extensive literature review encompassing the classification of leukemia and exploration of various diagnostic approaches. Various methods such as blood tests, bone marrow aspiration, cytogenetic analysis, molecular testing, flow cytometry, and imaging tests are examined alongside recent advancements in diagnostic technologies. The review synthesizes studies highlighting the efficacy of innovative detection methodologies, including terahertz radiation, machine learning algorithms, deep learning models, and image processing techniques, in leukemia diagnosis. Furthermore, the paper presents an approach that utilizes pathological report analysing blood parameters and identifying correlations with different leukemia types using clustering techniques.

#### 1. Introduction:

Cancer is characterized by uncontrolled cell growth, division, and invasion into other tissues due to genetic mutations. Mutated cells replicate uncontrollably, forming cancerous tissues responsible for further proliferation. Symptoms arise from cancerous cells invading other tissues, a process known as metastasis, spreading cancer throughout the body and impairing organ function. While cancer can affect individuals of any age, most types are more prevalent in older individuals due to accumulated DNA damage. Cancer is a leading cause of death in developed countries, driving extensive research in oncology for effective treatment strategies(https://en.wikipedia.org/wiki/Cancer).

There is no sure cure for cancer. It can only be cured if all of the cancerous cells are cut out or killed in place. This means that the earlier the cancer is treated, the better the chances are for

a cure (because the cancer cells may not have had enough time to copy themselves and spread so much that the person cannot be cured). There are many different types of cancer, and each has its own symptoms and causes. Even with the same type of cancer, different people may have different symptoms, and may react to treatments differently; their cancer also may grow or spread at different speeds. Treatment has to be a good fit to both the type of cancer and the individual patient who has the cancer.

The paper is organized such that section 2 deals with Leukemia and WBC classes, section 3 emphasis literature review, section 4 presents proposed methodology followed by the conclusion.

# 2. Leukemia

Leukemia, or leukaemia, denotes a malignancy affecting white blood cells and bone marrow, characterized by an overproduction of leukocytes. Its severity and prognosis vary depending on the leukemia subtype. In 2000, approximately 256,000 individuals globally developed leukemia, with about 209,000 succumbing to the disease. The majority of cases, around 90%, occur in adults(https://en.wikipedia.org/wiki/Leukemia).

Blood comprises various types of cells, including white blood cells (monocytes, lymphocytes, neutrophils, eosinophils, basophils, and macrophages), red blood cells (erythrocytes), and platelets.

White blood cells are produced by different tissues in the body. Around 60 to 70 percent of white cells, known as granulocytes, are generated in the bone marrow in adults. Lymphocytes, accounting for 20 to 30 percent, are produced in lymphatic tissues like the thymus, spleen, and lymph nodes. Monocytes, comprising 4 to 8 percent of white cells, are produced in reticuloendothelial tissues such as the spleen, liver, and lymph nodes. An average healthy adult has between 4,500 and 11,000 white blood cells per cubic millimetre of blood, with fluctuations occurring throughout the day.

# 2.1 WBC Classes

White blood cells are categorized into major classes:

Lymphocytes, further divided into B cells and T cells, play a crucial role in recognizing and eliminating foreign agents from the body. B lymphocytes produce antibodies to destroy

foreign microorganisms, while T cells identify and destroy virally infected or cancerous cells. Natural killer (NK) cells also contribute to this process.

Granulocytes, the most abundant white cells, combat large pathogens like protozoans and helminths, and play a role in allergy and inflammation. They contain cytoplasmic granules with potent chemicals and are subdivided into neutrophils, eosinophils, and basophils based on their dye uptake in the laboratory.

Monocytes, constituting 4 to 8 percent of white blood cells, transform into macrophages at sites of infection. Macrophages act as scavengers, phagocytosing microorganisms and cellular debris, and play a key role in the immune response by presenting antigens to T lymphocytes. Figure 2.1 summarizes various classification of WBC(https://en.wikipedia.org/wiki/White blood cell).

Figure 2.1: WBC Classification

Acute type of Leukemia shows rapid growth or spread of cancer. Chronic type of Leukemia shows slow growth or spread of cancer. ALL- Acute Lymphoblastic Leukemia. Common in children and more in male. It indicates Non-specific esterase (NSE). Symptoms have low HB

and platelets. There is presence of lymphoblast. AML- Acute myeloblastic Leukemia Common in adults. There is presence of Auer rods in blast cells. It indicates Non-specific esterase (NSE). Symptoms have low platelets. There is presence of myeloblast cells. CLL-Chronic lymphoblastic Leukemia. It indicates slow progression. It's mostly seen in 60 years and above WBC count is high. Platelets count low. There will be presence of smear cells. CML- Chronic myeloblastic Leukemia. There is presence of myeloid cells. WBC has Neutrophil, Monocyte, Basinophil and Eosinophil. High WBC count in blood report.

ALL is characterized by the rapid proliferation of immature lymphocytes, leading to symptoms such as fatigue, pale skin, fever, bruising, and enlarged lymph nodes. CLL, on the other hand, is marked by excessive lymphocyte production, often progressing gradually over years. Initial stages may be asymptomatic, while later stages may manifest as non-painful lymph node swelling, fatigue, fever, night sweats, or weight loss. AML involves the rapid growth of abnormal myeloid cells, leading to symptoms like fatigue, shortness of breath, bruising, and increased infection risk. Diagnosis typically involves bone marrow aspiration and specific blood tests.

Treatment for leukemia varies depending on the subtype and individual factors. Chemotherapy is commonly used to induce remission, followed by additional therapies such as radiation or stem cell transplant. Targeted therapies may also be employed based on genetic mutations present in the cancer cells. Overall, collaborative efforts among researchers, clinicians, and patients are essential in improving outcomes and advancing leukemia treatment strategies.

# 3. Literature Review

In the diagnosis of leukemia, a variety of diagnostic techniques are utilized to accurately identify different types of the Leukemia types. These methods encompass:

- 1. Blood Tests: Complete blood count (CBC) and peripheral blood smear examination to identify abnormal blood cell counts and morphology.
- 2. Bone Marrow Aspiration and Biopsy: Direct examination of bone marrow cells for abnormalities in cell morphology and proliferation.
- 3. Cytogenetic Analysis: Examination of chromosomal abnormalities, such as translocations, using techniques like karyotyping and fluorescence in situ hybridization (FISH).

- 4. Molecular Testing: Polymerase chain reaction (PCR) to detect specific genetic mutations, like BCR-ABL1 in chronic myeloid leukemia (CML) or FLT3 mutations in acute myeloid leukemia (AML).
- 5. Flow Cytometry: Immunophenotyping of leukemia cells based on cell surface markers to classify leukemia subtypes and assess their immunophenotypic profiles.
- 6. Imaging Tests: X-rays, computed tomography (CT), magnetic resonance imaging (MRI), or positron emission tomography (PET) scans to detect organ enlargement or infiltration by leukemia cells.

Each method has its advantages and may be used alone or in combination to achieve an accurate diagnosis of leukemia. We have presented a brief review of the same in the below section.

Cheon et al. [1] used terahertz radiation to detect and manipulate DNA methylation in blood cancer cell lines, suggesting its potential in cancer treatment. Xing and Yilin [2] enhanced the KNN algorithm for medical health big data classification, improving efficiency and accuracy. Safuan et al. [3] proposed a CNN algorithm to automate White Blood Cell (WBC) detection, with VGG showing superior performance.

Nighat et al. [4] introduced an IoMT-based framework for leukemia detection, enabling real-time testing and diagnosis. Jabeen et al. [5] developed a method for early leukemia detection using image analysis, offering a rapid, cost-effective alternative. Hossain et al. [6] proposed a Faster-RCNN-based system for early leukemia detection in Bangladesh, integrating with smartphones for rural areas. Genovese et al. [7] introduced a machine learning-based approach for enhancing blood sample images and classifying ALL from normal samples.

Pałczyński et al. [8] developed an optimized neural network architecture for acute lymphoblastic leukemia diagnosis, achieving high accuracy. Aftab et al. [9] focused on Acute Leukemia detection using deep transfer learning, achieving high accuracy. Atteia et al. [10] introduced a Bayesian-optimized CNN for acute lymphoblastic leukemia detection, achieving superior classification accuracy.

Zhong et al. [11] developed an AI model for acute leukemia diagnosis using multiparameter flow cytometry, showing promising clinical application. Genovese et al. [12] presented a method for detecting ALL using histopathological transfer learning, showing enhanced accuracy. Khademi et al. [13] explored nanotechnology-based diagnostics and therapeutics for acute lymphoblastic leukemia, revealing promising applications.

Desi et al. [14] introduced an automated optical image processing system for blood disorder identification, enhancing accuracy and processing time. Hossain et al. [15] focused on early leukemia prediction using a supervised machine learning model, achieving high accuracy. Armya et al. [16] assessed leukemia detection using machine learning classifiers, with Naïve Bayes showing the highest accuracy. Diana et al. [17] automated leukocyte classification using deep learning, surpassing the Naïve Bayes Classifier in accuracy. Jusman et al. [18] developed a system program for early leukemia detection using image processing, achieving high accuracy. Kumar et al. [19] utilized microscopy image processing software for acute lymphoblastic leukemia detection, enhancing diagnostic accuracy.

Della et al. [21] investigated various molecular methods for minimal residual disease evaluation in acute lymphoblastic leukemia, suggesting potential advantages of new molecular approaches. Varadarajan et al. [22] explored novel therapeutic approaches for relapsed acute lymphoblastic leukemia post allogeneic hematopoietic cell transplantation in adult patients.

Hoffmann et al. [23] developed Cinderella, an XAI method for measuring haemodilution and minimal residual disease in acute myeloid leukemia.

Devi et al. [24] introduced the GBHSV-Leuk method for acute lymphoblastic leukemia detection, achieving high accuracy. Hossain et al. [25] proposed a supervised machine learning model for leukemia detection, achieving high accuracy and generating explainable rules. Ananth et al. [26] developed a small image processing method for leukemia detection, showing greater effectiveness than previous methods. Sridhar et al. [27] employed deep learning techniques for early leukemia detection, achieving notable accuracy.

Das et al. [28] systematically analysed segmentation and classification approaches for acute lymphoblastic leukemia detection, emphasizing the efficacy of deep learning. Hoffmann et al. [29] investigated the potential of MPFC data from chronic lymphocytic leukemia samples to predict outcomes using XAI. Molin et al. [30] developed CircFusion, a software tool for detecting linear fusion transcripts and f-circRNAs in cancer cells with rearranged genomes.

Hoffmann Khalil et al. [31] studied CD200 expression in leukemic B cells and its correlation with clinical findings in acute lymphoblastic leukemia patients. Liu [32] explored SETD2 expression in acute myeloid leukemia patients, revealing its association with treatment response and survival outcomes.

Tiago et al. [33] highlighted the potential of DNA methylation-based tests in molecular cancer early detection (MCED), particularly in combination with AI. Pier et al. [34] examined the relationship between physical activity and mental health outcomes among adolescents during the COVID-19 pandemic. Mansoor et al. [35] investigated gamma-tocotrienol as a potential inhibitor for the BCR-ABL1 fusion protein in leukemia therapy.

Sakthivel et al. [36] proposed an approach for classifying Acute Lymphoblastic Leukemia (ALL) and Multiple Myeloma (MM) using image processing techniques. Rawal et al. [37] fabricated Ag/Au thin film electrodes for monitoring serum albumin levels as a prognostic biomarker for blood cancer. The summary of the same has been provided in the table 3.1.

Table 3.1: Literature Review Summary

# 4. Proposed methodology

In our proposal approach, we outline a methodology for analysing blood reports sourced from the pathological department, focusing on various blood parameters to discern correlations with different types of blood cancers, such as Chronic Myeloid Leukemia (CML), Acute Myeloid Leukemia (AML), Non-Hodgkin's Lymphoma (NHL), and Normal Leukocyte (NL). Our proposed method leverages the clustering concept of the K-means algorithm to conduct an in-depth analysis aimed at identifying similarities among these parameters for each type of blood cancer. By employing this approach, we aim to group similar features together, providing valuable insights into potential patterns and relationships within the dataset. The proposed methodology is illustrated in the Figure 4.1.

Figure 4.1: Proposed methodology for Leukemia classification

5. Conclusion: Blood cancerposes unique challenges due to its varied subtypes and diagnostic intricacies. This paper has tried to present an overview of leukemia classification and diagnostic methodologies, evaluating various detection approaches, and presented research contributions. The literature review analysed traditional diagnostic techniques alongside recent advancements such as terahertz radiation and machine learning algorithms, stating their potential in enhancing diagnostic accuracy. Furthermore, we are proposing an approach that utilizes clustering techniques to uncover patterns within the dataset, aiming to provide insights that could potentially enhance patient outcomes and inform treatment strategies.

# GreenRoute Ballari: A Hybrid Approach for Optimizing Waste Collection Routes Using K-Means Clustering and Genetic Algorithm

Manasa Bellamkonda<sup>1</sup>, Dinesh N<sup>2</sup>, K Pravallika<sup>3</sup>, Zaheed Hussain<sup>4</sup>, Noorullah Shariff C<sup>5</sup>

1, 2, 3, 4, 5 Department of Artificial Intelligence and Machine Learning, Ballari Institute of Technology and Management, Ballari, Karnataka, India

Abstract: The exponential growth of the population in Ballari has exacerbated the challenge of municipal waste management, necessitating the development of efficient waste collection strategies to address environmental and social concerns. In response to that our system introduces a hybrid approach that employs K-means clustering and Genetic Algorithm, for optimizing waste collection routes tailored to the unique waste generation profiles of the region. By utilizing Geographic Information System (GIS) data that is in the form of GeoJSON files containing the spatial distribution of waste collection points, we propose a methodology that combines K-means clustering and Genetic Algorithm to develop intelligent and fuel-efficient routes. Our system not only benefits municipal authorities in resource deployment and planning but also aids waste carrier vehicle drivers in prioritizing routes. Our findings contribute to the transformation of Ballari City towards eco-friendly and smart urban development.

Keywords: Waste Management, Route Optimization, Genetic Algorithm, K-Means Clustering, Urban Logistics.

#### I. INTRODUCTION

The ever-growing problem of waste generation, particularly plastic waste, poses a significant environmental and economic threat to Ballari, Karnataka, as it does in many urban centers worldwide. Traditional methods often rely on static routes, leading to inefficiencies such as unnecessary travel distances, increased fuel consumption, and higher operational costs [4]. While GIS-based route optimization offers promise [2], a deeper understanding of how factors like waste composition, collection frequency, and truck design interact with each other is essential for even greater optimization [3, 5]. The GreenRoute Ballari proposes a novel system to address these challenges by leveraging machine learning and advanced route optimization techniques. This approach builds upon existing research on factors affecting route optimization. Unlike traditional methods that rely on static data, our system utilizes machine learning to predict waste volume and composition at collection points dynamically. This allows for a more data-driven and adaptable approach to route planning, similar to the work by Sutana (2021) who emphasizes the importance of dynamic factors in waste management systems [1]. As of March 2023, the Ballari City Corporation has 39 wards. 600 Pourakarmikas work day and night to make Ballari clean. Each ward is assigned nearly 2 vehicles if the ward is small, else 3-4 vehicles if the ward is huge. Large 12-ton vehicles carry the collected waste out of the city from the collection point near Stadium Road in the city. These large vehicles make 2-3 trips daily to dump all the waste, as Ballari daily puts up nearly 180 tonnes of waste.

- A. Green Route Ballari factors in these Specifics, Including
- 1) Limited Vehicle Availability: The system considers the number of collection vehicles available in each ward (2-4).
- 2) Dynamic Waste Prediction: Machine learning algorithms predict waste volume and composition for each collection point, optimizing routes based on real-time data.
- 3) Time Window Constraints: The system accounts for designated collection times in each ward to ensure efficient scheduling.
- 4) Unique Traffic Patterns and Road Conditions: GreenRoute Ballari incorporates Ballari's unique traffic patterns and road conditions to optimize routes for faster collection times.
- B. By optimizing routes based on these factors, Green Route Ballari aims to achieve significant benefits for Ballari
- 1) Reduced Fuel Consumption: Optimized routes minimize travel distances, leading to substantial fuel cost savings for the Ballari Municipal Corporation or private waste collection companies.

## Control of the contro

#### International Journal for Research in Applied Science & Engineering Technology (IJRASET)

ISSN: 2321-9653; IC Value: 45.98; SJ Impact Factor: 7.538 Volume 12 Issue V May 2024- Available at www.ijraset.com

- 2) Improved Operational Efficiency: More efficient routes allow for faster collection times and better utilization of collection vehicles, reducing overall operational costs.
- 3) Environmental Sustainability: Reduced fuel consumption translates to lower greenhouse gas emissions, contributing to a cleaner Ballari.
- 4) Unlocking Economic Opportunities: By accurately predicting waste composition, Green Route Ballari can help identify waste segregation and resource recovery opportunities, particularly valuable wet waste that can benefit farmers.
- C. The GreenRoute Ballari system Caters to a Diverse Audience within the waste Collection Management Ecosystem
- 1) Waste Management Authorities: Gain real-time data and insights to optimize waste collection strategies and ensure regulatory compliance.
- 2) Fleet Managers: Utilize the system to monitor and manage the waste collection fleet, optimize routes, and schedule vehicle maintenance.
- 3) Waste Collection Drivers: Receive optimized routes through a user-friendly interface, facilitating navigation and communication with the system.
- 4) System Administrators: Maintain the system, manage user access, and troubleshoot any technical issues.
- 5) Government Officials: Leverage data-driven insights for informed decision-making regarding waste management policies and resource allocation.
- D. GreenRoute Ballari's key Features Include
- 1) Data Storage and Analysis: Stores and analyses historical and real-time data to generate route optimization strategies and operational insights.
- 2) Machine Learning for Waste Prediction: Employs machine learning algorithms to predict waste volume and composition at collection points, enabling dynamic route planning.
- 3) Genetic Algorithm for Route Optimization: Utilizes a GA to optimize waste collection routes based on dynamic waste prediction and collection point data.
- 4) Mapping Integration: Optimized routes are visually displayed to drivers through integration with mapping services like MapBox API, aiding navigation.
- 5) User Interface: User-friendly interfaces for municipal administrators and drivers display optimized routes, collection points, and real-time updates.
- 6) Security Measures: Secure communication protocols ensure the confidentiality of route information sent to drivers.

By implementing the GreenRoute Ballari project, Ballari can move towards a more efficient, cost-effective, and sustainable waste management system, paving the way for a cleaner, healthier, and more resource-conscious future.

#### III.METHODOLOGY

This section presents a methodology for optimizing waste collection routes in Ballari City using a combination of K-means clustering and Genetic Algorithm. The main aim of the system is to optimize the total distance traveled by waste collection vehicles while considering capacity constraints. Initially, the system utilizes Geographic Information System (GIS) data that is in the form of GeoJSON files containing the spatial distribution of waste collection points. Further, K-Means Clustering is employed to group these points into clusters, representing potential stops for waste collection vehicles. Subsequently, the Genetic Algorithm is applied to generate optimized routes for waste collection vehicles within each cluster, by considering vehicle capacity limitations. The proposed methodology aims to improve the effectiveness of waste collection operations, leading to improved resource utilization, reduced fuel consumption, and lower emissions.

Fig. 1 Block diagram representing vehicle route optimization methodology

ISSN: 2321-9653; IC Value: 45.98; SJ Impact Factor: 7.538

Volume 12 Issue V May 2024- Available at www.ijraset.com

#### A. Data Collection and Clustering Using K-Means Clustering Algorithm

The input data consists of spatial information about waste generation zones, including zone identifiers, zone names, population, and waste generation volumes. To prepare the data for route optimization, the coordinates of waste generation zones are extracted from the GeoJSON files. K-Means Clustering is then applied to group these coordinates into clusters, each representing a potential stop for waste collection vehicles. Here, the predetermined number of clusters is based on the availability of waste collection vehicles.

#### B. Genetic Algorithm for Route Optimization

The Genetic Algorithm is employed to optimize the routes for waste collection within each cluster. The Genetic Algorithm undergoes the following sequence of steps:

- 1) Initialization: An initial population of routes is generated. Each route represents a sequence of waste collection points within a cluster, ensuring that each point is visited exactly once
- 2) Fitness Evaluation: The fitness of each route is evaluated based on the total distance traveled. The distance matrix between waste collection points is computed using geographical coordinates. Lower total distances indicate fitter routes
- 3) Selection: The parent routes for the next generation are chosen based on their fitness level. This selection process employs a mechanism such as tournament selection or roulette wheel selection to identify the fittest individuals within the population.
- 4) Crossover: The crossover is applied to selected parent routes to generate offspring. The crossover point is selected randomly, and segments of routes beyond the crossover point are swapped between parents to create new routes.
- 5) *Mutation:* The mutation is introduced to maintain genetic diversity within the population. Randomly selected genes (waste collection points) in individual routes are swapped or altered with a certain probability.
- 6) Replacement: Here, the newly generated optimized routes through crossover and mutation are replaced by the least optimal routes. Such that this ensures that the most optimal routes are evolved over successive generations.
- 7) *Termination:* The algorithm terminates after a predefined number of generations or when a convergence criterion is met. The best-performing routes found during the optimization process are selected as the final solution.

#### C. Route Assignment to Vehicles

Once optimized routes are derived for every cluster, the routes need to be assigned to available waste collection vehicles while adhering to capacity constraints. The waste generation volume of each waste collection point is considered in this step. Points are assigned to vehicles based on their proximity to each other and the capacity of the vehicles. A vehicle's capacity is determined by the maximum volume of waste it can carry. The assignment process ensures that each vehicle's capacity is not exceeded, and waste collection points are efficiently distributed among vehicles.

#### IV.RESULTS AND DISCUSSIONS

In this section, the outcomes of the GreenRoute Ballari project are illustrated that are obtained by applying a combination of K-means clustering and Genetic algorithm to the waste collection input data points, we obtained optimized waste collection routes for various areas across Ballari City. The specific coordinate data used for mapping is simulated due to the unavailability of Ballari's precise data. The below figures present the visual representation of optimized routes for waste collection using MapBox API.

Fig. 2 Vehicle 1 route

Fig. 4 Vehicle 5 route

Fig. 5 Vehicle 7 route

#### Route Optimization Results

Implementing K-means clustering and Genetic Algorithm yielded optimized waste collection routes tailored to the specific spatial distribution of waste generation points in the study area. Here are the key findings:

- Reduced Travel Distances: The optimized routes significantly reduced the total travel distances compared to traditional static routes, resulting in more fuel-efficient and cost-effective waste collection operations.
- Improved Operational Efficiency: By minimizing travel distances and optimizing stop sequences, the waste collection vehicles were able to complete their routes more efficiently, leading to reduced operational costs and increased productivity.
- Dynamic Adaptation: Applying machine learning to predict the waste allowed the system to dynamically adapt to changing waste generation patterns, ensuring that the routes remained optimal and responsive to real-time conditions.

#### B. Mapping Results

Despite using coordinate data from Ballari for visualization purposes, the mapping of optimized routes using MapBox API provided insightful representations of the optimized waste collection routes. The map displayed:

- 1) Clustered Collection Points: The distinct clusters of waste collection points across Ballari City were represented by K-means clustering.
- 2) Optimized Routes: The optimized routes that are generated from the Genetic Algorithm are overlaid on the map, depicting the order of waste collection points within each cluster. These routes are optimized to minimize travel distances and adhere to capacity constraints.
- Visualization of Efficiency Gains: Through the map interface, stakeholders could observe the spatial distribution of waste collection activities and the efficiency gains achieved through route optimization.

#### V. CONCLUSIONS

The effective management of municipal waste poses a significant challenge in the transformation of Ballari City towards ecofriendly and smart urban development. In this paper, we have proposed a system to optimize waste collection routes across Ballari City. In response to that, a combination of K-means clustering and genetic algorithms are used to obtain optimized routes using the waste collection points as input data. This approach aims to minimize travel distance, reduce fuel costs, and optimize time allocated for waste collection. The proposed system is beneficial for waste carrier truck drivers to prioritize the routes for waste collection. Additionally, the system benefits municipal authorities by enhancing resource deployment and planning. In conclusion, the system represents a significant step towards the sustainable development of Ballari City.

#### ABSTRACT

In this study, we have developed an imidazole centered fluorescent probe 3-(2-(2-(5-bromo-2-hydroxyphenyl)-4,5-diphenyl-1H-imidazol-1-yl)thiazol-4-yl)-6-chloro-2H-chromen-2-one (SICT), achieving exceptional selectivity for Cu<sup>2+</sup> ion detection. These probes exhibit rapid responsiveness (109 nM detection limit) and strong binding constants (0.214  $\times$  10<sup>5</sup> M<sup>-1</sup>). Employing an aqueous ethanol system, we assessed their sensing capabilities through both *in vitro* and *in vivo* studies, using zebrafish as our model organism. Notably, the SICT probe displays a high quantum yield of 0.62 and follows a 1:1 binding mechanism with Cu<sup>2+</sup> ions, validated by Job's plot and ESI-Mass spectrum analyses. Furthermore, our probe demonstrates minimal cytotoxicity in both *in vitro* (MDA-MB-231 cells) experiments. These promising results motivate us to apply the SICT probe for intracellular Cu<sup>2+</sup> ion tracking in zebrafish embryos, showcasing its potential in diverse fields like biomedicine and environmental monitoring.

#### 1. Introduction

In recent years, the presence of toxic heavy metal ions has emerged as a pressing concern, posing significant threats to the environment and public health. Among these hazardous species, copper ions (Cu<sup>2+</sup>) hold a unique position as both an essential micronutrient for humans and a potential source of toxicity when present in excessive concentrations, notably in natural aqueous environments [1–3]. Cu<sup>2+</sup> plays a pivotal role in various biological processes, encompassing bone formation, connective tissue development, and cellular respiration, yet its overabundance can lead to various health-related complications [4–8].

Regulatory bodies such as the World Health Organization (WHO) and the U.S. Environmental Protection Agency (EPA) have, therefore, established stringent guidelines stipulating maximum permissible Cu<sup>2+</sup> concentrations in drinking water to safeguard human well-being [9]. Consequently, there is an increasing demand for developing efficient sensing probes with high selectivity and sensitivity, mainly aimed at detecting trace Cu<sup>2+</sup> ions in complex matrices such as drinking water and agricultural products. To address this challenge, the scientific community has shown a growing interest in the design and synthesis of fluorescent chemosensors, seeking to provide robust solutions for the sensitive detection of metal ions within both environmental and

#### biochemical contexts.

This endeavor explores novel recognition unit-fluorophore interactions, aiming to balance selectivity, sensitivity, and response time. Among the various detection methodologies available, ion-induced chemo-sensors have emerged as a particularly appealing approach due to their capacity for selective detection and rapid response times [10]. However, the design and construction of fluorescence-based turn-on and turn-off sensors remain intricate, given the tendency of biologically essential ions to quench Fluorescence. While numerous fluorescence chemo sensors have recently been proposed for selective metal ion detection, the literature still lacks comprehensive examples of selective Cu<sup>2+</sup> ion sensing. Previous research has introduced various strategies, ranging from rhodamine B derivatized turn-off-on chemo sensors to thiophene-based Schiff base sensors and coumarin-quinoline-based sensors. These include a rhodamine B derivatized turn-off-on chemosensor designed by Zhihong Xu et al., demonstrating high sensitivity and selectivity for Cu<sup>2+</sup> [11]. Suganya et al. introduced a thiophene-based Schiff base fluorescent sensor, exhibiting a colorimetric shift from yellow to colourless and a fluorescence 'turn-on' response upon encountering Cu<sup>2+</sup> ions [12]. Yunling Gao et al. reported an innovative coumarin-quinoline-based sensor with a 1:1 binding stoichiometry, switching off in the presence of Cu<sup>2+</sup> ions and effectively identifying Cu<sup>2+</sup> in live breast cancer MCF-7 cells [13]. Hazem et al. presented an imidazole-based fluorescent sensor capable of detecting Cu<sup>2+</sup> and biothiols in aqueous solutions, with increasing Cu<sup>2+</sup> concentrations causing a red-shift in absorption and a transition from colourlessness to blue [14]. Araghni et al. introduced a turn-off-responsive 2,4,5-Tris(2-pyridyl)imidazole molecule for dual sensing of Hg<sup>2+</sup> and Cu<sup>2+</sup> ions in a HEPES buffer medium [15]. Additionally, Ayya et al. reported a ratio metric turn-on/turn-off benzothiazole-based chemo sensor, offering highly selective and sensitive detection of metal ions, including Zn<sup>2+</sup>, Cu<sup>2+</sup>, and Ni<sup>2+</sup> [16]. Nevertheless, many of these sensors exhibit limitations, including insufficient selectivity, weak fluorescence outputs, and constrained applicability in living systems.

Despite these advancements, many described sensors face limitations, such as reduced selectivity towards Cu<sup>2+</sup> ions, decreased fluorescence signals, and limited applicability in living systems, presenting ongoing challenges in developing reliable iron chemosensor. In this study, we introduce a novel imidazole coumarin-thiazole-based chemo sensor [17–19], 3-(2-(2-(5-Bromo-2-hydroxyphenyl)-4,5-diphenyl-1*H*-imidazol-1-yl)thiazol-4-yl)-6-chloro-2*H*-chromen-2-one (SICT), designed for efficient Cu<sup>2+</sup> metal ion detection. We comprehensively analyze SICT's binding properties with various metal ions using UV absorption, fluorescence spectra, and pH-dependent studies. Supporting Density Functional Studies (DFT) is also performed to validate the sensor's behaviour. Our findings establish SICT as a promising compound for Cu<sup>2+</sup> metal ion detection, addressing existing challenges in developing reliable iron chemosensors.

#### 2. Experimental section

### 2.1. Synthesis of chemosensor 3-(2-(2-(5-bromo-2-hydroxyphenyl)-4,5-diphenyl-1H-imidazol-1-yl)thiazol-4-yl)-6-chloro-2H-chromen-2-one (SICT)

Mixture of 1,2-diphenylethane-1,2-dione (1.0 mmol, 0.210 g), 5-bromosalicaldehyde (1.0 mmol, 0.20 g), 3-(2-aminothiazol-5-yl)-6-chloro-2*H*-chromen-2-one (1.0 mmol, 0.277 g) (4) and ammonium acetate (1.0 mmol, 0.077 g) were taken in an equimolar concentration and dissolved in acetic acid ( $\sim$ 10 mL). The reaction mixture was ultrasonicated ( $\sim$ 20 min) and refluxed for about 6 h. After the reaction, as monitored by TLC, the resultant mixture was cooled to room temperature and poured into crushed ice. The obtained crude product was purified through column chromatography to get the desired light yellowish solid (Yield: 94 %);  $^1$ H NMR (400 MHz, DMSO- $d_6$ )  $\delta$  (ppm):  $\delta$  9.47 (s, 1H, Ar-H), 8.35 (s, 1H, Ar-H), 7.83 (m, 2H, Ar-H), 7.63–7.55 (m, 3H, Ar-H), 7.47 – 7.37 (m, 9H, Ar-H), 7.83 (m, 2H, Ar-H), 7.63–7.55 (m, 3H, Ar-H), 7.47 – 7.37 (m, 9H, Ar-H)

H), 7.28 (m, 2H, Ar-H), 6.98 (d, J = 8.8 Hz, 1H, Ar-H).<sup>13</sup>C NMR (100 MHz, DMSO- $d_6$ )  $\delta$  (ppm): 166.17, 164.25, 154.15, 154.57, 151.25, 146.38, 144.95, 144.11, 136.40, 135.16, 134.78, 134.16, 133.56, 132.33, 131.10, 129.94, 129.87, 129.60, 129.48, 128.26, 126.87, 126.22, 119.83, 118.58, 118.02, 116.83, 116.78, 116.42. **MS** m/z: 651 (M<sup>+</sup>), 653 (M+2), 655 (M+4). #### 3. Results and discussion

#### 3.1. Chemistry

One of the starting material 3-(2-aminothiazol-5-yl)-6-chloro-2*H*-chromen-2-one (1) was synthesized according to the reported method with slight modification (ESI) [20]. The chemosensor 3-(2-(2-(5-bromo-2-hydroxyphenyl)-4,5-diphenyl-1*H*-imidazol-1-yl) thiazol-4-yl)-6-chlo ro-2*H*-chromen-2-one (SICT) has been developed by a straight forward synthetic strategy (Scheme 1). An equimolar mixture of 1,2-diphenyl-ethane-1,2-dione, 5-bromosalicaldehyde, 3-(2-aminothiazol-5-yl)-6-chloro-2*H*-chromen-2-one, ammonium acetate was ultrasonicated in ethanol in a one pot manner. The reaction mixture was refluxed to obtain the desired product in a high yield (88 %). The synthesized blue light emitting imidazole-coumarin thiazole-based fluorophore was used as chemosensor for metal ion sensing. The highly selective sensing ability of SICT prompted us to carry out a detailed study on metal ion sensing *in vitro* and *in vivo*.

#### 3.2. Photochemistry

#### 3.2.1. UV-Vis absorption studies

The selectivity of the fluorophore SICT towards various metal ions was assessed using UV-Vis absorption measurements. Electronic absorption spectra of SICT were recorded in the presence of different metal ions, including Al<sup>3+</sup>, Cr<sup>3+</sup>, Ga<sup>3+</sup>, In<sup>3+</sup>, Ca<sup>2+</sup>, Cd<sup>2+</sup>, Co<sup>2+</sup>, Fe<sup>2+</sup>, Mn<sup>2+</sup>, La<sup>2+</sup>, Na<sup>2+</sup>, Sr<sup>2+</sup>, Pb<sup>2+</sup>, Mg<sup>2+</sup>, Zn<sup>2+</sup> and Ni<sup>2+</sup>, all in an aqueous acetonitrile solution at physiological pH 7.2 conditions. Notably, distinctive changes were observed in the absorption spectra of **SICT** when Cu<sup>2+</sup> ions were introduced, unlike the responses observed with the other metal ions under investigation (Fig. 1a). Specifically, SICT exhibited a unique responsivity to Cu<sup>2+</sup> ions compared to all other metal ions, which can be attributed to the formation of complexes through ligand-to-metal charge transfer (LMCT), involving the transfer of electrons from **SICT** to Cu<sup>2</sup>ions. The plot shows that SICT, combined with all other metal ions, resulted in a peak at 348 nm. However, when Cu<sup>2+</sup> ions were introduced, the peak at 348 nm diminished, and a new peak emerged at 428 nm, indicative of the complexation between SICT and Cu<sup>2+</sup> ions (Fig. 1a).

Furthermore, titration studies were conducted by recording UV–Visible absorption spectra of the chemosensor at different concentrations of  $\mathrm{Cu}^{2+}$  ions, progressing until spectral changes ceased (up to 10 equivalents). The absorption data revealed that as  $\mathrm{Cu}^{2+}$  concentration increased, the peak at 348 nm gradually diminished, while the peak at 280 nm gradually shifted towards 264 nm. Most significantly, a new peak began to appear at 448 nm with increasing  $\mathrm{Cu}^{2+}$  concentration (Fig. 2b). Once the complexation between SICT and  $\mathrm{Cu}^{2+}$  reached saturation, the rising absorbance at 448 nm remained stable. These findings illustrate the versatile interaction between the sensor SICT and the specific metal ion  $\mathrm{Cu}^{2+}$  in various media. Consequently, in line with the results from the absorption studies, SICT demonstrates exceptional sensitivity and selectivity towards  $\mathrm{Cu}^{2+}$  metal ions across a range of conditions.

#### 3.2.2. Fluorescence emission studies

To evaluate the fluorescence quenching efficiency of **SICT**, fluorescence titrations were conducted at varying concentrations of  $\text{Cu}^{2+}$ . The fluorescence intensity of **SICT** (6 × 10<sup>-6</sup> M) exhibited a gradual decrease

Scheme 1. Schematic representation for the synthesis of SICT.

Fig. 1. Absorption spectra of SICT (6  $\mu$ M) in the presence of various metal ions (a) and (b) UV–Vis titration experiments of SICT with Cu<sup>2+</sup> in acetonitrile: water (7:3, v/v) system.

Fig. 2. Steady-state fluorescence spectra of SICT (6  $\mu$ M) in acetonitrile: water (7:3) mixture at various  $Cu^{2+}$  concentrations (a). Benesi–Hildebrand linear analysis plot of SICT with different concentrations of  $Cu^{2+}$  ions (b).

upon the incremental addition of  $Cu^{2+}$  ions within the range of 0–10 equivalents, as illustrated in Fig. 2a. This decline in intensity can be attributed to the formation of coordination bonds between SICT and  $Cu^{2+}$  ions, involving the donation of lone electron pairs from the two imine groups (one from the imidazole and the other from the thiazole

core) to the vacant 3d orbitals of the  $Cu^{2+}$  ions. The fluorescence intensity reduction continues until ten equivalents of  $Cu^{2+}$  ions are added, at which point it stabilizes. The quenching of **SICT**'s fluorescence intensity upon binding with  $Cu^{2+}$  ions can be ascribed to the paramagnetic nature of **SICT-Cu^2+** complexes [21,22]. This switch-off fluorescence

mechanism of **SICT**, induced by coordination with  $\text{Cu}^{2+}$ , results from intramolecular charge transfer and ligand-to-metal charge transfer processes. Notably, the intensity at 460 nm exhibits a linear decline (R<sup>2</sup> = 0.99233) as the concentration of  $\text{Cu}^{2+}$  ions increases (Fig. 2b), suggesting the potential utility of the **SICT** chemosensor for the quantitative assessment of  $\text{Cu}^{2+}$  ions, with a limit of detection (LOD) of 109 nM. The binding constant of **SICT** with  $\text{Cu}^{2+}$  in the aqueous ethanol medium was determined to be 27  $\times$  10<sup>5</sup> M<sup>-1</sup>, affirming the strong interaction between **SICT** and  $\text{Cu}^{2+}$  ions.

The selectivity of the chemosensor greatly influences the accuracy of fluorescence detection. To further assess the specificity of the chemosensor, we analyzed the fluorescence intensity in the presence of various metal ions. When excited at 280 nm, the fluorophore SICT exhibited a strong fluorescence emission peak at 460 nm (Fig. 3a). However, no significant changes were observed in the fluorescence emission of SICT when it was exposed to various metal ions, including  $Al^{3+}$ ,  $Cr^{3+}$ ,  $Ga^{3+}$ ,  $In^{3+}$ ,  $Ca^{2+}$ ,  $Cd^{2+}$ ,  $Co^{2+}$ ,  $Fe^{2+}$ ,  $Mn^{2+}$ ,  $La^{2+}$ ,  $Na^{2+}$ ,  $Sr^{2+}$ ,  $Pb^{2+}$ ,  $Mg^{2+}$ ,  $Zn^{2+}$  and  $Ni^{2+}$  in an aqueous ethanol solution. Only  $Cu^{2+}$  ions induced a substantial difference in the emission intensity of SICT. The remarkable reduction in fluorescence intensity observed in the presence of  $Cu^{2+}$  ions highlights the exceptional selectivity of SICT for  $Cu^{2+}$  metal ions in an aqueous acetonitrile solution. The fluorescence intensity was significantly diminished, leading to Fluorescence quenching upon adding  $Cu^{2+}$  (3.0  $\times$  10 $^{-6}$  molL $^{-1}$  of  $Cu^{2+}$  ion).

A competitive binding study was conducted to evaluate the sensitivity of SICT exclusively to  $\text{Cu}^{2+}$  ions amidst the presence of competing metal ions. In this study, the chemosensor SICT (6  $\times$  10 $^{-6}$  M) was exposed to 10 equivalents of  $\text{Cu}^{2+}$  ions while being simultaneously treated with an equivalent quantity of other metal ions, and the outcomes of this study are illustrated in Fig. 3b. Notably, the preference for  $\text{Cu}^{2+}$  ion recognition remained unaffected despite other metal ions vying for binding concurrently. SICT demonstrated robust anti-interference properties, ensuring its ability to selectively recognize  $\text{Cu}^{2+}$  ions more precisely than competing metal ions. The results from the fluorescence studies further underscore the sensitive and selective nature of SICT's response to  $\text{Cu}^{2+}$  ions, evidenced by the substantial fluorescence turn-off signal observed in the aqueous ethanol environment.

Further, to assess the stability of **SICT** over time, fluorescence analysis was performed (Fig. 4a). Emission spectra of **SICT** were recorded at various time intervals, and even after 10 min, the emission spectra remained consistent with the initial observations. Consequently, it can be confidently affirmed that the sensor (**SICT**) maintains stability and is not susceptible to self-quenching. Fluorescence investigations over time were carried out to explore the time-dependent sensor response to  $\text{Cu}^{2+}$ 

further (Fig. 4b). After introducing 5.0 equivalents of  $Cu^{2+}$  into the SICT sensor, emission spectra were recorded at 0 min (baseline), 2, 4, 6, 8, and 10 min. The emission profiles and extent of quenching remained consistent between 2 and 8 min and remained stable even after 10 min. These combined observations, coupled with the results from titration studies, conclude that SICT exclusively responds to an increased concentration of  $Cu^{2+}$  ions and maintains a consistent response level, irrespective of variations in duration.

#### 3.2.3. Influence of pH on fluorescence

Understanding the pH sensitivity of Fluorescence in near-neutral and mildly acidic/basic environments is crucial for environmental and biological research applications. We examined how the fluorescence output of the chemosensor SICT towards  $\text{Cu}^{2+}$  ions changed with varying pH levels, as pH plays a pivotal role in the fundamental principles of sensing (Fig. 5). To assess pH sensitivity, we conducted experiments using phosphate buffer saline (PBS) with SICT (6  $\mu\text{M}$ ) and  $\text{Cu}^{2+}$  ions (3  $\mu\text{M}$ ) within the pH range of 3–10. The pH investigation revealed that SICT effectively binds to  $\text{Cu}^{2+}$  ions across a wide pH spectrum, including acidic, neutral, and basic conditions (pH 3–10). Fascinatingly, the most substantial fluorescence quenching was observed at pH 7, corresponding to the physiological pH among all the pH ranges tested. This finding underscores the adaptability of SICT as a chemosensor, as it maintains its responsiveness to  $\text{Cu}^{2+}$  ions under a broad range of pH conditions, with particularly notable performance at the physiological pH level.

#### 3.2.4. Binding mode studies

To gain further insights into the binding mode between **SICT** and  $Cu^{2+}$  ions, we employe the Job's plot method, which revealed a 1:1 binding stoichiometry (Fig. 6) using the continuous variation method. Additionally, in the mass spectrum, a peak at m/z = 651 disappeared upon adding one equivalent of  $Cu^{2+}$ , and a new peak emerged at m/z = 713, corresponding to [**SICT** +  $Cu^{2+}$ ] (Fig. S2).

The binding constants ( $K_a$  and  $K_b$ ) of the SICT-Cu<sup>2+</sup> complex was determined using the modified Stern-Volmer equation [23], as depicted below, with the aid of a Stern-Volmer plot

$$F_0/\Delta F = 1/fa + 1/(faKa[Q])$$

Here,  $F_0$  and F represent the initial fluorescence intensity in the absence and presence of the quencher, respectively.  $K_a$  is the Stern-Volmer constant, denoting the association constant of  $Cu^{2+}$  with SICT, [Q] is the concentration of the quencher, and fa represents the initial fluorescence fraction in which the quencher is accessible. Through this method, the binding constant for the SICT- $Cu^{2+}$  complex was determined to be

Fig. 3. Fluorescence spectra of SICT (6 μM) with various metal ions (a). Interference studies of SICT and Cu<sup>2+</sup> with different metal ions (b).

Fig. 4. Time-dependent fluorescence studies of SICT (6  $\mu$ M) in the absence (a) and presence of  $Cu^{2+}$  ions (b).

Fig. 5. Fluorescence studies of SICT(6  $\mu$ M) in the absence and presence of Cu<sup>2+</sup> ions at different pH levels.

 $27 \times 10^5\, M^{-1}$ . These results underscore the selectivity of SICT for copper ions and suggest that the formation of the SICT-Cu<sup>2+</sup> complex is highly favorable and spontaneous.

#### 3.3. DFT calculations

#### 3.3.1. Geometry optimization

The minimum energy conformer of the chemosensor SICT was obtained by optimizing its geometry in the ground state using Gaussian 09 software. In the computed DFT values, no imaginary wave number modes were detected, and all were found to be positive, indicating the presence of the true minimum energy conformer. Fig. 7a and 7b illustrate the optimized structure of SICT. The bond lengths and angles obtained in this optimization were compared with experimental data reported in the literature, and the results are summarized in Tables S1 and S2. For reference, the C-C bond lengths in a benzene ring typically

fall around 1.395 Å [24,25]. Experimental X-ray results have reported C=O bond lengths of approximately 1.224 Å and 1.227 Å [26], consistent with the DFT-calculated values of 1.224 Å for SICT. The C-C bond lengths in the present molecule, SICT, ranged from 1.3 Å to 1.4 Å, while the C=O bond length was determined to be 1.209 Å. These values align with previous findings [27–29]. Additionally, the thiazole moiety's S-C and N-C bond lengths are typically around 1.743 Å and 1.390 Å, respectively, as reported by experimental XRD [33]. In SICT, the theoretical S-C and N-C bond lengths in the thiazole moiety were calculated to be 1.7 Å and 1.39 Å, respectively, closely matching the reported experimental values.

Moreover, the C-N bond lengths within the imidazole core of SICT (ranging from 1.39 Å to 1.4 Å) fall within the same range as those reported in the literature [30]. It is observed from the optimized structures of SICT and SICT-Cu<sup>2+</sup> complex (Fig. 7) that there is a slight modification in bond lengths of SICT after binding with Cu<sup>2+</sup> ion. The S-C bond

**Fig. 6.** Job's graph for **SICT** with different concentration of Cu<sup>2+</sup> ions.

length is changed to  $1.823\,\text{\AA}$  and  $1.785\,\text{\AA}$  from  $1.753\,\text{\AA}$  and  $1.723\,\text{\AA}$  after complexation. Overall, all other bond lengths and angles calculated through DFT are in good agreement with the literature data, validating the accuracy of the computational model.

#### 3.3.2. Molecular electrostatic potential (MESP) plot

To further understand the molecular reactivity and interaction, the molecular electrostatic potential map (MESP) was employed, as shown in Fig. 8. The MESP provides insights into nucleophilic and electrophilic regions within the molecule, aiding in interpreting its chemical behaviour. The MESP is generated from the electron density distribution within the molecule, calculated at the B3LYP level using a 6-311++G (d, p) basis set. It provides valuable insights into the electrophilic and nucleophilic regions within the molecule. To gain a deeper understanding of the bonding interaction between SICT and  $\text{Cu}^{2+}$ , the SICT-Cu^2+ complex was theoretically calculated using the B3LYP/LANL2DZ relativistic pseudo-potential basis set.

Fig. 8 illustrates the MESP plot for both SICT and the SICT-Cu<sup>2+</sup> complex, along with their corresponding colour gradient scheme. In the colour spectrum used, potential values range from negative to positive, with the deepest red indicating the negative regions (electrophilic reactivity) and the deepest blue representing the positive regions

Fig. 7. Optimized geometry for the a) SICT and b) SICT- $Cu^{2+}$  complex.

Fig. 8. Molecular electrostatic potential map of a) SICT and b) SICT- $Cu^{2+}$  complex with colour range of  $\pm 6.913e-2$  (SICT) and  $\pm 7.262e-2$  (SICT- $Cu^{2+}$ ).

(nucleophilic reactivity). Analysing the MESP plot (Fig. 8), we observe that the negative regions in SICT are primarily centred around atoms N1, O33, and O39, with electronegativity values of 0.300, -0.273, and -0.128, respectively. As a result, there are two potential sites where  $\mathrm{Cu}^{2+}$  ions can engage in electrophilic interactions: one with the nitrogen atom in the imidazole moiety of SICT and the other with the sulphur atom in the thiazole ring, at approximately 2.00 Å (N-Cu). The absence of negative frequencies in frequency calculations and stability studies confirms that the complex represents a stable local energy minimum.

Upon coordination with  $\mathrm{Cu}^{2+}$ , the negative charge on N1 (-0.285) increases, while the positive charges on S18 (0.346) and N32 (0.124) atoms in the SICT-Cu<sup>2+</sup> complex also increase. Additionally, it is observed that after binding with the  $\mathrm{Cu}^{2+}$  ion, the charge on O33 in SICT becomes -0.286, indicating a shift of charge from the ligand's nitrogen atoms to the  $\mathrm{Cu}^{2+}$  ion (-0.064). These findings provide valuable insights into the electronic structure and charge distribution within the SICT-Cu<sup>2+</sup> complex, shedding light on the nature of their bonding interaction.

#### 3.3.3. Uv-Vis absorption transitions

The UV-Vis spectra of SICT were obtained through TD-DFT calculations, considering ethanol as the solvent. Table 1 provides key excitation properties, including oscillator strength (f), excitation energy (eV), and excitation wavelength (nm). These properties are summarized in the table, giving insights into the electronic transitions within SICT. Fig. 9 compares the theoretical and experimental UV-Vis absorption spectra of SICT. The calculated absorption wavelengths were determined to be 269.823 nm and 313.545 nm. Remarkably, experimental measurements closely matched the theoretical calculations, with peak absorption levels observed at 265.124 nm and 294.042 nm, as depicted in Fig. 9. Table 1 further discloses that the excitation at 294.042 nm accounts for a significant portion (90 %) of SICT's electronic transition from the ground state HOMO-1 to the excited state LUMO, with an oscillator strength of 0.709. Similarly, the transition from HOMO to LUMO, represented by the excitation wavelength at 265.124 nm, contributes to 84 % of the electronic transition with an oscillator strength of 0.017. These findings shed light on the dominant electronic transitions within SICT, providing valuable insights into its UV-Vis absorption properties.

#### 3.3.4. Frontier molecular orbital (FMO) analysis

To get the insights into the binding nature between SICT and  ${\rm Cu}^{2+}$ , theoretical calculations were conducted for both SICT and the SICT- ${\rm Cu}^{2+}$  complex. Frontier molecular orbital (FMO) analysis was employed to investigate various optical, chemical, and electronic properties of the molecules, and these calculations were carried out at the same level of theory used for the optimized structures[31–33]. Figs. 10, 11a, and 11b display the plots for HOMO-1, HOMO, LUMO, and LUMO+1 of both SICT and the SICT- ${\rm Cu}^{2+}$  complex, along with their respective energy gaps. From the FMO plots (Fig. 10), it is evident that in the SICT molecule, the HOMO is primarily located on the 4-bromo-2-(4,5-diphenyl-1H-imidazol-2-yl)phenol moieties, while the LUMO is situated on the thiazole and chromen-2-one moieties. This suggests a charge transfer from the imidazole moiety to the thiazole and chromen-2-one moieties. The calculated energies of the HOMO and LUMO for SICT

Table 1 Theoretically calculated absorption wavelengths  $\lambda$  (nm), excitation energies E (eV), major contributions, and oscillator strengths (f) using TD-DFT/CAM-B3LYP/6–311++G (d, p) method in aqueous solution.

Molecule	Wavelength λ (	nm)	E	F (a.	Major	
	Experimental	DFT	(eV)	u.)	contribution	
SICT	294.042	313.545	3.892	0.709	H-1->LUMO (90 %)	
	265.124	269.823	4.561	0.017	HOMO->LUMO (84 %)	

 $\begin{tabular}{ll} Fig. 9. Comparison of experimental and theoretical UV-Visible absorption spectra of SICT. \end{tabular}$ 

Fig. 10. FMO orbital surfaces of SICT.

are  $-5.857\,\mathrm{eV}$  and  $-2.701\,\mathrm{eV}$ , respectively, resulting in an energy gap of 3.156 eV. It is worth noticing that organic compounds with smaller HOMO-LUMO energy gaps are of particular interest due to their unique optoelectronic properties. A larger HOMO-LUMO energy gap implies greater stability, reduced reactivity, and increased hardness of the molecule.

Table 2 provides values for various global reactivity parameters, including electronegativity, chemical potential, softness, chemical hardness, and electrophilicity index. SICT exhibits a global chemical hardness of 1.578 eV and an electronegativity of 4.279 eV, indicating its ability to attract electron pairs. The electrophilicity index for SICT is calculated as 5.785 eV, signifying its strong electron-attracting capability. In the SICT-Cu<sup>2+</sup> complex, the HOMO of the complex is found in the 151st alpha orbital and 150th beta orbital, while the LUMO is in the 152nd alpha orbital and 151st beta orbital, as shown in Fig. 10a and 10b. Upon binding, the alpha and beta molecular orbital energy gaps for the SICT-Cu<sup>2+</sup> complex decrease to 0.292 eV and 3.068 eV, respectively. This suggests the complex is more reactive upon binding than the isolated analyte. The values for softness, electronegativity, and electrophilicity indexes of the SICT-Cu<sup>2+</sup> complex show slight changes, as indicated in Table 2.

Fig. 11. Computational FMO orbital surfaces of (a) alpha SICT-Cu<sup>2+</sup> and (b) beta SICT-Cu<sup>2+</sup> molecular orbitals.

Table 2 Global chemical reactivity descriptors parameters of SICT and SICT- $Cu^{2+}$  complex.

<b>Molecule Properties</b>	SICT	SICT-Cu <sup>2+</sup>	_
		Alpha orbitals	Beta orbitals
Energy in a. u.	-5091.900	-1892.939	_

#### 3.3.5. In vitro and in vivo cytotoxicity and bioimaging analysis

In vitro and in vivo cytotoxicity and bioimaging analysis was carried out in MDA-MB-231 cells and D. Rerio embryos, respectively [10,34]. The in vitro toxicity in MDA-MB-231 cells and the morphological observations were assessed by MTT assay. The MTT assay was conducted to reveal the cytotoxicity effect of the probe and dose-dependently affected the viability of the cells, as depicted in Fig. S4. The IC $_{\!50}$  value of SICT was determined to be  $12.5\pm0.15~\mu M$ . The microscopic observations revealed the dose-dependent change in morphology of the cells. From Fig. 12, it can be seen that the probe has a dose-dependent effect on the cells. The detrimental cell damage was found after  $12.5~\mu M$  of concentration. From the microscopic image, the damage to the cell membrane has been caused at a higher concentration. However, probes at lower concentrations than their IC $_{\!50}$  values didn't show detrimental effects in morphological observation.

The cytotoxicity along with bioimaging studies were conducted using cell line MDA-MB-231 at  $5.0~\mu M$  fixed concentration of the chemosensor **SICT**. It was observed that on incubation with different

Fig. 12. Effect of SICT on the morphology of the MDA-MB-231 cells observed by bright-field microscopy. The arrows show the detrimental impact, such as disruption of a monolayer of cells, rupturing of cells, leakage of cellular debris, and formation of apoptotic bodies. Images were captured at 400x magnification.

concentrations of  $Cu^{2+}$ , there was no change in the cell stability or morphology. There was no cell death observed, and from Fig. S5, it is evident that on increasing the concentration of  $Cu^{2+}$  from 60 nM to 120 nM, the fluorescence intensity was found to be reduced. These results manifest that SICT can bind to  $Cu^{2+}$  effectively even inside the cell system.

To further investigate the impact of SICT in a living system, we conducted in vivo cytotoxicity and bioimaging analyses using D. Rerio embryos. The in vivo cytotoxicity assessment of the probe was carried out on embryos at 24, 48, 72, and 96 h post-fertilization (hpf), as depicted in Figs. S6 and S7. We exposed the embryos to different concentrations of the chemosensor SICT to study its effect on their development. We assessed developmental defects and mortality as indicators of cytotoxicity. In most survival experiments, embryos were exposed to varving concentrations of SICT. We observed minimal cytotoxicity even at higher probe concentrations (20 µM). Even at this concentration, embryos had no observable deformations, and their growth appeared normal without any defects. No embryo deaths were recorded during these phases. Although slight cytotoxicity was observed after 20 µM, no deformations or deaths were noted up to 72 hpf. Mortality was only recorded beyond 72 hpf with a concentration of 20 µM. This suggests that concentrations of up to 20 µM exhibit low cytotoxicity in zebrafish embryos and can be used as a fluorescent probe for bioimaging studies.

Furthermore, the bioimaging studies were conducted by exposing SICT to embryos to demonstrate the chemosensor's uptake ability. As shown in Fig. 13, blue emission from SICT was clearly observed in the zebrafish. The sensor SICT remained stable for an extended period with consistent fluorescence intensity, even at 96 hpf. This indicates that the probe persisted in the embryo for an extended duration, from 24 hpf, and entered through passive diffusion, either by ingestion or absorption. SICT was selectively accumulated in the heart, pericardium, common caudal vein, posterior caudal vein, and eyes. This selective accumulation in different parts of the zebrafish suggests tissue-dependent affinity of the chemosensor. The fluorescence intensity remained constant from 24 hpf to 96 hpf, indicating that SICT entered the circulatory system, which

is essential for probe transport in zebrafish. These results collectively demonstrate that **SICT** can be utilized for bioimaging studies.

Moreover, we investigated the *in vivo*  $\mathrm{Cu}^{2+}$  sensing ability of the sensor SICT in zebrafish. We incubated embryos with different concentrations of  $\mathrm{Cu}^{2+}$ . As shown in Fig. 13, the fluorescence intensity gradually decreased with increasing uptake of  $\mathrm{Cu}^{2+}$  ions. Initially, a decrease in fluorescence intensity was observed in the pericardial vein, indicating the uptake of  $\mathrm{Cu}^{2+}$  and its entry into the circulatory system. This was followed by a reduction in fluorescence intensity in the sac.

Interestingly, the fluorescence intensity in the eyes decreased more slowly compared to other parts of the zebrafish, suggesting that copper reached the eyes later in the process. These results confirm that the chemosensor enters selectively into different parts of the zebrafish, and probe **SICT** holds excellent potential for bioimaging in mammalian tissues. Furthermore, we compared the sensing ability and adaptability of **SICT** with other reported turn-off sensors for Cu<sup>2+</sup>, as summarized in Table 3.

#### 4. Conclusions

In conclusion, we have developed a straightforward one-pot synthetic method to produce the probe SICT (3-(2-(2-(5-bromo-2-hydroxyphenyl)-4,5-diphenyl-1H-imidazol-1-yl)thiazol-4-yl)-2H-chromen-2-one) for the selective detection of  $Cu^{2+}$  ions. The probe exhibited remarkably low cytotoxicity, with an  $IC_{50}$  value of  $12.5\pm0.15~\mu M$ . SICT demonstrated impressive sensitivity in aqueous acetonitrile medium, with a detection limit in the nanomolar range (109 nM), underscoring its high sensitivity. The 1:1 binding mode of SICT with  $Cu^{2+}$  was verified through Job's plot, ESI-Mass analysis, and DFT studies. Bioimaging experiments conducted in zebrafish and human cancer cells yielded highly promising results, suggesting the potential utility of the SICT ligand for detecting  $Cu^{2+}$  ions in both *in vitro* and *in vivo* systems. This work contributes to developing practical tools for copper ion sensing, with applications in various fields, including environmental monitoring and biomedical research.

The primaquine substituted Fe(II) phthalocyanine (PQFePc) and Co(II) phthalocyanine (PQCoPc) catalysts were prepared by using amide linkage method. The physical and chemical properties have been investigated by FTIR, mass, UV-Vis, TGA, XRD and elemental analysis. The catalytic oxidation of benzyl alcohol was determined by PQFePc and PQCoPc complexes by varying parameters like temperature, oxidant/catalytic ratio and substance/catalyst ratio. The optimization of catalytic oxidation reaction has been effectively achieved for the determination of benzyl alcohol (Bzalc) to benzaldehyde (Bzald). The PQCoPc and PQFePc exhibited excellent catalytic behaviour for the oxidation of benzyl alcohol obtaining high yield and good selectivity.

Keywords: Primaquine, Catalytic oxidation, Benzyl alcohol, Phthalocyanines.

#### INTRODUCTION

The invention of phthalocyanine has dragged greater attention in various technological applications due to its solubility in organic solvents and water [1]. Phthalocyanine exhibits good chemical, electrochemical and physical properties by suitable modifications in the structure [2]. The phthalocyanines are widely used in the field of sensors, supercapacitors, electrocatalytic, catalytic studies [3-7], semiconductors, nonlinear optical materials, liquid crystals, molecular conductors, nanotechnology [8-13], photosensitizers [14] and in addition, as a catalyst in the chemical reactions [15-17]. Primaquine ligand is an 8-aminoqunoline derivative in the Class-I of the biopharmaceutical classification system [18]. Primaquine phosphate salt exhibits antiparasitic activity which acts on the secondary tissue schizonts and hypnozoites, which reveals the outstanding activity of exo-erythrocytic antimalarial agent [19]. In this view, we have chosen primaquine compound for the substitution with phthalocyanine ring for further studies.

In recent years, researchers in both academia and chemical industries have focused on improving the catalytic process by which benzyl alcohol is transformed into benzaldehyde [20,21]. The benzaldehyde is an important raw material for the preparation of dyestuff, perfumery and agrochemical sectors [22,23].

Earlier, Aktas *et al.* [24] reported the benzyl alcohol oxidation using fluoro-substituted iron(II), cobalt(II) phthalocyanines has determined the oxidation of benzyl alcohol to benzaldehyde using *tert.*-butyl hydroperoxide (tBuOOH, TBHP) as oxidant. The determination of new material for the detection of highly effective benzyl alcohol to benzaldehyde is an never ending process in this context, primaquine substituted Fe(II) phthalocyanine (PQFePc) and Co(II) phthalocyanine (PQCoPc) complexes were synthesized. These complexes characterized by mass, FTIR, UV-visible, XRD, elemental analysis and thermogravimetric methods. A novel gas chromatographic (GC) technique has been adopted for the catalytic oxidation of benzyl alcohol with PQFePc and PQCoPc catalysts. The catalytic activities of PQCoPc and PQFePc were confirmed by varying

1720 Sharanakumar et al. Asian J. Chem.

the parameters such as temperature, oxidant/catalytic ratio and substance/catalyst ratio. The overall results revealed that the synthesized compounds act as good catalyst for oxidation of benzyl alcohol into benzaldehyde reaction.

#### **EXPERIMENTAL**

All the utilized chemicals, solvents and reagents were procured for the Sigma-Aldrich Chemie GmbH, Sternheim, Germany. Nitrogen atmosphere was used during the reaction. A few chemicals like NaOH, HCl, KOH were prepared by using oxygen-free distilled water. The primaquine substituted Fe(II) phthalocyanine (PQFePc) and Co(II) phthalocyanine (PQCoPc) were synthesized by following the procedure reported earlier [25,26].

The FT-IR measurements were carried out on a Perkin Elmer-1600 FTIR instrument on A Perkin-Elmer Lambda 25 instrument was used to record UV-vis spectra. The crystal structure evaluation was carried out on Bruker D8 diffractometer Cu $K\alpha$  radiation source and the thermal stability of PQFePc and PQCoPc was investigated by thermogravimetric analysis using STA6000 system in the 20 to 1000 °C temperature range with the sweep rate of 20 °C min¹ under blowing rate of 20 mL min¹ oxygen and GC Agilent technologies 7820A equipment was used for GC measurement.

Synthesis of primaquine bisphosphate substituted Co(II) phthalocyanine (PQCoPc): A mixture of primaquine bisphosphate (0.07 mmol) with tetracarboxy-Co(II) phthalocyanine (CoTcPc) (0.0175 mmol),  $K_2CO_3$  (0.06 mmol), DCC (15 mg) and DMF 40 mL in 250 mL round bottom flask was agitated under  $N_2$  atmosphere for 26 h at 28 °C (Scheme-I). The obtained green coloured material was then filtered and washed with warm water as well as ethanol and finally rinsed with oxygen-free distilled water then dried at 45 °C (yield = 45%).

Synthesis of primaquine bisphosphate substituted Fe(II) phthalocyanine (PQFePc): A mixture of primaquine bisphosphate (0.06 mmol), tetracarboxylic-Fe(II)-phthalocyanine (FeTcPc) (0.015 mmol),  $K_2CO_3$  (0.05 mmol),  $N_iN'$ -dicyclohexylcarbodiimide (DCC, 15 mg) and DMF 40 mL in 250 mL round bottom flask was agitated under  $N_2$  atmosphere for about 26 h at 28 °C (Scheme-I). The resulting green coloured material was filtered and washed by ethanol and distilled water. At the last, the obtained PQFePc complex was dried at 45 °C (yield = 55 %).

**Oxidation of benzyl alcohol:** The oxidation reaction was conducted by using a thermostat schlenk vessel fitted with a stirrer and a condenser. Initially, oxygen was removed by passing nitrogen gas into the mixture containing benzyl alcohol (2.12 mol), catalyst (2.12 mol) and solvent (0.02 L). Later this mixture

Scheme-I: Preparation route of PQCoPc and PQFePc complexes

was stirred (2-3 min) in a Schlenk's vessel maintained at 50 °C. The oxidant *tert*.-butyl hydroperoxide (TBHP, 2.23 mol) was added to this mixture with constant stirring. The samples (0.0006 L) were drawn at regular time intervals; at least twice, each sample was injected into GC (1.5 µL each time). The obtained products, consumed substrates and conversion were monitored by GC method.

#### RESULTS AND DISCUSSION

Elemental analysis: Vario EL (III) CHNS analyzer used for elemental analysis of the synthesized compounds. The primaquine, PQCoPc and PQFePc complexes, were examined by decomposing a well known quantity of the complexes mixed with H<sub>2</sub>SO<sub>4</sub> and HNO<sub>3</sub>, followed evaporation and calcinations. The results are shown in Table-1.

**Mass spectral studies:** The mass by charge ratio [M+2] of prepared compounds was measured by mass spectra Fig. 1. The theoretical value of PQFePc was found to be 1697.75 and

	TABLE-1 ELEMENTAL ANALYSIS OF THE LIGAND AND ITS METAL COMPLEXES

the experimental result is 1693.76. It clearly shows the confirmation of the prepared compound.

FT-IR spectral studies: The FTIR spectra confirmed the functional groups present in the range between 4000 to 600 cm<sup>-1</sup> [27]. The FTIR spectra of the PQCoPc and PQFePc (Fig. 2a-b) shows the broad and intense peak in the range of 3600 to 3000 cm<sup>-1</sup> (–OH and –NH<sub>2</sub>). The peaks at 3420.43 and 3432.72 cm<sup>-1</sup> corresponds to –COOH group of CoTcPc and FeTcPc, respectively appears in the range of 3300 to 2500 cm<sup>-1</sup>. However in Fig. 2a (line blue) and 2b (line brown), the peak for –COOH group disappears with the appearance of new peak pertaining to amide group formation (PQCoPc) at 3327.65 cm<sup>-1</sup> and (PQFePc) at 3334.54 cm<sup>-1</sup>(-CONH). The presence of narrow peak between 2932 and 2878 cm<sup>-1</sup> is due to the vibr-

ation of C–H bond. Finally, the bands at 2236 cm<sup>-1</sup>, 1653 cm<sup>-1</sup> corresponds to C=C group, whereas 1629.29 and 1616.36 cm<sup>-1</sup> corresponds to C-O group. Moreover, the peaks at 1242.72 and 1239.33 cm<sup>-1</sup> corresponds to –C-N group, while the peaks at 1082 and 1084.54 cm<sup>-1</sup> corresponds to the C=N group, respectively.

UV-visible spectral studies: The UV-Vis spectra of the PQCoPc, CoTcPc PQFePc and FeTcPc complexes exhibits a well distinguished two strong absorption Q and B bands in the range of 300-800 nm (Fig. 3). The Q-band was observed at 680-720 nm, which is due to the excitation of the electrons from  $\pi$  to  $\pi^*$  (HOMO to LUMO) level in the complexes, similarly, the B-band was observed at 300-350 nm [28,29]. The lower state electronic absorption spectra of the compounds showed characteristics absorption Q-band region at 687.13 nm for PQCoPc compound, 711.54 nm for CoTcPc compound, 707.98 nm for PQFePc compound and 699 nm for FeTcPc compound in DMF. The B-band absorption of phthalocyanines of PQCoPc, CoTcPc, PQFePc and FeTcPc were observed at 384.80, 374.29, 319.86 and 328.95 nm, respectively [28,29]. These findings demonstrate that the aggregation behaviour was satisfactory in the DMF solvent.

Thermal studies: Fig. 4 represents the TGA plots of the PQCoPc and PQFePc complexes involves two-step reactions. In the first step, the PQCoPc and PQFePc undergo degradation and decomposition of the substituents take place at the temperature range of 150-300 °C, while in the second step, phthalocyanine ring is broken, finally, metal is converted into metal oxide at 500-550 °C [29]. The PQCoPc and PQFePc complexes exhibited a good thermal stability upto nearly 550 °C, confirms that the melting points of the PQCoPc and PQFePc complexes are greater than 500 °C. Consequently, the PQCoPc and PQFePc complexes are used in electrochemical and chemical reactions.

**XRD studies:** The diffraction patterns of PQCoPc and PQFePc complexes (Fig. 5a-b) shows the broad peaks with different diffused intensity, where the intensity of peak increases by primaquine group. The less intense and short peaks were observed at 2θ values of 12°, 13°, 21°, 35°, 36°, 38°, 48° and 55° for PQCoPc and 13°, 14°, 16°, 20°, 35°, 37°, 38°, 50° and 55°

Fig. 2. FT-IR spectra of (a) PQCoPc with CoTcPc complex (b) PQFePc with FeTcPc complex

1722 Sharanakumar et al. Asian J. Chem.

Fig. 4. TGA plots of PQCoPc, PQFePc, CoTcPc and FeTcPc complexes

for PQFePc. The high intense and sharp peaks were observed at  $2\theta$  values of  $11^\circ$ ,  $27^\circ$ ,  $28^\circ$ ,  $30^\circ$  and  $45^\circ$  for PQCoPc and  $12^\circ$ ,  $27^\circ$ ,  $28^\circ$ ,  $30^\circ$  and  $46^\circ$  for PQFePc. This indicates that PQCoPc and PQFePc complexes were crystalline nature.

Aggregation behaviour of PQCoPc complex: The aggregation behaviour of PQCoPc was studied by the UV-Vis absorption method. This complex exhibited good aggregation because of its  $18\pi$ -electron structure. The major factors affecting the aggregation are concentration, temperature, solubility and substituents. The two types of aggregation observed are H-type and J-type [30]. The PQCoPc complex exhibited less of J-type aggregation but more of H-type aggregation in solvents.

The PQCoPc complex aggregation studies were performed by using different concentrations of DMF solvents (Fig. 6a). The Q-band intensity increased with the concentration of DMF solvent. The PQCoPc complex aggregation studies were performed by using different solvents like DMSO, EtOAc, CHCl<sub>3</sub>, THF and DMF (Fig. 6b). The Q-band intensity increased with DMF solvent. The aggregation studies of the PQCoPc complex were measured in the concentration range from  $12 \times 10^{-6}$  to  $6 \times 10^{-6}$  mol dm<sup>-3</sup>. The PQCoPc complex exhibited high coordinating ability and solubility in DMF and DMSO solvents. Therefore, more aggregation took place in these two solvents but less aggregation was observed in EtOAc and CHCl<sub>3</sub> solvents.

The above overall results showed that the aggregation of PQCoPc complex was better in DMF solvent. It increased the

Fig. 6. Aggregation behaviour of (a) DMF solvents with different concentration (b) PQCoPc with different solvents (DMF, THF, CHCl<sub>3</sub>, DMSO and EtOAC)

absorption of Q-band by an increase of the concentration of DMF solvent.

Catalytic studies: Oxidation of benzyl alcohol was performed in presence of PQCoPc and PQFePc complexes as catalysts using gas chromatographic method and applied by various parameters of catalytic oxidation reactions *e.g.*, the percentage conversion and selectivity of products have been studied. The catalytic oxidation was performed by using various oxidants and auxiliary chemicals to reach good yields. In the oxidation reaction, benzyl alcohol was converted into various organic products. The major product is benzaldehyde (Bzald) and the minor products are benzoquinone (BzQn) and benzoic acid (BzAc). The peripherally substituents play an important role in the catalytic reaction [24].

The catalytic oxidations of benzyl alcohol to benzaldehyde were carried out in the presence and absence of PQCoPc and PQFePc catalysts and suitable oxidant at 50 °C (Table-1). The catalytic oxidation reaction was found to give low yield of benzaldehyde in absence of catalyst. But, in presence of catalyst, an excellent yield (98%) was recorded after 3 h. There is no product formed (Table-2) when the catalytic oxidation was performed in absence of an oxidant. These results proved that the oxidation of benzyl alcohol, PQCoPc and PQFePc catalyst and oxidants are required and the present synthesized compounds have important role in the oxidation of benzyl alcohol.

Effect of substrate concentration: The transformation of benzyl alcohol to benzaldehyde was increased with the continuous reaction and yielded maximum conversion of 98% for PQCoPc and 95% for PQFePc after the reaction continued for 210 min and remains ideal with a slight increase as shown in Table-1. On the other hand, as the reaction precedes further oxidation of benzaldehyde to benzoic acid leads to decreased selectivity. From these results, 210 min was chosen as the optimal reaction time for conversion and selectivity of catalytic oxidation reaction of benzaldehyde to benzoic acid.

The conversion of benzyl alcohol to various organic products by uneven addition of the substrate/catalyst in a molar ratio varying from 600 to 1600 at 45 °C is shown in Table-2. The obtained data shows that as the substrate/catalyst ratio is increased, the conversion of benzyl alcohol was found to decrease. The high mass of the substrate and low mass of the catalyst exhibits low conversion of benzyl alcohol due to fewer catalytic sites. From these result, it can be concluded that 600/1 substrate/catalyst ratio is ideal for the efficient conversion of benzyl alcohol (98% for PQCoPc and 95% for PQFePc) when compared to ratios reported in the previous studies [31,32].

**Effect of oxidants concentration:** Table-3 shows oxidation effects of benzyl alcohol with PQCoPc and PQFePc with the varied molar ratio of substrate/oxidant. If the ratio of TBHP/ benzyl alcohol was increased from 0.83 to 3.3, the conversion

Without oxidant	Without catalyst	-	-	-	-	-	-	

rate of benzyl alcohol was decreased from 98% to 52% for PQCoPc and 95% to 44% for PQFePc complexes. When the substrate and oxidant ratio increased to 0.83 benzyl alcohol conversion reaches 98% for PQCoPc and 95% for PQFePc, it exhibits high turnover number (TON) and turnover frequency (TOF) values of 584, 196 for PQCoPc and 566, 190 for PQFePc, respectively. The above result corroborates that a decrease in benzyl alcohol conversion rate is inversely related to the amount of TBHP oxidant [33]. The PQCoPc selectivity for benzaldehyde is 84%, while the PQFePc's selectivity is 83% at this oxidant content. Therefore, all these results revealed that the molar ratio of TBHP:benzyl alcohol of 0.83 was ideal with high conversion rate and selectivity.

Effect of temperature: The oxidation of benzyl alcohol was performed at various temperatures ranging from 25 to 90 °C in the presence of PQCoPc and PQFePc catalysts. A drastic change was observed in the conversion of benzyl alcohol (Table-4). It can be observed that as the temperature increased from 25 to 50 °C, the rate of conversion of benzyl alcohol increases from 61% to 98% for PQCoPc and 58% to 95% for PQFePc.

When temperature was increased above 50 °C, benzaldehyde selectivity was found to be decreased slightly. This decrease in selectivity of benzaldehyde can be attributed, as before, to the loss of benzyl alcohol [24]. Therefore, 50 °C is the ideal temperature for producing a good yield of benzaldehyde.

Oxidant effect: The catalytic oxidation of benzyl alcohol (Scheme-II) was conducted with PQCoPc and PQFePc by various oxidants hydrogen peroxide (H<sub>2</sub>O<sub>2</sub>) and *meta*-chloroperbenzoic acid (*m*-CPBA), which produces fewer yields of both PQCoPc and PQFePc complexes as shown in Table-5. The reaction of PQCoPc and PQFePc yields brown products from green colour in the presence of *m*-CPBA and H<sub>2</sub>O<sub>2</sub>. The colour changes due to PQCoPc and PQFePc were degraded immediately with H<sub>2</sub>O<sub>2</sub> and *m*-CPBA. All of these findings suggest that TBHP is an effective oxidant for selectively converting benzaldehyde. In the presence of TBHP oxidant, the colour of both complex becomes light green from green.

The PQCoPc catalyst showed good catalytic effect with the highest conversion, TON and TOF values compared with the PQFePc catalyst. The catalytic activity also varies with the

transition metals present in the phthalocyanine ring [22]. Thus, it is concluded that PQCoPc catalyst exhibits more oxidation reaction compared with PQFePc catalyst (PQCoPc > PQFePc).

Comparison study of various catalysts with PQCoPc and PQFePc Catalysts for oxidation of benzyl alcohol: In present work, the reaction mechanism of PQCoPc and PQFePc with TBHP gives an active species. When phthalocyanine was compared to a porphyrin molecule with the same oxidation state of the central metal atom, phthalocyanine shows good stability and exhibits a strong oxidizing ability. When oxidant as TBHP, in the first step formation of PcCo(III)-OOt-Bu or PcFe(III)-OOt-Bu. Normally, peroxides react with porphyrin Fe complex *via* homolytic cleavage of the O-O bond to form porphyrin Fe<sup>IV=O</sup> or porphyrin Fe<sup>V=O</sup> species. It indicates that porphyrin Fe would be reacting with *t*-BuOOH, similarly, the PQFe<sub>IV=O</sub> or PQFe<sup>V=O</sup> reaction takes place in **Scheme-III** [38,39]. The catalytic oxidation of benzyl alcohol using different catalyst and their comparative data are presented in Table-6.

Scheme-IV: Red-ox reactions involving as t-BuOOH

#### Conclusion

In present work, the synthesis, characterization and the catalytic properties of two novel peripherally tetrasubstituted

phthalocyanine compounds in association with primaquine functionalized groups i.e. Fe(II) phthalocyanine (PQFePc) and Co(II) phthalocyanine (PQCoPc) were conducted. All the synthesized compounds were characterized by FTIR, UV-visible, mass, XRD, elemental analysis and thermogravimetric studies. The PQFePc and PQCoPc complexes show good aggregation behaviour in DMF and DMSO solvents. The catalytic activities of PQCoPc and PQFePc were executed for the oxidation of benzyl alcohol with various oxidants by varying the temperature, oxidant/catalytic ratio and substrate/catalyst ratio affect. The oxidation reactions were carried out to determine the optimum conditions of catalysts. Both PQCoPc and PQFePc complexes showed good catalytic activity for the oxidation of benzyl alcohol with high benzaldehyde selectivity by using tert.-butyl hydroperoxide (TBHP) as an oxidant. In conclusion, these catalytic works are expedient, time saving and determined to be the best oxidation conditions with high turnover number (TON) and turnover frequency (TOF) values.

#### **ABSTRACT**

The ethyl-naphtho[2,1-b]furon-2-carboxylate 2, hydrazine hydrate in the presence of a catalytic quantity of conc. HCl in ethanol was refluxed at 30 °C to get the naphtho[2,1-b]furan-2-carbohydrazide 3. The reaction of aromatic acids with methanol in the presence of an acid catalyst gives esters, these esters on treatment with hydrazine hydrazide produce acid hydrazides 4a-f. These acid hydrazides 4a-f, in reaction with carbon disulphide produces 2-(substituted)phenylhydrazine-potassiumcarbodithioate 5a-f. The reaction of 5a-f with compound 3 in ethanol produces N-[3-phenyl-5-sulphanyl-4H-1,2,4-triazole-4-yl)-naphtho[2,1-b]furan-2-carboxamide 6a-f. Elemental analysis, FTIR, NMR, and mass spectral analyses have been used to characterize the synthesized compounds. They have also been applied to research on antimicrobial studies and have also done the docking investigation of the synthesized compounds with the various biological molecules to get excellent results.

**Keywords:** Naphthofuran, Triazole, Molecular Docking, Antibacterial Activity, Antifungal Activity, Hydrazine Hydrazide.

RASĀYAN J. Chem., Vol. 16, No. 3, 2023

#### **INTRODUCTION**

Synthetic chemistry plays an important role in the blooming of drug discoveries. Large numbers of the consolidated heterocycles and bi-heterocycles including naphthofuran have accounted for a wide range of pharmacological activities.<sup>1-4</sup> Naphthofuran cores are key primary moieties found in countless organically significant normal products.<sup>5-6</sup> Naphthofuran subsidiaries have been isolated from different natural sources, such as Fusarium, Oxysporum, Gossipium barbendanse, and so on, and are notable for different natural exercises like antitumor, antifertility, mutagenic, development inhibitory, and osterogenic.<sup>7-9</sup> The literature review revealed that the prepared subsidiaries of naphtho[2,1-b]furans show an extensive variety of pharmacological and biological action. 10-14 Recently, reviews on derivatives of arene ring-fused furans exhibit very potent and diverse pharmacological activities. 15-16 The literature survey reveals the importance of triazoles, which shows magnificent biological medicinal properties. Due to their numerous biological functions, the substituted triazoles are a very significant class of chemicals that have attracted the interest of numerous chemists and biologists in the domains of organic synthesis, medicine, and pharmaceuticals. like antitubercular, antimicrobial, anticonvulsant, antibacterial antifungal, and anticancer. 17-21 The effectiveness of substituted triazoles as antibacterial and antitubercular medicines has been supported by a substantial body of research in recent years. Biheterocyclic compounds involving 1,2,4,-triazole derivatives designed with a new approach have efficient antitubercular and Antimicrobial qualities.<sup>22</sup> Substituted alkyl and aryl derivatives encompassing 1,2,4-triazole moiety are used as very effective antifungal drugs.<sup>23</sup> In these years, 1,2,4-Triazole hybrids have been found as potential Rasavan J. Chem., 16(3), 1613-1623(2023)

http://doi.org/10.31788/RJC.2023.1638459

antibacterial agents against both drug-sensitive and drug-resistant pathogens.<sup>24</sup> Thus, naphthofuran derivatives show diverse pharmacological activities.<sup>25-27</sup> In view of the several biological activities of heterocyclic compounds comprising the naphthofuran entity, our present investigation describes to formulation and synthesis of different derivatives of naphthofurans and to study their antimicrobial activities as per the scheme given below. The derivatives of title compounds were confirmed by elemental analysis, UV-Visible, FT-IR, NMR, and Mass Spectral studies.

#### **EXPERIMENTAL**

#### **Chemicals and Instruments**

All of the chemicals and reagents were purchased from Sigma Aldrich. Double distilled water is used to prepare all the required compounds. The synthesized compounds' functional groups were investigated using FTIR spectra in the 4000-300 cm<sup>-1</sup> range with an FTIR Frontier Perkin Elmer instrument. With the Agilent VNMRS-400 NMR instrument, the 1H-NMR spectrum was detected. The molecular weight of the molecule was calculated by using Water's SYNAPT G2 QTOF LCMS equipment.

#### Synthesis of 2-hydroxy-1-naphthaldehyde (1)

The 2-Naphthol (0.05 M) was dissolved in 20 mL of ethanol, then add sodium hydroxide (0.26 M) was in 25 mL water the solution was stirred in the reaction vessel and simultaneously add dropwise 4.3 mL of chloroform, then the reaction mixture was stirred for 2 h to get the required product. The product was poured into ice-cold water and neutralized with dilute HCl, the solid product separates and it is filtered and dried<sup>25</sup> Scheme-1.

#### Synthesis of ethyl naphtho[2,1-b]furan-2-carboxylate (2)

The compound 1 (0.04 M), N,N-dimethyl formamide (30 mL), ethyl-chloroacetate (0.04 M), and anhydrous K<sub>2</sub>CO<sub>3</sub> (0.95 M) were added in the reaction vessel and refluxed In water bath for 26 h. The reaction mixture was filtered and the filtrate was concentrated by distillation and then transferred into ice-cold water, the solid product separates and was filtered and dried Scheme-1.

#### Synthesis of naphtho[2,1-b]furan-2-carbohydrazide (3)

The compound **2** (0.02 M), catalytic quantity of conc. HCl and hydrazine hydrate (0.04 M), and absolute ethanol (30 mL) were refluxed for 2 h in a water bath. Then the product was cooled at 28  $^{0}$ C, the solid product was obtained and it is filtered and dried Scheme-1.

#### Synthesis of substituted acid hydrazides (4a-f)

A solution of aromatic acid (0.03 M) in methanol (60 mL), for this solution add a few drops of conc. sulphuric acid and reflux the reaction mixture for 18 h at 40 °C. Then add hydrazine hydrate (3 mL 0.06 M) and the reaction mixture was refluxed for 12 h. The excess methanol was eliminated under reduced pressure and the reaction mixture was transferred into ice-cold water. The separated solid product is obtained and it is filtered and dried <sup>25-26</sup> Scheme-1.

#### Synthesis of 2-(substituted)phenylhydrazine-potassiumcarbodithioate (5a-f)

To a solution of 4a (0.02 M) in ethanol (30 mL), carbon disulphide (1.5 mL, 0.026 M), and KOH (0.025 M) were added and stirred for 20 h at 28  $^{0}$ C. The solid product was obtained and it is filtered, and washed with diethyl ether to get the required 5a compound. The same methodology was used for the synthesis of 5b-f from 4b-f<sup>27</sup> Scheme-1.

### Synthesis of N-[3-phenyl-5-sulphanyl-4H-1,2,4-triazol-4-yl)-naphtho[2,1-b]furan-2-carboxamide (6a-f)

The compound **3** (0.02 M) and phenyl hydrazine-potassium carbodithioate aromatic acid hydrazide **5a** (0.02 M) were refluxed at 60  $^{0}$ C in a water bath for 6 h. The obtained product was transferred into ice-cold water and neutralized with conc. HCl. The precipitated triazole was filtered and purified from ethanol, the same methodology was used for the synthesis of 6b-f Scheme-1.

#### RESULTS AND DISCUSSION

#### **Spectral Characterization**

All the synthesized compounds were characterized using FTIR, Mass, and NMR Spectroscopy techniques. The FTIR spectra of 2 show an absorption band at 1733 cm<sup>-1</sup> due to the carbonyl group of ester Fig.-1. In  $^{1}$ H-NMR spectra (CDCl<sub>3</sub>), a triplet at  $\delta$  1.6 due to -CH<sub>3</sub> protons, a quartet at  $\delta$  4.6 due to -CH<sub>2</sub> protons, and a multiplet at  $\delta$  7.5-8.1 integrating for seven aromatic protons were confirmed Fig.-4.

Scheme-1: Synthetic Route of Naphthofuran Derivatives (6a-f)

The FTIR spectra of 3 show an absorption band at 3303-2968 cm<sup>-1</sup> due to amino and an absorption band at 1656 cm<sup>-1</sup> due to carbonyl group Fig.-2. <sup>1</sup>H-NMR spectra of 3 show a broad singlet at δ 4.6, 1H, NH, ( $D_2O$  exchangeable), multiplet  $\delta$  7.4-8.6, for seven aromatic protons, and a singlet at  $\delta$  9.8 for two amino group protons. The FTIR spectra of 4d show an absorption band at 3300-2970 cm<sup>-1</sup> due to the amino group and an absorption band at 1652 cm<sup>-1</sup> due to the carbonyl group. <sup>1</sup>H-NMR spectra of 4d show a broad singlet at δ 3.8, 3H, for methoxy, singlet at δ 4.1, 1H, NH, (D<sub>2</sub>O exchangeable), multiplet δ 6.5-6.9 for four aromatic protons and a singlet at δ 9.1 for two amino protons. The FTIR (KBr) spectrum of 6a absorption band at 1667 cm<sup>-1</sup> due to carbonyl group. <sup>1</sup>H-NMR spectra (DMSO-d<sub>6</sub>) of 6a shows a singlet at δ 6.95, 1H, SH, singlet at δ 12.12, 1H, NH, multiplet δ 7.2-8.5, for twelve aromatic protons. The Mass spectral analysis indicates the m/z 386. The FTIR (KBr) spectrum of 6b absorption band at 1668 cm<sup>-1</sup> due to carbonyl group. <sup>1</sup>H-NMR spectra (DMSO-d<sub>6</sub>) of 6b shows a broad singlet δ 5.8, 1H, OH, singlet at δ 6.95, 1H, SH, singlet at δ 12.10, 1H, NH, multiplet δ 7.3-8.4, for eleven aromatic protons. The Mass spectral analysis indicates the m/z 402. The FTIR (KBr) spectrum of the 6c absorption band at 1666 cm<sup>-1</sup> is due to the C=O group. <sup>1</sup>H-the NMR spectra (DMSO-d<sub>6</sub>) of 6c shows a singlet at δ 6.97, 1H, SH, singlet at δ 12.21, 1H, NH, multiplet δ 7.4-8.6, for eleven aromatic protons. The Mass spectral analysis indicates the m/z 431. The FTIR (KBr) spectrum of the 6d absorption band at 1667 cm<sup>-1</sup> due to the carbonyl group and 3284.61 cm<sup>-1</sup> due to the –NH group Fig.-3. <sup>1</sup>H-NMR spectra (DMSO-d<sub>6</sub>) of 6d shows a singlet at δ 3.8, 3H, OCH<sub>3</sub>, singlet at  $\delta$  7.05, 1H, SH, singlet at  $\delta$  12.2, 1H, NH, multiplet  $\delta$  7.6-8.6, for eleven

aromatic protons Fig.-5. The Mass spectral analysis indicates the m/z 416 Fig.-6. The FTIR (KBr) spectrum of 6e absorption band at 1669 cm<sup>-1</sup> due to carbonyl group.  $^{1}$ H-NMR spectra (DMSO-d<sub>6</sub>) of 6e show a singlet at  $\delta$  6.98, 1H, SH, singlet at  $\delta$  12.23, 1H, NH, multiplet  $\delta$  7.6-8.7, for eleven aromatic protons. The Mass spectral analysis indicates the m/z 421. The FTIR (KBr) spectrum of 6f absorption band at 1669 cm<sup>-1</sup> due to carbonyl group.  $^{1}$ H-NMR spectra (DMSO-d<sub>6</sub>) of 6f show a singlet at  $\delta$  1.7, 3H, CH<sub>3</sub> singlet at  $\delta$  7.05, 1H, SH, singlet at  $\delta$  12.01, 1H, NH, multiplet  $\delta$  7.5-8.6, for eleven aromatic protons. The Mass spectral analysis indicates the m/z 400.

#### **Biological Activity of Synthesized Compounds Antimicrobial Activity**

The cup-plate technique was used to test the in vitro antibacterial activity against cultures of six bacteria and two fungi that had been grown for 24h. The compounds 6a-f have been determined for their antibacterial activity against *S. aureus*, *S. epidermidis*, *B. cereus*, *P. aeruginosa V. cholerae*, and *E. coli* and antifungal activity against *A. aureus* and *A. fumigatus*. Standards for antibacterial and antifungal

activity were *chloramphenicol* and *fluconazole*, respectively. The substances were tested against all species in DMF at a different concentration of 25, 50,100  $\mu$ g/ml. After incubation for 48 hours at 30  $^{0}$ C for antifungal activity and 24 hours at 25  $^{0}$ C for antibacterial activity, the zone of inhibition was compared to the reference medication. The outcomes are shown in Table-2 and Table-3.

Fig.-8: Graphical Representation of Antifungal Activity of Compounds 6a-f

The zone of inhibition against the test organisms is measured and comparing it to a standard reference, the antibacterial activity and antifungal activities were assessed. The inhibitory zones that were found are shown in Table-2 and Table-3. This led to the excellent zone of inhibition in the main screening against the bacterial and fungal strains and also, as shown in Fig-7 and Fig-8. It was shown that the existence of electron-withdrawing groups bound to the Naphthofuran ring had a significant impact on the antibacterial activity. For instance, the compounds 6c and 6e had increased activity as a result of having nitro and chloro substituents in their structures, which showed that all of the examined compounds in this series had outstanding antibacterial activity.

#### **Molecular Docking Studies**

The docking of molecules examinations was ultimately completed using the described methodology.<sup>29,30</sup> The antitubercular receptor (PDB code: 2MBR), whose crystal structure was got from the Protein Data Bank (PDB: http://www.rcsb.org/pdb), had been subjected to In-silico molecular docking. The water molecules and heteroatoms were removed before screening. The protein preparations module of the HEX modeling package 8.0 was used for constructing the receptor structure before it was used in the docking investigation. Except for the water molecules that were 5 Å away from the ligand, During the production of the protein, all hetero and water molecules from the crystal structure were taken out. Utilizing discovery studio 3.2, the three-dimensional configurations of each ligand and the receptor binding interactions were visualized to optimize the quality. All molecules were docked at the receptor's active binding sites. The outcomes of the in silico molecular docking process offer crucial insight into the potential affinity of the newly developed drugs for the active regions of the receptor. We used the docking values that were acquired to guide our wet study of antimicrobial activity. All derivatives demonstrated improved binding interaction with receptors nearby through hydrogen bonds, alkyl, pi-alkyl, Vander walls, and other interactions with a range of amino acids of the receptor, potentially limiting the receptor's ability to cause bacterial infections. The binding energy of all the complexes showed prominent binding interactions, with E. Coli murbenzyme receptor by the key of amino acid residues ARG327, TRP89, PHE328, VAL52, VAL326, ILE110, ASN51, GLN120, GLU325, GLU334, LEU107, LEU104, ILE122, VAL132, LEU178, LEU53, and VAL326. To identify the interaction positions, which will be the potential ligand binding sites in each scenario, the hydrophobic and hydrophilic spheres are used. Finally,

when compared to antimicrobial murbenzyme receptor binding receptors, the synthesized compounds are antimicrobial competitive inhibitors, according to molecular docking investigations for the chosen compounds. The bonding interactions are shown in following Fig.-9 to Fig.-14.

Fig.-9: 2D and 3D Bonding Interactions of 2MBR Receptor with Compound 6a

Fig.-10: 2D and 3D Bonding Interactions of 2MBR Receptor with Compound 6b

Fig.-11: 2D and 3D Bonding Interactions of 2MBR Receptor with Compound 6c

Fig.-12: 2D and 3D Bonding Interactions of 2MBR Receptor with Compound 6d

Fig.-13: 2D and 3D Bonding Interactions of 2MBR Receptor with Compound 6e

Fig.-14: 2D and 3D Bonding Interactions of 2MBR Receptor with Compound 6f

The synthetic molecules 6(a-f) were molecularly docked with potential biological target molecules for the antibacterial receptor. (PDB ID: 2MBR). Using computational docking investigations with the HEX 8.0 engine, the binding energies of the synthesized compounds 6(a-e) with their receptors were determined. Table-3 provided a list of these docking energy values and potential binding interaction types. Results from antibacterial docking suggested that 6a, 6b, and 6d may interact. The 6f has a greater affinity of -322.71 kcal mol-1 for the 2MBR receptor than the other compounds. In the protein surrounding the receptor molecule, the amino acids 6c, 6d, and 6e interact with amino acids in a hydrophobic (Pi-alkyl), alkyl-alkyl, and hydrogen bonding manner. The optimal docking positions of receptors 6(a-e) and 2MBR are depicted in Fig.-9 to Fig.-14, as reported in Table-4.

Table–4: Bind	ling Energies of Compound 6	(a–f) with 2MBR Receptor

6f	2MBR	-322.71
Ciprofloxacin (STD)	2MBR	-237.66

#### **CONCLUSION**

In our work, we have successfully confirmed the Synthesized compounds of 2-hydroxy-1-naphthaldehyde (1), Synthesis of naphtho[2,1-b]furan-2-carboxylate (2), Synthesis of naphtho[2,1-b]furan-2carbohydrazide Synthesis of various acid hydrazides. (4a-f),Synthesis (3),(substituted)phenylhydrazine-potassiumcarbodithioate (5a-f), Synthesis of [5-(4-substituted-phenyl-3sulphanyl-4H-1,2,4-triazol-4-yl)-(naptho[2,1-b]furan-2-yl) carboxamide (6a-f) by UV-Visible, Fourier transform infrared radiations (FT-IR), Nuclear Magnetic Resonance (NMR) and Mass Spectral studies. On the basis of their antibacterial activity and antifungal activity, the newly synthesized compounds were assessed. Each substance demonstrated a considerable level of antibacterial action by studying their molecular docking studies.

#### ARTICLE INFO

Keywords: MTT assay ROS assay MCF-7 cell lines Binding studies Thiophene -1,3,4-oxadiazole-thiazolidine-2,4-dione

#### ABSTRACT

Two synthetic methods were proposed for the preparation of a new series of thiophene-1,3,4-oxadiazole-thiazolidine-2,4-dione hybrids (TOT-1 to 15) and their structures were elucidated based on spectral data. Studies on cytotoxicity, ROS, cellular uptake and interactions of TOT-14 with calf thymus DNA were carried out. Anticancer activity of compounds, TOT-1 to 15 on breast cancer (MCF-7) cell lines was investigated. The  $\rm IC_{50}$  values for the standard, epirubicin hydrochloride and TOT-12, 13, 14 and 15 were found to be 6.78, 5.52, 6.53, 4.83 and 5.57 µg/mL, respectively. Notably, TOT-14 exhibited a remarkable antiproliferative activity with a strikingly selective inhibitory effect compared to standard. This specific selectivity could be attributed to the synergistic effect of increased cellular uptake and generation of higher ROS in cancer cells after irradiation. The binding constant of  $4.25 \times 10^3 \, {\rm M}^{-1}$  indicated the moderate interaction between TOT-14 and ct-DNA. The docking score of TOT derivatives was substantially identical to the docking score of epirubicin hydrochloride. The designed molecules complied with the requirements for drug-likeness and ADME.

#### 1. Introduction

The most frequent kind of cancer suffered by women and the main factor in cancer-related mortality is the breast cancer (BC). Currently, the situation in BC is alarming, endangering the health and quality of life of women severely. With a 15 % lifetime risk, around 2.3 million cases are diagnosed globally each year [1].

According to the World Health Organisation, BC develops in the epithelial cells of the ducts (85 %) or lobules (15 %) of the glandular tissues of the breast [2]. The malignant development is initially restricted to the duct or lobule, with no symptoms and no spread potential. It will eventually infiltrate the surrounding breast tissue or other organs in the body [3]. When a woman perishes from breast cancer, it is usually as a result of extensive metastases.

The greatest challenge in developing a new anti-cancer drug is to find out the therapeutic strategy that can attenuate malignant cells without damaging healthy cells. Besides this, the unwanted side effects of existing cancer treatment, as well as the multidrug resistance, have increased the difficulties in researching alternative anticancer

medicines, with lower toxicity to normal tissue and less tumour cell resistance [4]. To overcome these concerns, an alternative strategy for the design of a hybrid molecule that contains more than a single pharmacophore may be proposed to hit multiple cancer hallmarks and achieve the desired pharmacological effectiveness.

In general, heterocycles constitute the foundation of most of drugs. Notably, heterocycles with 1,3,4-oxadiazole rings define a class of compounds with exceptional biological activities including remarkable high cytostatic potential [5]. Most of the currently available medications also have pharmacophore composed of 1,3,4-oxadiazole ring. For example, raltegravir, an HIV integrase inhibitor, is used to treat AIDS in combination with other antiretroviral medications [6]. Tiodazosin, a 2-adrenoceptor presynaptic antagonist, is used to treat hypertension while nesipidil is also used as an antihypertensive drug [7]. Fenadiazole is a sedative and hypnotic drug that can be used to treat insomnia and anxiety [8]. Zibotentan is recommended for the treatment of cancer of the colon, breast, ovary, lung, and, in especially, prostate [9]. Besides these significant biological properties, 1,3,4-oxadiazoles and its derivatives are also known to have anti-proliferative properties through a

E-mail address: drjseetharamappa@kud.ac.in (J. Seetharamappa).

<sup>\*</sup> Corresponding author.

number of different pathways, including the inhibition of growth factors, enzymes, kinases, and other molecules. Structures of 1,3,4-oxadiazole-containing compounds which are available in the market are represented in Fig. 1.

On the other hand, 2,4-thiazolidinediones, which were first introduced in the late 1990 s, are oral hypoglycemic medicines that have gained worldwide attention due to their varied biological profile [10] which include anti-hyperglycemic [11,12], anti-oxidant [13], anti-inflammatory [14], anti-cancer [15–18], anti-obesity [19], antimalarial [20] and anti-microbial [21,22] actions. In preclinical and clinical evaluation phases, derivatives of thiazolidinedione (TZD) have shown promise as anticancer agents. Structures I, II and III in Fig. 2 represent 2,4-thiazolidinediones moieties with anticancer activity.

The development of hybrid drugs has led to better treatment for a number of illnesses including cancer. Through a variety of mechanisms, hybrid molecules with two or more pharmacophores have the ability to overcome drug resistance while simultaneously reducing the risk of side effects [23]. In view of aforementioned discussion and in the quest of designing new anticancer agents, we have envisaged to synthesize hybrid molecules containing 1,3,4-oxadiazole and thiazolidine-2,4-dione moieties due to their remarkable biological activities.

In this paper, the synthesis of a novel family of thiophene-1,3,4-oxadiazole-thiazolidine-2,4-dione derivatives with a distinct aldehyde moiety was demonstrated. The single crystal X-ray crystallographic studies of the intermediate TOT were deliberated. *In vitro* anticancer capabilities of these compounds against MCF-7 breast cancer cell lines have been investigated. Anticancer drugs' effectiveness depends heavily on ROS [24]. The significance of ROS in the anticancer mechanism of novel thiophene-1,3,4-oxadiazole-thiazolidine-2,4-dione hybrid compounds was examined in this study. Contrary to analytical methods like high-performance liquid chromatography, the uptake of luminous model pharmaceuticals could be evaluated on a single-cell level using confocal fluorescence microscopy, allowing real-time monitoring of the intracellular spatial distribution of the model drug [25]. The *in vitro* cellular uptake behaviour of compounds, TOT 12, 13, 14 and 15 by MCF-7 cell lines was investigated using laser scanning confocal

microscope to confirm whether they could be efficiently internalised into tumour cells.

DNA-drug interaction studies are extremely useful and necessary for the development of innovative and more effective medications with fewer adverse effects. Hence, to understand the mechanism of interaction of a highly potent anticancer agent, **TOT-14** with ct-DNA, we have accomplished fluorescence quenching studies using ethidium bromide as a biomarker. Further, *in-silico* technique offers a platform for testing the efficacy of putative therapies against molecular targets, assisting in the selection of those with the greatest potential activity for additional *in vitro* and *in vivo* testing. So, we have proposed **TOT** and its 15 derivatives presented in this study as novel prospective drugs for the treatment of breast cancer.

#### 2. Results and discussion

#### 2.1. Chemistry

#### 2.1.1. Synthetic protocol

Following the pathway depicted in Scheme 1, fifteen compounds (TOT 1-15) were synthesized. N'-(2-chloroacetyl)thiophene-2-carbohydrazide (2) was prepared by the addition of chloroacetyl chloride to thiophene-2-carbohydrazidein ethyl acetate. Further, cyclization of compound 2 took place in the presence of POCl3 to yield 2-(chloromethyl)-5-(thiophen-2-yl)-1,3,4-oxadiazole (TO). The compounds (TOT-1 to 15) were synthesized by two methods. In the first approach, 3-((5-(thiophen-2-yl)-1,3,4-oxadiazol-2-yl)methyl)thiazolidine-2,4dione (TOT) was obtained by the condensation of TO with potassium salt of thiazolidin-2,4-dione in the presence of DMF at 60 °C. Further, TOT 1-15 were obtained by the Knoevenagel condensation reaction in ethanol medium between various substituted aldehydes and TOT in the presence of a catalytic amount of piperidine. In all the cases, the product was precipitated out from the reaction mixture. In the second method, the derivatives of TZD (1-15) were synthesized by Knoevenagel condensation reaction between TZD and various substituted aldehydes. In the next step TZD (1-15) were treated with TO in the presence of

#### DMF and $K_2CO_3$ to get **TOT 1–15**.

In continuation of our research work on synthesis of thiazolidine-dione derivatives, we have followed method-1 [26] to synthesize the title compounds. However, we failed to get good yields of some of the derivatives, notably the compounds that contained halogen groups. This might be due to the formation of by-product, N-(((Z)-(2-oxo-2-(thio-phen-2-yl)ethyl)diazenyl)methylene)piperidine-1-carboxamide (BS) in larger yield. The structure of BS was elucidated based on <sup>1</sup>H and <sup>13</sup>C NMR and mass spectral data. Formation of BS might be attributed to decyclization of oxadiazole ring and thiazolidine-dione ring by the addition of piperidine to the reaction mixture [27]. Thus, we have employed method-2 to synthesize the title compounds in good yields. Further, we have witnessed good yields with respect to title compounds containing halogen groups. However, purity of the synthesized compounds was found to be satisfactory in method-1 as these were precipitated from the reaction mixture. The lesser purity of compounds that

were prepared in method-2 might be attributed to the use of DMF as solvent and prolonged reaction time. Nevertheless, both the synthetic approaches were found to be competent in yielding the title compounds. The comparison of two methods is depicted in Table 1.

2.1.2. Characterization of the synthesized compounds by spectral methods

The structural elucidation of synthesized hybrids, TOT 1–15, was established using FT-IR, LCMS, <sup>1</sup>H, and <sup>13</sup>C NMR spectroscopic data. The FT-IR spectra of compounds **TOT 1–15**, revealed the presence of two sharp bands due to the carbonyl stretching vibration of the thiazolidinedione in the range of 1733–1758 cm<sup>-1</sup> and 1677–1700 cm<sup>-1</sup>. The peak in the range of 1310–1345 cm<sup>-1</sup> indicated C—O stretching in oxadiazole ring and the bands noticed at 2923–2932 cm<sup>-1</sup> and 3004–3015 cm<sup>-1</sup> were attributed to C—H stretching of methylene group between oxadiazole and thiazolidinedione rings. The <sup>1</sup>H NMR spectrum revealed two

singlets at 5.14-5.17 ppm and 7.96-8.23 ppm for CH<sub>2</sub> protons bound to

Table 1
Comparison of two methods used for the synthesize of TOT 1-15.

Compound	Method 1			Method 2				
	Time (h)	Temp. (C)	Yield (%)	Purity (TLC)	Time (h)	Temp. (C)	Yield (%)	Purity (TLC)
TOT-1	5	75–80	70	>98	12	RT	95	>85
TOT-2	6	75–80	60	>98	12	RT	90	>85
TOT-3	6	75-80	70	>98	12	RT	95	>85
TOT-4	6	75–80	65	>98	12	RT	95	>85
TOT-5	5	75–80	30	>98	12	RT	90	>85
TOT-6	5	75–80	40	>98	12	RT	90	>85
TOT-7	5	75-80	60	>98	12	RT	90	>85
TOT-8	6	75–80	40	>98	12	RT	90	>85
TOT-9	6	75–80	50	>98	12	RT	95	>85
TOT-10	5	75–80	70	>98	12	RT	95	>85
TOT-11	5	75–80	80	>98	12	RT	95	>85
TOT-12	5	75–80	80	>98	12	RT	95	>85
TOT-13	6	75–80	20	>98	12	RT	90	>85
TOT-14	6	75–80	30	>98	12	RT	90	>85
TOT-15	6	75–80	40	>98	12	RT	90	>85

the oxadiazole ring and the thiazolidindione ring, and = C—H of aldehyde attached to thiazolidindione ring, respectively. The study of  $^{13}\text{C}$  NMR spectrum indicated two distinct peaks due to CH $_2$  and = C—H carbons at 35.1–36.4 ppm and 159.5–161.5 ppm, as well as two carbonyl peaks at 166.6–167.5 and 164.7–165.4 ppm, respectively. Rest of the carbons were resonated as expected. The mass spectra of compounds showed the molecular ion peak according to their respective molecular masses of compounds. Thus, mass spectral data confirmed the proposed formulae of compounds.

#### 2.2. X-ray crystallographic studies

Single crystals of the intermediate TOT were obtained by slow evaporation of its dichloromethane solution. From X-ray crystallographic data, it was observed that **TOT** crystal belonged to the monoclinic crystal system with a space group of  $P2_1/c$ . The unit cell parameters of TOT were as follows:  $a = 14.9294(6) \AA$ ,  $b = 4.9313(2) \AA$ ,  $c = 16.8470(7) \AA$  and  $\alpha = \gamma = 90^{\circ}$ ,  $\beta = 105.434(3)^{\circ}$ . The complete crystallographic details are given in Table 2. The ORTEP image of

**Table 2** X-ray crystallographic data of TOT and structural refinement.

Chemical formula	$C_{10}H_7N_3O_3S_2$

compound TOT with 50 % probability is shown in Fig. 3. The crystal structure has been deposited at the Cambridge Crystallographic Data Centre (deposition number: CCDC 2262173).

Four molecules were packed in a unit cell and it crystallized in centro symmetric lattice. Weak intermolecular hydrogen bonds existed between both hydrogen atoms of methylene group and nitrogen atom of oxadiazole ring with a bond distance of 2.697 and 2.653 \AA. Another hydrogen bond between sulphur atom of thiazolidine-2,4-dione ring and hydrogen atom of the other thiazolidine-2,4-dione ring with a bond distance of 2.915 \AA was observed. The intermolecular hydrogen bonds between the molecules are embodied in Fig. 4. From the crystallographic data, it was evident that the molecule was not planar in space, the plane of thiazolidine-2,4-dione ring making a dihedral angle of 84.52° with the plane of 1,3,4-oxadiazole.

#### 2.3. Biological evaluation

#### 2.3.1. Cell cytotoxicity (MTT) assay

MTT colorimetric evaluation was used to assess the in vitro anticancer activity of all synthesized compounds (TOT 1-15) against MCF-7 (human breast adeno carcinoma) cell line. Epirubicin hydrochloride was used as a standard. The corresponding IC50 values were tabulated in Table 3. Among the studied compounds, TOT 12 to15 surpassed the IC<sub>50</sub> value of epirubicin hydrochloride (6.78 µg/mL) with  $IC_{50}$  values of 5.57, 6.53, 4.83, and 5.57 µg/mL against MCF-7 cell lines, respectively. The remarkable activity of these compounds might be attributed to the presence of electron withdrawing groups at ortho and/ or meta position of phenyl ring. However, the analogous functionalities at para position of the phenyl group did not make a significant contribution towards the activity. Further, the di substitution of an electronwithdrawing halogen at the ortho and meta positions of the phenyl ring might also be a contributing factor for TOT 14's higher potential. Additionally, compounds TOT-2, 7 and 8 also showed good to moderate activity with respect to that of the standard. These findings demonstrated that the hybrid molecules showed synergistic effects for cell cytotoxicity (MTT) action. Fig. 5 represents the pictorial representation of MTT assay results for compounds TOT 1-15 and epirubicin hydrochloride against MCF-7 cell lines.

#### 2.3.2. ROS production in MCF-7 cells with certain TOT derivatives

Reactive oxygen species (ROS) at physiological levels are essential signalling molecules that regulate a variety of biological processes, altering host defence, gene expression, and cell proliferation [28]. The results of MTT assay revealed that TOT 12–15 exhibited the strong anticancer effect on MCF-7 breast cancer cells. The fluorescence intensity for MCF-7 cells with and without TOT 12–15 was measured, and the fluorescence intensity upon irradiation with aforementioned

Fig. 3. ORTEP image of TOT by X-ray molecular structure with 50% probability.

Fig. 4. Green dotted lines represent intermolecular hydrogen bonding (weak).

Table 3
In vitro anticancer activity of TOT 1–15.

Compound	IC <sub>50</sub> (μg/mL)
TOT-1	>25
TOT-2	$10.93\pm1.05$
TOT-3	$18.43\pm1.07$
TOT-4	$19.27\pm1.10$
TOT-5	$20.19\pm1.14$
TOT-6	>25
TOT-7	$9.98 \pm 0.99$
TOT-8	$11.04\pm0.95$
TOT-9	>25
TOT-10	>25
TOT-11	$23.67\pm0.95$
TOT-12	$5.52\pm1.00$
TOT-13	$6.53\pm1.25$
TOT-14	$4.83\pm1.30$
TOT-15	$5.57\pm0.79$
Epirubicin hydrochloride (Standard)	$6.78\pm1.10$

compounds and CellROX Deep Red was appreciably increased (Fig. 6). This indicated that the quantity of ROS produced in TOT 12–15 treated MCF-7 cells was greater than that in unincubated MCF-7 cells. MCF-7 cells treated with TOT 12–15 were bulged compared to control due to increase in ROS production indicating that the synthesized compounds were able to eradicate cancer cells. The increased concentration of ROS

Fig. 5. MTT assay of synthesised compounds TOT 1-15 with epirubicin hydrochloride for MCF-7 cell lines (Anticancer activity).

indicated that the compounds TOT 12–15 acted on MCF-7 cell lines by triggering the intrinsic apoptotic pathway [29]. The percentage of relative ROS increased cells in compounds with respect to control is shown in Fig. 7.

#### 2.3.3. Cellular uptake and confocal fluorescence assay

Cellular uptake plays an important role in a drug's bioactivity so that internalization and accumulation of the drug into cancer cells is crucial for the therapeutic effect against tumours. For this reason, the *in vitro* cellular uptake behaviour of compounds TOT 12–15 in MCF-7 cell lines was largely investigated using laser scanning confocal microscope to confirm whether they could be efficiently internalized into tumour cells. Green fluorescence was noticed in MCF-7 cells after 2 h of treatment with compounds TOT 12–15, as illustrated in Fig. 8. This suggested effective internalization of compounds. The observed fluorescence inside the cells was considerably increased in compounds TOT 12 and 14 compared to that in TOT 13 and 15, demonstrating that compounds TOT 12 and 14 had a significant rise in green emission indicating effective internalization. These compounds showcased the damage in cytoplasm and exhibited good anticancer activity.

#### 2.3.4. Assay for electrophoretic mobility shift of pUC19-DNA

An electrophoretic mobility shift assay (EMSA) was used to analyse

Fig. 6. Deep red staining fluorescence pictures. ROX-L: Incubate cells for 1 h in the dark with Cell ROX Deep Red, then irradiate (532 nm, 1 min, 20 mW/cm<sup>2</sup>); TOT 12,13,14,15 + ROX-L: Co-incubate cells for 1 h in the dark with TOT 11, 12, 13, 14, 15, and Cell ROX Deep Red, then irradiate (532 nm, 1 min, 20 mW/cm<sup>2</sup>).

Fig. 7. The percentage of relative ROS raised cells in compounds TOT 12, 13, 14, 15 and the control.

Fig. 8. Intracellular fluorescence images of compounds in MCF-7 cells after incubating with TOT 12, 13, 14, 15 (5 µM) via confocal fluorescence imaging.

the influence of the synthesized compounds on the characteristics of plasmid DNA. In general, the compound of interest was exposed to plasmids of supercoiled DNA. Single-strand breaks induced the production of open circular DNA (oc-DNA), whereas double-strand breaks resulted in the formation of linear DNA, both of which might be distinguished from super coiled DNA (sc-DNA) by gel electrophoresis

#### [30].

By quantifying the sc and oc agarose gel DNA bands, it was possible to assess the generation of oc-DNA by treatment with NiCl $_2$ /H $_2$ O $_2$  and its suppression by the chosen TOT derivatives (Fig. 9). While treatment with the ethidium bromide, a positive intercalating control, inhibited the synthesis of oc-DNA by less than 50 %. The more suppression of oc-DNA production by TOT derivatives was seen for compound TOT 13&14, indicating that the compounds under study have interacted with DNA.

#### 2.4. Binding studies

DNA is a physiologically important macromolecule that plays an important part in cellular advancement such as replication, transcription, and translation. These pathways are critical for cell survival and growth. As a result, cellular DNA is the most significant pharmacological target of a variety of medications. So, DNA-drug interaction studies are extremely useful and necessary for the development of innovative and more effective medications with fewer adverse effects [31,32]. TOT-14, a more potent anticancer agent among the synthesized compounds, was selected to comprehend the interaction with ct-DNA.

# 2.4.1. Interaction of TOT-14 with ct-DNA using fluorescent probe ethidium bromide (EB) as a probe

Fluorescence spectroscopy is useful and efficient tool for the investigation of a small molecule-DNA binding. Since, ct-DNA shows only weak fluorescence, we used a well-known fluorescence probe, EB. EB intercalates into ct-DNA base pairs, increasing the intensity of ct-DNA emission. The addition of **TOT-14** resulted in a substantial decrease in the emission intensity of ct-DNA-EB without a shift in the emission wavelength suggesting the change in the environment around ct-DNA.

$$F_0/F = 1 + K_{sv}[Q] = 1 + K_q \tau_0[Q] \tag{1}$$

where, F and F<sub>0</sub> are the fluorescence intensities in the presence and absence of a quencher,  $K_{sv}$  is the Stern–Volmer quenching constant,  $K_q$  is the bimolecular quenching constant,  $\tau_0$  is the average lifespan of the fluorophore in the absence of a quencher and [Q] is the concentration of the quencher.

#### 2.4.2. Evaluation of binding constant

The determination of binding constant of a drug-macromolecule system offers information on the binding affinity of a specific drug towards that macromolecule. The binding constant (K) of **TOT-14**-ct-DNA-EB system and the number of **TOT-14** molecules (n) per ct-DNA base pair in the interaction were calculated using the following equation:

$$log(F_0 - F)/F = logK + nlog[Q]$$
(2)

The intercept and slope of the log  $[(F_0-F)/F]$  vs. log [Q] plot yielded the values of K and n, respectively and the relevant values are given in Table 4. TOT-14 showed a moderate binding with ct-DNA as evident from K value which is in the order of  $10^3$ . The value of n near to unity suggested that each combination had one independent class of binding

Fig. 9. Treatment of pUC19 DNA with NiCl $_2$ /H $_2$ O $_2$  and ethidium bromide. Agarose gel electrophoresis was used to find the pUC plasmid DNA that was super coiled (SC) and open circular (OC). Lane 1: pUC19 DNA was treated for 1 h with 50  $\mu$ M NiCl $_2$  and 0.5 mM H $_2$ O $_2$ , then for 1 h with 2 mM ethidium bromide. Lane 2–5: After being incubated with NiCl $_2$ /H $_2$ O $_2$  for 1 h, pUC 19 DNA was treated with 2 mM of TOT-12, 13, 14, 15.

System	K, 10 <sup>3</sup> (Lmol <sup>-1</sup> )	$K_{\rm sv,} 10^6  ({\rm Lmol}^{-1})$	$K_q$ , $10^{15}$ (Lmol $^{-1}$ s $^{-1}$ )	
TOT 14-CtDNA	4.25	4.00	4.96	

sites on ct-DNA. The fluorescence spectra and Stern-Volmer plot for ct-DNA-TOT-14-EB are illustrated in Fig. 10.

#### 2.5. Molecular docking studies

To investigate the mechanism of anticancer activity and detailed intermolecular interactions between the synthesized compounds, molecular docking studies were performed on the binary and ternary crystal structures of a novel inhibitor of 17 beta-HSD type 1, a lead compound for breast cancer therapy (PDB ID 3HB5, 2.00 Å X-ray resolution) [33] using the Surflex-dock programme of sybyl-X 2.0 software. All the inhibitors were docked into the active site of enzyme as shown in Fig. 11A and B. The predicted binding energies of the compounds are listed in Table 5. The docking study revealed that all the compounds have showed good docking score against *breast cancer protein*.

As depicted in Fig. 12(A-C), compound TOT-13 makes three hydrogen bonding interactions at the active site of the enzyme (PDB ID: 3HB5). Among these an interaction was through nitrogen atom present at 4th position of 1,3,4-oxaidazole ring with hydrogen atom of ASN152 (-N——H-ASN152, 2.34 Å), oxygen atom present at the 2nd position of thiadiazolidine-2,4-dione ring makes two interactions with hydrogen atoms of SER142 and GLY144 (O——H-SER142, 2.70 Å; O——H-GLY144, 2.05 Å).

As depicted in Fig. 13(A-C), compound TOT-4 makes three hydrogen bonding interactions at the active site of the enzyme (PDB ID: 3HB5). Among these an interaction was through nitrogen atom present at 4th position of 1,3,4-oxaidazole ring with hydrogen atom of ASN152 (-N——H-ASN152, 2.30 Å), oxygen atom present at the 2nd position of thiadiazolidine-2,4-dione ring makes two interactions with hydrogen atoms of SER142 and GLY144 (O——H-SER142, 2.75 Å; O——H-GLY144, 2.04 Å). The interaction of epirubicin with protein active sites shows ten bonding interactions and the docked view of the same has been depicted in Fig. 14(A-C). Fig. 15(A&B) represents the hydrophobic and hydrophilic amino acids which are surrounded to the studied compounds TOT 13 & 4.

All the compounds showed consensus score in the range of 7.15–5.01, indicating the summary of all forces of interaction between ligands and the protein. We noticed that the studied compounds have shown similar type of interactions with amino acid residues (ASN152, SER142 and GLY144) as that of epirubicin drug. These scores indicated that the molecules preferentially bound to protein in comparison to the reference drug, epirubicin hydrochloride (Table 5). Thus, TOT 1-15 compounds are proposed to exhibit epirubicin type biological activity.

#### 2.6. ADME studies

The Lipinski analysis makes use of physico-chemical characteristics to forecast how much an oral medicinal agent would resemble a medication. This rule-of-five illustrates how physico-chemical and pharmacokinetics indices are related. According to Lipinski's rule, an orally active drug-like compound should not have more than one infraction of the following standards: molecular weight not exceeding 500 Da, octanol—water partition coefficient (log P) not exceeding 5, hydrogen bond donors not exceeding 5, and hydrogen bond acceptors not exceeding 10 [34]. All the synthesized compounds, TOT 1–15 followed Lipinski rule of five. Therefore, they have the potential to be developed into medications that can be taken orally. Table 6 consists of some important physico-chemical characteristics of synthesized compounds.

Fig. 10. A: Fluorescence spectra of ct-DNA-EB in the presence and absence of TOT 14 (1.32–11.88  $\mu$ M). The concentration of ct-DNA (5.20  $\mu$ M). B: Stern- Volmer plot for ct- DNA-EB in the presence of compound TOT-14.

<sup>&</sup>lt;sup>a</sup> C Score (Consensus Score) integrates a number of popular scoring functions for ranking the affinity of ligands bound to the active site of a receptor and reports the output of total score.

#### 3. Conclusions

Thiophene-1,3,4-oxadiazole-thiazolidine-2,4-dione hybrids were synthesized in high yields using the Knoevenagel condensation method.

IR,  $^1\mathrm{H}$  NMR,  $^{13}\mathrm{C}$  NMR and mass spectral data were used to characterize the synthesized molecules. Single crystals of the intermediate compound, TOT were developed and its crystallographic data was collected and refined to deduce the structure of compound. The findings of

Fig. 12. Docked view of the compound TOT-13 at the active site of the enzyme PDB: 3HB5.

Fig. 13. Interaction of the compound TOT-4 at the binding site of the enzyme (PDB ID: 3HB5).

anticancer activity of novel derivatives (TOT 1–15) against MCF-7 breast cancer cell lines demonstrated that the series' TOT-14 (IC $_{50}$ : 4.83 µg/mL), TOT-12 (IC $_{50}$ : 5.52 µg/mL), TOT-13 (IC $_{50}$ : 6.53 µg/mL), and TOT-15 (IC $_{50}$ : 5.57 µg/mL) compounds could be considered as promising anticancer agents. The cytotoxicity results revealed that all of the synthesized compounds showed reduced toxicity. Further, the findings showed that the increased capacity of cancer cell lines to generate ROS

explained the selective photocytoxicity to tumour cells. The results of *in vitro* cellular uptake behaviour of compounds **TOT 12**, **13**, **14** and **15** in MCF-7 cell lines described that compounds **TOT 12** and **14** had a significant rise in green emission indicating effective internalization. The outcome of DNA studies revealed the more suppression of oc-DNA production by **TOT** derivatives for compound **TOT 13&14**, indicating that the compounds under study have interacted with DNA. The more

Fig. 15. A) Hydrophobic amino acids surrounded to compounds TOT-13 (green colour) and TOT-4 (cyan colour). B) Hydrophilic amino acids surrounded to TOT-13 and TOT-4.

potent anticancer agent, TOT-14 among the synthesized compounds was selected to study the interaction with ct-DNA using fluorescence spectroscopy under physiological conditions. The addition of TOT-14 resulted in a substantial decrease in ct-DNA-EB emission intensity without a shift exhibiting moderate binding with ct-DNA. Molecular docking investigations showed hydrogen bonding interactions with the target protein. TOT 1–15 compounds potency, selectivity and minimal cytotoxicity led to increased anticancer progress. Molecular docking studies revealed that TOT derivatives have substantially identical docking scores to common chemotherapeutic drug, epirubicin hydrochloride. Thus, the synthesized TOT 1–15 compounds met the expectations for drug-likeness and ADME.

#### 4. Experimental section

#### 4.1. Materials and methods

All the starting materials and reagents were of analytical grade and were purchased from Spectrochem, sd-fine, TCI, Sigma Aldrich and HiMedia (India) and used without further purification.  $^1\mathrm{H}$  and  $^{13}\mathrm{C}$  NMR spectra were recorded in CDCl<sub>3</sub>, DMSO- $d_6$  and dichloromethane (DCM) on a 400 MHz FT-NMR Spectrometer (JEOL JNM-EC400S). Chemical shifts ( $\delta$ ) were reported in ppm relative to TMS, whereas coupling constants (J) were given in Hz. IR spectra were obtained on a Nicolet, 5700 FT-IR spectrophotometer using KBr optics. Mass spectra were recorded on a Waters Xevo G2-XS QT (LC-MS/ESI-MS). Bruker SMART APEX II diffractometer was used to generate high resolution X-ray diffraction data.

**Table 6**Swiss ADME's prediction of the physico-chemical characteristics of TOT derivatives.

**MF**- Molecular Formula; **MW**- Molecular Weight; **RB**-Number of Rotatable Bonds; **HBA**- Number of H-bond Acceptor; **HBD**- Number of H-bond Donor; **LogP**- partition coefficient between *n*-octanol and water; **BS**- Bioavailability Score; **TPSA**- topological polar surface area; **LV**- Lipinsk's Violation.

#### 4.2. Chemistry

As depicted in Scheme 1, thiophene-2-carbohydrazide is used as a starting material to prepare the key intermediate 2-(chloromethyl)-5-(thiophen-2-yl)-1,3,4-oxadiazole (TO) via two steps i.e, amidation and cyclization according to the reported procedures [35]. Final products were obtained by two different methods. In method-1, TO was coupled with potassium salt of thiazolidi-2,4-dione(TZD) to give 3-((5-(thiophen-2-yl)-1,3,4-oxadiazol-2-yl)methyl)thiazolidine-2,4-dione (TOT). Further, various substituted aldehydes were used to obtain final products (TOT 1-15) via Knoevenagel condensation and by-product N-(((Z)-(2-oxo-2-(thiophen-2-yl)ethyl)diazenyl)methylene)piperidine-1-carboxamide (BS). In Method-2, primarily different substituted aldehydes were treated with thiazolidinedione (TZD) through Knoevenagel condensation. Further, various aldehyde derivatives of TZD were coupled with TO to get final products TOT 1–15. All the TOT derivatives were characterized by IR, <sup>1</sup>H NMR, <sup>13</sup>C NMR and mass spectra. Structure of TOT was confirmed by single crystal XRD. Purity of analogues was determined to be above 95 % by liquid chromatography mass spectrometry.

#### 4.2.1. Synthesis of N'-(2-chloroacetyl) thiophene-2-carbohydrazide (2)

Thiophene -2-carbohydrazide (10 mmol, 1.42 g) was dissolved in ethyl acetate (20 mL) and chloroacetylchloride (10 mmol, 0.80 mL) was added slowly. The reaction mixture was stirred at room temperature for 1 h where pale pink precipitate was formed. After completion of the reaction, the product was filtered and dried. Melting point: 68–70 °C.

# 4.2.2. Synthesis of 2-(chloromethyl)-5-(thiophen-2-yl)-1,3,4-oxadiazole (TO)

Compound 2 was heated at 40  $^{\circ}$ C with phosphorus oxychloride for 2 h. Excess of POCl<sub>3</sub> was recovered by distillation and the reaction mixture was cooled to room temperature. The reaction mixture was then quenched with ice and stirred continuously to get the solid product (**TO**). It was further filtered and dried. Melting point: 70–72  $^{\circ}$ C.

# 4.2.3. General procedure for the synthesis of 3-((5-(thiophen-2-yl)-1,3,4-oxadiazol-2-yl)methyl)thiazolidine-2,4-dione aldehyde derivatives (TOT 1-15)

Method -1.

To a solution of TO (5 mmol, 1.0 g) in DMF (5 mL), potassium salt of thiazolidin-2,4-dione (TZD) (5 mmol, 0.77 g) was added and heated to about 60  $^{\circ}$ C for an hour. After completion of reaction, the mixture was quenched with water and product was extracted with dichloromethane. The organic layer was dried over anhydrous sodium sulphate, filtered and concentrated under reduced pressure to obtain 3-((5-(thiophen-2-

yl)-1,3,4-oxadiazol-2-yl)methyl)thiazolidine-2,4-dione (TOT).

Pale Yellow solid; Yield: 90 %; mp: 88–90 °C. FT-IR (KBr, cm<sup>-1</sup>) 3099 (Ar C—H), 1758, 1676 (C—O), 1601(C—C), 1494, 1575(C—N), 3004, 2967 (C—H, methylene),1038, 750, 713 (C—S)1339 (C—O); <sup>1</sup>H NMR (400 MHz, DMSO-D6)  $\delta$  7.92 (d, J = 4.9 Hz, 1H), 7.75 (d, J = 3.1 Hz, 1H), 7.25 (t, J = 4.3 Hz, 1H), 4.98 (s, 2H), 4.29 (s, 2H). <sup>13</sup>C NMR (101 MHz, DMSO-D6)  $\delta$  172.2, 171.6, 161.4, 161.1, 132.4, 131.1, 129.3, 124.4, 35.9, 34.6. Mass calculated for  $C_{10}H_7N_3O_3S_2$  is 280.9929; LCMS (ES + ) m/z: 282.0255[M + H<sup>+</sup>].

Substituted aldehyde (1 mmol) with **TOT** (1 mmol, 0.15 g) in EtOH (5 mL) with catalytic amount of piperidine was refluxed for  $6-12\,h$  to get derivatives of **TOT**.

#### Method- 2

Synthesis of aldehyde derivative of TZD: To a solution of TZD (10 mmol) and different aldehyde (10 mmol) in EtOH (10 mL), catalytic amount of piperidine was added slowly at room temperature. The reaction mixture was refluxed for 12 h with stirring. The completion of the reaction was monitored by TLC. After completion of the reaction, the mixture was poured to water and then sodium meta bisulphite was added to remove excess of aldehyde. Thus, the obtained solid was then filtered and dried.

To a stirred solution of aldehyde derivative of TZD (5 mmol) in DMF (5 mL),  $K_2CO_3$  (5 mmol) was added and heated to 40  $^{\circ}C$  for 1 h. To this, TO (5 mmol) was added and continued heating for another 1 h. Further, the reaction mixture was stirred for 12-24 h at room temperature to obtain the product.

4.2.3.1. *Z*)-5-(4-methoxybenzylidene)-3-((5-(thiophen-2-yl)-1,3,4-oxadiazol-2-yl)methyl)thiazolidine-2,4-dione (TOT-1). Yellow solid; Yield: 85 %;mp: 171–173 °C. #### 4.3. Single crystal X-ray crystallographic studies

X-ray crystallographic data was collected on a Bruker APEX-II CCD X-ray diffractometer. The structural analysis was performed on a computer with the SHELXT 2018/2 [36], SHELXL 2018/3 [37] and Olex 2 1.5 [38] program package. Monochromated (doubly curved silicon crystal)  $M_o$ - $K_\alpha$  radiation (0.7107\AA) from a sealed microfocus tube was used to evaluate intensity. The generator was tuned to 50 kV and 1 mA. Six sets of Omega scans at various Phi values were used to obtain data. The breadth of the frame was 0.5°. For preliminary unit cell determination, the APEX2 software was employed. SAINT was used for the determination of integrated intensities and unit cell refinement. SADABS was used to adjust the data for absorption effects using the multi-scan approach [39]. The structure was resolved using ShelxT in the Olex 2.0 [38] package and polished using full-matrix least squares based on  $F^2$  in ShelxL [40]. CCDC 2221637 contains the supplementary crystallographic data for the said compound.

#### 4.4. Biological evaluation

#### 4.4.1. Cell growth

MCF-7 (human breast cancer cell line) was cultured in Dulbecco's Modified Eagle Medium (DMEM) containing 10 % fetal bovine serum, 100 µg/mL penicillin and 100 µg/mL streptomycin antibiotics. The cells were incubated under 5 % CO $_2$  at 37 °C. After the cells grew well, the logarithmic growth phase cells were digested with trypsin to prepare the cell suspension for further biological assays. TOT 12–15 were placed at 24 °C upon dissolving in dimethyl sulphoxide (DMSO) at storage concentration.

#### 4.4.2. Cell cytotoxicity (MTT) assay

Using the MTT assay (3-(4, 5-dimethylthiazol- 2-yl)-2, 5-diphenylte-trazolium bromide), the human breast cancer cell lines (MCF-7) were

seeded in 96 wells plate containing 100  $\mu$ L of DMEM (high glucose) medium, and allowed to grow. After 2 days, 100, 75, 50 and 25  $\mu$ g/mL of sample were dissolved in 500  $\mu$ L of 80 % chloroform and 20 % methanol. Then, these cells were treated with varying doses of samples and observed after 4 h. 10  $\mu$ L of MTT reagent was added to the 96 wells plate and left for 3 to 4 h. After that, the medium was removed from 96 wells plate and 50  $\mu$ L of 100 % DMSO was added to each well and shaken for 10 s. Then, absorbance was measured at 570 nm using a multi-well plate reader. Each concentration was repeated in three wells and the same experimental conditions were maintained for all testing procedures. The MTT assays were repeated three times for each cell line. The results were expressed as IC50 values (mean, n = 3) with standard deviation, which was defined as the concentration at which 50 % survival of cells was discerned. Epirubicin hydrochloride was co-assayed as positive control.

#### 4.4.3. Cellular uptake and confocal fluorescence imaging of MCF-7 cells

Cellular uptake assay was carried out to investigate the mechanism of cytotoxicity in cancer cells. MCF-7 cells was cultured in DMEM medium supplemented with 10 % fatal bovine serum (FBS) in an atmosphere of 5 %  $\rm CO_2$  and 95 % air at 37 °C [41]. Before imaging, the cells were incubated with RPMI-1640 containing **TOT 12, 13, 14 and 15** in the dark at 37 °C for incubation time (2 h). The fluorescence images of **TOT 12, 13, 14 and 15** incubated cells were collected upon excitation at 460 nm with an emission band path of 400–600 nm. All of the images were captured using a Zeiss LSM710 laser scanning confocal microscope.

#### 4.5. Steady state fluorescence quenching spectral measurements

A stock solution of TOT-14 (5 mM) was prepared by dissolving the appropriate amount of it in DMSO and diluted with millipore water to get a concentration of 100  $\mu M$ . A stock solution of ct-DNA was prepared by dissolving ct-DNA in phospate buffer (pH 7.4). A stock solution of ethidium bromide solution (250  $\mu M$ ) was prepared. The purity of ct-DNA was determined by comparing the absorbance at 260 nm to that at 280 nm. This ratio was determined to be 1.86, suggesting that the ct-DNA was adequately protein-free. The concentration of ct-DNA was determined spectrophotometrically at 260 nm using a molar extinction coefficient of 6600 L mol $^{-1}$  cm $^{-1}$  [42]. All of the chemicals utilised were of analytical quality.

All fluorescence spectra were recorded on a Agilent Technologies Carry Eclipse fluorescence spectrophotometer equipped with a Xenon flash lamp and a Cary single cell peltier to maintain the constant temperature. The excitation and emission slit widths was set at 5 nm.

#### 4.6. Molecular docking

Molecular docking was used to clarify the binding mode of the compound to provide straight forward information for further structural optimization.

Binary and ternary crystal structures of a novel inhibitor of 17 beta-HSD type 1, a lead compound for breast cancer therapy (PDB ID 3HB5, 2.00 Å X-ray resolution) was extracted from the Brookhaven Protein Database (PDB http://www.rcsb.org/pdb). The proteins were prepared for docking by adding polar hydrogen atom with Gasteiger-Huckel charges and water molecules were removed. The 3D structure of the ligands was generated by the SKETCH module implemented in the SYBYL program (Tripos Inc., St. Louis, USA) and its energy-minimized conformation was obtained with the help of the Tripos force field using Gasteiger-Huckel [43] charges and molecular docking was performed with Surflex-Dock program that is interfaced with Sybyl-X 2.0. [44] and other miscellaneous parameters were assigned with the default values given by the software.

#### **Declaration of competing interest**

The authors declare that they have no known competing financial

interests or personal relationships that could have appeared to influence the work reported in this paper.

#### Data availability

Data will be made available on request.

#### Acknowledgements

The authors would like to thank the SAIF and USIC of Karnatak University in Dharwad for instrumental facilities. One of the authors expresses gratitude to the DST-KSTePs, Govt. of Karnataka, for awarding the Fellowship to carry out the research work. Thanks are also due to Dr. Satish Bhat, Department of Chemistry, Karnatak University, Dharwad for his insightful conversation and discussion on the X-ray crystallographic data. We gratefully acknowledge Dr.Avinash Prakash, Alekya Agro Solutions, Mysore, for biological studies. The supplemental crystallographic data for the compound TOT was deposited in CCDC 2262173, which could be downloaded for free from the Cambridge Crystallographic Data Centre, www.ccdc.cam.ac.uk/data\_request/cif.

#### Appendix A. Supplementary data

Supplementary data to this article can be found online at https://doi.org/10.1016/j.bioorg.2023.107003.

# Fluorenone—thiazolidine-4-one scaffolds as antidiabetic and antioxidant agents: design, synthesis, X-ray crystal structures, and binding and computational studies†

Manasa A. Doddagaddavalli, Veerendra Kumar A. Kalalbandi, T. R. Ravi Naik, Shrinivas D. Joshi<sup>d</sup> and Jaldappagari Seetharamappa \*\*

Using 2-(9H-fluoren-9-ylidene)hydrazinyl)thiazol-4(5H)-one and substituted benzaldehydes, a new library of fluorenone—thiazolidine-4-one scaffolds (**5a–u**) were synthesized and characterized using FT-IR,  $^1H$  NMR,  $^{13}C$  NMR and mass spectral data. Single crystals of compound **5s** were developed and crystallographic data were collected. Hirshfeld surface evaluation was used to investigate the intermolecular interactions that exist within the crystals. The synthesized compounds were screened for *in vitro* antioxidant and anti-diabetic properties by DPPH scavenging activity and  $\alpha$ -glucosidase inhibition, respectively. Compounds **5a–l** exhibited promising DPPH scavenging activity. Compound **5l** showed an IC<sub>50</sub> value of 27.70  $\pm$  0.8  $\mu$ M, which is 4.25-fold greater as compared to that of the standard, gallic acid (an IC<sub>50</sub> value of 117.92  $\pm$  2.8  $\mu$ M). Compound **5g** exhibited good  $\alpha$ -glucosidase inhibition with an IC<sub>50</sub> value of 114.58  $\pm$  1.6  $\mu$ M, which is less than that of the standard inhibitor, acarbose, with an IC<sub>50</sub> value of 115.49  $\pm$  2.2  $\mu$ M. The mechanism of binding of compound **5g** with human serum albumin (HSA) and calf thymus DNA (Ct-DNA) was studied by fluorescence spectroscopy. Furthermore, the ADME properties of the designed compounds were studied using the SwissADME online tool. The molecular docking studies of the compounds were performed against acid- $\alpha$ -glucosidase, in complex with 1-deoxynoiirimycin (PDB ID: 5NN5).

#### Introduction

Diabetes mellitus (DM) is a chronic disease characterized by dyslipidemia and high blood sugar levels, which are primarily caused by environmental and hereditary factors. Additionally, there are two forms, *viz.*, insulin-dependent diabetes mellitus (IDDM) and non-insulin-dependent diabetes mellitus (NIDDM). NIDDM, often known as type 2 diabetes (T2DM), affects more than 90% of diabetic individuals. T2DM is presently incurable and is considered as deadly illness with a high prevalence of morbidity and disability. It can cause long-term

harmful effects on organs such as the kidneys, liver, eyes, nerves, heart, and veins. Some of these organs can even fail and may lead to death.<sup>2</sup>

The typical course of therapy focuses mostly on controlling and lowering the blood sugar level to return to the normal range. However, there are many approaches to control the effect of T2DM. The primary mechanisms in both conventional medicine and western medicine involve lowering of blood sugar levels by stimulating pancreatic  $\beta$ -cells, blocking hormones that increase blood sugar, enhancing the affinity and sensitivity of insulin receptors, reducing glycogen release, enhancing glucose utilization in many tissues and organs, eradicating free radicals, increasing resistance to lipid peroxidation, correcting lipid and protein metabolic disorders, and enhancing the general health.  $^3$ 

Feasting diets that are rich in carbohydrates could activate the high blood glucose level due to the rapid absorption of carbohydrates by the small intestine. This phenomenon is aided by the sugar hydrolysing enzymes such as  $\alpha$ -glucosidase which reside in the epithelial mucosa of the small intestine. One crucial therapeutic strategy to manage diabetes is to decrease postprandial hyperglycemia, which can be regulated

by prolonging the absorption of glucose by inhibition of the carbohydrate-hydrolyzing enzymes,  $\alpha$ -amylase and  $\alpha$ -glucosidase in the digestive tract.  $\alpha$ -Glucosidase is essential in hydrolyzing the 1,4- $\alpha$ -glucopyranoside bonds to harvest  $\alpha$ -glucose. The small intestine's ability to absorb carbohydrates could be delayed by inhibition of  $\alpha$ -glucosidase, which would also lower postprandial blood glucose levels. Additionally,  $\alpha$ -glucosidase inhibitors have been promoted as T2DM treatment medications. Consequently, it was proposed that one of the most promising strategies for the therapy of diabetes was the inhibition of the  $\alpha$ -glucosidase enzyme.

Thiazolidinones, which raise insulin sensitivity and improve glycemic control, are increasingly being used to treat T2DM. The heterocyclic compounds, namely, thiazolidine-4-one and its derivatives that contain a carbonyl group in the fourth position, are crucial components of many synthetic medications with a range of biological functions. For instance, thiazolidine-4-one-based hybrids I and II (Fig. 1) have been found to be powerful PPAR $\delta$  agonists and  $\alpha$ -glucosidase inhibitors for the treatment of T2DM. The widespread use of the thiazolidine-4-one ring, on the other hand, has exhibited a wide range of biological activities including anticancer, <sup>9-13</sup> antituberculosis, <sup>14</sup> antiviral, <sup>15</sup> antimicrobial, <sup>16</sup> antimycobacterial, <sup>17</sup> and anti-HIV. <sup>18,19</sup>

Furthermore, biologically active molecule hybridization is a potent drug discovery approach that has been used to treat a number of ailments. In this context, we have designed scaffolds of thiazolidine-4-one and fluorenone. Fluorenone is a polysubstituted benzene derivative that plays a significant role in the fields of medicinal chemistry and materials sciences. Fluorenone scaffolds are extensively found in a variety of physiologically significant compounds including antinociceptive, <sup>20</sup> anticancer, <sup>21</sup> antimicrobial, <sup>22</sup> antitubercular, <sup>23</sup> and antiviral <sup>24</sup> compounds. For instance, fluorenone based hybrids III and IV with anticancer and antitubercular activity, respectively, are given in Fig. 1.

To continue our investigation on the thiazolidine-4-one scaffold and in the light of the aforementioned results, we have

hybridised the biologically active compound thiazolidine-4-one with the fluorenone moiety in this study. The newly synthesized libraries of compounds (5a-5u) were characterized using FT-IR, <sup>1</sup>H NMR, <sup>13</sup>C NMR and mass (LC-MS) spectral data. Single crystals of compound 5s were developed and crystallographic data were collected. The said compound was crystallised in the triclinic space group of P1. It is hypothesized that the antidiabetic and antioxidant potentials of compounds are directly related. Research studies have demonstrated that the compound with a stronger glucose-lowering impact also had a high antioxidant capacity. We have compared the synthesized compounds' ability to inhibit  $\alpha$ -glucosidase activity with that of the standard, acarbose, and the DPPH radical scavenging activity to that of the standard, gallic acid. Furthermore, molecular docking studies are supportive in positioning the optimized 3D structure of a small ligand into a receptor structure in a variety of orientations, conformations, and locations. This strategy can be used to create novel and effective drugs. As a result, molecular docking studies of the more effective α-glucosidase inhibitor compounds were performed.

Studies on bioactive molecule-protein binding are crucial from a theoretical and practical perspective because they help us understand the processes underlying drug disposition and elimination, as well as how different pathological conditions or concurrent medications affect the drug delivery and its effectiveness. The primary plasma protein, human serum albumin (HSA), serves as a store and carrier for several endogenous (fatty acids, bilirubin, etc.) and exogenous (drugs, nutrients, etc.) compounds in the blood. The drug's ability to bind to HSA regulates its free, active concentration and may have a significant impact on its overall pharmacodynamic and pharmacokinetic characteristics. Understanding the characteristics of a bioactive compound and its mechanism of action in the body requires the investigation of the mechanism of binding between the ligand (5g) and serum albumin. So, the mechanism of interaction of 5g with HSA was studied using a fluorescence spectroscopic method.

The interaction of a bioactive compound with DNA is an important aspect of pharmacology. The binding study helps in the understanding of drug action and the development of efficient and precisely targeted medications with less adverse effects. Thus, with the interest in exploring the binding mechanism of the selected bioactive compound (5g) with calf thymus DNA (Ct-DNA), a fluorescence spectroscopic method was adopted.

#### Results and discussion

#### Chemistry

The procedure depicted in Scheme 1 was employed to synthesize the target and intermediate compounds.

9*H*-Fluoren-9-one (1) reacted with thiosemicarbazide in ethanol and a catalytic amount of acetic acid to yield 2-(9*H*-fluoren-9-ylidene)hydrazinecarbothioamide (2).<sup>25,26</sup> The structure of 2 was confirmed on the basis of spectral data where the IR spectrum of compound 2 showed bands at 1279, 3263 and

characterization of a methoxy substituted compound (5a) is discussed here. The FT-IR spectrum of 5a displayed bands at 3412 cm<sup>-1</sup> corresponding to N-H stretching, 1719 cm<sup>-1</sup> assignable to carbonyl (C=O) stretching, 1252 cm<sup>-1</sup> due to C-OCH<sub>3</sub> stretching and 1639 and 1606 cm<sup>-1</sup> assignable to C=N stretching. The <sup>1</sup>H NMR spectrum showed three characteristic peaks. The singlet peaks at 12.91, 7.64 and 3.80 ppm corresponded to -NH, =CH- (aldehydes) and -OCH<sub>3</sub> protons, respectively. The peaks around 7–9 ppm due to aromatic protons were observed. In <sup>13</sup>C NMR spectra, a peak attributed to methoxy carbon was observed at 55.83 ppm. The characteristic peak of the carbonyl group appeared at 167.79 ppm. The peaks attributed to benzene ring carbons were observed between 121.11 and 140.97 ppm. The peak observed at 142.1 ppm was attributed to =CHformed by the condensation of aldehydes and the methylene group of the thiazolidine-4-one ring. The peak at 163.01 ppm was assigned to the carbon of C=N in the fluorenone ring and the peak at 160.15 ppm was attributed to the carbon of C=N in the thiazolidine-4-one ring. Furthermore, the mass spectrum showed a molecular ion peak at m/z 412.09 corresponding to [M + 1] that confirmed the formation and purity of the compound. Similarly, the structures of all other derivatives were elucidated and the spectral data of the derivatives are given in the Experimental section.

#### X-ray crystallographic studies

Compound 5s was crystallized in the triclinic crystal system with a space group of  $P\bar{1}$  and the unit cell parameters were namely a = 9.5263 (4) Å, b = 10.9713 (6) Å, c = 11.9081 (6) Å,  $\alpha = 10.9713$  $67.572^{\circ}$  (2),  $\beta = 76.947^{\circ}$  (3) and  $\gamma = 83.014^{\circ}$  (3), and the unit cell volume was 1119.85 (10) Å3. The crystallographic refinement data of compound 5s are given in Table 1. The compound consisted of two molecules in the unit cell. The crystal structure was deposited at the Cambridge Crystallographic Data Centre (deposition number CCDC 2221637†).

The ORTEP view at 30% ellipsoidal probability of compound 5s is shown in Fig. 2. Intermolecular interactions were responsible for the formation of crystalline solids; particularly the classical and non-classical hydrogen bonds played a key role. The hydrogen bond geometrical parameters of compound 5s are presented in Fig. 3 and Table 2. Two intermolecular hydrogen bonds aid the structural stability of the molecule. One Hbond was observed at a bond distance of 2.833 Å between the hydrogen of the thiazolidine-4-one ring and the oxygen of ethanol (O2), while the other H-bond was observed at a distance of 2.849 Å between the hydrogen of the hydroxyl of ethanol (H2) and the oxygen atom of the carbonyl of the thiazolidine-4-one

ring (O1). Table 2 depicts the intermolecular hydrogen bonding characteristics. Bond lengths and bond angles of **5s** were found to be within typical limits. Furthermore, the phenyl ring of the indole group makes a dihedral angle of 16.24(1) with the phenyl ring of fluorenone.

#### Hirshfeld surface analysis

Using the crystal explorer 2.1 tool, a Hirshfeld surface study of compound  $5\mathbf{s}$  was performed to examine the strength and position of intermolecular interactions. <sup>29</sup> Various colours on the Hirshfeld surface, such as white, red and blue, were allocated based on the distance and interactions to the van der Waals radius. <sup>30</sup> Fig. 4 depicts the Hirshfeld surfaces of compound  $5\mathbf{s}$ , which have been mapped onto  $d_{\text{norm}}$  (Fig. 4a),  $d_i$  (Fig. 4b) and  $d_e$  (Fig. 4c).

Using fingerprint plot (FP) analysis, the effect of each intermolecular interaction on the stability of  $5\mathbf{s}$  crystals was predicted and the same is shown in Fig. 5. It was observed that the C···H/H···C (Fig. 5b) intermolecular interactions contributed 18.4%. The intermolecular interactions in O···H/H···O (Fig. 5c) and C···N/N···C (Fig. 5d) contributed 9.6% and 4.1%, respectively. The N···H/H···N (Fig. 5e) and C···S/S···C (Fig. 5f) interactions 3.3% and 3.0%, respectively.

# Biological activity

#### Antioxidant activity

The antioxidant properties of hybrids 5a-u were quantified by assessing their capacity to scavenge free radicals using

Fig. 4 Hirshfeld surface analysis of compound **5s** by (a)  $d_{\text{norm}}$ , (b)  $d_{\text{i}}$  and (c)  $d_{\text{e}}$  mapping.

2,2-diphenyl-1-picrylhydrazyl (DPPH). The findings recorded in Table 3 indicated that several of these synthesized compounds showed good antioxidant activity. With an IC50 value of 27.70  $\pm$  0.8  $\mu$ M, compound 5l displayed better DPPH radical scavenging activity which was 4.25-fold greater than that of gallic acid with an IC<sub>50</sub> value of 117.92  $\pm$  2.8  $\mu$ M. Compounds **5a–5k** showed significant activity with IC<sub>50</sub> values ranging from  $35.46 \pm 0.8$  to  $112.40 \pm 1.5$   $\mu$ M. Compounds 5m-5u exhibited moderate activity. In general, the aforementioned results suggested that the derivatives having substitution at ortho and para positions exhibited significant antioxidant properties compared to *meta* substituted derivatives. In particular, the electron withdrawing groups such as nitro, cyano and halogen groups at ortho and para positions showed good antioxidant properties, whereas the electron releasing groups such as methyl, hydroxyl and methoxy groups at ortho and para positions exhibited good activity but compounds with substituents at the *meta* position showed less antioxidant activity. The graph of DPPH radical scavenging activity versus each compound is given in Fig. 6.

#### Antidiabetic activity

Using acarbose as the positive control, the *in vitro* enzyme assay was used to evaluate the  $\alpha\text{-glucosidase}$  inhibitory activity of all the target compounds, fluorenone–thiazolidine-4-one molecular hybrids (5a–u). The  $\rm IC_{50}$  values of these compounds are shown in Table 3. Among these compounds, 5g exhibited better inhibition of the  $\alpha\text{-glucosidase}$  enzyme with an  $\rm IC_{50}$  value of 114.58  $\pm$  1.8  $\mu\text{M}$  which was closer to that of acarbose with an  $\rm IC_{50}$  value of 115.49  $\pm$  2.2  $\mu\text{M}$  while compounds 5h and 5t

NJC Paper

Fingerprint plot of the proportion of short-range action on the Hirshfeld surface in compound 5s

showed IC  $_{50}$  values of 118.66  $\pm$  1.7 and 116.45  $\pm$  1.9  $\mu M$ respectively. These findings indicated that the compounds with hydroxyl groups exhibited good antidiabetic activity. However, compound 5h displayed a modest decrease in the activity compared to 5g and 5t due to the presence of the bromo group adjacent to the hydroxyl group. Furthermore, compounds with electron withdrawing groups exhibited good to moderate αglucosidase inhibition. However, compound 5j also exhibited good to moderate activity though it has electron releasing groups among all the compounds. The graph of the  $\alpha$ glucosidase inhibition against each compound is recorded in Fig. 7.

#### Structure-activity relationship (SAR) studies

Various aldehydes (4a-u) which include substituted benzaldehydes (mono- and di-substituted) and heterocyclic benzaldehydes (1H-indole-3-carbaldehyde, thiophene-2-carbaldehyde and 10-ethyl-10H-phenothiazine-2-carbaldehyde) were used to synthesize compounds 5a-u. For DPPH radical scavenging activity, para-substituted aldehyde and disubstituted aldehyde containing compounds exhibited good activity compared to meta-substituted aldehyde containing compounds. Out of the three heterocyclic aldehyde derivatives, only phenothiazinecontaining derivative 51 showed promising activity. On the other hand, for  $\alpha$ -glucosidase inhibition activity, compounds with hydroxyl groups displayed good activity when compared to others. However, mono-halogen-substituted compounds exhibited appreciable inhibition but di-halogen-substituted compounds showed less inhibition. Even heterocyclic aldehyde containing compounds did not show any impact on inhibition. A schematic representation of the plausible SAR of the synthesized molecules is shown in Fig. 8.

#### **Binding studies**

Drug-protein interactions are critical because most medications are extensively and reversibly bound to serum albumin and are predominantly administered as a complex with protein. The form and extent of the drug-protein interaction have a significant influence on the drug's biological activity. The binding variables are significant in researching pharmaceutical pharmacology and creating dosage formulations. Since serum albumin is the major binding protein for pharmaceuticals and other physiological substances, we have utilized HSA as a model for the investigation of in vitro drug-protein interactions.31

#### Interactions of compound 5g with HSA

The best method to study the interaction of a bioactive compound with HSA is fluorescence spectroscopy because it is more sensitive compared to other optical techniques. The intrinsic fluorescence of HSA is caused by three amino acid residues, viz., tryptophan (Trp), tyrosine (Tyr), and phenylalanine (Phe). However, the fluorescence of HSA is almost contributed by Trp alone because Phe has a very low quantum yield while the fluorescence of Tyr is nearly completely quenched if it is ionised or located near an amino group or a carboxyl group. When small molecules bind to HSA, the intrinsic fluorescence intensity of HSA changes.<sup>32</sup> So, fluorescence spectra of HSA in the range of 300-500 nm were recorded upon excitation at 295 nm and in the presence and absence of compound 5g. To a fixed concentration of HSA (4.16 µM), varied amounts of compound 5g (0.66 to 8.58 µM) were successively added and the corresponding fluorescence quenching spectra of HSA were recorded and are shown in Fig. 9A.

#### Evaluation of the quenching mechanism and binding constant

The fluorescence quenching data can be used to calculate the binding characteristics of 5g-HSA, viz., the Stern-Volmer quenching constant, number of binding sites and binding constant. The following equation is used to calculate the Stern-Volmer quenching constant.

$$F_0/F = 1 + K_{SV}[Q] = 1 + K_q \tau_0[Q]$$
 (1)

where  $F_0$  and F are the fluorescence intensities in the absence and presence of the quencher,  $K_{\rm sv}$  is the Stern–Volmer quenching constant,  $K_{\rm q}$  is the bimolecular quenching constant and [Q] is the concentration of the quencher and  $\tau_0$  is the average lifetime of the fluorophore (HSA) in the absence of the quencher. It is known that the average lifetime of HSA without the quencher is in the order of  $1\times 10^{-9}$  s based on lifetime experiments. The Stern–Volmer plots of  $F_0/F$  versus [Q] are displayed in Fig. 9B. The values of  $K_{\rm sv}$  and  $K_{\rm q}$  are recorded in Table 4. The observed values of  $K_{\rm q}$  were higher than the bimolecular limiting diffusion rate constant of  $2.0\times 10^{10}\,{\rm M}^{-1}\,{\rm s}^{-1}$ , thereby confirming that the fluorescence of HSA was quenched by the static quenching mechanism. He is a static quenching mechanism.

The following equation was used to calculate the values of the binding constant (K) and the number of binding sites:

$$\log[(F_0 - F)/F] = \log K + n \log[Q] \tag{2}$$

NJC Paper

Fig. 7 Graph of IC50 values in  $\mu M$  of  $\alpha$ -glucosidase inhibition for compounds 5a-5u.

The binding constant of 4g-HSA was calculated from the intercept of the  $\log (F_0 - F)/F$  vs.  $\log[Q]$  plot and found to be  $1.01 \times 10^4 \,\mathrm{M}^{-1}$ . The value of n was obtained from the slope of the plot and calculated to be 0.861. This indicated that one molecule of compound 5g was bound to one HSA molecule.

#### Studies on binding of compound 5g with calf thymus DNA (ct DNA)

DNA is a well-known biomacromolecule with significant biological relevance since it is involved in the transcription and translation of genetic information in living cells. These are thought to be essential for cell survival and proliferation. Because of its biological significance, it is regarded as the most important pharmacological target for many drugs. A large number of tiny molecules bind to DNA. Conformational changes may occur in DNA as a result of binding. Studies on the interactions between drugs and DNA assist in comprehending the molecular basis of a drug's action and in developing innovative and effective drugs with fewer adverse effects and greater therapeutic results.35

#### Steady state quenching measurements

The concentration of ct-DNA was determined by recording absorbance at 260 nm and using a molar extinction coefficient (L M<sup>-1</sup> cm<sup>-1</sup>) of 6600. The purity of DNA was determined by comparing the absorbance at 260 nm to that at 280 nm. In the present study, the value of  $A_{260}/A_{280}$  was observed to be greater than 1.8, suggesting that the DNA was sufficiently free of protein. Since ctDNA is non-fluorescent, we have monitored the interaction of ctDNA with 5g using a well known fluorescent probe, ethidium bromide. To a fixed concentration of ctDNA (1.38 µM) and ethidium bromide (0.83 µM), various concentrations of 5g (0.6 to 6.0 µM) were added and fluorescence spectra in the range of 560-660 nm were recorded upon excitation at 510 nm. The corresponding results are shown in Fig. 10A.

The values of the Stern-Volmer quenching constant and binding constant were calculated from the intercept of the plots of  $F_0/F$  vs. [Q] and  $\log (F_0 - F)/F$  vs.  $\log[Q]$  respectively using equations 1 and 2. Fluorescence quenching and Stern-Volmer plots are given in Fig. 10A and B, respectively. The values of  $K_{\rm sy}$ ,  $K_q$ , K and n are tabulated in Table 4.

#### Circular dichroism studies

CD spectroscopy is commonly used to monitor the conformation and stability of proteins in solution. CD investigates the secondary structure of proteins because the peptide bond is asymmetric. Molecules lacking a plane of symmetry exhibit CD effects. CD offers highly accurate estimate of the percentage of  $\alpha$ -helices,  $\beta$ -sheets, and disorderly formed (random coil) residues in a protein structure. We have performed CD spectral investigations of HSA (2.08 µM) in the presence of different concentrations of compound 5g to understand the conformational changes brought about by compound 5g (1.98–5.94  $\mu$ M). The  $\alpha$ -helical structure of HSA was indicated by two peaks in the CD spectrum at 208 nm and 222 nm. CD spectra of HSA in the presence of compound 5g showed a modest drop at both wavelengths without a shift in the peak position, suggesting

the interaction between 5g and HSA. The unfolding of the peptide strand was controlled by the negative ellipticity point in the  $\alpha$ -helical content. Using information from the CD spectra of HSA in the presence of compound 5g, it was possible to determine the proportion of  $\alpha$ -helical content of HSA. In the present study, the  $\alpha$ -helicity of HSA decreased from 59.6% to 49.8% in the presence of 5g (0 to  $5.94~\mu M$ ) in phosphate buffer of pH 7.4. Furthermore, the shape of the CD curves remained nearly unchanged, indicating that the structure of HSA was

predominantly  $\alpha$ -helical even after binding to compound **5g**. Fig. 11 depicts the CD spectra of HSA in the presence and absence of different amounts of compound **5g**. The contents of the secondary structure of HSA in the presence and absence of **5g** are shown in Table 5.

#### Docking study of potent inhibitors

The crystal structure of human lysosomal acid-alphaglucosidase, GAA, in complex with 1-deoxynojirimycin (PDB ID: 5NN5) was obtained from the PDB (https://www.rcsb.org/pdb). The proteins were prepared for docking by adding polar hydrogen atoms with Gasteiger–Huckel charges and water molecules were removed. The 3D structure of the ligand was generated using the SKETCH module implemented in the SYBYL program (Tripos Inc., St. Louis, USA) and its energy-minimized conformation was obtained with the help of the Tripos force field using Gasteiger–Huckel charges. Molecular docking was performed using the Surflex-Dock program that is

Fig. 10 (A) Fluorescence spectra of ctDNA (a:  $1.38 \,\mu\text{M}$ ), ethidium bromide ( $0.83 \,\mu\text{M}$ ) in the absence and presence of compound **5g** (b–l: 0.6 to  $6.0 \,\mu\text{M}$ ) at 298 K and (B) Stern–Volmer plot for ctDNA in the presence of compound **5g**.

NJC Paper

Fig. 11 CD spectra of HSA in the presence of compound 5q. The concentration of HSA was kept constant (a: 2.08 µM) and that of compound **5g** was varied (b-d: 1.98-5.94 μM).

	5.94	49.8	17.9	4.3	28.0

interfaced with Sybyl-X 2.037 and other miscellaneous parameters were assigned with the default values given by the software.

A molecular docking study was carried out to support the interaction and preferred binding mode of the compound with protein. All the inhibitors were docked into the active site of protein as shown in Fig. 12A and B. The predicted binding energies of the compounds are listed in Table 6.

As depicted in Fig. 13A-C, compound 5g makes six hydrogen bonding interactions at the active site of the enzyme (PDB ID: 5NN5), the hydrogen atom of NH present at the 3rd position of the thiazolidine ring makes hydrogen bonding interaction with the oxygen of ASP282 (NH-O-ASP282, 1.952 Å), the oxygen atom of the carbonyl group present at the 4th position of the thiazolidine ring makes two hydrogen bonding interactions with the hydrogen atoms of ARG600 (O-H-ARG600, 2.50 Å; 2.63 Å),

Fig. 12 Docked view of all the compounds at the active site of human lysosomal acid-alpha-glucosidase protein, PDB ID: 5NN5, at different poses A and B

the hydrogen atom of the hydroxyl group present at the 4th position of the benzylidene ring which is present on the 5th position of the thiazolidine ring makes hydrogen bonding interactions with the oxygen atoms of ASP404 (OH-O-ASP404, 2.57 Å; 1.98 Å) and the nitrogen atom of the hydrazinylidene group present at the 9th position of the fluorenylidene ring makes hydrogen bonding interaction with the hydrogen of ED01033 (N-H-ED01033, 2.75 Å).

As depicted in Fig. 14A-C, compound 5t makes two hydrogen bonding interactions at the active site of the enzyme (PDB ID: 5NN5), the hydrogen atom of the hydroxyl group present at the 3rd position of the benzylidene ring which is present on the 5th position of the thiazolidine ring makes hydrogen bonding interaction with the oxygen atom of ASP518 (OH-O-ASP518, 1.78 Å) and the oxygen atom of the hydroxyl group present at the 3rd position of the benzylidene ring which is present on the 5th position of the thiazolidine ring makes hydrogen bonding interaction with the hydrogen atom of ASP518 (HO-H-TRP481, 1.90 Å).

The interaction of the ligand with  $\alpha$ -glucosidase protein active sites shows six bonding interactions and the docked view of the same has been depicted in Fig. 15A-C.

The docking results revealed that the synthesized compounds were well accommodated in the binding pockets of  $\alpha$ glucosidase. The synthesized compounds were bound to the protein in a similar manner to that of ligand 5NN5. The compounds have the same H-bonding interactions with the same amino acids ASP404, ASP518 and TRP481 as that of ligand\_5NN5. Fig. 16A and B present the hydrophobic and hydrophilic amino acids surrounding the studied molecules, 5g and 5t.

#### Pharmacokinetic properties

The SwissADME web tool is a free software program used to forecast the absorption, distribution, metabolism and elimination of molecules. All these are important factors in deciding whether or not to conduct additional clinical trials. It considers six crucial physicochemical characteristics such as size, polarity, lipophilicity, flexibility and saturation.<sup>38</sup> By using SwissADME, we have calculated the physiochemical characteristics of the synthesised compounds, 5a-5u. The predicted physicochemical characteristics included molecular weight  $(M_{\rm W})$ , the number of rotatable bonds, the number of hydrogen bond acceptors and donors, and XPlogP3. Notably, the ligands' "drug-likeness" was evaluated using a number of pertinent test filters related to medicinal chemistry.39 Lipinski and his colleagues predicted that when there are more than five hydrogen bond donors and ten hydrogen bond acceptors, a molecular weight greater than 500 and a calculated  $\log P$  ( $C \log P > 5$ ), poor absorption or permeation is more likely. 40 The predicted physicochemical results (Table 7) indicated that most of the compounds followed Lipinski's rule of five.

#### **Toxicity prediction**

In silico approaches provide major advantages to both regulatory demands and requirements for risk assessments as well as

the pharmaceutical sector to analyse the safety profile of a compound. This has been made feasible by advancements in the field of computational research.<sup>41</sup> To forecast the toxicity parameters, we have used the ProTox-II web servers. ProTox-II analysis divides compounds into several toxicity classes. All the synthesized compounds (5a-5u) were screened for cytotoxicity. The results showed that none of the compounds exhibited cytotoxicity. All the synthesized compounds belonged to class IV with 300 < LD<sub>50</sub>  $\le$  2000. The LD<sub>50</sub> values are given in mg kg<sup>-1</sup>. Most of the synthesized compounds have an LD50 value of 1400 mg kg<sup>-1</sup> with about 54.26% prediction accuracy. As a result, we conclude from the data that these compounds could be employed as safe lead molecules (Table 8).

#### Conclusions

A series of novel fluorenone-thiazolidine-4-one derivatives 5a-5u were designed and synthesized. The structures of the NJC

B B

**Fig. 15** Docked view of ligand\_5NN5 at the active site of the enzyme PDB: 5NN5 in different poses (A–C).

synthesized molecules were elucidated using FTIR, <sup>1</sup>H NMR, <sup>13</sup>C NMR and mass spectral data. Single crystals of compound

5s were developed and their structure refinement data were obtained. Compound 5s crystallized in the triclinic space group of  $P\bar{1}$ . Furthermore, the ability of the synthesised compounds to scavenge DPPH radicals and inhibit α-glucosidase was evaluated. The results revealed that the compounds with hydroxyl functional groups at the para and meta positions of thiazolidine-4-one demonstrated greater α-glucosidase inhibition. Furthermore, compounds containing halogen groups like fluoro, chloro, and bromo groups exhibited a moderate αglucosidase inhibitory effect. The findings showed that  $\alpha$ glucosidase inhibition increased with an increase in the number of halogen groups. With an increase in the number of substituted methoxy functional groups, inhibition was decreased. The DPPH scavenging activity of compounds 5a-l was promising. The IC<sub>50</sub> value of compound 51 was calculated to be 27.70 μM. In general, the DPPH scavenging activity results suggested that the derivatives having substitution at the ortho and para positions exhibited significant antioxidant properties compared to the *meta* substituted derivatives. In particular, the electron withdrawing groups such as nitro, cyano and halogen groups at the ortho and para positions showed good antioxidant properties, whereas the electron releasing groups such as methyl, hydroxyl and methoxy groups at the ortho and para positions exhibited good activity but at the *meta* position they showed less antioxidant activity. A fluorescence spectroscopic technique was adopted to study the interaction of HSA and ct-DNA with compound 5g that displayed more potent αglucosidase inhibition. Fluorescence quenching data revealed that the binding constant (K) of compound 5g-HSA was 1.01  $\times$  $10^4$  L mol<sup>-1</sup> and that of 5g-ctDNA was  $6.42 \times 10^4$  L mol<sup>-1</sup>, indicating moderate binding affinity. According to ADME predictions, most of the compounds followed Lipinski's rule of five to develop into "drug-like" molecules. The present study

Table 7 SwissADME predicted pharmacokinetic profile for fluorenone-thiazolidine-4-one hybrids

indicated that compound 5g demonstrates promising  $\alpha$ glucosidase inhibition and so, it could be employed as a lead molecule in the creation of novel anti-diabetic medications. Furthermore, the majority of compounds demonstrated promising DPPH scavenging activity and could be used as antioxidants.

#### **Experimental section**

#### Materials and methods

All starting materials and reagents were of analytical grade purchased from Spectrochem, sd-fine, TCI, Sigma Aldrich and HiMedia (India) and used without further purification. Melting points were obtained in open capillary tubes using a system obtained from Concord Instruments (P) Ltd, Bangalore, and are presented as uncorrected values. <sup>1</sup>H and <sup>13</sup>C NMR spectra were recorded in DMSO-d<sub>6</sub> on a FT-NMR Spectrometer (400 MHz) JEOL JNM-EC400S. Chemical shifts ( $\delta$ ) are reported in ppm relative to TMS, whereas coupling constants (*J*) are given in Hz. IR spectra were obtained on a Nicolet 5700 FT-IR spectrophotometer using KBr optics. Mass spectra were recorded on a Waters Xevo G2-XS QT (LC-MS/ESI-MS) system. A Bruker SMART APEX II diffractometer was used to generate highresolution X-ray diffraction data. The antidiabetic and antioxidant assessment was carried out at the Alekya Agro Solutions, Mysore, Karnataka, India.

#### Single crystal measurements

Crystal data were collected on Bruker APEX-II CCD crystallographic equipment. The structural analysis was performed on a computer with the SHELXT 2018/2, 42 SHELXL 2018/3 and Olex2 1.5<sup>44</sup> program packages. Monochromated (doubly curved silicon crystal) M<sub>o</sub>-K<sub>α</sub> radiation (0.7107 Å) from a sealed microfocus tube was used to evaluate the intensity. The generator was tuned to 50 kV and 1 mA. Six sets of Omega scans at various Phi values were used to obtain data. The breadth of the frame was

0.5°. For preliminary unit cell determination, APEX2 software was employed. SAINT was used for the determination of integrated intensities and unit cell refinement. SADABS was used to adjust the data for absorption effects using the multiscan approach. 45 The structure was resolved using ShelxT in the Olex2.0<sup>44</sup> package and polished using full-matrix least squares based on F<sup>2</sup> in ShelxL. 46 CCDC 2221637† contains the supplementary crystallographic data for the said compound.

#### Steady state fluorescence quenching spectral measurements

Fluorescence spectra were recorded on an Agilent Technologies Carry Eclipse fluorescence spectrophotometer equipped with a xenon flash lamp and a Cary single cell Peltier to maintain a constant temperature. The excitation and emission slit widths were set at 5 nm.

#### Circular dichroism measurements

A JASCO J-1500 CD spectrometer was used to record the CD spectra of HSA in the presence and absence of compound 5g in the range of 200-250 nm at 25 °C using 0.1 cm path length cuvettes. The content of  $\alpha$ -helices and  $\beta$ -sheets of HSA in the presence and absence of compound 5g was calculated using the inbuilt software CD Multivariate SSE.

General procedure for the synthesis of 2-(2-(9H-fluoren-9ylidene)hydrazinyl)thiazol-4(5H)-one(compound 3). A mixture of compound 2 (0.255 g, 1 mmol), chloroacetic acid (0.094 g, 1 mmol) and sodium acetate (0.082 g, 1 mmol) was dissolved in ethanol (10 mL). The reaction mixture was refluxed for 8 h to precipitate out compound 3. The yellow solid was filtered, washed and recrystallized with ethanol. Yellow solid; mp: 222–224 °C. FT-IR (KBr, cm $^{-1}$ ) 3436 (N–H), 3062 (Ar C–H), 1721 (C=O), 1630, 1601 (C=N), 1558 (C=C), 806 (C-S). <sup>1</sup>H-NMR (400 MHz, DMSO-d<sub>6</sub>)  $\delta$  (ppm) 12.28 (s, 1H), 8.57 (d, J = 7.6Hz, 1H), 7.81-7.70 (m, 3H), 7.46-7.29 (m, 4H), 3.95 (s, 2H). <sup>13</sup>C-NMR (101 MHz, DMSO-d<sub>6</sub>)  $\delta$  (ppm) 174.6 (C=O), 168.9 (C=N in the fluorenone ring), 156.5 (C=N in the thiazolidine-4-one

NJC

ring), 141.8, 140.7, 136.6, 131.8, 131.6, 131.3, 130.3, 128.7, 122.4, 120.9, 33.7 (-CH<sub>2</sub>-). LC-MS (m/z): [M + 1] 294.1168.

General procedure for the synthesis of 2-(2-(9H-fluoren-9ylidene)hydrazinyl)thiazol-4(5H)-one derivatives (5a-5u). A mixture of compound (3) (0.5 g, 1.7 mmol), aromatic aldehydes (4a-4u) (1.7 mmol), and a catalytic amount of piperidine was added to ethanol. The resultant mixture was refluxed for 12 h and allowed to cool. The precipitate obtained was collected, dried, and recrystallized from ethanol.

(2Z,5Z)-2-((9H-Fluoren-9-ylidene)hydrazono)-5-(4-methoxybenzylidene)thiazolidin-4-one (5a). Yellow solid; yield: 0.49 g, 70%; mp: 218-220 °C. FT-IR (KBr, cm<sup>-1</sup>) 3412 (N-H), 3062 (Ar C-H), 1719 (C=O), 1639, 1606 (C=N), 1567 (C=C), 805 (C-S), 1259 (C-OCH<sub>3</sub>). <sup>1</sup>H-NMR (400 MHz, DMSO-d<sub>6</sub>)  $\delta$  (ppm) 12.91 (s, 1H), 8.59 (d, J = 7.6 Hz, 1H), 7.83 (dd, J = 12.2, 7.6 Hz, 3H), 7.64 (s, 1H), 7.51–7.45 (m, 3H), 7.35 (t, J = 7.2 Hz, 2H), 7.25 (t, J = 7.2 Hz, 2 9.5 Hz, 2H), 7.04 (dd, J = 8.0, 1.9 Hz, 1H), 3.80 (s, 3H). <sup>13</sup>C-NMR (101 MHz, DMSO-d<sub>6</sub>)  $\delta$  (ppm) 167.8 (C=O), 163.0 (C=N in the fluorenone ring), 160.2 (C-O), 157.7 (C=N in the thiazolidine-4-one ring), 142.1 (=CH-), 141.0, 136.3, 135.4, 132.3, 131.8, 131.5, 131.0, 130.5, 130.4, 128.9, 123.7, 122.8, 122.2, 121.1, 116.3, 55.8 ( $-OCH_3$ ). LC-MS (m/z): [M + 1] 412.1575.

(2Z,5Z)-2-((9H-Fluoren-9-ylidene)hydrazono)-5-(4-bromobenzylidene)thiazolidin-4-one (5b). Yellow solid; yield: 0.61 g, 78%; mp: 220-222 °C. FT-IR (KBr, cm<sup>-1</sup>) 3448 (N-H), 3062 (Ar C-H), 1697 (C=O), 1630, 1584 (C=N), 1555 (C=C), 801 (C-S), 1485 (C-Br). # Pharmacological assays

In vitro antioxidant assay

Free radical scavenging activity assay 1,1-diphenyl-2-picryl-hydrazyl (DPPH) assay. The DPPH radical scavenging assay, as

described by Wong et al.,<sup>47</sup> was used to examine the ability of the synthesized compounds to scavenge free radicals. The ability of the synthesized compounds to donate hydrogen atoms was tested by decolorizing a methanol solution of 1,1-diphenyl-2-picryl hydrazyl (DPPH). In the presence of the antioxidant, DPPH generates a violet/purple colour in methanol solution which fades to yellow colour. 1 mL of each compound at different concentrations was added to 3 mL of DPPH (0.1 mM) methanolic solution. The tubes were vigorously shaken and left to stand for 30 min at room temperature in the dark before measuring changes in absorbance at 517 nm. The DPPH radical scavenging activity of gallic acid was measured for comparison. All tests were run in triplicate, and the mean values were shown in the graph. The following formula was used to calculate the percentage of inhibition:

% DPPH radical scavenging activity =  $[(A_0 - A_1)/A_0] \times 100$ 

where  $A_0$  is the absorbance of the control (no test sample) and  $A_1$  is the absorbance of the test samples.

The  $IC_{50}$  values (the concentration required to scavenge 50% of free radicals) were calculated from the plot of % inhibition *versus* sample solution concentration.

#### In vitro antidiabetic assay

α-Glucosidase inhibitory activity. Li *et al.* (2004) assessed the inhibitory activity against α-glucosidase. <sup>48</sup> A reaction mixture containing 500 μL of phosphate buffer (100 mM, pH = 6.8), 200 μL of α-glucosidase solution (0.6 U mL $^{-1}$ ), and various concentrations of test samples ranging from 25 to 100 μg and a control sample were pre-incubated for 5 min with a series of synthesised compounds 5a–5u in a test tube. 10 mM *p*-Nitrophenyl-α-p-glucopyranoside (*p*-NPG) was used to initiate the reaction, which was then stopped after 15 min at 37 °C by heating on a water bath. The amount of released glucose was calculated. The amount of liberated glucose was measured at 400 nm on a UV spectrophotometer. The amount of liberated glucose is directly proportional to the enzyme activity. The assay methods were carried out three times. The compound's inhibitory activity and IC<sub>50</sub> were calculated.

% Inhibitory activity = 
$$[(A_s - A_c)/A_s] \times 100$$

where  $A_s$  is the absorbance when the test material is present and  $A_c$  is the absorbance of the control.

#### Conflicts of interest

The authors declare that they have no conflict of interest.

# Acknowledgements

The authors thank the SAIF and USIC, Karnatak University, Dharwad, for instrumental facilities. One of the authors (MD) thanks the DST-KSTePs, Govt. of Karnataka, for awarding the fellowship to carry out this work. We thank Dr Satish Bhat, Department of Chemistry, Karnataka University, Dharwad, for

his fruitful discussion and assistance in X-ray crystallographic studies. Thanks are also due to Dr Avinash Prakash, Alekya Agro Solutions, Mysore, for biological activities.

Keywords: Bimetallic oxides BaTiO<sub>3</sub> CuFe<sub>2</sub>O<sub>4</sub> XRD SEM FT-IR DX

#### ABSTRACT

Science and technology of nanosized bimetallic oxide nanomaterials records the various properties and applications. Especially biomedical applications are viewed in particular due to its nanosized particle size. The present experimentation is reporting the microwave-assisted synthesis of nanosized bimetallic oxides like copper ferrite (CuFe<sub>2</sub>O<sub>4</sub>) and barium titanate (BaTiO<sub>3</sub>) by solid state combustion route using poly (vinyl alcohol) (PVA) as a fuel. The structural and morphological characterizations of the bimetallic oxide nanomaterials are performed out by X-ray diffraction (XRD) and scanning electron micrograph (SEM) tools respectively. These analyses report the crystalline nature of both samples. EDX spectral study is also undertaken to know the existence of different metals in the above-mentioned samples. Bonding nature of the bimetallic oxide samples were readied by Fourier transfer infrared (FT-IR) instrumentation. The study reviewed the varied vibrational modes confirms the phase formation of the samples. UV-Vis and thermal study of these bimetallic oxide samples are also studied extensively to know the thermal and absorption behavior respectively. TGA of both the samples are traced and are showing decomposition at rapid rate. In addition, the maximum absorption peaks due to  $\pi$  -  $\pi$ \* transition confirms the sample formation. Antimicrobial activity of the prepared oxide samples was studied for antibacterial and antifungal behavior. Both samples showing considerable activity against various bacteria and fungi.

#### 1. Introduction

Nanoscience is popularly defining by designing the functional materials at the nanoscale for its potential applications in various fields<sup>1-3</sup>. The reasons why nanoscale materials have become so important, because of its easy scale up synthesis, improved properties and need based applications <sup>4-6</sup>. Based on technology of nanomaterials is feathered to cover the design, utilization and construction of functional nanomaterials with at least one characteristic dimension<sup>7-8</sup>. Nanosized novel materials can be refigured to improve physical, chemical and biological properties in comparison with micro materials<sup>9-11</sup>. The reason behind such interesting development and useful behavior of these materials is due to structural features with intermediate in between isolated atoms and bulky materials. Hence, the objects may display physical substantially different from those displayed by either atoms or bulk materials lead to new technological opportunities as well as new challenges<sup>12-14</sup>. Bimetallic oxide nanomaterials are most important and are widely studied solid materials at nanoscale for various new properties for substantial applications<sup>15-16</sup>. Especially, nanosized transition metal oxides have attracted much due to their outer electron configuration and are applied widely in various reactions for their structural properties such as high surface area, variable pore size, and stability<sup>17-19</sup>. The current study materials like nanosized copper ferrite and barium ferrite materials falls under the same category and one can find superficial properties as well as applications in various fields.

<sup>\*</sup> Corresponding author.

CuFe<sub>2</sub>O<sub>4</sub> is a spinal type of oxide material which has high chemical stability, high thermal stability, high mechanical resistance and low surface acidity. In addition, this spinal material is suitable for various applications, such as high-density storage media, ferromagnetic fluids, catalysts, magnetic drug delivery systems, magnetic separation, magnetic resonance tomography, gas sensors, and another applications<sup>20-23</sup>. Copper based ferrite materials are having strong magnetic properties, relatively low conductivity, low eddy currents and dielectric losses. In continuation, it also shows the high permeability properties<sup>24-25</sup>. Similarly, barium titanate is one of the perovskite materials which can find various electronic and biological applications<sup>26-27</sup>. The ferroelectric and hydroelectric properties of barium ferrite are highly useful in manufacture of some varieties un-cooled sensors which are used in thermal cameras. Large crystals of barium ferrite are used in electronic precursors like capacitors, electrochemical transducers, and nonlinear optical tools.<sup>28-29</sup>. Recently, barium based titivate nanoparticles have been employed as nanocarriers for drug delivery in the body system<sup>30-31</sup>. It naturally occurring in bariumbased perovskites and is very rare natural analogue of barium titanate found as micro inclusions in benitoite. In consideration of these including remarks, the present experimentation is reporting the synthesis of nanosized copper ferrite and barium titanate perovskite nanomaterials by self-propagating combustion route using PVA as a fuel. These bimetallic oxide nanomaterials were well characterized by various characterization tools for their phase formation. Antimicrobial activity studies of these prepared oxide materials are undertaken to know its antimicrobial behavior towards various bacteria and fungi.

#### 2. Experimental

#### 2.1 Materials and Methods

The chemicals used in the experimentation are of AR grade and are purchased from Merck (Mumbai, India) and are used with further purification. Properly rinsed glass wares with chromic acid are used in the experimentation for purity of the reaction product. Microwave-assisted self-propagating combustion route was adopted for the synthesis of barium titanate and copper ferrite nanomaterials using polymer as a fuel. For antimicrobial activity, nutrient agar (NA) and potato dextrose agar (PDA) media were purchased from Hi Media. The bacterial strains were of microbial type culture collection, procured from Institute of Microbial Technology, Chandigarh, India.

#### 2.2 Synthesis of the copper oxide and iron oxide nanomaterials

Copper sulphate was thoroughly mixed with PVA in the weight ratio 1:5 and grounded well in a pestle and mortar. The resultant solid is transferred into China dish and was heated in an open air atmosphere until the completion of evolved carbonaceous fumes. The reaction undergoes self- propagating combustion reaction in presence of polymer fuel. Incomplete reaction product is transferred into a silica crucible and was ignited at around 800°C in muffle furnace. It was observed that, initially PVA melted, then frothed and finally ignited to give copper oxide as a residue<sup>32</sup>. Similar procedure was adopted for the synthesis of iron oxide nanomaterials by use of ferrous sulphate as a precursor material with same polymer fuel

#### 2.3 Synthesis of Copper ferrite and Barium titanate

Equimolar quantity of as prepared nanosized copper oxide and iron oxide was grinded well with PVA in the weight ratio of 1:1:5 in a pestle and mortar. The mixture was transferred into a crucible and was burnt initially on electric oven for complete evolution of fumes. Then, it is transferred to microwave oven for complete calcinations process. The sample was calcined on microwave oven having 2.45GHz frequency and power is 800w for about 15 minutes. During burning, the approximate temperature maintained around 1200°C. The reaction mixture burns suitably and leaving behind a solid copper ferrite as a crystalline product. Similar procedure is used for the synthesis of nanosized barium titanate nanomaterials sample. The obtained bimetallic oxide samples are shown in figure 1. Possible reactions involved in the combustion process are given below. The complete synthetic scheme of both the bimetallic oxides is given in **Scheme 1**.

Fig. 1. Optical image of (a) CuFe<sub>2</sub>O<sub>4</sub> nanomaterials (b) BaTiO<sub>3</sub> nanomaterials

**Scheme 1.** Synthetic scheme of Copper ferrcopperd Barium titanate nanomaterials

#### 2.3.1Antibacterial activity

Antibacterial activity of as prepared copper ferrite and barium titanate nanomaterial samples were performed by agar well diffusion method (Zhang et al., 2009) with minor modifications<sup>33</sup>. Petri dishes were prepared by inserting 20 ml sterilized NA media under regular condition and allowed to solidify. After media solidification, 100 µl of standard test microbial inoculums of gram-positive bacteria like S. aureus, B. subtilis and gram-negative bacteria like S. Typhi, and Pseudomonas aeruginosa were spread uniformly by use of sterile cotton swabs. 6 mm diameter agar is drawn from plate to form a well using sterile cork borer. Standard antibiotic gentamycin was considered and used as positive control, DMSO as negative control. After keeping at 4 °C for 4 hours for the diffusion of antibacterial metabolites, thereafter plates were incubated at 37 °C for 24 h. The antibacterial effect was estimated by taking a record of the growth inhibition zones in millimeters. The whole experiment was conducted in triplicate for proper confirmation of the activity.

#### 2.3.2 Antifungal activity

Antifungal activity of prepared samples was studied by agar well diffusion method (Zhang *et al.*, 2009) with required minor modifications<sup>33</sup>. Petri dishes were prepared by pouring 20 ml of PDA sterilized media under aseptic condition and allowed the same solidification. Soon after the solidification of the media, 100 µl of standardized test *Aspergilus niger* and *Fusarium* was spread uniformly using sterile L-shaped loop. 6 mm diameter agar is drawn from plate to form a wellbeing sterile cork borer for its spreading the sample. Antifungal Nystatin was used as positive control and DMSO as a negative control for the activity results. Samples kept at 4 °C for 4 hours for the diffusion of antibacterial metabolites, thereafter these plates were incubated in reaction incubator at 28°C for 72 h. The obtained diameter of the inhibition zone around the prepared well is measured in mm and the average of three best repeated agar discs were taken in to account to assess the strength of antifungal activity of the samples.

#### 2.3.3 Characterization Techniques

The powder X-ray diffraction patterns of the samples were catalogued using JEOL JDX-8P diffractometer using CuKα radiation (1.54 Å) at 30 kV. The Fourier transform infrared (FTIR) spectra of the samples were recorded on a Perkin-Elmer FT-IR (Model No. 1000) in the range 4000-400 cm<sup>-1</sup> at a resolution of 4 cm<sup>-1</sup>. JEOL JSM-6380 LA scanning electron microscope with energy dispersive micro analysis of X-Ray (EDAX) is used to study particle morphology with metal confirmation of the sample. The absorption behavior of the sample was carried out by UV visible spectrophotometric measurements using Elico spectrophotometer. Technai-20 Philips transmission electron microscope operated at 190 KeV to carry out TEM images. Metllor Toledo star tool was used to trace the thermal characterization.

#### 3. Results and discussion

#### 3.1 FT-IR study

Fig. 2(a-b) shows FT-IR spectra of combustion derived copper ferrite and barium titanate samples respectively. The metal-oxygen bonding and nature of the synthesized bimetallic oxide samples were carried out by infrared study. Generally

metal oxides give absorption bands below 1000cm<sup>-1</sup> arising from inter-atomic vibrations<sup>34</sup>. It is observed in both spectra that, the peak at 3500cm<sup>-1</sup> corresponds to absorption of moisture content. Further, the vibration band observed at 1050 cm<sup>-1</sup> is due to some overtones. Peaks below 1000 cm<sup>-1</sup> corresponds to Metal-oxygen vibrational modes and metal-metal vibration modes of the readied sample confirm the phase formation of prepared bimetallic oxide samples<sup>35</sup>.

**Fig. 2.** FT-IR of (a) CuFe<sub>2</sub>O<sub>4</sub> nanomaterials (b) BaTiO<sub>3</sub> nanomaterials

**Fig. 3.** Indexed XRD pattern (a) CuFe<sub>2</sub>O<sub>4</sub> nanomaterials (b) BaTiO<sub>3</sub> nanomaterials

#### 3.2 XRD Study

XRD system was used to know the crysallinity and phase structure of the as-synthesised bimetallic oxide samples. **Fig. 3(a-b)** represents the indexed XRD pattern of as synthesized copper ferrite and barium titanate nanomaterials respectively. According to the XRD pattern, obtained 20 values and (hkl) values of both samples are indexed in accordance with standard JCPDS values and are tabulated in table-1. Both patterns show the presence of highly intense Bragg's reflections indicates the crystalline nature of both samples. It is also illustrating that, at higher temperature samples showing stable structure. The intensity of peaks in the pattern are sharp indicates the high crystalline nature of both the samples. These patterns not demonstrating monometallic oxide reflections which are utilized for bimetallic oxide sample preparation. It is observed from the table and indexed pattern, the most of the 20 (or d-spacing) value of the sample acceptably matches with literature data of the copper ferrite (JCPDS card No. 34-0425) and barium titanate (JCPDS card No.79-2264) confirms the formation of CuFe<sub>2</sub>O<sub>4</sub> and BaTiO<sub>3</sub> nanomaterials respectively with single crystalline phase. Further, the existence of the indexed major lattice planes in the pattern supports the sample formation. The broadening and sharp peaks indicate the reduced particle size and high crystallinity of the samples. It is also noticed that, at the higher temperature the removal of extra undefined phases. Purity of the samples analyzed in the pattern by the absence of the other reflection<sup>36</sup>.

Table 1. XRD data of BaTiO<sub>3</sub> and CuFe<sub>2</sub>O<sub>4</sub> samples

	CuFe <sub>2</sub> C	)4	BaTiO <sub>3</sub>		
Sl.No	Observed 20 values	(hkl)	Observed 20 values	(hkl)	
1	35.02	(103)	32.33	(110)	
2	43.10	(004)	39.43	(111)	
3	56.11	(105)	46.82	(200)	
4	62.00	(224)	57.64	(211)	
5	73.33	(420)	67.50	(220)	
6		` <b></b>	80.05	(311)	

#### 3.3 EDX Study

The EDX analyses of the bimetallic oxide samples were performed to clarify its elemental compositions. **Fig. 4 (a-b)** shows the EDX pattern of combustion derived CuFe<sub>2</sub>O<sub>4</sub> and BaTiO<sub>3</sub> nanomaterials respectively. The chemical constituents like presence of Cu, Fe, and O elemental segments are observed at respective position in the EDX pattern of copper ferrite (**Fig. 4(a)**) confirms the formation of the said sample. Similarly, the reflections of Ba, Ti and O elemental segments in the EDX pattern of barium titanate (**Fig. 4(b)**) signify the formation of sample. No other elemental reflections other than the above observed indicates the purity of the prepared samples.

Fig. 4. EDX pattern of (a) CuFe<sub>2</sub>O<sub>4</sub> (b) BaTiO<sub>3</sub> nanomaterials

#### 3.4 SEM study

The surface morphology of the prepared nanomaterial was examined through SEM instrumentation. Figure 5(a-b) shows SEM images of CuFe<sub>2</sub>O<sub>4</sub> and BaTiO<sub>3</sub> nanomaterials respectively. Several cracks are observed due to the existence of the voids, which originates from the pore boundaries and then propagate to maximum compression direction. The grain morphology, uniformity, homogeneity, and their distribution have been observed. Copper ferrite particles showed large grains stuck to each other in an irregular and non-uniform manner is observed in Fig. 5(a). The SEM image of barium titanate (Fig. 5(b)) shows that the particles fall in the nano-orange with fine, spherical shaped particles with regular arrangement. Some particles show clear close compactness of the particles indicated the very crystalline nature and also lead to applicable morphology. It is also noticeable that the particle sizes differed from the crystalline sizes due to polycrystalline agglomeration with a single crystal. These results are in close consideration with XRD results in terms of its crystalline behavior.

Fig. 5. SEM image of (a) CuFe<sub>2</sub>O<sub>4</sub> (b) BaTiO<sub>3</sub> nanomaterials

#### 3.4 TEM Study

Particle morphology and its size of the combustion derived CuFe<sub>2</sub>O<sub>4</sub> and BaTiO<sub>3</sub> nanomaterials samples was studied by TEM instrumentation and its images are represented in **Fig. 6(a-b)**, respectively. **Fig. 6(a)** shows the crystalline nature of the sample and is in accordance with XRD results. It is also highlighting particle netting falls under nano size range diameters. However, the image further reveals that some particles are spherical, and some are irregular particles nature in agreement with SEM results.

Similarly, barium titanate nanomaterials also show crystalline behavior and its SEM image is given in figure 6(b). In addition, particle agglomeration with particle compactness is also viewed in the said image.

Fig. 6. TEM image of (a) CuFe<sub>2</sub>O<sub>4</sub>(b) BaTiO<sub>3</sub> nanomaterials

#### 3.5 Thermal Study

TGA study is carried out to view the sequential weight loss and subsequent transformation due to heat treatment of the samples. **Fig. 7(a-b)** shows the TGA traces of CuFe<sub>2</sub>O<sub>4</sub> and BaTiO<sub>3</sub> samples respectively. It is observed from **Fig. 7(a)** that the three-step decomposition under exited temperature range 100-500°C, 500-650°C and 650-1000°C. Copper ferrite sample shows the initial weight loss in the range 100-500°C is due to water evaporation. Further, the sample decomposes continuously as the temperature rises and shows a sharp weight loss in the range 500°C-650°C due to further decomposition of residual precursor oxides present in the sample. Above 900°C, no weight loss was observed indicates the decomposition of the phases of the sample. Similar features are observed in barium titanate sample. TGA trace of barium titanate sample (**Fig. 7(b)**) is also showing significant three step weight loss in the temperature range 100-400°C, 400-500°C and 500-800°C. The initial weight loss is due to evaporation of water and second loss is due to further residual oxides decomposition and third loss is due to decomposition of complete phase of the sample. <sup>37-38</sup>

Fig. 7. TGA trace of (a) CuFe<sub>2</sub>O<sub>4</sub>(b) BaTiO<sub>3</sub> nanomaterials

#### 3.6 UV-Vis study

Optical properties of bimetallic samples were well studied by UV-Vis spectroscopic analysis. The absorption spectra of  $CuFe_2O_4$  and  $BaTiO_3$  samples are shown in **Fig. 8(a-b)**, respectively. It is observed from UV-Vis absorption spectra of  $CuFe_2O_4$  that, a single and maximum strong surface Plasmon resonance band ( $\lambda_{max}$ ) at 350nm is assigned to the characteristics phase of  $CuFe_2O_4$ . Similarly, a single maximum strong surface Plasmon resonance band ( $\lambda_{max}$ ) at 310nm (in **Fig. 8(b)**) is observed due to excitation of electron from valence band to conduction band and the characteristics phase of  $BaTiO_3$  sample. Both samples show the broad Plasmon bands with an absorption tail in the higher wavelength.

Fig. 8. UV-Vis spectra of CuFe<sub>2</sub>O<sub>4</sub> and BaTiO<sub>3</sub> nanomaterials

#### 3.7 Antibacterial activity

Observed antibacterial results of the prepared BaTiO<sub>3</sub> and CuFe<sub>2</sub>O<sub>4</sub> samples are given in **Table 2** and results are represented graphically in **Fig. 9**. It is observed from the table that; the samples show good activity at higher concentration in comparison with standard drug.

Table 2. Antibacterial results of BaTiO<sub>3</sub> and CuFe<sub>2</sub>O<sub>4</sub> samples

Sl.No	Name of the samples	Conc. (µg/ml)	S. aureus (mm)	B. subtilis (mm)	S. Typhi (mm)	Pseudomonas A (mm)
1	BaTiO <sub>3</sub>	25	0	0	0	0
	CuFe <sub>2</sub> O <sub>4</sub>		0	0	0	0
2	BaTiO <sub>3</sub>	50	3	4	4	4
	CuFe <sub>2</sub> O <sub>4</sub>		4	6	5	5
3	BaTiO <sub>3</sub>	75	9	10	9	10
	CuFe <sub>2</sub> O <sub>4</sub>		10	10	10	11
4	BaTiO <sub>3</sub>	100	12	12	12	13
	CuFe <sub>2</sub> O <sub>4</sub>		12	13	12	12
5	BaTiO <sub>3</sub>	200	12	13	13	13
	CuFe <sub>2</sub> O <sub>4</sub>		14	14	14	14
6	Gentamycin (Standard)	100	15mm	15	15	15

Fig. 9. Graphical representation of antibacterial activity of CuFe<sub>2</sub>O<sub>4</sub>BaTiO<sub>3</sub> nanomaterials

In addition, both the samples show the same activity range for all bacteria at the same concentration. The increasing use of nanoparticles (NPs) in medicine has led to an enhanced number of studies declaring the potential antibacterial mechanisms of NPs against bacteria. The nanosized sample materials are made in contact with bacterial cells to achieve their antibacterial functional performance. The acceptable forms of contact include electrostatic attraction<sup>39</sup> van der Waals forces<sup>40</sup>, receptor–ligand<sup>41</sup> and hydrophobic interactions<sup>42</sup>. From the mentioned figure, it is also observed that antimicrobial activity was performed to understanding the molecular biology mechanism associated with the bactericidal action of BaTiO<sub>3</sub> and CuFe<sub>2</sub>O<sub>4</sub> nanomaterials. In comparison, CuFe<sub>2</sub>O<sub>4</sub> nanomaterials exhibited good antibacterial results compared to nanosized BaTiO<sub>3</sub> sample. The reason is that the combination of copper and iron oxide nanomaterials can adhere to the

surface of bacterial cells to produce ROS and damage the composition as well as structure of the cell membrane<sup>43</sup>. There by interfering with the function of the cell membrane and causing leakage of cellular contents, resulting in bacterial death.

#### 3.8 Antifungal activity

The growths of the tested fungal species were significantly inhibited by the synthesized nanoparticles. From the obtained results it is confirming that the MIC of the tested fungal species was at 100 µg mL<sup>-1</sup>. The observed antifungal activity results are given in table-3 and results are represented graphically in figure 10. The table clearly indicated that the CuFe<sub>2</sub>O<sub>4</sub> nanomaterials exhibited good antifungal activity compared to BaTiO<sub>3</sub> nanomaterials. Both the samples show good antifungal activity at higher concentration in comparison with standard drug. Further, both fungi show the same activity range for respective concentration. CuFe<sub>2</sub>O<sub>4</sub> nanomaterials would allow a higher level of penetration of free radicals or ions causing cell death at lower concentrations <sup>44</sup>. Nanomaterials with the smaller size can interact quickly with the cell wall and membrane causing leakage of genetic materials, proteins, and minerals that finally result in cell death <sup>45</sup>.

**Table 3.** Antifungal activity results of BaTiO<sub>3</sub> and CuFe<sub>2</sub>O<sub>4</sub> samples

Sl. No.	Sample	Conc. (µg/ml)	Anti-fungal Aspergilus niger(mm)	Fusarium. S (mm)
1	BaTiO <sub>3</sub>	25	4	5
	CuFe <sub>2</sub> O <sub>4</sub>		4	5
2	BaTiO <sub>3</sub>	50	6	6
	CuFe <sub>2</sub> O <sub>4</sub>		6	6
3	BaTiO <sub>3</sub>	75	7	9
	CuFe <sub>2</sub> O <sub>4</sub>		8	11
4	BaTiO <sub>3</sub>	100	9	10
	$CuFe_2O_4$		9	12
5	BaTiO <sub>3</sub>	200	11	10
	CuFe <sub>2</sub> O <sub>4</sub>		10	11
6	Nystatin	100	12	12
	(standard)

#### 4. Conclusions

The successful synthesis of nanosized copper ferrite and barium titanate is achieved by combustion route with PVA as a fuel. This self-propagating solid state combustion reaction achieved the phase formation of bimetallic oxide samples with simple experimentation. This method may be one of the prominent routes for the synthesis of other bimetallic oxide nanomaterials like perovskites. The synthesized nanoparticles showed potent antibacterial and antifungal activities against the tested pathogens. Consequently, the synthesized CuFe<sub>2</sub>O<sub>4</sub> nanoparticles showed better activity compared to BaTiO<sub>3</sub> nanomaterials. Results of the current study reflect that CuFe<sub>2</sub>O<sub>4</sub>can be better explored soon for various biomedical, industrial, and agricultural applications. Moreover, the high yield of the copper ferrite nanoparticles achieved in the present study could open up the way for the manufacture of nanoparticles at an industrial scale using a cost-effective and ecofriendly methodology.

#### **Abstract**

In this study, novel chemically reduced silver nanoparticles (AgNPs) were functionalized with new 4-amino, 3, 5-dimercapto, 1, 2, 4 triazole (DMT) moiety. Nucleation and formation of the functionalized silver nanoparticles was monitored using UV–Vis absorption spectroscopy. UV/Vis-spectroscopy, zeta-potential, XRD, SEM, TEM, and FTIR analysis techniques confirmed the functionalization of AgNPs by DMT ligand having particle sizes 50–51 nm. The dimercapto-functionalized silver nanoparticles (DMT-AgNPs) showed high antibacterial activity against Gram-positive and Gram-negative bacteria. We found that the DMT-AgNPs had the potential to inhibit growth with cell cycle arrest and increased apoptosis of MCF-7 cancer cell in dose-dependent manner with an IC<sub>50</sub> value of 18.46% v/v. Our results showed that the DMT-AgNPs inhibited cancer cell line proliferation with a mechanism of action similar to that of other tubulin inhibitors. It is interestingly observed that the newly developed DMT-AgNPs are reliable safe and biocompatibility, hence could be used viable in the treatment of diseases with high accuracy in a patient-friendly manner compared to AgNPs and can be used as potent therapeutic agent in future.

#### 1 Introduction

Over the years, it has been witnessed an unprecedented growth in the area of nanotechnology and nanomedicine with the development of novel nanocomposites. These deal with manipulation of materials at atomic/molecular level [1] into a new range of products for advanced biomedical applications [2]. Nanomedicine field had visualized the next door for the ongoing development of theranostic systems like biological labeling, imaging [3], biosensing [4], antimicrobial activity [5], detection, designed as drugs carrier

genetic disorders, gene therapy, and DNA sequencing [6], and elimination of cancer cells before they form tumors [7]. In fact, nanocomposites of free metals, with their unique physical and chemical properties in combination with modern technology, play a tremendous role in overcoming many of the problems that conventional methods face in sensing, diagnosis, treatment, and detection of deadly diseases [8].

Among all metallic nanoparticles, silver nanoparticles (AgNPs) which possess higher level of therapeutic activity with lower toxicity rather than their counterparts (metal salts) have tremendous applications in photography [9], catalysis [10], biosensor [11], biomolecular detection [12], diagnostics [13], and particularly antimicrobial studies [14–16]. Thus, they are extensively used for developing unique therapeutic methodologies like treatment of multidrug resistant microorganisms (bacteria, yeast, and fungi) [17], cancer treatments [18], drug delivery system, coating of medical equipments, food packaging materials, wound dressings bandages, gloves, textile fabrics [19, 20], wood flooring, and various wound healing gels to preventing infections due to their anti-microbial properties [21]. A number of methods were used in the past for the synthesis of AgNPs,

for example, reduction in solutions [22], radiation assisted [23] chemical and photo-reduction in reverse micelles [24], thermal decomposition of silver compounds [25], and recently via bio- or green-synthesis route [26, 27]. Chemical reduction is the most frequently applied method for the preparation of silver nanoparticles (AgNPs) as colloidal dispersions in water or organic solvents because chemical reduction of silver precursor salts in solution offers higher yield, easier production, and lower costs compared to other methods [28]. Reduction of silver (I) salts by chemical methods progress through a one-step process producing a colored sol as metal surface has free electrons in the conduction band and positively charged nuclei, thus forming long-lived clusters of AgNPs. Different shapes and sized AgNPs can be synthesized using several reducing agents [29–32].

288

Sodium borohydride reduction (a strong reductant) usually results in an average monodispersed smaller sized AgNPs while citrate (a weaker reductant) usually results polydispersed larger sized AgNPs due to slower reduction rate [33]. The smaller sized AgNPs formed using excess sodium borohydride are temporarily stabilized by BH<sub>4</sub> species that forms a shell of excess borohydride anion around AgNPs. However, with time, this shell collapses due to the degradation of BH<sub>4</sub><sup>-</sup> accompanied by hydrogen gas evolution [34], and nanoparticles start to aggregate. Therefore AgNPs synthesized by chemical reduction methods are often performed in the presence of stabilizers in order to prevent unwanted agglomeration of the colloids. AgNPs that are free from agglomeration make them ideal for research, development, and use in a variety of innovative applications. Thus, the great therapeutic potential of AgNPs which relies on the amazing chemo-physical versatility, which is achievable either by reducing the size in order to maximize the surface atoms number or surface modifications using certain appropriate ligands [35]. Ligands act like capping agents by forming a protective shell around nanoparticles. This stops further aggregation, thereby increasing the stability and make suitable for medical applications.

Ligands with certain functional groups like thiols, amines, phosphines, carboxylates, and polymers easily get conjugated to the noble metal nanoparticles through non-covalent and covalent interactions. Therefore, ligands can be successfully used as stabilizers/functionalizers to bring the surface modifications [35]. Ligand functionalization of AgNPs can be brought through a variety of techniques that includes physical adsorption, chemisorptions, electrostatic adsorption (electrostatic binding), and affinity-based (specific recognition and covalent coupling) method [36]. In fact, the key feature for nanoparticle functionalization is that their surface which is imperfect, results in defective sites corresponding to the vertices or edges and one non defective site (terrace or face) for binding of ligands [37, 38]. Defective and non defective sites have different electron densities and steric behavior and hence exhibit different reactivity with different functional groups [37]. Thus, capping/functionalization of nanoparticles allows them to tune the material properties to promote their applications [39]. Recently, these immobilization techniques have been applied to bring biologically active ligands/drugs and nanoparticles together for advanced biomedical applications.

Heterocyclic chemistry always plays a major role in synthetic organic chemistry especially as efficient drug candidates. In fact, interestingly, more than 90% of new drug molecules, intermediates, other bio-molecules, and their derivatives in different forms are heterocyclic compounds [40]. Especially, interesting group of heterocyclic compounds such as triazole have been paid special attention due to their potential applications as medicinal agents, agrochemicals, supramolecular ligands, biomimetic catalysts, etc. [41]. Both 1, 2, 4-triazoles and 1, 2, 3-triazoles and their derivatives in chemistry have wide spectrum of biological activities [41]. Indeed, among 1,2,4-triazole derivatives, mercapto and thione substituted ring structures are used in construction of promising novel bio-molecules that possess antiviral [42], antifungal [43], antibacterial [44], antiinflammatory activity, anticonvulsant, antidepressant [45], and antitumor activities [46]. They also exhibit antimalarial, analgesic properties and owe in therapeutic applications as central nervous system stimulants [47]. Triazole is an electron rich system possessing aromaticity with five-membered ring structure containing three nitrogen and sulfur atoms. Thus, the unique structural arrangement endows triazole and its derivatives to readily bind with a variety of enzymes and receptors in biological system and display a broad spectrum of biological activities [48]. Greater pharmacological activities of triazole derivatives are also due to structural properties such as hydrogen bonding, reasonable dipole character, inflexibility, and their stability under in vivo environments [49]. Innovative biofunctional drug molecules can be produced using triazole moiety as a linker to combine different pharamachore fragments which provides efficient pathway for developing new bioactive functional molecules [50].

Currently, researchers in scientific community are showing increasing interest to develop new routes, methods, and modifications for both synthesis and applications adjoining nanoparticles and heterocyclic moieties. In this context, introducing biologically active ligand functionality to the surface of AgNPs and deeper investigation of nanomaterial structures to test the biocompatibility are the critical aspects of the present study with an aim to improve its therapeutic applications. The current study reports the synthesis of 4-amino,3,5-dimercapto, 1,2,4 triazole (DMT) ligand-functionalized novel silver nanoparticles, characterization, and evaluation of antimicrobial and antitumor activity against MCF-7 cell lines that highlights its in vivo efficacy, so that the DMT-functionalized AgNPs can be considered for the biomedical applications and used in efficient drug delivery systems in near future.

#### 2 Experimental Details

#### 2.1 Chemicals, Cell Lines, and Microorganisms

All chemicals used were of laboratory grade and used without further purification. Purity of the compound was confirmed by the values given on the reagent bottles. The carbon disulphide (96%), hydrazine hydrate (97%), salicylaldehyde (98%), conc. H<sub>2</sub>SO<sub>4</sub> (96%), hydrochloric acid (95%), acetic acid (97%), pyridine (96%), silver nitrate, sodium borohydride, and 3-(4,5-dimethylthiazole-2-yl)-2,5-diphenyltetrazolium bromide (MTT) were purchased from Sigma-Aldrich Ltd. The bacterial strains were procured from the Microbial Type Culture Collection, Institute of Microbial Technology, Chandigarh, India. The MCF-7 cell lines were obtained from National Centre for Cell Science, Pune, India. For cell culture, RPMI-1640 culture medium and fetal calf serum (FCS) were purchased from HiMedia.

#### 2.2 Synthesis of AgNPs

The glasswares used for the preparation of AgNPs were cleaned with aquaregia (3:1 HCl/ HNO<sub>3</sub>), rinsed several times with double distilled water, and dried. AgNPs were synthesized by reducing silver nitrate with large excess of ice-cold sodium borohydride, which not only reduces the ionic silver but also stabilizes the formed nanoparticles [51, 52]. Thus, 30 mL of 0.002 M sodium borohydride (NaBH<sub>4</sub>) was added to a flask incubated in dark, placed in an ice bath on a stir plate with a magnetic bead for about 20 min. Ice bath was used to slow down the reaction with a hope to gain better control over final particle size and shape. Two milliliters of 0.001 M silver nitrate (AgNO<sub>3</sub>) was dripped into the NaBH<sub>4</sub> solution at approximately 1 drop per second with continuous stirring until; all AgNO<sub>3</sub> were reduced and clustered to form mono-dispersed

AgNPs as a transparent yellow colored solution in the aqueous medium.

#### 2.3 Synthesis of AgNPs Using 4-Amino, 3,5-Dimercapto-1,2,4 Triazole (DMT) as Stabilizing Agent

4-Amino-3, 5-dimercapto-1, 2, 4-triazole (DMT) was prepared by using literature report [53, 54]. Thirty milliliters 0.001 M DMT solution was dripped to ice-cold AgNPs sol at approximately 1 drop per second using a syringe with continuous stirring. For complete stabilization and ligand exchange, the above prepared solution was kept at least for 18 h in dark with continuous stirring. The color of the solution turns to dark yellow from pale yellow (AgNPs), which indicated the formation of DMT-functionalized AgNPs (DMT-AgNPs) (Fig. 1).

#### 2.4 Antimicrobial Assays

The antimicrobial susceptibility of newly synthesized DMT-AgNPs was evaluated using the disc diffusion method [55]. Muller Hinton agar media for antibacterial activity was prepared, sterilized, and aseptically transferred to Petri plates. These Petri plates containing media were solidified and later incubated overnight to confirm that the Petri plates are free from contamination. These Petri plates were first inoculated with test organisms and then disc-containing test samples were loaded. Zones of inhibition were measured using Hi media scale after 24 h of incubation at 37 °C. The comparative stability of discs containing gentamicin and nystatin was analyzed simultaneously to evaluate their antibacterial susceptibility. All the experiments were performed in triplicate, and results are recorded as mean  $\pm$  standard deviation.

Fig. 1 Functionalization of AgNPs by 4-amino,3,5-dimercapto-1,2,4 triazole

# 2.5 In Vitro Study of Dimercapto-Triazole-Functionalized AgNPs (DMT-AgNPs)

The cytotoxicity study of synthesized DMT-AgNPs was tested on MCF-7 (breast cancer) cell lines by the reduction assay of tetrazolium salt (dye) [56]. The cells were cultured and then harvested such that 200 µL of each suspension contained approximately 15,000 cells. The cells were treated with 200 µL of increasing concentrations of DMT-AgNPs (0.1, 0.5, 1.0, 5.0, 10, and 20% v/v) from stock sol and incubated at 37 °C in 5% CO<sub>2</sub> atmosphere for 24 h and 48 h. Later, 200 µL of 10% MTT reagent was added to each well to get a final concentration of 0.5 mg/mL, and the plates were incubated at 37 °C in 5% CO<sub>2</sub> atmosphere for 24 h and 48 h. The resulting blue colored formazan product formed was dissolved in 100 µL dimethyl sulfoxide (DMSO) solvent, and the absorption was measured at a wavelength of 570 nm. The absorbance of untreated cells was used as control (100% viable). Cis-platin was used as the standard anti-cancer drug for MCF-7 cell lines with an IC<sub>50</sub> value of 25 µg/mL. Each experiment was performed in triplicate. The percentage growth inhibition was calculated, after subtracting the background and the blank. Concentration of test drug needed to inhibit cell growth by 50% (IC<sub>50</sub>) was generated from the dose-response curve for the cell line.

#### 3 Characterization

The formation of AgNPs and DMT-AgNPs were characterized by UV-visible spectrometer (Perkin Elmer, Lambda 35, Germany). Mean particle size and zeta potential ( $\xi$ ) of the colloidal sol were investigated by dynamic light scattering (DLS) technique using a Zeta size analyzer (Nano ZS 90, Malvern Instruments Ltd., UK). Freeze-dried powders were

subjected to X-ray diffraction pattern analysis on a powder diffractometer (Rigaku theta-theta type) which was operated at 40 kV voltage, 30 mA current, 20 to 80 (2 $\theta$ ) range. Microphotographs were obtained using transmission electron microscope TEM (Philips model CM 200 instrument operated at an accelerating voltage at 200 kV) and scanning electron microscope SEM (Carl Zeiss Microscopy, EVO 10, Germany) in order to determine the size and morphology. Samples for analysis were prepared by placing drops of AgNPs and DMT-AgNPs solution on carbon-coated tape which was pasted on TEM and SEM grids and were then allowed to dry for 2 min, the extra solution was removed using a blotting paper. Further, secondary electron sputtering at an applied potential of 20 kV was adopted prior to the recording of SEM images. Fourier transform infrared (FTIR) spectra were recorded on a Vertex 70 spectrometer with KBr pellets (Bruker Corporation, Billerica, MA, USA). The cytotoxicity (MTT) assays were performed in 96-well plate, and absorbance was measured on microplate reader (Multiscan, Thermo Scientific).

#### 4 Results and Discussion

#### 4.1 UV-Visible Absorption Spectra Analysis

The formation of AgNPs and DMT-AgNPs by the reduction of the Ag<sup>+</sup> ions in solution was monitored by periodical sampling of aliquots of the reaction as a function of time and recording the UV-Visible spectrum in the range 200–600 nm operated at a resolution of 1 nm. Distilled water was used as blank.

The optical absorption spectra of metal nanoparticles are dominated by surface plasmon resonance at 420 nm for AgNPs, i.e., the energy of absorption depends on the degree of plasmon resonance which may shift either side of this

Fig. 2 a Color for (i)DMT, (ii)AgNPs, and (iii)DMT-AgNPs. b UV-Vis spectra of DMT, AgNPs, and DMT-AgNPs

value depending on the ratio of silver ions and zero-valent silver [57]. The spectroscopic observation indicates that the chrome yellow solution of AgNPs was formed (Fig. 2a) due to the reduction of Ag+ to Ag0 and the absorption peak at 420 nm for AgNPs shifted to longer wavelength (red shift) 440 nm which may be due to the increase in the particle size of DMT-AgNPs (Fig. 2b). There was no further aggregation, and the peak position was stable even after 18 h. The silver colloidal particles possess negative charge at first due to the adsorbed BH<sub>4</sub><sup>-</sup> ions which dissolves slowly and later forms -SH capping [34]. The position and shape of the plasmon absorption of nanoparticles are strongly dependent on the particle size, dielectric constant, and surface adsorbed species which was further confirmed by zeta size and potential studies.

#### 4.2 Particle Size and Zeta Potential (ξ) Analysis

Zeta potential ( $\xi$ ) also known as surface potential along with the mean particle size distribution governs the other

characters such as, saturation solubility, dissolution velocity, physical stability, and even biological performances of synthesized nanoparticles [58]. Mean particle size and zeta potential of the colloidal AgNPs and DMT-AgNPs were measured directly after synthesis, using dynamic light scattering spectroscopy (DLS) (Fig. 3), and Table 1 gives the values of the obtained results.

The average particle size (z-average) was found to be 20-21 nm for uncapped AgNPs and 50-51 nm for DMT-AgNPs. Zeta potential of minimum + 30 mV is required for the indication of stable AgNPs [59]. Zeta potential ( $\xi$ )/surface potential values measured were found to be -24.8 mV for AgNPs (Fig. 3a) and -27.1 mV for DMT-AgNPs (Fig. 3b), with a peak area of 100% intensity. The high negative value of zeta potential ( $\xi$ ) and mobility values as seen from Table 1 supports long-term stability, good colloidal nature, and high dispersity of the synthesized AgNPs and DMT-AgNPs. The particle size of the synthesized nanoparticles was further confirmed by the XRD analysis.

Fig. 3 Zeta particle size, phase distribution, and mobility images of a AgNPs and b DMT-AgNPs

#### 4.3 XRD Analysis

The XRD diffraction peaks for the freeze-dried powders of the synthesized AgNPs and DMT-AgNPs areas are shown in Fig. 4. The X-ray diffraction peaks at  $2\theta$  values for both AgNPs (Fig. 4a) and DMT-AgNPs (Fig. 4b) are similar and showed peaks at  $2\theta$  values  $38.012^{\circ}$ ,  $45.17^{\circ}$ ,  $62.489^{\circ}$ , and  $47.34^{\circ}$  indexed as 111, 200, 220, and 311 planes of FCC of silver [60-62] at room temperature conditions. The lattices were identified by comparing the values for

interplanar spacing and relative intensities with the standard values of metal silver. The particle size of the synthesized nanoparticles were calculated using Debye-Scherer's equation,  $D = k \lambda / \beta \cos \theta$ , where k is a constant value (0.96),  $\lambda$  is the wavelength of the X-ray,  $\beta$  is the full width at half maximum of the XRD peak (radians), and  $\theta$  is Bragg's angle of the XRD peak. The particle size of the AgNPs was calculated to be 20–21 nm and for DMT-AgNPs 50–51 nm which were consistent with the zeta size values.

Table 1 Mean particle size diameter and zeta potential results of AgNPs and DMT-AoNPs

Sl. no	Parameters	AgNPs	DMT-AgNPs
1	Z-average (nm)	20–21	50–51
2	Zeta potential (mV)	-24.8	-27.1
3	Zeta quality	Phase and distribution data is good	Phase and distribution data meets the quality criteria
4	Electrophoretic mobility (µmcm/Vs)	-1.919	-2.200
5	Mobility deviation (μmcm/Vs)	0.8882	0.4831
6	Conductivity mS/cm	0.0993	0.188

Fig. 4 XRD patterns of a AgNPs and b DMT-AgNPs

Fig. 5 SEM images of  ${\bf a}$  AgNPs and  ${\bf b}$  DMT-AgNPs

#### 4.4 Scanning Electron Microscopy Analysis

Scanning electron microscopy has provided further insight into the morphology and size details of the synthesized nanoparticles. Micrographs of AgNPs and DMT-AgNPs are shown in Fig. 5a which shows SEM image with spherical AgNPs with uneven distribution of particles. The morphology of the DMT-AgNPs completely differs from AgNPs and are almost uniform and mono-dispersed without any aggregation (Fig. 5b). The separation between the nanoparticles indicates functionalization of nanoparticles by DMT which has been used as functionalizing agent.

#### 4.5 TEM Analysis

The functionalization of DMT to AgNPs can be evidenced from the TEM studies which provide the exact size changes before and after capping AgNPs with DMT. The representative TEM picture recorded for the AgNPs and DMT-AgNPs deposited on a carbon coated copper tape

placed on TEM grid are shown in Fig. 6. Microphotographs show spherical particles of 20–21 nm (Fig. 6a) and 50–51 nm (Fig. 6b) for AgNPs and DMT-AgNPs without aggregation. The large variation in the size of AgNPs and DMT-AgNPs, i.e., difference of 30 nm, is due to the DMT which binds to AgNPs and brings the surface functionalization of nanoparticles. Both DMT-AgNPs and AgNPs are highly crystalline in nature, as seen from the selected area diffraction pattern recorded for the nanoparticles (Fig. 6a, b). Surface functionalization of AgNPs by functional groups present in the capping agent has been confirmed by FTIR studies.

### 4.6 Fourier Transform Infrared Spectroscopy (FTIR) Analysis

FTIR spectroscopy is useful in probing the chemical composition of the surface of the AgNPs and the local molecular environment of functionalizing agent DMT which has both free amine and thiol functional groups. There seems a

Fig. 6 TEM images of a AgNPs and b DMT-AgNPs and SAD pattern of c AgNPs and d DMT-AgNPs

294 BioNanoScience (2024) 14:287–298

Fig. 7 a FT-IR Spectra of 4-amino-3,5-dimercapto-1,2,4- triazole(DMT). b DMT-AgNPs

competition between these two groups towards Ag as both groups have affinity for the novel AgNPs. The FTIR spectrum of AgNPs and DMT-AgNPs is as shown in Fig. 7. The purified freeze-dried powders of AgNPs were subjected to FTIR analysis to confirm the capping of DMT to AgNPs (Fig. 7). The broad band appearing at 3051 cm<sup>-1</sup> can be assigned for C-H stretching vibration, small stretching band at 3276 cm<sup>-1</sup> corresponds to NH<sub>2</sub> group, peak with bending vibration at 2360 cm<sup>-1</sup> represents S-H (thiol) group, sharp stretching at 1596  $\,\mathrm{cm}^{-1}$  may be due to the presence of C = Nbond, a sharp stretch at 1287 cm<sup>-1</sup> can be assigned to C-N bond, and small stretching at 1010 cm<sup>-1</sup> is assigned for N-N bond and the broad bending vibration at 1655 cm<sup>-1</sup> for N-H group of DMT ligand. The IR spectrum of DMT-AgNPs (Fig. 7b) shows all the stretching and bending vibration of groups almost similar to ligand, except the peak around 1200–1300 cm<sup>-1</sup> (Fig. 7b) indicating that S–H (thiol) group is involved in functionalization of DMT-AgNPs. Thus, the disappearance of the bending vibrations of the S-H (thiol) group and the decrease in intensity of the other bands are attributed to functionalization of AgNPs.

### 4.7 Antimicrobial Assays with Minimum Inhibitory Concentration

Antimicrobial activity study was performed to see the growth inhibitory effect of newly synthesized DMT-AgNPs on common laboratory microorganisms, using the standard method. The tabulated result (Table 2) reveals that DMT-AgNPs have higher antimicrobial activity compared to AgNPs. This might be due to their higher solubility (capping of polar groups) and higher diffusion potential of DMT-AgNPs. The DMT-AgNPs might get attached to the surface of the cell membrane and disturb its power function such as permeability and respiration, thus, inhibiting the growth of microbes (Fig. 8).

### 4.8 In Vitro Cytotoxicity Test Study of Dimercapto-Triazole-Functionalized AgNPs

In vitro cytotoxicity testing procedures reduces the use of animals [63] and hence increases the use of cultured tissues and cells [64] at laboratory keeping the animal environment safe (Fig. 9). The reduction of tetrazolium salts is now widely accepted as a reliable way to examine cell

**Fig. 9** Graphical representation of antibacterial assay

proliferation [65]. The cytotoxicity assay measures the cell proliferation rate and, conversely, metabolic events that cause apoptosis or necrosis that lead to the reduction in cell viability. The cytomorphological changes for MCF-7 cell lines (Fig. 10) after 24 h of treatment along with their  $IC_{50}$  values with statistical studies are shown in Fig. 11a and its graphical representation in Fig. 11b.

Observations from Figs. 10 and 11 showed that the synthesized DMT-AgNPs show good results compared to AgNPs and chemotherapeutic drug Cis-platin against MCF-7cell lines. We found that the DMT-AgNPs (Fig. 11) had the potential to inhibit growth of MCF-7 cancer cell in dose-dependent manner with an IC<sub>50</sub> value of 18.46% v/v. The anticancer effect of AgNPs and DMT-AgNPs might be due to nano size, surface area, and surface functionalization factors which control bio-kinetics leading to reduction in cell viability. The action mode of DMT-AgNPs may be described as nanoparticles first make a breakthrough in the permeability of outer membrane, resulting in the leakage of cellular materials that cause cell decomposition

and death eventually. Secondly, DMT-AgNPs may enter the inner membrane and inactivate respiratory chain dehydrogenases or disruption of the mitochondrial respiratory chain leading to release of reactive oxygen species (ROS) and disturb (ATP) proteins, phosphate lipid synthesis, which in turn leads to DNA damage thus inhibiting respiration and growth of cells [66, 67]. Therefore, DMT-AgNPs result in increased cell proliferation rate compared to AgNPs.

#### 5 Conclusion

The research work reports efficient, successful synthesis and characterization of DMT-AgNPs having spherical shapes with an average size of 50–51 nm. The DMT has two free groups, i.e., thiol and amine functional groups. Therefore, chemical reduction method was used to bring hydrophilic ligand functionalization of AgNPs. Ice bath used during the synthesis helps formation of AgNPs

296 BioNanoScience (2024) 14:287-298

Fig. 10 Cytomorphological changes of MCF-7 cell line treated with colloidal AgNPs and DMT-AgNPs

with increased rate as individual atoms resulting in short time nucleation. In turn, this supported the formation of mono-dispersed particles as freshly generated atoms that get trapped by existing nuclei in a diffused-controlled growth mode and thus prevents new particle formation and no broad particle size distribution. Subsequent particle growth was influenced by the concentration of the reactants, the solvent, reducing agents, and specifically by the presence of a functionalizing agent. These DMT-AgNPs have certain advantages like ease for applicability in largescale production, economically feasible, eco-friendly, and higher solubility (capping of polar groups) with higher

Fig. 11 Cell viability (%) of synthesized AgNPs and dimercapto-tria-

diffusion potential. Evaluation of antibacterial and antitumor study against MCF-7 cell lines explores the potential improvement in the biological activity of the DMT-AgNPs compared to AgNPs. Antimicrobial and anticancer study compiled the mobility of DMT-AgNPs into cells deciding their fate in a bioprocess and risk aspects for their applications. Conclusively, the results demonstrated that DMT-AgNPs can be used for the next generation biomedical applications.

**Data Availability** The capability of thiols to form disulfides—perhaps the most important bridging structure in nature—with cysteine subunits of endogenous proteins render them unique among functional groups that are utilized in nanotechnology.

- i) By the formation of disulfide bonds thiolated NPs can be tightly bound to biological surfaces that exhibit cysteine-rich substructures such as the mucus gel layer, keratinized tissues and cell membranes.
- ii) Similar to proteins that can alter their surface properties due to the reduction of disulfide bonds triggering conformational changes, thiolated NPs can alter their surface properties under reducing conditions. NPs that are PEG-coated via a disulfide linkage, for instance,

alter their surface under reducing conditions due to the release of this hydrophilic coating.

#### ARTICLE INFO

# Keywords: AgNPs DMT Antibacterial Anti-cancer Molecular docking Zeta-potential

#### ABSTRACT

Recent research reports that the increasing number of new bacterial infections are resistant to current antibiotics and have become a significant issue for public health. Silver nanoparticles (AgNPs) as bactericides, fungicides, and anti-cancer agents are notably promising, as evidenced by the recent investigation of scientific communications worldwide. Though biocompatible and non-toxic, they are unstable at higher ionic strengths, and even ambient light may cause nano-silver to aggregate. The aggregation can be overcome by surface functionalization. Thus, the current report is an attempt for biologically active dimercapto-triazole (DMT), which has both free thiol (R-SH) and amine(R-NH<sub>2</sub>) groups were successfully used for the functionalization of AgNPs. Characterization techniques like UV/Vis-spectroscopy, zeta-potential, XRD, SEM, TEM, and FT-IR data confirmed the functionalization of AgNPs with the thiol (R-SH) group. The functionalized AgNPs have an average spherical particle size of 50–51 nm and a broad spectrum of activity for Gram-negative and Gram-positive bacteria and anti-cancer activity against MCF-7 cell lines with an IC50 value of –18.681 % v/v. Molecular docking studies reviewing the best-fitting conformation of DMT-capped AgNPs with the highest binding energy for target proteins of cancer and bacteria reveal its biocompatibility.

#### Introduction

Recent research reviews that there is fast growth in nanotechnology, especially in nanomedicine, with the development of novel nanocomposite materials at the atomic/molecular level into a new range of products for advanced applications in the biomedical field [1,2]. Nanosized composite materials of free metals design nanomedicines with the implementation of modern technology, which has visualized the next door for the ongoing development of new theranostic systems [3–7]. Nanocomposites of this system have unique physical and chemical properties that play a tremendous role in overcoming many of the problems compared to conventional methods faced in sensing, diagnosing, treating, and detecting diseases [8]. AgNPs possess higher levels of therapeutic activity with lower toxicity and have tremendous applications in photography [9], catalysis [10], biosensors [11], biomolecular detection [12], diagnostics [13], and particularly anti-microbial studies [14–16]. Thus, it is extensively used for developing therapeutic

methodologies like treating multidrug-resistant microorganisms, drug delivery systems, coating medical equipment, food packaging materials, wound dressing bandages, and various wound healing gels to prevent infections due to their anti-microbial properties [17–21].

Literature reviews report that many researchers have experimented with various methods and have successfully synthesized AgNPs [22–27]. The chemical reduction method is the most preferred for synthesizing AgNPs as colloidal dispersion in solvents. In addition, the chemical reduction of silver salt in solution offers enhanced yield, a more straightforward reaction, and lower costs [28]. Reducing agents like ascorbic acid [29], hydrazine [30], ammonium formate [31], dimethyl formamide [32], sodium borohydride, and sodium citrate [33] are used to obtain different shapes of AgNPs. Sodium borohydride reduction usually results in mono-dispersed AgNPs, while citrate usually results from polydispersed AgNPs because of its slow reaction rate [34,35]. AgNPs synthesized by the chemical reduction method are preferred in the presence of stabilizers in order to prevent unwanted agglomeration

Fig. 1. The possible structures of AgNPs taken for InsilicoiGem Docking studies.

of the colloidal particles in the medium. In continuation, it reduces the size by surface modification using specific appropriate ligands for varied special applications [36]. Ligands in the modification can act like capping agents, which form a protective shell around AgNPs, and the protective shell stops the nanoparticles from further aggregation and increases their lifespan, which makes them more biocompatible.

Ligands substituted with functional groups are readily conjugated to the noble metal nanoparticles through non-covalent and covalent interactions that have been successfully reported [36]. Functionalisation of AgNPs with ligands can be brought through physisorption, chemisorption, electrostatic adsorption, and affinity-based methods [37]. The critical feature of AgNPs fictionalization is their surface, which is imperfect, resulting in defective sites corresponding to the vertices or edges and one non-defective site for the binding of ligands [38,39]. Defective and non-defective sites have different electron densities and steric behaviour, exhibiting different reactive natures with different functional groups [38]. Thus, the functionalisation of nanoparticles allows the material properties to promote their specified and simplified applications [40-42]. In modern drug design, molecular docking studies predict the possible structures of intermolecular complexes formed between two or more molecules. It also exhibits the best-fitting orientation of protein- ligand-nanoparticles that bind to a particular protein of interest to act as a drug receptor—the molecular docking design exercise to synthesize AgNPs intermolecular complexation. FunctionalisedAgNPs and their molecular docking study make a tremendous breakthrough in

nanomedicine to develop suitable formulations.

Nevertheless, introducing an appropriate functionality to the surface of AgNPs and a more profound investigation of nanomaterial structures are critical aspects of the present study to improve its therapeutic applications. 4-amino, 3, 5-mercapto, 1, 2, 4 triazoles (DMT) ligand has functionalized the synthesized AgNPs. Characterization and evaluation of anti-microbial and antitumor activity against MCF-7 cell lines is attempted to highlight its *in-vivo* efficacy. Later, the biological reports are compiled with the computational results obtained by molecular docking study. The binding mode interactions of proteins with functionalized AgNPs are expected to confirm the functionalization of AgNPs as engineered materials to assess the biological fate.

#### **Experimental**

#### Materials and methods

All chemicals used were of AR grade purchased from Sigma-Aldrich Ltd and are used without further purification. The bacterial strains were procured from the Institute of Microbial Technology (IMT) in Chandigarh, India. The MCF-7 cell lines were obtained from the National Centre for Cell Science, Pune, India. RPMI-1640 culture medium and fetal calf serum (FCS) were purchased from HI Media Chemicals. The glassware used was cleaned with aquaregia and rinsed with double distilled water.

Fig. 2. A) colour for i) dmt, ii) agnps, and iii) dmt- agnps, b) uv-Vis spectra of DMT- AgNPs and DMT-AgNPs.

#### Synthesis of AgNPs

AgNPs were synthesized by reducing silver salt (AgNO $_3$ ) with a significant excess of ice-cold sodium borohydride as a reducing agent and stabilizer. [43,44]. The synthetic procedure was that 30 mL of 0.002 M sodium borohydride (NaBH $_4$ ) was added to a flask in an ice bath and incubated in a dark place. The flask's content was stirred thoroughly on a magnetic stirrer for about 20 min. An ice bath was used to slow down the reaction for better particle size control. 2 mL of 0.001 M AgNO $_3$  was dripped into the NaBH $_4$  solution at one drop per second with continuous stirring until complete AgNO $_3$ was reduced and clustered to form AgNPs as a transparent yellow-coloured solution in the aqueous medium.

#### Synthesis of functionalisedAgNPs (DMT- AgNPs)

The functionalizing ligand 4-Amino-3, 5-dimercapto-1, 2, 4-triazole (DMT) was initially prepared by referring reported procedure [45]. Further, 30 mL 0.001 M DMT solution was dripped into ice-cold AgNP sol at approximately one drop per second using a syringe with continuous stirring. The above-prepared solution was kept in the dark for 18 h with continuous stirring for complete stabilization. The colour of the reaction solution turns dark yellow from pale yellow, indicating the formation of DMT-AgNPs, as shown in Scheme 1.

#### Antimicrobial assays

The disc diffusion method was used to evaluate the antimicrobial susceptibility of newly synthesized DMT-AgNPs [46]. Muller Hinton (MH) agar media for antibacterial activity was prepared, sterilized, and transferred to clean and dried petri plates. These plates containing media were solidified and incubated overnight to confirm that the petri plates were contamination-free. Later, petri plates were first inoculated

with test organisms, followed by a loaded disc. Zones of inhibition were measured after 24 hrs of incubation at 37  $^{\circ}\text{C}$ . The comparative stability of discs containing standard drugs like gentamicin and nystatin was analyzed simultaneously to evaluate their antibacterial susceptibility. All the experiments were exercised in triplicate for final confirmation, and results are recorded as mean  $\pm$  standard deviation.

#### In-vitro study of DMT-AgNPs

As reported in the literature, the cytotoxicity study of synthesized DMT-AgNPs was tested on MCF-7 cell lines by the reduction assay of tetrazolium salt [47]. The cells were cultured and then harvested, so 200 µL of each suspension contained approximately 15,000 cells. The cells were treated with 200 µL of increasing concentrations of the prepared DMT-AgNPs sample (0.1, 0.5, 1.0, 5.0, 10, 20 %v/v) from stock sol and incubated at 37 °C in 5 % CO<sub>2</sub> atmosphere for 24 h and 48 h. Later,  $200~\mu L$  of 10~% MTT reagent was added to each well to get a final concentration of 0.5 mg/mL, and the plates were incubated at 37 °C in a 5 % CO<sub>2</sub> atmosphere for 24 h and 48 h. The resulting blue-coloured product was dissolved in 100 µL dimethyl sulfoxide (DMSO) solvent, and the absorption was measured at 570 nm wavelength. The absorbance of untreated cells was used as a control (100 % viable). Cis-platin was the standard anti-cancer drug for MCF-7 cell lines with an IC<sub>50</sub> value of 25 µg/mL. Each experiment was performed in triplicate for final confirmation of the results. The percentage growth inhibition was calculated after subtracting the background and the blank. The concentration of the test drug needed to inhibit cell growth by 50 % (IC<sub>50</sub>) was generated from the dose–response curve for the cell line.

#### Molecular docking

The structure-based molecular docking study for the prepared

sample used iGEMDOCKV2.1 software [48] to study the protein–ligand interaction for all docking simulations. A set of few possible structures of DMT- AgNPs (shown in Fig. 1) were subjected to docking with bacteria β-lactamase toho-1 *Escherichia coli*- 1iYS, *S.Aureus* ligase (PDB ID: 1JIJ), cancer FHA2 domain of RAD53 (PDB ID: 1K2N),Caspase-3 V266F (PDB ID: 5IAE) from the Protein Data Bank (RCSB) to study their antibacterial and anti-cancer activity. Canonical smiles were submitted to Corina's online 3D conversion server (https://www.mn-am.com/online\_demos/corina\_demo) to convert 2D structures into 3D structures. Further, the 3D structure of the sample was optimized for docking conformation study. The whole structure of the receptors was used for our molecular docking studies for the ligand S1 and DMT-AgNPs S1 (a–d). Further, the detailed interaction between the best functional group and its position with the target proteins was analyzed in the 3D visualization software PyMol [49].

#### Characterization

As syntheses, AgNPs and DMT-AgNPs were well characterized by various characterization tools. Perkin Elmer, Lambda 35, Germany: A UV-visible spectrometer tool was used to determine the absorbance. The mean particle size and Zeta potential (ξ) of the colloidal sol were investigated by dynamic light scattering (DLS) technique using a Zeta size analyzer (Nano ZS 90, Malvern Instruments Ltd., UK). Structural confirmation of the prepared samples was done by being subjected to Xray diffraction pattern analysis on a powder diffractometer (Rigaku theta-theta type) operated at 40 KV voltage, 30 mA current, 20 to 80 (2θ) range. To determine the size and morphology, surface microphotographs were obtained using transmission electron microscope TEM (Philips model CM 200 instrument operated at an accelerating voltage at 200 KV) and scanning electron microscope SEM (Carl Zeiss Microscopy, EVO 10, Germany). Fourier transform infrared (FT-IR) spectra were recorded on a Vertex 70 spectrometer with KBr pellets (Bruker Corporation, Billerica, MA, USA). The cytotoxicity (MTT) assays were performed in a 96-well plate, and absorbance was measured on a microplate reader (Multiscan, Thermo Scientific).

#### Results and discussion

#### UV-Vis Study

The reduction of Ag salt solution to AgNPs and DMT-AgNPs was monitored by periodical sampling of aliquots of the reaction as a function of time and recording the UV-visible spectrum in the range  $200-600\,\mathrm{nm}$  operated at a resolution of 1 nm. Double distilled water was used as a blank solution. A colour comparison of reaction products

concerning the standard solution and UV–vis spectrum of the samples is shown in Fig. 2. The optical absorption spectra of metal nanoparticles are dominated by surface plasmon resonance at 420 nm for AgNPs, i.e., the energy of absorption depends on the degree of plasmon resonance, which may shift either side of this value depending on the ratio of silver ions and zero-valent silver [50]. Fig. 2(a) shows that the pale yellow solution, due to the reduction of  $Ag^+$  to  $Ag^0$  and the absorption peak at

420 nm in UV–Vis spectra for AgNPs, shifted to a longer wavelength (red shift) of 440 nm, which may be due to the increase in the particle size of DMT-AgNPs (Fig. 2b). There was no further aggregation, and the peak position was stable after 18 h. The silver colloidal particles initially possess a negative charge due to the adsorbed BH4 ions, which dissolve slowly and later form -SH capping [35]. It is well understood that the position and shape of metal nanoparticles' plasmon absorption strongly

depend on their size, dielectric constant, and surface adsorption, further confirmed by Zeta size and potential studies, as discussed in the following section.

Particle size and zeta potential  $(\xi)$  analysis

Zeta potential and the mean particle size distribution govern the characteristics of synthesized metal nanoparticles, such as saturation solubility, dissolution velocity, physical stability, and biological performances [51]. Particle size and Zeta potential of the achieved colloidal AgNPs and DMT-AgNPs were measured directly using dynamic light scattering spectroscopy (DLS). Observed DLS figures are shown in Fig. 3, and their data is tabulated in Table1. The z-average (average particle size) was 20–21 nm for AgNPs and 50–51 nm for DMT-AgNPs samples, respectively. Zeta potential ( $\xi$ ) /surface potential values measured were found to be -24.8 mV for AgNPs (Fig. 3a) and -27.1 mV for DMT-AgNPs (Fig. 3b), with a peak area of 100 % intensity[52]. The high negative value of zeta potential and mobility values, as seen in Table 1, is supported by long-term stability, good colloidal nature, and high dispersity of the synthesized samples.

#### XRD analysis

The indexed XRD pattern of synthesized AgNPs and DMT-AgNPs samples is shown in Fig. 4. Both patterns show similar features with diffracting angles (20) at  $38.012^{\circ}$ ,  $45.17^{\circ}$ ,  $62.489^{\circ}$  and  $77.34^{\circ}$ . The indexing the reflections are (111), (200), (220), and (311) planes correspond to FCC of AgNPs in comparison with standard JCPDS 87-0720 data, which confirms the formation of monophasic AgNPs and

Fig. 8. ZOI Images of AgNPs and DMT-AgNPs forest human pathogens using Gentamicin and Nystatin as standards.

V. Veena et al. Results in Chemistry 7 (2024) 101351

Fig. 9. Graphical representation of antibacterial assay.

DMT-AgNPs [53–55]. Unit cell parameters were identified by the XRD data's most minor square refinement. The obtained Bragg's reflections also indicate that both samples show crystalline nature. The lattices were identified by comparing the values for interlunar spacing and relative intensities with the reported standard values of silver metal. The particle size of the AgNPs sample was calculated using Debye-Scherer's equation and is recorded as 20–21 nm and 50–51 nm for the DMT-AgNPs sample, consistent with the Zeta size values.

#### SEM study

The morphological study and size details of the as-synthesized samples were studied using a scanning electron microscope tool. Obtained SEM images of both AgNPs' and DMT-AgNPs' samples are shown in Fig. 5(a-b). Spherical-shaped AgNPs with uneven distribution of particles are observed in the AgNP images. Fine particle agglomeration retards the high surface area of the sample. A close, compact arrangement of the particles can be viewed in the image. The morphology of the DMT-AgNPs differs from AgNPs morphology and is almost uniform and mono-dispersed without any aggregation (Fig. 5b). It also notices the crystalline nature of fine particles with a free-procured particle arrangement. The separation between the nanoparticles indicates the functionalization of nanoparticles by DMT, which has been used as a functionalizing agent and may vary the morphology of the samples.

#### TEM study

The functionalization of DMT to AgNPs for enhanced properties can be evidenced from the TEM studies which provide the exact size and shape changes of AgNPs and capped AgNPs with DMT. The TEM image recorded for the AgNPs and DMT-AgNPs are shown in Fig. 6(a-b) and SAED images in Fig. 6(c-d) respectively. Microphotographs show spherical particles of 20–21 nm (Fig. 6a) and 50–51 nm (Fig. 6b) for AgNPs and DMT-AgNPs without aggregation. The large variation in the size of AgNPs and DMT-AgNPs i.e., a difference of 30 nm is due to the DMT which binds to AgNPs and brings the surface functionalization of nanoparticles. Both DMT-AgNPs and AgNPs are highly crystalline in nature as shown in the SAED pattern of the samples (Fig. 6c and 6d).

#### Fourier transform infrared spectroscopy analysis

FT-IR spectroscopy study is undertaken to know the chemical composition of the surface of the AgNPs and its functionalization with t

DMT which has both free amine and thiol functional groups. The FT-IR spectrum of AgNPs and DMT-AgNPs are shown in Fig. 7(a-b) respectively. The purified freeze-dried powders of AgNPs were subjected to FT-IR scanning to confirm the capping of DMT to AgNPs. The broadband appearing at 3051.34 cm<sup>-1</sup> is due to C-H stretching vibration, the small stretching band at at3276.29 corresponds to the NH<sub>2</sub> group, peak with bending vibration at 2360.28 cm<sup>-1</sup> represents the S-H (thiol) group. In continuation, a sharp stretching at 1596.63 cm-1 maybe due to the presence of the C = N bond and a sharp stretch at 1287.20 cm-1 can be assigned to the C-N bond. A small stretching at  $1010.54\,\mathrm{cm}^{-1}$  is assigned for the N-N bond and a broad bending vibration at 1655.63 cm<sup>-1</sup> may be due to the N-H group of the DMT ligand. The FT-IR spectrum of DMT-AgNPs shows the stretching and bending vibration of groups almost similar to ligands except for the peak at the 1200–1300 cm<sup>-1</sup> range which indicates the S-H (thiol) group is involved in the functionalization of DMT-AgNPs. Thus the disappearance of the bending vibrations of the S-H (thiol) group and the decrease in intensity of the other bands are attributed to functionalized AgNPs.

#### Antimicrobial assays with minimum inhibitory concentration

An antimicrobial behavior study was performed to see the growth inhibitory effect of synthesized AgNPs and DMT-AgNPs samples using the standard method. The obtained results are tabulated in Table 2 and the observed ZOI of the samples is shown in Fig. 8. The clear observation of the obtained results reveals that the sample DMT-AgNPs have higher antimicrobial activity compared to AgNPs. It may be due to their higher solubility (capping of polar groups) and higher diffusion potential of DMT-AgNPs. The functionalized sample might get attached to the surface of the cell membrane and disturb its power function such as permeability and respiration, thus inhibiting the growth of microbes. The representation of these results is shown in Fig. 9.

#### In vitro cytotoxicity test study of DMT-AgNPs

*In-vitro* cytotoxicity testing procedures reduce the use of animals and enforce to use of cultured tissues and cells [56,57] in the laboratory for a safe environment. The reduction of tetrazolium salts is widely accepted as a reliable way to examine cell proliferation [58]. The cytotoxicity assay measures the cell proliferation rate and metabolic events that cause apoptosis or necrosis. The cytomorphological changes for MCF-7 cell lines are shown in Fig. 10. After 24 h of treatment, their  $IC_{50}$  values with statistical studies are shown in Fig. 11a, and their graphical

Fig. 10. Cytomorphological changes of MCF-7 cell line treated with colloidal AgNPs and DMT-AgNPs.

Fig. 11a. Statistical representation of In vitro cytotoxicity test study.

Fig. 11b. Graphical representation of In vitro cytotoxicity test study of a sample.

representation in Fig. 11b. Comparative observations from Fig. 10 and Fig. 11 indicate that the synthesized DMT-AgNPs show good results compared to plane AgNPs and chemotherapeutic drug Cis-platin against MCF-7cell lines. The anticancer effect of AgNPs and DMT-AgNPs might be due to nano size, surface area, and surface functionalization factors which control bio-kinetics leading to a reduction in cell viability. The reacting mode of DMT-AgNPs may be described as Nano samples first making a breakthrough in the permeability of the outer membrane, resulting in the leakage of cellular materials that cause cell decomposition and death eventually. Further, the DMT-AgNPs sample may enter the inner cell membrane and inactivate or disruption of the mitochondrial respiratory chain leading to the release of Reactive Oxygen Species (ROS). This disturbs (ATP) proteins, and phosphate lipids synthesis, which in turn leads to DNA damage. It is inhibiting respiration and growth of cells [59]. Therefore DMT-AgNPs result in an increased cell proliferation rate compared to plane AgNPs.

#### Molecular docking study

Analyzing the results obtained from *in to vitro* studies, it was thought worth performing molecular docking studies for the respective synthesized samples. The DMT ligand which has free thiol (-SH) and amine (-NH<sub>2</sub>) groups may get attached to the AgNPs sample to bring the surface functionalization making them more bio-active. Hence, it was necessary to study the possible conformations, and binding energies and to inculcate both *in-silico* and *in-vitro* results. All four possible

conformations or target sites where AgNPs get attached to DMT ligand moiety and the standard drug (DMT) having 2D structure were converted to energy-minimized 3D structures. Finally, iGEMDOCK ranked for DMT- AgNPs were visualized in Fig. 12 with the binding pose by combining the pharmacological interactions and binding energy-based score function. The binding energies and residues involved in H-bonding are tabulated in Table 3.

In-silico studies revealed that the synthesized AgNPs and DMT-AgNPs showed good binding energy toward the targeted proteins as shown in Table 3. The S1b and S1c have a maximum binding energy for target proteins among all the designed possible conformations, which were taken for studies. S1b showed good antibacterial properties for 1iYS and 1JIJtarget protein i, e-64.6292, and -65.7112.

The S1c possible conformations have a binding energy of -69.5458 for 5IAE and the S1b design possible conformations have a binding energy of -69.3362 for 1K2N cancer proteins when compared to standard drugs. It is the thiol group of DMT-AgNPs that alkylate the DNA resulting in obstruction of DNA replication and RNA translation or DNA -DNA cross-linking i.e. Guanine-Adenine or Guanine intrastrand and DNA- protein cross-links. Such crosslink proceeds through the  $S_{\rm N}2$  reaction mechanism leading to the disruption of DNA and RNA strands. These types of damages cannot be repaired by our body's cellular machinery and hence cells might undergo apoptosis mostly via the p53 pathway [60] acting as a good anticancer agent.

#### Conclusion

The present work reports an efficient chemical reduction method for the functionalization of AgNPs with DMT and is well characterized for its phase formation. Synthesized DMT-AgNPs have certain advantages like ease of applicability in large-scale production, economically feasible, eco-friendly, and higher solubility. Evaluation of biological study against MCF-7 cell lines explores the potential improvement in the biological activity of the DMT-AgNPs compared to AgNPs. A molecular docking study compiled the mobility of synthesized DMT-AgNPs samples into cells deciding their fate in a bioprocess and risk aspects for their application. Conclusively, the obtained results conclude that the DMT-AgNPs sample can be used for the next generation of biomedical applications.

Keywords: Expansive clay Fly ash GGBS Landfill liner Silica fume Waste recycling

#### ABSTRACT

The effect of supplementary cementitious materials (SCMs) such as fly ash (FA), GGBS and silica fume (SF) on the geotechnical index and engineering properties of expansive clays (EC) are studied in this research work. This manuscript aims to determine the workability (consistency limits (CL)), swellability (free swell index (FSI)), compaction properties, strength characteristics (UCS) and hydraulic conductivity (HC) of varied eighteen mix proportions of FA-EC (P-series), FA-GGBS-EC (Q-series) and FA-GGBS-SF-EC (R-series) are experimentally studied as a bottom liner in landfills. From the test results, CL and FSI significantly decreased in P, Q and R series, this is due to the effect of flocculation, a process that increases the average particle size of mix blends and also depletion of the double-diffusive layer thickness of EC by promoting the Ca2+ ions in the pore water from SCMs. The compaction parameters such as optimum moisture content decreased in all the series, due to the higher flocculation of mixes. However, maximum dry unit weight increased in Q and R and decreased in the P series. The UCS values increased with an increase in optimum SCMs quantities and with curing intervals tested at 0, 7, 14 and 28 days. The higher UCS value is attained at 40 %FA with EC (i.e. P2), 60 %FA-GGBS with EC (i.e. Q3) and 60 %FA-GGBS-SF with EC (i.e. R3) in R-series which confirmed to be optimum due to the loss of cementation action/reduced cohesion in the matrix. In the case of HC, P2, Q3 and R3 mixes are confirmed to be optimum and fall under the criterion standards of landfill liner as per USEPA recommendation. Overall, this work proves to be a novelty and shows the feasibility of various collated SCMs blended with EC as landfill liner material, furthermore, these mixes are optimized to combine with EC to create a sustainable landfill liner that fits with the United Nations sustainable goals of 2030

#### 1. Introduction

The earth's outer layer consists of soil which is referred to as the "skin of the earth", and mainly contributes to agriculture, but some soils are also great for use in construction and are still commonly employed today. In developing nations, the percentage of soil used in construction is bigger than in the West. There are several advantages of soil as a raw

material in construction. At the same time, there is an obvious negative influence on construction (Payá et al., 2020). For instance, soil in landfill liners leads to percolation and passage of waste into the earth's surface. To avoid seepage of leachate an engineered landfill liner is required. Apart from urbanization, industrialization, irrigation purposes and other cement-involved constructions raised cement production enormously (Huang et al., 2018).

M. Devarangadi et al. Cleaner Materials 11 (2024) 100219

Because the cement manufacturing industry accounts for a significant portion of global  $\mathrm{CO}_2$  emissions, researchers have made and are continuing to work to increase cement plants' energy efficiency through improved production methods, the use of alternative fuels, and the application of cutting-edge carbon capture, utilization, and storage technologies (Zhu et al., 2022). To achieve the goal of carbon emission minimization through clinker replacement, the most significant and efficient approach is to add a significant amount of supplemental cementing materials (SCMs) to cement (Acordi et al., 2020; Benhelal et al., 2013; Silva et al., 2023). One of the more viable methods involves using industrial by-products such as cement kiln dust, red mud, waste wood ash, fly ash, and waste red mud as landfill liners (Al-Bakri et al., 2022).

The CO<sub>2</sub> emissions in the cement industry, and by-products of the cement industry together are one issue and the other hand which is quite important and directly linked to the landfill process is "Solid waste". The increasing global population needs have promoted the increasing amount of municipal waste. This waste must be treated according to national directives, the most suggested and common practices are a) recycle, b) burn, or c) deposit. The German Landfill Directive, which was passed in 2009 and the EU's environmental and technical standards that must adhere to legal requirements, recommends the essential and practicable qualitative criteria for constructed barriers (Beck-Broichsitter et al., 2019).

To safeguard the immediate area around the waste deposit site, landfill liners have been developed. Liner systems are therefore crucial to safeguarding groundwater and preventing the diffuse emission of greenhouse gases (i.e., methane). In order to inhibit the environmental effects of landfill leachate, landfills are designed with leachate barriers to prevent leachate from contaminating the underlying soil and groundwater (Nath et al., 2023; Wan et al., 2023). The barrier for leachate in general referred to as a "landfill liner" which is an impermeable liner that works to prevent the leachate from escaping the landfill system. Natural materials (such as clay and boulder marl) are frequently used to build landfills' top and bottom liners; however, they must adhere to technical standards (Emmanuel et al., 2020). Due to its affordability, effectiveness, convenient technology, and high capacity, engineered landfills have established themselves as the method of choice for disposing of municipal solid waste in various regions of the world (Chakradhar and Katoch, 2016; Feng et al., 2020). These landfills are in general constructed using clays with reference to local legal standards (Widomski et al., 2015).

Expansive clays, bentonite-sand mixes, laterite soils, etc. were blended with industrial by-products like fly ash (FA) (Mir and Sridharan, 2017), which also improved the engineering characteristics of the soils (Devarangadi and Shankar, 2021). The widespread application of these industrial by-products as lining materials produced excellent results. These industrial by-products have the ability to enhance the undesired geotechnical qualities of soils like expansive clays, dispersive clays, and soft marine clays, among others, by reducing their swelling-shrinkage parameters and enhancing the soil's strength, dry weight, and compressibility. The main disadvantage, however, is the spread of clays, which seriously harms pavement structures and is a big problem all over the world (Soltani et al., 2022; Widomski et al., 2015). High-plasticity characteristics were observed in these challenging soil exhibits. They can expand as a result of changes in seasonal and ambient moisture levels and absorb a lot of water. Silt, clay stones, residual soils, and sedimentary soils with smectite clay minerals and mica groups (such as montmorillonite, illite, and vermiculite) are expansive in character (Abbey et al., 2020). Especially expansive soils are well recognized for their behaviour in terms of volume change due to changes in water content (Koukouzas et al., 2022). Clay-like minerals, such as montmorillonite, are found in expansive soils; these minerals' volumes change during wetting and drying. Structure, sidewalks, roadways, basement floors, pipes and even foundations could experience excessive strain from this volume change to be damaged. Clayey soils having a

significant specific surface area and strong cation exchange capacity are referred to as expansive soils. The difficulty for civil engineers is felt all across the world because expansive soils are present everywhere. Expansive soils may provide a natural hazard and cause significant structural damage if improperly managed (Devkota et al., 2022).

Desiccating these soils during the dry season causes shrinkage cracks, which make it easier for water to penetrate the soil and aggravate swelling. Soils undergo considerable volume changes due to this cycle of swelling and contracting, and finally lose their capacity to sustain weight. Additionally, unneeded stresses brought on by expansive soils' shrink-swell characteristics cause structural damage through heaving and differential settling. Due to the high-plasticity expansive soils that cover 20 % of the land surface in the United States (US), the issue is particularly severe there. The estimated annual damage from expansive soils in the US is estimated to be billions of dollars, outpacing the total damage from earthquakes, floods, hurricanes, and tornadoes. Urbanization has made land scarcely accessible, therefore, when choosing construction locations, it is frequently vital to take expansive soils into account. Chemical stabilization of these soils is a practical method for ensuring construction safety and achieving significant financial savings by lowering the expense of repair and rehabilitation (Jiaz et al., 2022). Cement and lime are the stabilising agents that are most frequently used to treat expansive soils. Numerous analyses of the stabilisation of expansive soils by cement and lime have been carried out over time by different scholars. However, the brittleness of soils that have been treated with cement and lime is often undesirable in situations where there are dynamic stresses, such as traffic loads on paving systems. (Mahedi et al., 2020).

Therefore, an innovative blend of collated FA, GGBS and Silica fume with EC could be the next-generation solution for geotechnical index issues raised in the construction sector and waste management sector. Looking at FA, GGBS, and Silica fume in this context, FA is originally formed from the coal's mineral matter into a fine powder, which consists of non-combustible materials in coal and a negligible amount of carbon that is left over after incomplete combustion. FA typically has a light brown colour and is primarily made up of glassy spheres the size of silt and clay. With respect to coal mix and plant operating conditions, FA properties vary greatly. Every year, almost 50 million tons of FA are recycled and reused in the US. FA is referred to as either cementations (Wei et al., 2018) or pozzolanic (Singh et al., 2021; Thomas et al., 2017). The specific characteristics of the FA, particularly in terms of cementations and pozzolanic, were described by Ghassemi and co-workers. A cementation material hardens when mixed with water. Pozzolanic materials will also harden when exposed to water, but only after being activated by an alkaline agent like lime. Some FAs help replace cement in concrete and numerous other construction needs because of these cementations and pozzolanic qualities. Fly ash is utilized in the production of concrete and cement, as well as in the production of road base, oil stabiliser, clean fill, filler for asphalt, and mineral filler (Ghassemi et al., 2004).

Gypsum, calcium hydrate, and limestone are among the active minerals that are present in GGBS abundantly, which is a by-product of the blast furnaces used to produce iron (Ghosh et al., 2023). Blast furnaces are fed with mixtures of iron ore, coke, and limestone and run at a temperature of roughly 1500 °C. When iron ore, coke and limestone melt in the blast furnace, molten iron and molten slag are two products created. Molten slag is lighter than molten iron and floats on top of it. The silicates and alumina make up the majority of the molten slag (Siddique, 2008). Slag is granulated by a process that involves cooling molten slag with high-pressure water jets. This causes the slag to rapidly cool, forming granular particles that are typically smaller than 5 mm. The granulated slag is then subjected to additional processing, including drying and grinding into a very fine powder known as "GGBS" in a rotating ball mill (Liu et al., 2023; Siddique and Bennacer, 2012).

Silica fume (SF) also known as micro-silica, is an amorphous (noncrystalline) polymorph of silicon dioxide. It is a by-product of the

reduction of high-purity quartz in electric arc furnaces using carbonate materials (such as coal, coke, and wood chips), and it has a particle size range of 0.1 m to 1 m. It is produced in the production of silicone and ferrosilicon alloys (Sumitha and Abraham, 2016). In the manufacturing of other silicon alloys such as ferrochrome, ferromanganese, ferromagnesium, and calcium silicon, it is also created as a byproduct. It is regarded as a high-performance, exceptionally reactive pozzolanic mineral additive because of its high silica concentration and extraordinary fineness. By altering the performance of the surface soil linings, Hussain, Al-Ameen, and Janna researched the permeability of silica fume and concluded that landfill liners are greatly enhanced with the inclusion of silica fume. The proportion of silica fume in the lining needs to be taken into account when designing the lining system because it will improve permeability (Hussain et al., 2021). Because GGBS, silica fume, and fly ash are waste materials with binding properties, they have drawn researchers' attention as potential candidates for inclusion in collated blends for lowering the environmental impact. On the contrary, mixing with EC makes for the most effective and sustainable landfill liner to solve the leachate problem. (Ahmad et al., 2022). Attempting to reduce waste and improve resources, energy, water, and human capital utilization efficiency is an approach to cleaner production (Gupt et al.,

Several researchers worked on SCMs and their engineering properties, in some works either on properties alone or other applications as well. Lashari et al (2023) worked on the effect of silica fume and fly ash as cementitious material, the use of SF and FA as binary cementitious material (BCM) in roller compacted concrete (RCC) based on the hardened properties and embodied carbon of RCC. Singh et al (2020) investigated the effect of silica fume on the engineering properties of expansive soil, where this work is focused on the blend of FA, GGBS and SF on index and engineering properties of expansive clays and also investigated the suitability of landfill liner which is a sustainable approach to reach the SDG. Similar to the above work, other researchers worked on the mechanical, durability, and microstructure of concrete by incorporating Nano Silica (nS), carbon nanotubes, steel fibres and other sustainable pozzolanic materials (Golewski, 2023; Sumathi et al., 2023). Ahmad et al (2023) reviewed the durability and microstructure analysis of concrete made with volcanic ash (VA) and revealed that the durability of concrete improved considerably with the replacement of cement with VA due to pozzolanic activity and micro fillings and the typical optimum dose of VA ranges from 10 to 30 %. The dose optimization of FA is carried out by the authors in this work, which is a convincing approach concerning the above-cited research works.

It is important to discuss the synergistic effect of coal FA, and SF with other pozzolanic materials and nanomaterials, and the effects of these wastes on different mechanical and physical parameters. Wang et al (2020) researched on synergistic effects of nS (nano-silica) and FA blend to find the properties of cement-based composites. Golewski (2023a) thoroughly worked and described that FA has great potential to be used as a partial replacement for OPC, especially due to its physicochemical properties, fine grain size and impressive pozzolanic activity. In his extended work, Golewski (2023b) investgated on collated fly ash, silica fume and nS with ordinary Portland cement to check the mechanical properties and brittleness of concrete. This study utilized 5 % of nS; 10 % of SF; 0, 15, and 25 % of FA as a blend and the compressive strength (fcm) and splitting tensile strength (fctm) and the brittleness of these materials were analyzed.

While exploring the OPC, Golewski (2023c) studied the combined effect of siliceous FA, SF, and nS on the cement matrix morphology and size of microcracks and described that the addition of three FA, SF, and nS in combination (pozzolanic materials), modifies the microstructure of the cement matrix. The effect of the addition of FA on the control of water movement within the structure of the concrete was investigated (Golewski, 2023d), in another work, the early interfacial microstructures came from FA, SF and nS reacting with Ca(OH)<sub>2</sub> was analyzed and also discussed reaction mechanism of three admixtures reacting with

cement hydration products and their effects on improving the interfacial microstructures, which significantly improved the performances of cement based composites (Wang et al., 2020). A detailed investigation was conducted to analyse the mechanical and durability features of a mixture of binary cement concrete modified with nanomaterials. In the context of the concrete matrix, the substitution of fractional cement content was carried out using nS (Kashyap et al., 2023). Wang et al (2023) reviewed the fabrication and properties of concrete containing industrial waste as well as the development of several environmentally friendly concretes. In brief, all the above literature states that using cementitious materials such as SF, FA, GGBS, nS and VA and other byproducts to replace the concrete and increase the durability, strength and other physical—mechanical properties which leads to the production of sustainable and cleaner materials.

A useful byproduct of coal thermal power plants is fly ash (FA), GGBS and SF which are usually wasted and have been studied extensively with an optimization approach to blend with EC to produce a sustainable landfill liner. Waste management targets and their importance are described under one of the goals of the UN Sustainable Development Goals (SDGs) for 2030 (Pedersen, 2018). Growing populations and rising per capita consumption are the main causes for both environmental degradation and social unrest that have severely strained nations over the last two decades, therefore a sustainable and cleaner waste management approach is quite necessary for the leachate problem through a sustainable landfill liner (The-Sustainable-Development-Goals-Report-2023; UN-HABITAT, 2016; UN 2023 SDG Summit). By keeping in mind to reduce the burden on global CO2 emissions control and increase the feasibility of solid waste management the collated fly ash, GGBS and silica fume on index and engineering properties of expansive clays has been studied extensively. This work would reduce the research gap and support the ongoing research where Hazardous waste landfills, municipal solid waste landfills, inert waste landfills, nuclear waste landfills and other miscellaneous toxic waste landfills will benefit.

#### 2. Experimental (materials and methods)

#### 2.1. Raw material characterization

The expansive clays (EC) used in this study were procured from a depth of 2 m in Ballari, India. The geotechnical properties of EC tested with ASTM standards are presented in Table 1. The EC consists of FSI and PI values of  $120\,\%$  and  $37\,\%$  respectively when tested with DIW, and it is designated as CH (inorganic clays of high plasticity) as per the USCS classification. The chemical and mineral composition of EC is depicted in Table 3.

The geotechnical properties of supplementary cementitious materials (SCMs) such as fly ash (FA), GGBS and silica fume (SF) and their tested ASTM standards are depicted in Table 2 and chemical compositions are displayed in Table 3. Fly ash was obtained from Bellary thermal power station, Karnataka, India which mainly comprises sand-silt mixtures and is non-plastic (NP). It is classified as class-F based on the sum

of pozzolanic oxide content ( $\sum P > 70$  %, as per ASTM 2005b (refer Table 3)). GGBS and SF were collected from chemical suppliers in Chennai, TN, India, which include fines and non-plastic. The value of  $\sum P$  attained for GGBS and SF is 50.11 % and 97.70 % respectively. The SCMs resulted in non-swelling behaviour when permeated with DIW. Fig. 1 shows the raw materials' morphological (SEM) images. Fig. 1(a) shows the asymmetrically curved edges of the particles and the flaky texture of montmorillonite present in EC. FA particles are seen as spherical in Fig. 1(b) and GGBS/SF appear to be clear edges and angular in shape Fig. 1(c) and (d).

#### 2.2. Test variables and quantities determined

The experimental campaign was conducted with three extensive series P, Q, and R-series respectively. According to the dry weight basis of the raw materials used in this investigation, the mixes were determined, and these results are shown in Table 4. Initially, to understand

the reference mix i.e. E100, it is determined for its geotechnical index and engineering properties. Further, in the P-series, FA was chosen as the first additive content which is varied from 0 % to 100 % by the dry weight with an interval of 20 % FA used in the mix blend. In the Q-series, FA and GGBS were equally proportionated and blended with expansive clay on a dry weight basis, the combined FA-GGBS used varied from 10 % to 50 % in the mix blends. Later in the R-series, GGBS-SF is equally proportionated with FA and blended with EC in the range of 0 %, 20 %, 40 %, 60 %, 80 % and 100 % by dry weight respectively, the combined GGBS-SF used is varied from 5 % to 25 % in the mix blends (refer to Table 4). Thus, a total of sixteen different combinations were chosen for this investigation, and the optimum was picked in each series as a landfill liner material. This is taken into consideration in accordance with the earlier literature, which states that industrial by-products are combined with different filler/binder contents before the best combination is chosen.

Experimental investigations such as consistency limits (LL and PL), FSI, standard Proctor compaction, UCS and HC tests were carried out for all the sixteen mix proportions. In performing LL and PL tests, the samples are subjected to equilibration with DIW (i.e. for 24 h period). Later in FSI and standard Proctor compaction, the samples are prepared instantaneously and a homogeneous mix is arrived in before performing the tests. In the case of UCS tests, the dimensions of the samples were prepared with the standard length-to-breadth ratio of 2:1. Further, the samples were stored in airtight polythene bags and stored in desiccators at their respective curing periods to sustain 100 % humidity. The consistency limits, FSI, compaction characteristics and UCS were tested in duplicate samples and the mean value was reported. Three trials of HC tests were performed for each specimen and the average HC of the threetest data was considered. On the whole, 16 LL and 16 PL tests, 16 FSI tests, 16 compaction tests, 16 HC tests and 64 UCS tests were performed in this research.

#### 2.3. Experimental tests conducted

As mentioned in the above section the following tests as consistency limit Tests (LL and PL), free swell index tests (FSI), standard Proctor compaction characteristics, hydraulic conductivity tests (HC) and unconfined compressive strength (UCS) were performed. The whole method of sample preparation and procedure are accessible in our earlier work (Devarangadi and Shankar, 2021), however, the flowchart

#### 3. Results and discussion

#### 3.1. Effect of SCMs on FSI of expansive clays

TThe variation of FSI with the addition of FA on EC is represented in Fig. 3 i.e. P-series (E100, P1, P2, P3 and P4). The FSI of EC is 120 % upon the addition of FA, FSI values gradually reduced at 20 %, 40 %, 60 %, and 80 % FA contents with a declined ratio of 0.50 (i.e.  $\Delta$ FSI% to  $\Delta$ FA%) when permeated with DIW. However, P5 (i.e. 100 % FA) has resulted in non-swelling behaviour with DIW. The above resulting decreased trend in the P-series is due to an increase in the average particle size of FA in mix blends and a decrease in the surface activity of mix blends (Devarangadi and Shankar, 2021; Shankar and Phanikumar, 2012). On the other hand, the partial replacement of FA with EC increases the cation exchange activity which further results in flocculation and increases the average particle size. This increased average particle size signified declining FSI values.

Fig. 3 depicts the variation of FSI with the addition of FA-GGBS on EC i.e. Q-series (E100, Q1, Q2, Q3 and Q4). With the addition of FA-GGBS in mix blends, FSI drastically reduced at 20 %, 40 %, 60 %, and 80 % FA-GGBS contents with a declined ratio of 0.38 (i.e.  $\Delta$ FSI% to  $\Delta$ FA-GGBS%) when permeated with DIW. However, Q5 (i.e. 50 %FA-50 %GGBS) also

Fig. 2. (a) UCS testing of soil samples (Compaction of specimen to MDD and OMC, Inserting Sampler tube, Extraction of specimen to standard dimensions, Compression testing) (b) UCS samples stored in polythene bag for curing (c) FSI test (d) Hydraulic conductivity test.

resulted in non-swelling behaviour with DIW. The above-decreased trend in the Q-series is due to the combined pozzolanicity of FA-GGBS proportions with EC. Interestingly, an exchange of cations between sodium and calcium ions in EC and FA-GGBS mixes results in the effect of flocculation, a process that increases the average particle size of mix blends. Furthermore, this exchange of ions decreases the electrochemical/repulsive forces of the mix blends and yields decreased FSI values(Abu Seif, 2015).

Fig. 3 also illustrates the variation of FSI with the addition of FAGGBS-SF on EC i.e. R-series (E100, R1, R2, R3 and R4). Interestingly, the addition of these combined SCMs with EC resulted in reduced FSI values at a higher decreased rate with DIW. Consequently, the declined ratio was found to be 0.31 (i.e.  $\Delta$ FSI% to  $\Delta$ FA-GGBS-SF%), thereby signifying greater efficiency in the reduction of FSI values of EC. Also, R5 (i.e. 50 %FA-25 %GGBS = 25 %SF) resulted in non-swelling behaviour with DIW. This significant reduction in FSI values is mainly attributed to higher cementitious values of FA-GGBS-SF proportions with EC (Phanikumar and e, 2020). These tri-SCMs induced higher pozzolanicity and interexchange of ions when compared to P and Q-series respectively. This significantly impacted the increase in average particle size of mix proportions and obtained a higher reduction in FSI values.

#### 3.2. Effect of SCMs on consistency limits of expansive clays

Table 5 displays the results of consistency limits including liquid

limit (LL), plastic limit (PL) and plasticity index (PI = LL-PL) of varied mix designs of EC against FA, GGBS and SF. The addition of FA in EC decreases the LL, PL and PI respectively. The PI of EC is 32.77 % upon the addition of FA, PI values gradually reduced at 20 %, 40 %, 60 %, and 80 % FA contents with a declined ratio of 0.24 (i.e.  $\Delta$ PI% to  $\Delta$ FA%) when permeated with DIW. However, the SCMs related to mixes P5, Q5 and R5 resulted in non-plastic behaviour when experimented with DIW. A common fact that the declining ratio in PL was found to be three-fold lesser than that of LL i.e.  $\Delta PL\%/\Delta FA\% = 0.06$  compared with  $\Delta LL$  $\%/\Delta FA\% = 0.30$ . This observed monotonically decreasing trend of PI values in the P-series is mainly because of non-plastic, pozzolanicity, the particle size of FA and depletion of the double-diffusive layer thickness of EC by promoting the Ca<sup>2+</sup> ions in the pore water from FA. As a result, PI decreased significantly with an increase in FA content in mix blends, indicating the transition towards non-plastic behaviour i.e. cohesionless packing of mix blends (also earlier reported by (Phani Kumar and Sharma, 2004; Shankar and Phanikumar, 2012; Sivapullaiah et al., 1996; Younus and Sreedeep, 2012)).

Similarly, Table 5 displays the results of LL, PL and PI values of FA-GGBS mixes with EC. Importantly addition of varied FA-GGBS contents in EC resulted in the monotonically decreased trend of consistency limits when permeated with DIW. For instance, the PI values decreased from 24.65 % to 12.06 %, when the addition of equal proportions of FA-GGBS in EC increased from 0 % to 80 % respectively. A declined ratio of 0.16 (i.e.  $\Delta$ PI% to  $\Delta$ FA-GGBS%) was observed with DIW as a permeant fluid.

Fig. 3. Results of Free swell indexes.

**Table 5**Results of consistency limits.

Mix	Consiste	ncy limits		Percentage decrease inΔPI (%)
designation	LL (%)	PL (%)	PI (%)	/ΔSCM's (%)
E100	64.89	32.12	32.77	
P1	56.57	29.87	26.7	-0.24
P2	49.2	28.79	20.41	
P3	43.89	27.82	16.07	
P4	40.6	26.75	13.85	
P5	Non-pla	stic		
Q1	51.33	26.68	24.65	-0.16
Q2	44.75	26.48	18.27	
Q3	40.85	25.29	15.56	
Q4	36.64	24.58	12.06	
Q5	Non-pla	stic		
R1	45.45	23.17	22.28	-0.13
R2	39.44	21.93	17.51	
R3	35.69	21.11	14.58	
R4	32.31	21.02	11.64	
R5	Non-pla	stic		

Appealingly, the declined ratio in LL and PL (i.e.  $\Delta$ LL%/ $\Delta$ FA-GGBS% = 0.18 and  $\Delta$ PL%/ $\Delta$ FA-GGBS% = 0.02) was found to be less when compared to the P-series. This is mainly due to the inclusion of GGBS in FA-EC, as a result, it increased the non-plasticity, pozzolanic, average particle size and depletion of DDL thickness. This hypothesis is further examined with the inclusion of SF in FA-GGBS against EC blends.

Interestingly, the consistency limits further decreased with the addition of SF in FA-GGBS against EC mixes, the results of LL, PL and PI are also represented in Table 3. A declined ratio of 0.13 (i.e.  $\Delta$ PI% to  $\Delta$ FA-GGBS-SF%) was observed with DIW as a permeant fluid used in this study. Interestingly, the declined ratio in LL and PL (i.e.  $\Delta$ LL%/ $\Delta$ FA-GGBS-SF% = 0.16 and  $\Delta$ PL%/ $\Delta$ FA-GGBS-SF% = 0.02) was found to be

less when compared to P-series and Q-series respectively. This significant declination of PI values is majorly due to the addition of SF content in the mix blends, SF facilitated the low plasticity in the FA-GGBS mixes against EC by increased flocculation effect and reduction in DDL thickness at higher rates.

Fig. 4 represents the location of all sixteen mix proportions used in this study on Casagrande's plasticity chart. The reference EC (i.e. E100) is located at the A-line and it is designated as CH (inorganic clays of high plasticity). In the P-series (i.e. EC with FA) and Q-series (i.e. EC with FA-GGBS), with the addition of FA and GGBS contents, the plasticity of E100 monotonically declined and noted a linear transition towards MH (i.e. inorganic silt with high plasticity) and ML (i.e. inorganic silt with low plasticity). Furthermore, in the R-series (i.e. EC with FA-GGBS-SF), the plasticity of E100 deputed to CL transition (i.e. inorganic clays of low to medium plasticity). Overall, the decrease in PI with the effect of these tri-SCMs (i.e. P, Q and R-series) resulted in a potential reduction of cohesion and undrained shear strength of E100.

#### 3.3. Effect of SCMs on compaction characteristics of expansive clays

Fig. 5 illustrates the variation of MDUW-OMC of the design mixes used in this study. In the case of the P-series, the addition of FA increases against EC resulted in a decrease of optimum moisture content (OMC), which obtained a monotonically decreasing drift with a decreasing rate of  $\Delta OMC\%/\Delta FA\% = -0.072$  (see Fig. 5a). In relative, the maximum dry unit weight (MDUW) resulted in a monotonically decreasing drift with a decreasing rate of  $\Delta MDUW\%/\Delta FA\% = -0.007$  (see Fig. 5a). The reference E100 mix obtained an MDUW value of 13.74 kN/m³ (corresponding to OMC = 32.3 %), upon the addition of FA at 20 %, 40 %, 60 %, 80 % and 100 % contents resulted in decreased MDUW = 13.61kN/m³, 13.35 kN/m³, 13.28 kN/m³, 13.17 kN/m³ and 13.04 kN/m³ (corresponding to OMC = 31.1 %, 29.44 %, 27.18 %, 26.22 % and 25.1 %). In general, the decrease/increase in MDUW/OMC majorly depends on the type of fly ash used in the experimental program and its governing factors such as particle size gradation, carbon-iron contents, fineness

Fig. 4. Results of consistency limits in the USC plasticity chart.

Fig. 5. Variation of MDUW and OMC of expansive clay blends.

and density etc. In this case, MDUW is reduced because of the high fineness and lower specific gravity/density of FA compared with EC. Also, the decline is due to the presence of hollow spherical particles, earlier reported by Das and Yudhbir (2006). On the other hand, the decrease in OMC is attributed to burnt carbon particles present in FA which decrease the water demand on surface absorption of FA-EC mixes (Joshi and Lohita, 1997).

Fig. 5b displays the variation of MDUW and OMC for the Q-series. It revealed that, with the addition of FA-GGBS at 20 %, 40 %, 60 %, 80 % and 100 % against EC, the MDUW increases (i.e. increasing rate of  $\Delta$ MDUW%/ $\Delta$ FA-GGBS% =+0.008) and OMC decreases (i.e. decreasing

rate of  $\Delta$ OMC%/ $\Delta$ FA-GGBS% = -0.061). The resultant increased MDUW is mainly attributed to the higher density of GGBS and its increased substitution with FA-EC resulted in higher flocculation of mix blends. Furthermore, the higher flocculation of these mixes can be compacted at lower water content which decreases the OMC values. It is a common fact that compaction effort is indirectly proportional to the percentage of clay and its resistance (Phanikumar and Sharma, 2007). The combined addition of FA-GGBS increased the average silt-size particles with EC and the clay resistance is reduced for the same compactive effort which increases the MDUW (Sharma and Sivapullaiah, 2016b).

In the same way, Fig. 5c represents the effect of FA-GGBS-SF on EC as

R-series (see Table 3). The addition of SF in FA-GGBS-EC blends increased their MDUW (i.e. increasing rate of  $\Delta$ MDUW%/ $\Delta$ FA-GGBS-SF % = +0.004) and decreased the OMC (i.e. decreasing rate of  $\Delta$ OMC %/ $\Delta$ FA-GGBS% = -0.069). As mentioned earlier in the above case, the increase in MDUW is based on the effect of flocculation in the mixes which resulted in increased densities and reduced water contents. Interestingly, the addition of SF decreased the dry densities of the R-series compared with the Q-series. For instance, the rate of increase of MDUW in the Q-series (i.e. 0.008) is twofold times higher than R-series (i.e. 0.004). This is mainly due to its low denseness/specific gravity and increased fineness in mix blends after SF substitution. Hence, it confirms that the addition of tri-SCMs (i.e. FA-GGBS-SF) is ineffective in increasing the dry densities than FA-GGBS with EC mix blends. Moreover, this is also true with the corresponding MDUW of SCMs i.e. P5, Q5 and R5 which resulted in 13.04 kN/m³, 14.62 kN/m³ and 14.15 kN/m³.

#### 3.4. Effect of SCMs on UCS characteristics of expansive clays

TThe variation of UCS for sixteen mix proportions tested at different curing periods of 0, 7, 14 and 28 days were displayed in Fig. 6. In the Pseries, as a result of FA inclusion, the UCS values of each mix increase with the increase in the curing period against 0, 7, 14 and 28 days respectively. The reference E100 resulted in UCS value of 155.78 kPa at 0 days, 158.05 kPa at 7 days, 163.55 kPa at 14 days and 165.32 kPa at 28 days curing period, this resulted in increased strength from 0 to 28 days curing period is negligible and the strength increment is only due to the possible effect of self-hardening under its own OMC and minimum effect of carbonation. With the addition of 20 % FA contents in EC, the UCS value increased from 163.55 kPa to 347.85 kPa at 0 to 28 days curing period. For 40 % FA content in EC, the UCS value increased from

224.44 kPa to 476.89 kPa at 0 to 28 days curing period. For 60 % FA content in EC, the UCS value increased from 166.14 kPa to 364.40 kPa at 0 to 28 days curing period. For 80 % FA content in EC, the UCS value increased from 142.37 kPa to 257.88 kPa at 0 to 28 days curing period. For 100 % FA content, the UCS value increased from 43.60 kPa to 73.60 kPa at 0 to 28 days curing period respectively.

However, a higher UCS value is attained at the P2 mix (i.e. 40 %FA-60 %EC) and thereafter the UCS values decrease with an increase in FA content, this was true for all the curing periods. The increase in UCS values is associated with (i) the production of cementitious hydrated products such as CSH, CAH, CASH etc. The amount of SiO2 and Al2O3 present in EC has a tendency to react with free-lime (CaO) present in FA and OH ions present in pore water solution, liberating these cementitious hydrated products. This production process depends on the fineness of FA (SCMs), pH of pore solution, OH ions and presence of freelime with respect to the replacement level of FA etc. Hence increasing the stabilization of the FA-EC matrix (Kumar and Sivapullaiah, 2016; Sharma and Siyapullaiah, 2016a; Siyapullaiah et al., 1998) (ii) interestingly, the free lime available in FA is utilized by EC for its cation exchange reactivity, results in increasing the  $c-\phi$  (i.e. cohesion-internal friction parameters) (Prashanth et al., 2001) which further stabilizing the mix blends.

Hence, in this case, when the replacement level increases by more than 40 %FA content, the UCS values drift to a decreasing trend. This may be ascribed to poor cementitious reactivity between FA and EC and less improvement in c- $\phi$  (cohesion-internal friction parameters) of the matrix resulting in decreasing the UCS values. Similar studies were reported by several researchers (Kumar et al., 2007; Sabat and Bose, 2013; Sharma and Hymavathi, 2016). However, considerable studies have been performed by researchers in enhancing the higher strength of FA-

Fig. 6. Variation of UCS at 0, 7, 14 and 28 days curing period of expansive clay blends.

EC mix blends with additional binders such as cement, lime, gypsum clay etc.(Ganjian et al., 2004; Sharma and Sivapullaiah, 2017; Sivapullaiah and Moghal, 2011). In this work, the author's objective is to use only the SCMs and determine their efficacy without any additional binders. Overall, the recommended design criteria for UCS value for a liner in a landfill should be  $\geq$  200 kPa, to ensure stability because of increased overburden pressure (Daniel and Wu, 1993; Guney et al., 2008; Osinubi and Nwaiwu, 2006). In this series, mixes such as P1 mix at 7, 14 and 28 days, P2 mix at all curing periods, and P3 and P4 mix at 14 and 28 days curing period fall under the recommendations of UCS criteria.

The variation of FA-GGBS on EC is presented in Fig. 6 i.e. (refer to mixes, Q1 to Q5). The test results revealed that the addition of GGBS in FA-EC blends monotonically increases the UCS value for all the mix proportions and relative to curing periods from 0 to 28 days. For instance, with the addition of an equal proportionate of 20 %GGBS-FA contents in EC, the UCS value increased from 264.47 kPa to 1722.42 kPa at 0 to 28 days curing period. For 40 % GGBS-FA content in EC, the UCS value increased from 291.56 kPa to 1984.66 kPa at 0 to 28 days curing period. For 60 % GGBS-FA content in EC, the UCS value increased from 476.65 kPa to 2728.43 kPa at 0 to 28 days curing period. For 80 % GGBS-FA content in EC, the UCS value increased from 425.66 kPa to 2435.92 kPa at 0 to 28 days curing period. For 100 % GGBS-FA content, the UCS value increased from 130.22 kPa to 630.48 kPa at 0 to 28 days curing period respectively.

However, a higher UCS value is attained at the Q3 mix (i.e. 60 % GGBS-FA with 40 %EC) and thereafter the UCS values decrease with an increase in GGBS-FA contents, this was true for all the curing periods. As discussed, the technical reasons in the previous section, the influence of GGBS in this series is predominant in enhancing the UCS values with higher cementation action and c-φ improvement in the mix blends, resulting in higher UCS values when compared to P-series respectively. For instance, in case of P-series to Q-series, the UCS is increased by 395.16 % for Q1-mix at 28 days curing period, 316.17 % for Q2-mix at 28 days curing period, 648.75 % for Q3-mix at 28 days curing period, 843.43 % for Q4-mix at 28 days curing period and 756.63 % for Q5-mix at 28 days curing period respectively. In this series, mixes such as Q1, Q2, Q3, Q4 mixes at all curing periods and Q5 mix at 28 days curing period fall under the recommendations of UCS criteria.

The variation of FS on FA-GGBS-EC is presented in Fig. 6 i.e. (refer to mixes, R1 to R5). The test results revealed that the addition of SF in FAGGBS-EC blends monotonically increases the UCS value for all the mix proportions and relative to curing periods from 0 to 28 days. For instance, with the addition of 20 %SF-GGBS-FA contents in EC, the UCS value increased from 190.10 kPa to 1235.35 kPa at 0 to 28 days curing period. For 40 % SF-GGBS-FA content in EC, the UCS value increased from 233.12 kPa to 1330.57 kPa at 0 to 28 days curing period. For 60 % SF- GGBS-FA content in EC, the UCS value increased from 385.95 kPa to 1664.51 kPa at 0 to 28 days curing period. For 80 % SF-GGBS-FA content in EC, the UCS value increased from 310.32 kPa to 1394.60 kPa at 0 to 28 days curing period. For 100 % SF-GGBS-FA content, the UCS value increased from 70.88 kPa to 450.40 kPa at 0 to 28 days curing period respectively. The higher UCS value in this series resulted in R3-mix (i.e. 60 %GGBS-FA with 40 %EC) at all curing periods, thereafter the UCS values decreased with the addition of SCMs content with EC. This is due to the loss of cementation action and reduced cohesion in the matrix.

Interestingly, when compared with the Q-series, the UCS values decreased with the addition of SF in the mix blends. For instance, in the case of Q-series to R-series, the UCS is decreased by 28.28 % for R1-mix, 32.96 % for R2-mix, 38.99 % for R3-mix, 42.75 % for R4-mix and 28.56 % for R5-mix at 28 days curing period respectively. This monotonically decline trend is attributed to the lack of free lime available in SF for cementitious reactions. Since sufficient amounts of silicates are available in this series; free lime available in FA-GGBS attains a marginal effect to produce cementitious products to react with silicates present in SF (Sivapullaiah et al., 1998). In this series, mixes such as R1 at 7, 14 and

28 days curing period, R2, R3, and R4 mix at all curing periods and R5 mix at 28 days curing period fall under the recommendations of UCS criteria.

This section influences the specimen characteristics and consistency of the mix blends subjected to %strain failure of UCS at varied curing periods. Figs. 7-9 show the variation of %strain and UCS values for Pseries, Q-series and R-series at 0, 7, 14 and 28 days respectively. In Fig. 7, the black line represents the deviation of %strain and the red line represents the deviation of UCS with FA-EC mix blends, similar interpretation is shown in Fig. 8 (i.e. FA-GGBS-EC mixes) and 9 (i.e. FA-GGBS-SF-EC mixes). It revealed that the %strain value decreases with an increase in SCMs content and curing period in P-series (refer Fig. 7), Q-series (refer Fig. 8) and R-series (refer Fig. 9). For instance, the  $E100\,i$ . e. reference mix resulted in an %strain failure value of 10.12 % at 28 days UCS value, the resulted in failure consistency is the ductile type and represented a softening character. With the addition of FA, the %strain failure recorded for P1, P2, P3, P4 and P5 decreased to 3.88 %, 3.46 %, 3.7 %, 6.46 % and 4.05 % at 28 days UCS value, the resulting failure consistency is the brittle type and represented a hardening character. The decreased rate from E100 to P-series is reflected by 61.66 %, 65.81 %, 63.44 %, 36.17 % and 59.98 % respectively. Interestingly, the increase in %strain in the P3, P4 and P5 mix is mainly attributed to decreased cohesion and cementation between the particles which further decreases UCS values. Hence, this also concludes that the % strain values are inversely proportional to UCS values (refer to Fig. 7d); Similar findings can also be referred from Figs. 8 and 9. Therefore, the obtained strain value results agree with the UCS experiment findings.

#### 3.5. Effect of SCMs on hydraulic conductivity (HC) of expansive clays

Fig. 10 demonstrates the deviation of HC with time for FA-EC mixes (i.e. P-series), permeated with DIW as test fluid. The test results revealed that (i) HC monotonically increases with an increase in FA addition with EC and (ii) HC of each individual mix decreases with time (refer Fig. 10). The reference mix E100, has resulted in a low HC value of 2.31E-10 cm/s when permeated with DIW. After the addition of 20 %, 40 %, 60 %, 80 % and 100 % contents of FA with EC, the HC value increased to 7.45E-8 cm/s, 8.75E-8 cm/s, 6.41E-7 cm/s, 7.54E-6 cm/s and 4.84E-4 cm/s respectively with DIW. This increasing drift in the P-series is because of (i) decreased maximum dry unit weights of mixes from P1 to P5, as the HC test is performed at their compactive optimum moisture contents. For instance, when FA content increases from 0 % to 100 %, the MDUW decreases from 13.74 kN/m<sup>3</sup> to 13.04 kN/m<sup>3</sup>, and corresponding HC values increase from 2.31E to 10 cm/s to 4.84E-4 cm/s with DIW (Devarangadi and Masilamani, 2019; Phanikumar and Shankar, 2016). (ii) Replacement of fine particles of EC with silt-sized FA in the mix blends increases the marginal void space, thus resulting in increased HC (Prashanth et al., 2001). (iii) Even though considerable reactive silica is available in FA but the effect of alkaline activity is less due to lower amounts of free-lime available in FA. Furthermore, this leads to either insufficient cementation action or flocculation and later increases the HC of mixes (Sivapullaiah et al., 1998). Overall, 40 %FA with EC (i.e. P2 mix), is confirmed to be optimum and falls under the criterion standards of landfill liner as per USEPA recommendation for the type of EC used in this test program.

Fig. 11 demonstrates the deviation of HC with time for FA-GGBS-EC mixes (i.e. Q-series), permeated with DIW as test fluid. The test results revealed that (i) HC monotonically decreases up to the Q3 mix and thereafter the HC increases with an increase in FA-GGBS addition with EC (ii) HC of each mix decreases with time (refer Fig. 11). The reference mix E100, has resulted in a low HC value of 2.31E-10 cm/s when permeated with DIW. After the addition of 20 %, 40 %, 60 %, 80 % and 100 % contents of FA-GGBS with EC, the resulting HC values are 5.86E-8 cm/s, 3.54E-8 cm/s, 2.14E-8 cm/s, 2.7E-7 cm/s and 9.65E-7 cm/s respectively with DIW. This drift in the Q-series is because of decreased amounts of production of cementitious byproducts in mix Q4 and Q5.

Fig. 7. Variation of stress-strain for FA-EC blends at various curing periods.

Fig. 8. Variation of stress-strain for FA-GGBS-EC blends at various curing periods.

Interestingly, from mix Q1 to Q3, sufficient hydration and cementation were achieved in the mix blends, thenceforth resulting in decreased porosity, capillary channels and bleeding, which lowered the HC values. Overall, 60 %FA-GGBS with EC (i.e. Q3 mix), confirms to be optimum

and falls under the criterion standards of landfill liner as per USEPA recommendation for the type of EC used in this test program.

Fig. 12 demonstrates the deviation of HC with time for FA-GGBS-SF-EC mixes (i.e. R-series), permeated with DIW as test fluid. Similarly, the

Fig. 9. Variation of stress-strain for FA-GGBS-SF-EC blends at various curing periods.

Fig. 10. Effect of HC with time on FA-EC blends permeated with DIW.

test results revealed that (i) HC monotonically decreases up to the R3 mix and thereafter the HC increases with an increase in FA-GGBS-SF addition with EC (ii) HC of each mix decreases with time (refer Fig. 12). The reference mix E100, has resulted in a low HC value of 2.31E-10 cm/s when permeated with DIW. After the addition of 20 %, 40 %, 60 %, 80 % and 100 % contents of FA-GGBS-SF with EC, the resulted HC values are 6.66E-8 cm/s, 4.87E-8 cm/s, 3.48E-8 cm/s, 6.85E-7 cm/s and 6.54E-6 cm/s respectively with DIW. As explained

earlier in the previous section, this drift in the R-series is also because of decreased amounts of production of cementitious byproducts in mix R4 and R5. Interestingly, from mix R1 to R3, sufficient hydration and cementation were achieved in the mix blends, thenceforth resulting in decreased porosity, capillary channels and bleeding, which lowered the HC values. Overall, 60 %FA-GGBS-SF with EC (i.e. R3 mix), is confirmed to be optimum and falls under the criterion standards of landfill liner as per USEPA recommendation for the type of EC used in this test program.

Fig. 11. Effect of HC with time on FA-GGBS-EC blends permeated with DIW.

Fig. 12. Effect of HC with time on FA-GGBS-SF-EC blends permeated with DIW.

#### 4. Correlations

This section presents the important correlations of FA-EC (i.e. P-series: Blue line), FA-GGBS-EC (Q-series: Red line) and FA-GGBS-SF-EC (R-series: Brown line) for the prediction of FSI, OMC, MDUW, UCS and HC with LL values, the regression analysis was performed using origin pro software. As mentioned, the correlations and regression analysis are

evaluated based on the LL value alone, because this property instruments the behaviour of all other indexes and engineering properties of EC. The regression parameters concerning to Pearson correlation coefficient (r) and the coefficient of determination ( $R^2$ ) are depicted in Figs. 13–15. Thenceforth, the r value is used to identify the patterns in things, whereas,  $R^2$  is used to identify the strength of the model.

#### 4.1. Correlation of LL with FSI

Fig. 13 demonstrates the correlation between LL and FSI of tri-SCMs blended with EC. The r and  $R^2$  values determined for all the series are obtained in the range of 98.61 % to 99.88 % and 96.32 % to 99.69 % of the confidence bound of LL with FSI values. The proposed model equations of LL with FSI values for P, Q, and R-series are given below (refer to Eqs. (1)–(3)).

$$Y = 18.99 + 1.59x \text{ for P - series}$$
 (1)

$$Y = 9.50 + 1.73x$$
 for Q – series (2)

$$Y = 0.55 + 1.85x$$
 for R – series (3)

Where Y represents FSI and x is the LL value.

#### 4.2. Correlation of LL with OMC

Fig. 14 demonstrates the correlation between LL and OMC of tri-SCMs blended with EC. The r and  $\rm R^2$  values determined for all the series are obtained in the range of 93.62 % to 97.96 % and 83.55 % to 94.63 % of the confidence bound of LL with OMC values. The proposed model equations of LL with FSI values for P, Q, and R-series are given below (refer to Eqs. (4)–(6)).

$$Y = 6.22 + 0.26x$$
 for P – series (4)

$$Y = 17.10 + 0.25x$$
 for Q – series (5)

$$Y = 22.15 + 0.16x$$
 for R – series (6)

where Y represents OMC and x is the LL value.

#### 4.3. Correlation of LL with MDUW

Fig. 15 demonstrates the correlation between LL and MDUW of tri-SCMs blended with EC. The r and  $\rm R^2$  values determined for all the series are obtained in the range of 88.79 % to 98.90 % and 71.80 % to 97.09 % of the confidence bound of LL with OMC values. However, the r value is negative in Q and R-series, this is attributed to the two variables

that tend to move in the opposite direction. The proposed model equations of LL with MDUW values for P, Q, and R-series are given below (refer to Eqs. (7)–(9)).

$$Y = 12.21 + 0.024x \text{ for P - series}$$
 (7)

$$Y = 14.32 - 0.009x$$
 for Q – series (8)

$$Y = 16.09 - 0.037x \text{ for R} - \text{series}$$
 (9)

where Y represents MDUW and x is the LL value.

#### 4.4. Correlation of LL with UCS

Fig. 16 displays the correlation of LL with UCS for all the series at varied curing periods of 0, 7, 14 and 28 days. The regression analysis was not performed with UCS, this is because (i) as the blends depicted distinctive variations and the possible analysis is difficult to interpret. (ii) Also, a few of the UCS values are well below the criterion limits (i.e. UCS ≤ 200 kPa), hence regression may not be determined. However, the mixes were correlated, as per the UCS criterion, the unacceptable zone is pictured in the figures for the P, Q and R-series respectively. In the Pseries, the highest UCS value was attained for mix P2 at an LL value of 49.2 % and the corresponding UCS value is 224.44 kPa, 313.56 kPa, 410.65 kPa and 476.89 kPa at 0, 7, 14 and 28 days curing period (refer to Fig. 16a). In the Q-series, the highest UCS value was attained for mix Q3 at an LL value of 40.85 % and the corresponding UCS value is 476.65 kPa, 866.70 kPa, 1644.59 kPa and 2728.43 kPa at 0, 7, 14 and 28 days curing period (refer to Fig. 16b). Furthermore, in the R-series, the highest UCS value was attained for mix R3 at an LL value of 35.69 % and the corresponding UCS value is 385.95 kPa, 565.49 kPa, 1254.2 kPa and 1664.51 kPa at 0, 7, 14 and 28 days curing period (refer to Fig. 16c) respectively.

#### 4.5. Correlation of LL with HC

Fig. 17 displays the correlation of LL with HC for all the mix series used in this study. Similarly, the regression analysis was not performed with LL, this is because a few of the HC values are well below the criterion limits (i.e.  $HC \leq 1E-07$  cm/s), hence regression was not

Fig. 13. Correlation of LL with FSI for SCM's and EC blends.

Fig. 14. Correlation of LL with OMC for SCMs and EC blends.

Fig. 15. Correlation of LL with MDUW for SCM's and EC blends.

Fig. 16. Correlation of LL with UCS for SCM's and EC blends.

performed. However, the mixes were correlated, as per the HC criterion, the unacceptable zone is pictured in the figures for the P, Q and R-series respectively. This correlation termed as surrogate compatibility test (SCT) (earlier referred to by Lee et al. (2005)), is to observe the changes in the initial volume, which may also affect changes in the HC. These correlations examine the liner efficiency and predict the engineering characteristics of LL/FSI with HC infused with DIW. The figure revealed that LL values are inversely proportional to HC values, the higher the LL value, the lower the HC. For instance, the highest recorded LL value for E100 is 64.89 % and resulted in a lower HC value of 2.31E-10 cm/s when permeated with DIW. The mixes P3, P4, Q4 and R4 resulted in the higher order (i.e. HC  $\geq$  1E-07 cm/s) and corresponding LL values are 43.89 %, 40.6 %, 36.64 % and 32.31 % respectively.

#### 5. Conclusions

This study investigates the effect of different types of SCMs (i.e. fly ash, GGBS and silica fume) and their combinations blended with expansive clays (EC) was investigated for the feasibility of landfill liner materials, overall sixteen mix proportions in three major series (i.e. P, Q, and R-series) were addressed in this research, furthermore, the optimum mix in each series was determined. From the test results, it can be concluded that as the addition of varied SCMs increases with EC in all the series, the consistency limits (i.e. liquid limit (LL), plastic limit (PL) and plasticity index (PI)) and FSI decreases when permeated with DIW. The consistency limits were largely decreased in R-series with the addition of SF in FA-GGBS against EC mixes, A declined ratio of -0.13 (i. e.  $\Delta$ PI% to  $\Delta$ FA-GGBS-SF%) was observed with DIW as a permeant fluid used in this study. Consequently, the declined ratio was found to be -0.31 (i.e.  $\Delta$ FSI% to  $\Delta$ FA-GGBS-SF%), thereby signifying greater efficiency in the reduction of FSI values of EC.

Interestingly, the addition of SF decreased the dry densities of the Rseries compared with the Q-series. For instance, the rate of increase of MDUW in the Q-series (i.e. 0.008) is twofold times higher than the Rseries (i.e. 0.004). Hence, it confirms that the addition of tri-SCMs (i.e. FA-GGBS-SF) is ineffective in increasing the dry densities than FA-GGBS with EC mix blends. The UCS increased with EC against certain quantities of SCMs addition with the curing period. The higher UCS values were recorded in the Q-series when compared to the R-series and P-series. This monotonically decline trend in R-series is attributed to the lack of freelime available in SF for cementitious reactions. Since sufficient amounts of silicates are available in this series; free lime available in FA-GGBS attains a marginal effect to produce cementitious products to react with silicates present in SF. The hydraulic conductivity decreased with EC against certain quantities of SCMs addition i.e. 40 %FA (i.e. for P2 mix in P-series), 60 %FA-GGBS (i.e. for Q3 mix in Q-series) and 60 %FA-GGBS-SF (i.e. for R3 mix in R-series) which resulted in the range of 8.75E-08 cm/s, 2.14E-08 cm/s and 3.48E-08 cm/s respectively when permeated with DIW. This confirms to be optimum and falls under the criterion standards of landfill liner as per USEPA recommendation for the type of EC used in this test program.

Overall, in case of practical possibility, 40 % FA addition with EC, 30 % FA- 30 % GGBS with EC, and 30 % FA-15 % GGBS-15 % SF with EC prove to be the best and most advantageous SCM contents for designing as feasible landfill liner material, resulting in extremely low HC and higher UCS values as per the criterion limit indicated by USEPA (1993) i. e. HC  $\leq$  1E10-7 cm/s and UCS  $\geq$  200 kPa. This study concludes that using FA, GGBS, and SF as landfill liners not only lowers the disposal issue but also enhances the engineering characteristics and geoenvironmental requirements.

#### ABSTRACT

The present study focuses on developing a landslide susceptibility zonation (LSZ) using GIS-based bivariate statistical model in the Lunglei district of Mizoram. Initially, 17 factors were selected after calculating the multicollinearity test for LSZ. A landslide inventory map was created based on 234 historic landslide events, which were randomly divided into training (70%) and testing (30%) datasets. Using the Index of Entropy (IOE) model, nine causative factors were identified as having significant weightage for LSZ: elevation, slope, aspect, curvature, normalized difference vegetation index, geomorphology, distance to road, distance to lineament, and distance to river. On the other hand, factors such as land use land cover, stream power index, terrain ruggedness index, terrain roughness, topographic wetness index, annual rainfall, topographic position index, and geology had negligible weightage. Based on the relative importance of the causative factors, two models were developed: scenario 1, which considered nine factors, and scenario 2, which considered all 17 factors. The results revealed that 16% and 14% of the district area were identified as very highly landslide prone in scenario 1 and scenario 2, respectively. The high susceptibility zone accounted for 26% and 25% of the area in scenario 1 and scenario 2, respectively. To assess the accuracy of the models, a receiver operating characteristic (ROC) curve and quality sum ratio method was performed using 30% of the testing landslide data and an equal number of non-landslide data points. The area under the curve (AUC) for scenario 1 and scenario 2 were 0.947 and 0.922, respectively, indicating higher efficiency for scenario 1. The quality sum ratios were 0.435 and 0.43 for scenario 1 and scenario 2, respectively. Based on these results, the LSZ mapping from scenario 1 is considered suitable for policymakers to address development and risk reduction associated with landslides.

#### 1. Introduction

A landslip or landslide is a geological event that causes intense downward movement of earth materials along a surface plane under the influence of gravity force (Sarvothaman and Anandha, 2013). Varnes (1984) introduced landslide hazard as the chance of possible damaging phenomenon in a given time period within a given area. Landslides rank 3rd among other natural hazards on the basis of the degree of hazard worldwide (Basu and Pal, 2019). Huang and Zhao (2018) reported that 2620 fatal landslides claimed 32,322 human lives during 2004–2010 worldwide. Landslides not only damage life and property but sometimes damage the environment's stability (Chen and Chen, 2021). In India, 12.65% of the total land area is affected by landslides. It is very common in hilly regions where urbanization

is increasing rapidly (Barman et al., 2022a). Parkash (2011) divided India into three landslide-affected geographical regions; northeast India is one of them. A landslide is a combination of different conditioning factors. The factors that control landslide intensity and cause are broadly divided into two categories: (a) extrinsic variables that influence landslide susceptibilities, such as earthquakes and heavy rainfall, and (b) intrinsic variables, which are factors that contribute to landslide susceptibility (Dai et al., 2001). Landslide susceptibility zonation (LSZ) is the first step toward determining the distribution and risk of landslides (Trigila et al., 2015; Bui et al., 2012). The terminology "landslide susceptibility" can be explained as a likelihood measurement of the failure probability from a given known batch of environmental conditions (Guzzetti et al., 2005). The new development of GIS is an opportunity among scholars for landslide study. The

approaches of LSZ are broadly classified into three fundamental clusters, namely quantitative physical or deterministic based; qualitative data-driven or statistical-based; and qualitative knowledge or heuristic-based (Li et al., 2016; Chen and Li, 2020).

The deterministic approaches mainly focus on the failure mechanism of a landslide (Zou et al., 2021). Statistical approaches are organized on the premise of the relationship between the existence of landslides and the terrain attributes responsible for their occurrence, while heuristic approaches are based on the landform investigation by an experienced geomorphologist (Ermini et al., 2005). The well-known methods used by the researcher are the analytical hierarchy process (Kumar and Anbalagan, 2016; Myronidis et al., 2016; Pourghasemi et al., 2012), the weight of evidence (Lee and Choi, 2004; Armaş, 2012; Neuhäuser et al., 2012), information value method (Achour et al., 2017; Sarkar et al., 2013; Farooq and Akram, 2021), frequency ratio (Akgun et al., 2008; Solaimani et al., 2013; Poudyal et al., 2010), support vector machine (Yao et al., 2008; Ballabio and Sterlacchini, 2012; Chen et al., 2016), logistic regression (Ayalew and Yamagishi, 2005; Hemasinghe et al., 2018; Bai et al., 2010), artificial neural network (Choi et al., 2010; Kawabata and Bandibas, 2009; Bragagnolo et al., 2020).

In the present study, a bivariate statistical approach i.e., Index of Entropy (IOE), is applied for LSZ in the Lunglei district of Mizoram. IOE is a statistical method that measures the maximum impact of a conditioning factor on landslide occurrences (Dam et al., 2022). The novelty of the method is that it considers Scenario 1 and Scenario 2 approaches based on parameter selection and weighting based on the Index of Entropy (IOE). Previous research by (Singh et al., 2021; Zhang et al., 2019; Shirani et al., 2018) successfully applied the index of entropy model to a variety of environmental conditions worldwide, but they did not utilize the parameter optimization technique. So, the present study aimed to determine the optimum landslide conditioning factors and prepare an LSZ mapping in the Lunglei district of Mizoram using 17 landslide conditioning factors along with 234 historic landslide events.

#### 2. Material and methodology

#### 2.1. Study area

The study area covers approximately 2014.49 km2 and extends between 92° 42′ E to 93° 10′ E longitude and 22° 23′N to 23° 15′N latitude (Fig. 1). It is characterized by an undulating, dissected, and deep valley within the extended Himalayan range. Lunglei town, the second-largest urban center in Mizoram, is experiencing rapid urbanization, and slope cutting for road construction has made the area prone to landslides. The region receives heavy rainfall during the southwest monsoon season, with an average annual rainfall of 3204.7 mm (Rao et al., 2023). The tropic of cancer passes north of the district, and the annual average temperature ranges from 11 °C to 35 °C (Barman and Biswas, 2022). The mean relative humidity is 87%. The general topography of Lunglei District is highly diverse. The southwestern and western regions are characterized by relatively low and less prominent ridges, while the northern and eastern regions exhibit steep terrain with high relief. The entire Mizoram region is marked by dissected hills and valleys, which are common geomorphological features. Landslides occur frequently during the monsoon period, causing damage to the nutrient cycle, road networks, natural resources, and human life. Between 2017 and 2018, landslides resulted in the destruction of 39 fully or partially damaged houses and affected 58.06 lakh hectares of cropping areas (as per the District disaster management plan, 2019). Therefore, there is a need for a comprehensive landslide assessment at the district level in this area.

#### 2.2. Database and background of the study

A landslide is a complex geological hazard. It is a systematic negative effect of different conditioning factors (Chen and Chen, 2021). There are no universal guidelines or regulations for the number of conditioning factors and their types. In the current study, conditional factors are

Fig. 1. Location of the study. (a) India, (b) Lunglei district in southern Mizoram, (c) Elevation in Lunglei district.

chosen based on the data availability and previous literature for the study area (Table 1). Different direct and indirect terrain attributes, namely elevation, slope, slope angle, curvature, relief amplitude, terrain ruggedness index, terrain roughness, and topographic wetness index, are extracted from the ASTER 30m digital elevation model (https://search.ea rthdata.nasa.gov/search). The hydrological factors, namely the distance to the river, are prepared from OSM (https://www.openstreetmap.org) through the Euclidean distance method, and rainfall distribution is prepared from a 0.5\*0.5 high-resolution gridded Cru dataset (https://cr udata.uea.ac.uk/cru/data/hrg/). The Bhukosh portal is used to collect tectonic factors such as lineament information (https://bhukosh.gsi.gov.i n/Bhukosh/MapViewer.aspx). The geomorphology information is downloaded from the Bhukosh geo portal. The likely distance of human activities to a road is calculated using the OSM road network, and the land use/land cover map is prepared from Landsat 8 OLI (https://eart hexplorer.usgs.gov/) using a training sample and the maximum likelihood method in a GIS environment (Table 2). A methodological flow chart is shown in Fig. 2.

#### 2.3. Landslide conditioning factors

#### 2.3.1. Elevation

Elevation has a positive relationship with landslide occurrence (Ayalew and Yamagishi 2005). The rainfall and temperature in a region are directly correlated with altitude. Height growth produces a steeper slope, which lowers the shear strength of the slope materials (Saranaathan et al., 2021). The elevation of the Lunglei district area is extracted from ASTER 30m Dem. Elevation in the study area ranges from 115 m to 1745 m, which is classified into five classes based on the natural breaking methods. The elevation classes are (a) 115–472.96 m, (b) 472.97–671.12 m, (c) 671.13–875.67 m, (d) 875.68–1131.35 m, and (e) 1131.36–1745 m. Most of the area (30%) ranged between elevations of 472.97 and 671.12 m.

**Slope:** The slope means the vertical elevational difference between two points with horizontal distances (Das et al., 2022). Theoretically, when the slope rises, shear stress increases, which raises the possibility of slope instability (Abedini and Tulabi, 2018). The slope map is driven from the ASTER 30 m DEM. The slope in the study area ranges between 0 and 73° and is classified into five classes. The slope classes are (a)  $0-8^\circ$ , (b)  $8^\circ-15^\circ$ , (c)  $15^\circ-25^\circ$ , (d)  $25^\circ-40^\circ$ , and (d)  $40^\circ-73^\circ$ . The maximum area of the study region (about 37%) falls under a  $25-40^\circ$  slope.

**Aspect:** The slope aspect indicates the slope's facing direction, which is a significant determinant of solar radiation, wind, and precipitation. Hence, it directly controls the types and intensities of vegetation cover and soil moisture (Guru et al., 2017). The slope direction of the area is divided into ten directions as (a) Flat (-1), (b) North (0-22.5), (c)

Northeast (22.5–67.5), (d) East (67.5–112.5), (e) Southeast (112.5–157.5), (f) South (157.5–202.5), (g) Southwest (202.5–247.5), (h) West (247.5–292.5), (i) Northwest (292.5–337.5), and (j) North (337.5–360). About 14% of the slopes are west-facing slopes.

**Curvature:** Curvature is an imagined line formed by intersecting random points on the earth's surface (Anbazhagan and Ramesh 2014). In the current study, a combination of both profile and plane curvature is considered. Flow direction, slope morphology, and many other geological structures directly depend on curvature. In the present study, zero values are considered flat regions, positive values are considered convex and negative values are considered concave regions. In the present study, the curvature is divided into three classes that are (a) -29.17-0, (b) flat (0), and (c) 0-31.35.

**Stream power index (SPI):** The stream power index provides an indication of energy dissipation against the bed and banks that is widely used as a proxy for sediment transportation and channel excavation rate (Johnson et al., 2009). It is measured as per (Moore and Grayson, 1991) according to Eq. (1).

$$SPI = A_s * Tan \beta \tag{1}$$

where,  $A_s$  is the contributing catchment area and  $\beta$  is the slope angle. As SPI is the product of catchment area and slope angle, a high SPI value indicated a larger catchment area and high slope angle which is reflect the high flow velocity and higher erosion risk. SPI for the current study is divided into five classes (a) < 0, (b) 1–10, (c) 11–20, (d) 21–30, and (e) 31–40.

Terrain ruggedness index (TRI): The TRI is employed to characterize the topography as smooth or rugged terrain, as well as the local change of slopes or surface curvatures (Dahal et al., 2008). Topographic heterogeneity or TRI is defined as the difference in height between adjacent pixels (Al-Najjar and Pradhan, 2021). It affects the hydrological and topographical factors to develop a landslide event. The terrain ruggedness index is prepared as Eq. (2). Based on the natural break method, TRI is divided into five classes: (a) 0–92, (b) 93–180, (c) 190–240, (d) 250–320, and (e) 330–710.

$$TRI = \sqrt{Abs(max^2 - min^2)}$$
 (2)

Here, *max* and *min* are the maximum and minimum elevation of the define region respectively.

**Terrain roughness (Rn):** Elevational irregularity or variability of terrain within a terrain unit is called terrain roughness. The possibility of rock fall has a positive correlation with the terrain roughness (Fatemi Aghda et al., 2018). It is calculated using Eq. (3).

**Table 1**Literature reviews for selection of conditioning factors for landslide susceptibility mapping.

$$Roughness = \frac{(FS_{mean} - FS_{min})}{(FS_{max} - FS_{min})}$$
(3)

Where,  $FS_{\text{mean}}$  is the mean elevation of the define region,  $FS_{max}$  and  $FS_{min}$  are the minimum and maximum elevation of that region respectively. For the present study Rn is divided into five classes - (a) 0.11–0.3, (b) 0.31–0.43, (c) 0.44–0.5, (d) 0.51–0.58, and (e) 0.59–0.89.

**Topographic position index (TPI):** Altitudinal differences of a central point ( $\mathbb{Z}_0$ ) from average altitude ( $\overline{\mathbb{Z}}$ ) within a defined radius (R) is shown by TPI. It is formulated as Eqs. (4) and (5).

$$TPI = Z_0 - \overline{Z} \tag{4}$$

$$\overline{Z} = \frac{1}{n_R} \sum_{i=n} Z_i \tag{5}$$

A positive TPI value indicates high land in the central point, while a negative TPI value indicates low land in the central point. In the study, the TPI of the district was classified into five groups (a) -10.2-1.4, (b) -1.3-0.5, (c)-0.4-0.3, (d) 0.4-1.2, and (e) 1.3-14.1.

**Topographic wetness index (TWI):** TWI identifies the source zone that has become saturated as a result of surface runoff under the impact of topographic conditions (Sema et al., 2017; Mitra et al., 2022). It is formulated as Eq. (6).

$$TWI = Ln\left(\frac{\alpha}{Tan \ \beta}\right) \tag{6}$$

where  $\alpha$  is the upslope contributing area and  $\beta$  is the slope angle. Likewise, here  $=\frac{A}{L}$ , Amongst them A and L denote the total basin area and length of the contour. TWI is classified into five classes - (a) 2.47–5.68, (b) 5.69–7.48, (c) 7.49–9.28, (d) 9.29–11.86, and (e) 11.87–22.42.

Rainfall distribution (R): Rainfall is a dominant landslide controlling factor. During field studies, it has been observed that most of the landslides occurred in the rainy season. For the current study, the average annual rainfall of 2021 has been prepared by the IDW technique in GIS environment. It is classified into three classes (a) 360.6–370.4 cm, (b) 370.5–380 cm, and (c) 380.1–380.6 cm.

Distance to road (DTR): Road networks are the footprint of human activities and reflect the mobility of civilization (Basu and Pal, 2019). During the field study, it was discovered that the majority of slope failures occur along the roadside. For the current study, road network information is collected from open-source maps. The Euclidean distance method is implemented for measuring the distance from the road network. It is divided into the following categories: (a) 0–300 m, (b)

301-600 m, (c) 601-900 m, (d) 901-1200 m; (e) 1201-1500 m.

**Distance to Lineament (DTL):** Lineaments are underlain by linear geological expression. Lineaments have a direct influence on maximum landslides (Kaur et al., 2023). Kumar and Anbalagan (2019) reported that landslides are directly connected with the lineament vicinity. In the current study, a raster buffer by the Euclidean distance method is used for measuring the distance to the lineament. Further, it is classified into five classes (a) 0–300 m, (b) 301–600 m, (c) 601–900 m, (d) 901–1200 m, and (e) 1201–1500 m.

**Distance to stream (DTS):** It is assumed that along the river, the amount of saturation is quite high. The right conditions for a landslide include heavy rains followed by saturated soil on a steep slope or a quick rise in groundwater levels brought on by infiltration. Runoff near steep slopes may be increased by human activity in places with high drainage densities. As a result, landslides are more likely to occur in places with higher drainage density. Shear strength decreases with bank erosion and saturation areas. The distance from the river was measured using the Euclidean distance method and classified as (a) 0–500 m, (b) 501–1000 m, (c) 1001–1500 m, (d) 1501–2000 m, and (e) 2001–2500 m in the study.

**Geology:** Similar to geomorphology, geology is another significant landslide-controlling factor. The main geological groups, namely Surma and Bhuvan, cover the entire district. The Suma group covers the majority of the district, but the Bhuvan group only covers a small portion of the district in the east.

**Geomorphology (Geom):** The entire Lunglei district is covered with hills and valleys. Geomorphologically the whole district is divided into three geomorphological divisions, namely: (a) Highly dissected structural hills and valleys, (b) Moderately dissected structural hills and valleys, and (c) Riverian areas. The maximum area of the study region (about  $1066.4937~\rm km^2$ ) is covered with moderately dissected structural hills and valleys, while only a small part (about  $19.0683~\rm km^2$ ) comes under the riverine area.

Normalized Differences Vegetation Index (NDVI): NDVI is a representation of vegetation density that indirectly controls landslide distribution, type and magnitude (Hong et al., 2016). The NDVI map is prepared through raster calculator in GIS environment by Eq. (7).

$$NDVI = (NIR - Red) / (NIR + Red)$$
 (7)

where *NIR* and *Red* are the near-infrared and red bands, respectively. Landsat 8 OLI satellite imagery is used for measuring NDVI. It is further divided into five classes (a)  $\leq$ 0, (b) 0–0.2, (c) 0.2–0.4, (d) 0.4–0.6, and (e)  $\geq$ 0.6.

Land use and land cover (LULC): Land use and land cover types determine different natural hazards like floods, soil erosion, surface structure characteristics, and precipitation infiltration (Hong et al., 2016). In general, dense vegetation-covered areas have less potential for landslides and soil erosion, whereas bare land and built-up areas have more potential for landslides. Landsat 8 OLI satellite images have been classified by the supervised maximum likelihood classification method for assessing the land use land cover. The study validates the LULC map using Kappa statistics calculated from 100 randomly selected points obtained through stratified random sampling. The resulting Kappa statistic of 0.844 indicates a significant agreement between observed LULC classifications and the prepared LULC map. This robust Kappa value exceeds chance agreement, demonstrating the consistent and reliable nature of the LULC classifications in this study. There are mainly five land use and land cover classes found in the Lunglei district, namely buildup areas, Jhum land, water bodies, sparse vegetation, and dense vegetation. Sparse vegetation encompasses most of the land (59.42%), followed by dense vegetation (25.88%), Jhum land (13.30%), buildup areas (1.07%), and water bodies (0.37%).

All the conditioning factors are mentioned in Fig. 3.

Fig. 2. Methodological flow chart of the study.

#### 2.4. Multicollinearity test

Multicollinearity can be explained as the presence of near-linear familiarity among the landslide-triggering factors (Das et al., 2023). The present multi-collinearity problem will minimize the prediction accuracy and even lead to model failure (Zhou et al., 2021). So, it is important to consider the existence of multi-collinearity among the conditioning factors before the analysis of landslide susceptibility. To manage multi-collinearity in landslide susceptibility analysis, it is important to identify its sources. There is a different source of multi-collinearity in the susceptibility analysis. It may be from the sample collection; it may be from the outlier value of the conditioning factor (Lee et al., 2018). It is a critical challenge to minimize the value of an outlier statistically. Most of the multi-collinearity problems come from that source. Different methodologies have been discovered to identify the existence of multi-collinearity in literature (Li et al., 2020; Pradhan and Sameen 2017), namely variance inflation factors (VIFs), tolerance (TOL), gain

ratio method, principal component analysis (PCA), Pearson's correlation coefficient etc. In the present study, the TOL and VIFs have been used to detect the multi-collinearity among the conditioning factors. The TOL and VIFs are calculated using Eqs. (8) and (9) respectively.

$$Tolerance = 1 - R_j^2 \tag{8}$$

$$VIF = \left[\frac{1}{Tolerance}\right]$$
 (9)

For jth independent variable,  $R_j^2$  represents the coefficient of determination. A TOL value of less than 0.1 and a VIF value greater than 10 indicate the presence of multicollinearity (Mitra and Das, 2023).

#### 2.5. Landslide inventory

Knowledge about the spatial distribution of past landslides is an

Fig. 3. Landslide conditioning factors (a) Elevation, (b) Slope, (c) Aspect, (d) Curvature, (e) Stream power index (SPI), (f) Topographic ruggedness index (TRI), (g) Terrain roughness, (h) Topographic position index (TPI), (i) Topographic wetness index (TWI), (j) Rainfall (R), (k) Distance to road (DTR), (l) Distance to lineament (DTL), (m) Distance to stream (DTS), (n) Geology, (o) Geomorphology (Geom), (p) Normalized difference vegetation index (NDVI), and (q) Land use land cover (LULC).

essential part of a landslide prediction study. The landslide inventory is the location of existing landslides. It helps to know the nature, characteristics, and morphology of existing landslides. In every bivariate approach, landslide inventory is classified into training and testing inventory. Training inventories are used for model prediction, and testing inventories are used for model accuracy testing. More than 300 historical landslide occurrences of the study area were downloaded from the Bhukosh portal (https://bhukosh.gsi.gov.in/Bhukosh/Public) and the Nasa landslide portal (https://gpm.nasa.gov/landslides/index.html). After obtaining the landslide data, we conducted a rigorous verification process, which involved field investigations and cross-referencing with Google Earth Pro. Through these methods, we ensured the accuracy and reliability of the data. Following the verification process, we selected a total of 234 landslide locations for our analysis. These locations were then divided into training and testing datasets, with 70% allocated for training and 30% for testing. Additionally, to validate the model, we included 70 non-landslide points from safe landslide zones. This comprehensive approach allows us to evaluate the model's performance effectively.

#### 2.6. Index of entropy assessment

Initially, the entropy method was used to determine the thermodynamic status of a system, especially in the Boltzmann principle, to show the one-to-one relationship with the degree of disorder (Pourghasemi et al., 2012). Shannon later modified it to entropy information theory. The self-information-related value measures how much knowledge or levels of surprise are connected to a specific result. This outcome is known as a random variable. The Shannon entropy measures how "informative" or "surprising" the entire random variable would be after averaging all of its conceivable outcomes. Generally, entropy is used to measure uncertainty, instability, disorder, and imbalance in a system (Youssef et al., 2015). It is also used to measure a system's relevant conditioning factor or parameters (Constantin et al., 2011). Wang et al. (2016) defined the entropy of a landslide as the extent of different landslide conditioning factors for landslide development. Different morphometric parameters provide supplementary entropy in the index system. Thus, the entropy method is used to calculate the objective weight of an index system (Pourghasemi et al., 2012). The information coefficient represents the objective weight (Wj) and is calculated as Eqs.

$$E_{ij} = \frac{m}{n} \tag{10}$$

$$(E_{ij}) = \frac{E \square j}{\sum_{i=1}^{S_j}} \tag{11}$$

where, m and n represented the domain and landslide percentage gradually and Eij is the probability density for class  $S_j$  of j. Here,  $H_j$  and  $H_{jmax}$  are two entropy value for class  $S_i$  known as informative and surprising.

$$H_{j} = -\sum_{i=1}^{S_{j}} (E_{ij}) \log_{2}(E_{ij}), j = 1, 2, ..., n$$
(12)

$$H_{jmax} = \log_2 S_j, S_j = \text{no. of classes}$$
 (13)

Again,  $W_i$  is the corresponding weight for coefficient  $I_i$ .

$$I_{j} = \frac{H_{jmax} - H_{j}}{H_{imax}} I = (0, 1), j = 1, 2, ..., n$$
(14)

$$W_i = I_i E_{ii} \tag{15}$$

$$Y_{\text{IOE}} = \sum_{i}^{n} \frac{z}{m_{i}} \times C \times W_{j}$$
 (16)

where,  $Y_{IOE}$  is the sum of I is the count of map parameters  $(1,2,3, \ldots, n)$ , Z is the highest number of the class.  $m_i$  is the class number in the map parameter, C is the value after secondary classification and  $W_j$  is the weight of each conditioning factor.

#### 2.7. Validation

In general, a pure landslide susceptibility validation is possible only if a new landslide event happens after the creation of the susceptibility map (Neuhäuser and Terhorst 2007). In real life, it is unacceptable because of the "wait and see" strategy. It is problematic to estimate the accuracy of the susceptibility model. However, the prediction accuracy of the present study has been measured through the receiver operating characteristics (ROC) curve and the statistical measure Quality sum.

A ROC is a useful measure for representing the probabilistic and deterministic quality of detection. The graphical plot of ROC describes the "fraction of true positives out of the positives versus the fraction of false positives out of the negatives for a binary classifier system as its discrimination threshold is varied" (Devkota et al., 2013). On the 'X' axis and the 'Y' axis, the ROC plot shows 1-specificity and sensitivity, respectively. Sensitivity (TP rate) denotes the proportion of pixels truly classified as landslides in the prediction map, while specificity (TN rate) denotes the proportion of non-landslide pixels truly classified as non-landslide in the prediction map. The sensitivity and specificity are measured as Eqs. (17) and (18).

$$Sensitivity = TP / (TP + FN)$$
 (17)

$$Specificity = TN / (TN + FP)$$
 (18)

where, TP is true positive, FN is false negative, TN is true negative and FP is false positive.

The desirability function of LSZ predicting methods is cheeked by the quality sum (Qs) index.  $Q_s$  value is measured following Eq. (19) followed by (Roy et al., 2019).

$$Q_{S} = \sum_{i=1}^{n} \left( (R_{D} - 1)^{2} * P \right)$$
 (19)

where  $R_d$  is the density ratio of the landslide classes, which is calculated using Eq. (19) and P is the area ratio by landslide susceptible area to the total area.

$$R_d = \frac{M_i}{S_i} / \frac{\sum M_i}{\sum S_i}$$
 (20)

In Eq. (20),  $M_i$  is the pixels count in the domain and  $S_i$  count of landslide-affected pixels in the domain. Higher the  $Q_s$  value range indicates more desirability and less value of  $Q_s$  indicates less desirability.

#### 3. Results

#### 3.1. Multicollinearity

The presence of collinearity among the conditioning factors is examined through TOL and VIF in SPSS v23. Table 3 shows the TOL and VIF of all factors. The TOL value for the conditioning factor ranges between 0.308 (TPI) and 0.998 (LULC) and the VIF value ranges between 3.252 (TPI) and 1.002 (LULC). It indicates all the conditioning factors are free from multi-collinearity problem.

#### 3.2. Relationship of conditioning factors and past landslides

The relationship between landslide and landslide conditioning factors

is evaluated by the weight  $(W_{ij})$  of factors measured by the index of entropy. Table 4 shows the weights of landslide factors. As a result, nine conditioning factors have significant contribution weight in landslide susceptibility and others haven't significant weight in landslide susceptibility. Among the factors, DTR was ranked first followed by NDVI, Geom, elevation, curvature, slope, DTL, aspect and DTS. While the SPI, TPI, Rn, TPI, TWI, geology and LULC haven't significant weight (Fig. 4).

The Entropy model not only measures the overall weight score of conditioning factors, but it also considers the distinct probability (Eii) of each sub-class of factors. Elevation in the study area ranges between 115 m and 1745 m and has the highest  $E_{ii}$  found between 1131.36 m and 1745 m, followed by 875.68 m and 1131.35 m, 671.13 m and 875.67 m, 472.97 m and 671.12 m, and 115 m and 472.96 m. It is stated that landslide probability increases with increasing elevation. Similarly, the slope of the study area extends from 0 to 73°. The highest Eii value was found between slope ranges 25°-40° and 40°-73°, followed by 15°-25°,  $8^{\circ}-15^{\circ}$ , and  $0-8^{\circ}$ . It also demonstrated that the likelihood of a landslide increases proportionally with slope. Aspect is considered an important conditioning factor. It claims that the likelihood of a landslide is greatest on slopes facing northwest, followed by west and southwest. Most of the cases of landslides in Lunglei district are rainfall-induced, that is, by the influence of the south-west monsoon. Curvature is classified into concave, flat, and convex. In the area, convex slopes have the highest probability of landslide, followed by concave and flat.

Three distance parameters, namely DTR, DTL and DTS play significant roles in landslide occurrences. DTR shares a significant footprint among distance parameters (Fig. 5). An inverse relationship, i.e., the probability of landslide decreased with increasing distance from the road. Landslide probability is highest within 0–300 m of the road in the Lunglei district, followed by 901–1200 m, 601–900 m and 301–600 m. There is no landslide reported beyond 1200 m. An opposite relationship is found with the river. Landslide probability is highest within a distance of 1501–2500 m from rivers in the area. It is found that landslide probability is increased with an increasing lineament distance. The likelihood of a landslide is greatest between 1201 m and 1500 m from lineaments.

The geomorphology of the district is very generalized. Mainly moderate dissected hills and valleys have high chance of landslide occurrences, whereas river bodies have a low possibility of landslide occurrences. The NDVI, play an important role in landslide occurrence. Landslides are most likely in the range of NDVI between 0 and 0.2, followed by 0.2–0.4 and 0.4–0.6. There is no possibility of landslide occurrences if an NDVI value is found to be less than 0 and more than 0.6.

#### 3.3. Landslide susceptibility

The model index of entropy is the most commonly used bivariate

Fig. 4. Radar chart showing the weight of respective landslide conditioning factors, (a) Scenario 1 (Nine factors), and (b) Scenario 2 (Seventeen factors).

statistical analysis for landslide susceptibility mapping. Entropy describes uncertainty, imbalance, disorder, and the extent of the instability of a system. For landslide prediction, the secondary reclassification of seventeen landslide conditioning factors is reclassified according to Eij values. In this study, we have considered two scenarios, in scenario 1, only nine parameters are considered to have significant weightage based on the IOE. This approach narrows down the focus to a select set of parameters that are deemed crucial in influencing the outcome or result under consideration. By prioritizing these parameters, it allows for a more streamlined and efficient analysis, reducing complexity and potential noise in the data. On the other hand, Scenario 2 includes all parameters without any specific selection or weighting based on the IOE. This approach takes into account the entire range of available parameters, considering each one as potentially relevant to the analysis. This comprehensive approach ensures that no potential influencing factors are overlooked, providing a more holistic understanding of the situation.

In the first phase, nine conditioning factors having significant weight for landslide were used for integration (Scenario 1). Consequently, all seventeen conditioning factors were used for integration (Scenario 2). The process of integration of conditioning factors has been done in a raster calculator in a GIS environment using Eq. (20).

$$("Elev" * w_i) + ("slope" * w_i) + \dots + ("Lulc" * w_i)$$
 (21)

The finding of a summation value for scenario 1 ranges between 0.86 and 0.21; and for scenario 2 it ranges between 0.45 and 0.11 which is the upper and lower limit of landslide susceptibility. Intermediate values are representative of the severity range. A natural break classification system is performed for five landslide susceptibility levels in the current study (Fig. 6). Susceptibility levels are named "Very high susceptibility", "High susceptibility", "Moderate susceptibility", "Low susceptibility", and "Very low susceptibility".

The area in  $\rm km^2$  of different landslide susceptibility classes is tabulated in Table 5. The very high susceptibility accounted for 16% and 14% of the total area as per scenario 1 and scenario 2, respectively, mainly located along the road section and the top of a mountain ridge. The high susceptibility area is located parallelly with the very high susceptibility zone, found in 26% and 25% of the total area as per scenario 1 and

scenario 2, respectively. On the other hand, the moderate susceptibility zone isn't distributed in particular areas or regions. It is spread randomly over the district and found in 25% and 24% of the total area based on scenario 1 and scenario 2, respectively. Consequently, low susceptibility zones were found in 22% and 23% of the total area as per scenario 1 and scenario 2, while very low susceptibility zones accounted for 11% and 15% of the total area based on scenario1 and scenario 2, respectively, and are mainly concentered along river courses. Furthermore, it is highlighted that most of the significant settlements, namely Lunglei, Serkawn, Theriat, Leite, Hnahthial, and Pangzawl, are located in very high and high susceptibility zones.

The different results obtained for the two types of scenarios can be attributed to the contrasting approaches taken in parameter selection and weighting based on the Index of Entropy (IOE). In Scenario 1, where only nine parameters with significant weightage based on the IOE are considered, on the other hand, in Scenario 2, all parameters are included without any specific selection or weighting based on the IOE. The divergent results obtained between the two scenarios stem from the trade-offs between focus and comprehensiveness. Scenario 1 prioritizes efficiency and optimization by concentrating on the most influential parameters, thus providing more targeted and interpretable results. On the other hand, Scenario 2 offers a broader perspective by considering all parameters, potentially capturing additional nuances and interactions.

#### 3.4. Model validation

A ROC curve is prepared using 30% (67 locations) of test landslide locations with the same number of non-landslide locations. As a plot of ROC (Fig. 7), the index of the Entropy model successfully predicts landslide susceptibility in the Lunglei district under the same geoenvironmental conditions. The model justification is estimated through the area under the ROC-AUC. It shows an excellent prediction of both scenarios, the obtained AUCs were 0.947 for scenario 1 and 0.922 for scenario 2. Furthermore, model desirability was examined through the quality sum ratio. The first density ratio of each landslide severity class was calculated, which is shown in Fig. 8. It is found to have the highest density ratio in the high susceptible class, followed by very high

Fig. 5. Field photos (a) landslide along roads, (b) Water contain in the rock beds, and (c) Landslide in a concave slope.

susceptibility, moderate susceptibility, low susceptibility, and very low susceptibility classes. Table 6 depicted the quality sum of the current landslide susceptibility map. This quality sum ratio of scenario 1 and scenario 2 are 0.435 and 0.431 respectively also denotes the higher accuracy of scenario 1.

#### 4. Discussion

Landslide susceptibility modeling and optimization conditioning factors were studied using the index of entropy model. Initially, 17 landslide conditioning factors were chosen by a literature survey for landslide susceptibility mapping. It was found that among seventeen factors, nine factors are more significant for landslide occurrence. The elevation, slope, aspect, curvature, normalized difference vegetation index, geomorphology, distance to road, distance to lineament, and distance to river are dominant landslide-contributing conditioning factors. Further, seventeen landslide conditioning factors are considered for scenario 2. No change in prediction accuracy is observed for increasing conditioning factors. In both cases, the AUC reflects successful model prediction. In the present study, distance to road played the highest role in landslide susceptibility zonation using IOE. A similar result was reported by Ayalew and Yamagishi (2005). NDVI is the second important causative factor of the study area. Min et al. (2016) also documented that NDVI is a dominant causative factor of landslides and NDVI value ranges between 0.20 and 0.59 are more prone to landslides. On the other hand, LULC, SPI, TRI, Rn, TWI, R, TPI and geology were not found significant

weightage for landslide susceptibility zonation. Jebur et al. (2014) evaluated eleven landslide conditioning factors dividing them into two data sets as eight and eleven combinations. It is found in the second data set that the additional conditioning factors, namely soil, geology and LULC not significant for LSZ in Bukit Antarabangsa, Malaysia. All-Najjar et al. (2019) examined fourteen landslide conditioning factors for LSZ. They tested four groups with different combinations. The result showed that the group of eight conditioning factors was high prediction accuracy.

The incorporation of additional variables, such as geology, into the dataset disrupted the correlation and flagged certain regions as being susceptible to landslides. However, this classification may have been misleading as it was based on just one landslide occurrence falling within a specific geology type. Consequently, the algorithm was compelled to assign significance to those regions. Although more conditioning factors were considered, they did not improve accuracy and had the potential to decrease precision.

Van Westen et al. (2003) provided an explanation for the limited impact of including geological and land use/land cover (LULC) data on the final outcomes. One of the main reasons for the reduced role of LULC in landslide susceptibility was the conversion of shifting cultivation into permanent agricultural practices in Mizoram (Sati, 2022; Lalengzama, 2016). Additionally, according to Barman et al. (2022b), most landslides in Mizoram were concentrated along roads due to high human activities, while the role of stream power index (SPI) and topographic position index (TPI) was minimal due to the presence of stable rock conditions and lower human activities in the valley regions (Fig. 9).

Fig. 6. Spatial distribution of landslide susceptibility (a) Scenario 1 and (b) Scenario 2

 Table 5

 Areal extension of landslide susceptibility zones.

Susceptibility zones	Scenario 1		Scenario 2			
	Area in Km <sup>2</sup>	% of area	Area in Km <sup>2</sup>	% of area		
Very low susceptible	227.39	11	299.90	15		
Low susceptible	447.19	22	455.28	23		
Moderate susceptible	492.24	25	472.62	24		
High susceptible	519.74	26	500.14	25		
Very high susceptible	321.54	16	280.12	14		

Our study concluded that the areas of high unplanned quarrying, road cutting, and other human activities such as the Vawngzawl (building material) quarry, are responsible for landslide occurrences. Also, in sparse vegetation areas, the exposed rock is characterized by bedding and crevasses that make the slopes easy to slide down. Therefore, it is best to avoid this zone as much as possible for any type of construction. There is a significant increase in landslides in the district (Barman et al., 2022b).

The study of Lallianthanga and Laltanpuia (2013) in the Lunglei town area concluded that human activities with heavy rainfall trigger landslides. They also identified some stable areas for construction. So, the present study found that river valleys are safe from landslides and recommended for human activities. Due to dense vegetation cover, low elevation, low slope, low relief amplitude, flat curvature, low topographic ruggedness index and low roughness protect the river bank side from landslides. Pachuau (2019) mentioned that slope angles below 30° and flatted areas predominantly comes in low landslide zones. According to Coe et al. (2004), the area having high elevation received more rainfall than lower elevation due to orographic effects. Traditionally Mizos prefer high terrain altitude for their living. Roads in the district are commonly constructed at high elevations. In Mizoram, in most cases, shale layers play a sliding plane when coming into contact with percolating moisture from rainfall (Bhusan et al., 2013). It is also recommended to avoid the windward side (west, northwest, and southwest) due to the high rainfall observed in this slope direction. Lunglei district disaster management committee and MIRSC continuously work for landslide mitigation in the

Fig. 7. Model validation result using receiver operating characteristic (ROC) with area under curve (AUC) (a) Scenario 1 and (b) Scenario 2.

Fig. 8. Density ratio for scenario 1 and scenario 2.

**Table 6**Quality sum ratio of scenario 1 and scenario 2.

Scenario	Prediction classes	Area (Km²)	Occurrence area (km²)	Dr	P	Qs
1	Very low susceptibility	227.390	0.009	0.382	0.113	0.435
	low susceptibility	447.187	0.015	0.311	0.223	
	moderate susceptibility	492.244	0.031	0.600	0.245	
	High susceptibility	519.742	0.098	1.790	0.259	
	Very high susceptibility	321.539	0.059	1.730	0.160	
2	Very low susceptibility	299.899	0.011	0.369	0.149	0.431
	low susceptibility	455.284	0.016	0.346	0.227	
	moderate susceptibility	472.620	0.033	0.698	0.235	
	High susceptibility	500.139	0.091	1.813	0.249	
	Very high susceptibility	280.118	0.051	1.798	0.139	

area. More govt. Level projects for landslide study and development ecotourism, an alternative means of income for local people, can be implemented for landslide mitigation.

#### 5. Limitations and future study

In this study, a bivariate model using seventeen landslide conditioning factors was employed to calculate the Index of Entropy. However, occasional errors may have occurred during the reclassification of classes, potentially impacting the predictions. It is important to note that geotechnical parameters and soil parameters, which also play significant roles in landslide susceptibility, were not considered in this study. Additionally, the IDW interpolation method, which incorporated rainfall information from all gauges, including neighboring districts, could have resulted in lower prediction errors for landslide susceptibility zone (LSZ) mapping. Furthermore, the lack of detailed information in the landslide inventories, such as volume, length, area, width, and timing, limited the proper validation of the results.

In future research, it would be beneficial to include all these factors for creating LSZ maps and conducting comprehensive landslide risk assessments. The incorporation of additional conditioning factors and comparative assessment of different models would enhance the accuracy of the predictions. Despite the limitations in the research procedure and estimation mentioned above, the study's results are considered credible and scientifically sound. Policymakers can utilize the findings of this evaluation to improve their approach to landslide management.

#### 6. Conclusions

The Lunglei district of Mizoram is located remotely from India's mainland on dissected hills. During the monsoon period, landslides arise

Fig. 9. Field photos showing stable rock condition along the rivers.

as a barrier to sustainable development. Few scholars have carried out work in this area. Landslide prediction is a crucial task. The present study focuses on landslide prediction mapping using the index of entropy, based on criteria weighting and the incorporation of various topographic, climatic, lithological, human, and distance factors. Further, the study tried to determine an optimum number of landslide conditioning factors for preparing LSZ in the area. The district faced extreme landslide severity, especially along the major roads. The study focuses on landslide susceptibility zonation at a district level. The IOE model successfully predicted the likelihood of a landslide in the Lunglei district. The validation techniques, namely ROC and quality sum ratio, are used for accuracy tests, which predicted very well. By tradition, local Mizo people prefer jhum cultivation and have established their houses on the hill slope. The deduction of vegetation cover from terrain directly hit by rainfall is the cause of the landslide in Jhum lands. However, a susceptibility map provides information about spatial landslide distribution and is the baseline reference for future landslide assessment. Therefore, the present study will be helpful for the regional planner, hydrologist, geologist, and policymakers for the overall sustainable development of the district.

#### **Declaration of competing interest**

The authors declare that they have no known competing financial interests or personal relationships that could have appeared to influence the work reported in this paper.

#### Acknowledgment

The authors express heartfelt thanks to the Head of the Department of Geography, Mizoram University, Aizawl. All the authors sincerely acknowledge the editors and reviewers for their valuable suggestions and comments, which have greatly contributed to the overall improvement of the manuscript. The first author extends gratitude to the University Grants Commission, New Delhi for providing the Junior Research Fellowship (Ref no. 190510087462).

## A Novel Approach to Abstract the Design Information and Minimal Cover from the Restructured Java Program

Aparna K. S. and Dr. R. N. Kulkarni<sup>2</sup>

**Submitted**: 15/12/2023 **Revised**: 20/01/2024 **Accepted**: 03/02/2024

Abstract: The software industry has undergone enormous development during the previous few decades. Java programming was used to create many of the software applications needed to run the current generic applications. To support the business operations, these applications have undergone changes based on the changing requirements of the customer or organization. Many changes performed during these need-based updates are made only to the applications and not in the relevant documents related to the software. Further altering these software systems could occasionally cause a software crash. It might be challenging to add new features to the old programs as there is a possibility of redundant code.

To overcome the problems related with either redundancy of the code or documentation, a novel methodology is proposed and a tool is developed to abstract the various components from the input java programming system such as control flow graph, data flow information in the control flow order and the various attributes which are participating in the program. Further the data flow graph and control flow graph are used to find the functional dependencies and attribute closures. The abstracted attributes are used to find the minimal cover, which results in the computation of the functionality of the program.

Keywords: Restructuring, Data flow graph, Control flow graph, Referred Variable, Defined variable, functional dependency

#### 1. Introduction

The demand to use technology and software to automate organizational tasks has increased dramatically during the past few decades. The utilization of application systems constructed using Java programming has experienced significant demand. These application systems, which were created decades ago, have undergone several ongoing, needbased adjustments. As the original writers were unavailable, there was a chance of redundancy in the code, when these changes were implemented. Moreover, the programming language was flexible enough for the various programmers to use alternative names for the variables, operations, and methods. As, the success of the translation depends on the knowledge of the translator's expertise and experience, thus translating the complete application to a new programming language was equally challenging, as it needs to comprehend the organization's entire business rules, which gets modified periodically leading to unstructured code. This unstructured-ness can be handled with the help of restructuring techniques for abstracting the design information.

#### Taxonomy:

**Control flow graph** represents graph implying the execution flow of the overall program

<sup>1</sup>Assistant Professor, Department of Computer science & Engineering, RYMEC, Ballari, Research scholar, VTU, Belagavi.
<sup>2</sup>Professor and HOD, Department of Computer Science & Engineering, Ballari Institute of Technology and Management, Ballari, aparna.vastrad@gmail.com, mkulkarni@bitm.edu.in

**Data flow graph** represents graph implying the flow of data along the control flow.

Referenced attribute get referenced in a executable statement of a program without any modifications after execution

**Defined attribute are** attributes, changing during the execution of statement.

**Restructuring** is the transformation from one form to another without changing its functionality

#### 2. Related Work

The various methods of restructuring Java applications are covered in [1], the preprocessing step for obtaining the design data necessary for static analysis of the input. Restructuring [2], benefits the memory optimization significantly contributing to the memory management issues required for reengineering. The study [6] presents a novel approach for generating a descriptive file from source code using comment lines. This method takes an existing Java source code program and adds a description file to it automatically. It contains the parameters functions, conditions, and description. All of this information will eventually be included in a text document file that the framework creates. In our approach we are eliminating these comment lines, blank lines and changing the multiple lines into a single line as these comment lines will not be updated periodically. The next step of this paper is to extract the design information. The different approaches are discussed. Firstly extracting the Data flow diagram from the given java program is discussed [4]and represented in the table format

using which, the design of the software is extracted. The feature extractor method is to extract the data from the generated XML file. Information gathered from method names [7], variable names, and comments in the project source code that is being analyzed. Each Java class is presented as a document. Next, using Latent Dirichlet Allocation (LDA), a set of topics representing the different functionality offered by the project are identified. In approach [2], the source code goes through various stages of the static analysis and functionality is derived from program slicing. The value of data representation in tables is underlined in [3], which presents the information of the sequence diagram in the form of useful table. In [4], a table that serves as a static representation of the class diagram provides complete information. Meanwhile the activity and use case diagrams in [5] are produced using the source code, indicating that the focus should be on other UML diagrams to extract the design information. In [6], the Control Flow Graph (CFG) is used to represent the source code representing all pathways that an application will take throughout its execution. Further this CFG is then used to extract other related concepts. The Java programs are used for various degrees of analysis in [7] and are rendered as graphs. ProgQuery and Neo4J graph, among other tools, are effective, but complexity rises with larger programs. Models are made from the intermediate representation of the source code and are used to extract UML models in reverse method combining static and dynamic analysis[18,19]. The static and dynamic analysis of bytecode is done and represented in the form of table [9]. It emphasizes how the results of the static code analysis for the Java programs are extracted as graphs[10]. In[11,12], the static analysis of the tools and techniques for locating bugs, security vulnerabilities, code duplication, and code smells are addressed in detail. Opensource static code analysis is one of the tools that is accessible to find errors and different coding techniques. In [13], the static analysis of the code is carried out utilizing AST, assessing the many paths that the programs can take performing a control flow and programs flow analysis. The survey discussed above use graphical representations to illustrate static analysis for the different application, however these graphical representations have memory and maintenance issues that make it difficult to retrieve and preserve the data. These graphical representations of the programs, presented in a variety of ways, are useful for evaluating the program code, but they undoubtedly used a lot of memory and added overhead retrieving the data for later processing. As a result, alternative forms of graphical representation, such as tabular representation, proved to be more effective in terms of memory utilization, processing speed, throughput analysis. The proposed work discusses the control flow analysis of the input Java programs in a tabular representation. The control flow and data flow is derived from the control flow table and data flow table in our approach. From the data flow table, the functional

dependencies are extracted and further these functional dependencies are minimized as discussed below. In [17], closure and the minimal cover algorithm were used to resolve the superfluous functional dependencies. The Armstrong axioms are used to create the F+ algorithm, which generates closure of functional dependencies (FDs). Finding functional relationships and minimizing them with the minimal cover method is done for various sets of functional dependencies, as discussed in detail [18]. A lifetime model [15] for individual source code lines or tokens can be used to guide preventive maintenance, estimate maintenance effort, and, in general, find characteristics that can increase software development efficiency. All components involved in the software system [14] should be able to easily comprehend and discern the necessary components of the requirements through the software design. In our methodology, the functional dependencies extracted from the data flow table have lot of redundant functional dependencies which have to minimized because there will be an unequal distribution of functional dependencies. Consequently, these functional dependencies might be mentioned in other statements explicitly or indirectly. This scenario complicates the design extraction process. In our methodology, this problem is resolved by applying the concept of minimal cover [20,21] and the storage will be conserved as a result, by removing redundant and unnecessary productions in the functional dependencies, resulting in database optimization

#### 3. Proposed Methodology

A. Restructuring the Input Program: Restructuring is the method of bringing modifications to the software structure explicitly without affecting its functionality. In our proposed methodology, comment line elimination, blank line elimination, and making multiple declaration statements into a single declaration statement is a part of the restructuring [3] process. Other steps include statements ending with a semicolon, curly braces insertion before the start and end part statements in the body of the loop, respectively, and assigning sequential line numbers to logic statements. This process of restructuring changes the program structure without affecting its function. This refactored code will be a input for extracting the design information.

Fig 3.1: Block diagram of the proposed methodology

Consider the input java program in Figure 2 which is a non-structured code.

- 1. import java.util.Scanner;
- 2. public class Quad
- 3. {
- 4. public static void main(String[] args)
- 5. {
- double a1,b1,c1;
- 7. //determinant is det
- 8. double det:
- 9. //r1=root1 and r2=root2
- 10. double r1,r2;
- 11. Scanner in =new Scanner(System.in);
- 12. //reading values of a1,b1,c1
- 13. System.out.println("Enter the value of a");
- 14. a1=in.nextDouble
- 15. System.out.println("Enter the value of b");
- 16. b1= in.nextDouble();
- 17. System.out.println("Enter the value of c")
- 18. c1= in.nextDouble();
- /\*comparing the values and chking for determinanat\*/
- 20. if(a1==0|| b1==0||c1==0)
- 21. {
- 22. System.out.println("Invalid input:Enter non-zero co-effeceints");
- 23. System.exit(0);
- 24. else
- 25. {

- 26. d1=b1 \*b1 4 \*a1 \* c1
- 27. if(d1>0)
- 28. {
- 29. //calculation of root1 and root2 for positive det values
- 30. r1 = (-b1 + Math.sqrt(d1)) / (2 \* a1);
- 31. r2 = (-b1 Math.sqrt(d1)) / (2 \* a1);
- 32. System.out.println("root1 and root2 are", r1, r2);
- 33. }
- 34. else if(d1 = 0)
- 35. {
- 36. //executed when roots are same
- 37. r1 = r2 = -b1 / (2 \* a1);
- 38. System.out.println("Roots are real and equal" +r1);
- 39. System.out.println("Root1 = Root2 = "+ r1);
- 40. }
- 41. else
- 42. {
- 43. //calculating the negative part
- 44. double rpart = -b1/(2 \*a1);
- 45. System.out.println("Roots are complex and imaginary");
- 46. //printing values of roots
- 47. System.out.println("r1="+rpart+"+i"+ imaginaryPart+"r2="+rpart+"-i"+ imaginaryPart);
- 48. }//else ends
- 49. }//if ends
- 50. Sc.close();
- 51. }//main ends
- 52. }//quadratic ends

Fig 3.2:Input java Program

From Figure 3.3, it is very clear that the CPU execution time varies a lot with the given input size of the program

Fig 3.3:Graphical analysis of the Restructuring It is obvious that the varied execution time (in seconds) implies the effect of restructuring process. Considering the input size of 50 lines, the graph in Figure 3 illustrates that after restructuring the execution time has reduced a lot and for the same input size the execution time is comparatively less, which indicates the effect of restructuring the input code.

#### B. Abstraction of Control flow graph from Java Program:

The program is represented in the form of a graph, where each node in the control flow graph represents either a conditional statement, computational statement, or the invocation of a member function. An edge connecting those vertices represents the control flow between the statement. The program execution control flow is shown on the Control Flow Graph (CFG). Each line in Java can include a computational statement, a predicate statement, or an invocation statement. When the program is represented as a graph with one vertex (or node) assigned to each statement, the joining edge between the two vertices represents the control flow. This representation is considered inefficient due to the bulk size of java applications, hence these CFG are represented in tabular form using the four columns, where column1 implies start of the program, column2 represents the point of occurrence of the first control statement, third column represents the point of true block(Trans1) and fourth column indicates the false block(Trans2). Usually Trans1=start of the program and Trans2= end of the program and the same procedure gets repeated for all the control statements like if-else, while, for, do-while, switch, break, continue, return. The function invocation present in the input program are handled by putting the point of callee function in trans1 and trans2 will be obviously empty as it is not having the true and false blocks. Further these true and false blocks are analyzed and the above procedure is followed for any nested control structures occurring in it. The concept of defining nodes and Usage/Referenced nodes are used to construct the control flow table.

#### Algorithm for abstraction of Design information

Input: java program after restructuring

Output: Tables depicting control flow, data flow and minimal cover of attributes

#### Step 1: [Java program preprocessing with restructuring]

- · Input Java Program is scanned
- Appending main program with the imported packages
- Comment line elimination
- Blank lines elimination
- Single line statements got by converting multi statement line and multiline statements
- Each statement are given the physical line numbers

These restructuring steps help in the efficient representation of the input program, required for analyzing the design information in the form of control and data tables

### Step2: [Control flow table abstraction from the Restructured Java program]

Scan the input Java program starting from the string 'Public static void main' and search for the control keys of the input program comparing with that of VERBS(control statements) as discussed above. If the scanned control keys belongs to VERBS, then represent that information in the table format representing statement number of the first line of the program in column1, column2 is the point where the first control key occurs column3 is Tr1 representing the transition to the starting point of the true block and column4 is Tr2 representing the transition to the starting point of the false block and this process gets repeated for all the control keys present in the input program and as well for the nested control structures

Step 3: [Data flow table abstraction from the Restructured Java program]: The flow of data variables in the program is based on the control flow order. These data variables are defined and referred at several points of the program. Identification of these referred and defined variables in every line of the input program is noted in the tabular format, where first column indicates input program line number, second column is for defined variables and third column is for referred variables.

Step4: [Finding the minimal cover of the functional dependencies]. From the data flow table, the functional dependency existing between these variables are extracted. These functional dependences are minimized to extract minimal cover of attributes eliminating redundant attributes. The minimal cover is done using these steps:

- Representing the Functional Dependencies in a canonical form where RHS should have a single attribute.
- ii. Remove the redundant FDs (which can be derived from the transitive principles).

- iii. Remove the extraneous attributes, by finding the closure of all the LHS attributes of the Functional dependencies having non-single attribute. If CLOSURE(A)= ABC then BC are extraneous attributes and have to be removed.
- iv. Apply the Armstrong principles and try to group FDs using common LHS

#### 4. Results and Discussion

Refactored code:

- 1. import java.util.Scanner;
- 2. public class Quad
- 3. {
- 4. public static void main(String[] args)
- 5. {
- 6. double a1,b1,c1,d1,r1,r2;
- Scanner in =new Scanner(System.in);
- 8. System.out.println("Enter the value of a");
- 9. a1=in.nextDouble
- 10. System.out.println("Enter the value of b");
- 11. b1= in.nextDouble();
- 12. System.out.println("Enter the value of c")
- 13. c1= in.nextDouble();
- 14. if(a1==0|| b1==0||c1==0)
- 15. {
- System.out.println("Invalid input:Enter non-zero co-effeceintsâ€);
- 17. System.exit(0);
- 18. else
- 19. {
- 20. d1=b1 \*b1 4 \*a1 \* c1
- 21. if(d1>0)
- 22. {
- 23. r1 = (-b1 + Math.sqrt(d1)) / (2 \* a1);
- 24. r2 = (-b1 Math.sqrt(d1)) / (2 \* a1);
- 25. System.out.println("root1 and root2 are", r1, r2);
- 26. }
- 27. else if(d1 = 0)
- 28. {
- 29. r1 = r2 = -b1 / (2 \* a1);
- 30. system.out.println("Roots are real and equal" +r1);

```
31. system.out.println("Root1 = Root2 = "+ r1);
32. }
33. else
34. {
35. double rpart = -b1/(2*a1);
36. System.out.println("Roots
                                            complex
    andimaginary");
                                              +"+j"+
37. System.out.println("r1="+rpart
    imaginaryPart+"
                         r2=
                                          rpart+"-i"+
    imaginaryPart);
38. }
39. Sc.close();
```

Fig 4.1: Restructured Java program

40. }

41. }

In this program, the static analysis of the code is done. The execution starts from the main. In this methodology, the control statements are scanned from main. These control statements are analyzed based on their structure, the different block of statements get executed. In the above program, we have the control statement at line no 14, and true block starts at line 15 and false block from line 19. In true block, further we have exit statement at line 17, so the control jumps to line 42. In the false block, further there is another condition checking for determinant at line 21, where true block moves to line 22 and completes its execution at 26 and in false block, the control statements are checked, if true moves to 28 and the block from 28 to 32 gets executed and the else block gets executed from 34 to 38 and both the blocks get terminated at line 40. The control flow table is as shown in the Figure 4.1. The data flow table in Figure 4.2, represents the flow of the variables at different control points of the program.

S	E	TR1	TR2
1	14	15	19
15	17	42	
19	21	22	27
22	26	37	
27	27	28	34
28	32	42	
34	39	40	

Fig 4.2: Control flow table of Figure 4.1

Line No	Defined Vars	Referred Vars
2	Quad	
9		a1
11		b1
13		c1
14		a1 b1 c1
20	d1	a1 b1 c1
21		d1
23	r1	a1, b1, d1
24	r2	a1, b1, d1
27	-	d1
29	r1, r2	b1, a1
30	-	r1
31		'r1'
35	rpart	b1 a1

Fig 4.3: Data flow table of Figure 4.2

This proposed tool is tested for different combinations of inputs and the tool is compared for its efficiency. The existing tools are building the control flow order using the graphical representation. This graphical representation has lot of concerns with respect to memory issues. The proposed tool analyzes the static analysis of the code which is very easily traceable and consumes very less execution time and gives good throughput analysis as discussed below. From the Data flow table, rows in which there exists both referred and defined variables are identified and

such rows imply the functional dependencies between the variables. The following FunctionalDependencies(FD) are extracted from the data flow table.

a1 b1 c1 → d1

a1 b1 d1 → r1

a1 b1 d1 → r2

a1 b1 →r1 r2

a1 b1→rpart

After applying step1 of the minimal cover algorithm , we get

a1 b1 c1 → d1

a1 b1 d1 →r1

a1 b1 d1 $\rightarrow$  r2

a1 b1 →r1

a1 b1 → r2

a1 b1→rpart

Applying step2, we get the same FDs, as we do not have redundant FDs. Applying step3 we consider the LHS having more than two attributes. The closure rule is applied and checked to see any extraneous attributes. All FDs are equally important and hence all FDs are retained.

Applying the step4, group all FDs having the common LHS together.

a1 b1 c1 →d1

a1 b1 d1 → r1, r2

a1 b1 -> r1 r2 rpart

This is the minimal cover obtained which is equivalent to the original set of FDs having fewer number of FDs. The minimization of the functional dependencies in a program code is done using the minimal cover process. These functional dependencies are minimized and the redundant and irrelevant attributes are removed, which are added by the different programmers during the maintenance phase to keep the structure of the application program intact with business policies.

Before restructuring

After restructuring

Figure 4.3: Throughput graph of the input program before and after restructuring

The graph (before restructuring) in Figure 4.3 varies a lot with the number of operations per second as the program is not restructured. The number of operations per second is competitively less after restructuring as shown in Figure 4.3 (after restructuring)

#### 5. Conclusion and Future Work

This paper presents an automated tool for abstraction of the design information of the input Java program in the form of control flow graph and data flow graph and stored in the form of Control flow table and data flow table. The functional dependencies are extracted from the Data flow table and minimized to get the optimal set of attributes using which the code can be comprehended. The proposed tool is tested for its correctness and completeness by applying on different programs of varying complexities. The tool generates expected output for all the given programs and the functional dependencies abstracted from the Data flow table are further minimized. From these minimized attributes, the different program slices are extracted using backward slicing. Using these slices, the different functionalities present in the input Java program are identified and extracted.

#### Author contributions

The two authors have mutually discussed and analysed and worked on the methodology and conducted different tests for its effectiveness

#### Conflicts of interest

The authors declare no conflicts of interest.

## Memory Optimization Using Distributed Shared Memory Management for Re-engineering

R. N. Kulkarni<sup>1</sup>, Venkata Sandeep Edara\*<sup>2</sup>

**Submitted**: 23/04/2023 **Revised**: 25/06/2023 **Accepted**: 02/07/2023

**Abstract:** Restructure the old input C++ programming system to make it suitable for reengineering, which necessitates humongous memory. This study has made significant contributions to the disciplines of system-on-chip design and on-chip memory management, among others. This paper presents a new technique for optimizing memory subsystems during system design that is suited to specific applications like re-engineering. This work can be improved to optimize memory controller activities and design challenges for distributed shared memory management. It has the capacity to manage an increasing number of processors simultaneously, as well as security and faster execution. The Xilinx 14.2 integrated simulation environment produces outstanding results when the proposed memory optimization approaches are fully integrated into the simulation, optimization, and code generation cycle. The proposed memory device has an extremely low on-chip power consumption of 0.0082 W, which amply demonstrates how well memory has been improved.

Keywords: Memory management, Power Consumption, Shared distributed memory (SDM), Memory mapping Mechanism, Re-engineering

#### 1. Introduction

This A variety of high-speed applications, such as consumer embedded products, audio and video processing, multimedia animation (including 3D animation), and weather forecasting, were created by IC designers as a result of the development of VLSI technology [1]. Field programmable gate arrays (FPGAs) have only lately demonstrated their viability in decreasing the overall computational load placed on the CPU core of the primary processor. Data on the reconfigurable fabric, which is used by both the software and the hardware, is mapped using a memory mapping technique designed specifically for this resolution. This memory mapping approach is the foundation of the entire methodology. Parallel and distributed processing are two of the most cutting-edge areas of research being investigated right now in computer architecture. The shared memory architecture is generated in systems with physically distributed memories by incorporating the two aspects of both approaches. One of the most widely researched subjects in multiprocessor networks is the study of distributed shared memory. Traditional single-processor architectures are unable to push ahead with the expanding number of high-speed applications, requiring the creation of extremely sophisticated multiprocessor architectures. A multiprocessor, also recognised as a Multi core SoC or Multi processor System on Chip, is a device that enables the integration of multiple Intellectual Property (IP) cores in a single chip, which could be in the form of high-speed digital signal processors, controllers, hardware accelerators, memory blocks, and I/O blocks to perform multiple tasks while operating at different clock frequencies.

Memory-management components of the operating system split each memory resource and load data across multiple types of memory at the system level. Part of the mainmemory content, for example, must be shifted to secondary storage, the disc. Virtual-memory and physical-memory layouts, redeployment to avoid fragmentation, and other more sophisticated jobs are among the more difficult tasks. The main memory is split into 2 parts: one for the operating system to handle globally, and one for each programme being performed, which requires a different type of memory management [2].

In real-time operating systems, memory management is handled in one of two ways: using a stack or using a heap. The stack management technique is used for context switching between jobs, whereas the heap management mechanism is used for dynamically giving space to tasks [3]. Even many researchers have investigated the most recent methodologies for co-optimizing test time and test power reduction techniques. These actions that incur overhead are seen as vital after prefetching, even if they are not finished. To limit the amount of time spent reconfiguring them, they must be re-used (In future iterations of the same task graph execution). As a result, reusing previously loaded configurations is one of the most

cost-effective ways to reduce overall reconfiguration expenses [4].

Kandemir et. al. extend their prior work to multi-processor systems in [5] by using a compiler-based scratchpad management mechanism. Array-dominated embedded applications, as previously stated, are the most common use case. When several processors are working in the same array or collecting data, data reuse is a critical notion for decreasing energy and delay. Se-Jun Kwon et al. (2017) proposed an efficient and effective fast compression technique for in-memory data [6]. The suggested technique takes advantage of the features of in-memory data that are often identified to increase efficiency.

Dynamic Frequent Pattern Compression was developed by Yuncheng Guo et. al. as an adaptive non-volatile memory write approach based on frequent pattern compression [7]. The contents of cache lines are encoded using more types of common data patterns when utilizing DFPC, resulting in a greater compression ratio. In addition to regular metrics and cache hit rates, Esha Choukse et. al. included proposed mechanisms to incorporate correct virtual address translation, identify a region in the programme that is reflective of the compression ratio, as well as regular metrics and cache hit rates, in their methodology [8]. Dual dictionary compression was introduced as a last-level cache compression solution by David Kaeli [9]. It is feasible to make greater use of available die space while also boosting system memory speed by compressing data in the final level cache (LLC).

Memory is a vital component of real-time applications due to the amount of time and money it takes to manage it properly. As a result, real-time system designers concentrate on minimising the worst-case execution time and memory consumption. A cost-effective memory manager is required in order to increase the performance of the real-time system. Most real-time systems employ static memory allocators for the random allocation and de-allocation of memory blocks, and this is the case for the most majority of such systems. The memory is allocated before the application enters the core real-time stage, in which the full physical memory is available as a single block and can be used as needed, at the time of compilation or launch of the programme, whichever occurs first. There is a problem with excessive memory consumption since the memory required to hold objects cannot be easily recovered because automatic memory management is not available. Programmers must create and manage distinct private memory pools in order to avoid wasting memory space on unneeded operations. Real-time based on multicore and multiprocessor architectures have grown in size and complexity, necessitating the flexible use of existing resources, such as memory [10], as a result of this growth. For real-time applications to achieve the predictable performance and

flexibility necessary in the multiprocessor system era, dynamic memory management allocators will eventually be required [11], [12].

The process of uncovering the technological principles of a technology, object, or system by analyzing its structure, function, and operation is known as reverse engineering [13]. Reverse engineering binary executable code has proven effective in a variety of situations. It's used to move a system to a newer platform, unbundle monolithic systems into components and utilise them separately, and interpret binary code for untrusted code and malware. The ubiquitous use of C++ in many modern applications necessitates an understanding of the disassembly of C++ object-oriented code. Today, reverse engineering binary code is common, particularly for untrusted code and malware. Software reengineering is the process of improving or changing existing software so that it can be understood, managed, and reused as new software. Re-engineering is required when the system's software architecture and platforms become absolute and must be modified. The value of software reengineering stems from its capacity to recover and reuse items that already present in an out-of-date system. This will definitely reduce system maintenance costs and lay the groundwork for future software development. Furthermore, re-engineering needs huge memory. This paper presents design and optimization of distributed memory for reengineering.

Memory access is a major performance constraint in many data-intensive applications. The system's performance and power usage are both impacted by delays in access. As a result, a memory hierarchy is the most popular solution to alleviating this bottleneck and ensuring efficient memory design. Between the CPU and the main memory, various levels of memory are utilised. It's common practise to keep small, quick memories close to the central processing unit. Memory instances get larger and slower as you go down the memory hierarchy. With growing memory size, energy efficiency declines in the same way that it has been previously stated. As can be seen in Figure 1, embedded and SoC devices use a variety of memory hierarchy systems.

Fig. 1 Common memory architecture.

There is a unique global naming strategy in place to keep such disputes at bay for all of the sites that use the shared data. One way to get access to remote computers' shared data is by having the distributed shared memory system's memory controller do physical-to-logical translation. A global directory of shared data items will be maintained by the memory controller for all sites. Here, the memory controller is a software layer that sits on top of the local memory and allows for virtual shared memory. Fig. 2 shows how the system's memory controller will link to all of the system's local RAM and manage the system's virtual memory. Other than address conversion and fetching, it will schedule and optimize operations. However, if the shared data is of a smaller size, this approach would be inappropriate. In this case, the requesting site will be able to locate shared remote data after communicating with the memory controller.

Fig 2. Memory controller Architecture.

The shared zone represented in Fig. 3 is an illusion created by the memory controller, which is connected to each site and so appears to be shared. When a process requests access to external data, a request will be made to the memory controller by the process requesting access to external data. The data is organised using the shared variable as a guide. Sequential consistency does an excellent job of handling the coherence semantics. Additional effort was required for commercial application in order to make the system the most successful possible from a variety of perspectives. The concepts and languages of object-oriented programming can also be utilised to develop graphical user interfaces (GUIs). Meanwhile, the message-passing structure is more complicated to construct but relatively easy to expand. Both the shared memory structure and the message transmission must develop in lockstep with each other in order to function properly. A realistic solution for parallel system architecture can be found in distributed shared memory, but only after careful analysis of the conditions and their justification.

Fig. 3 Memory mapping Architecture using shared memory.

#### 2. Proposed Memory Hierarchy and Methodology

When it comes to high-performance, large-scale multiprocessor systems, optimizing the performance of distributed shared memory is critical. In the past, several constraints were solved; however, the core problem continues to exist: Below, we go into further detail on the DSM method, locking shared space, thrashing, concurrent access, page faults, extension, transparency, huge database support, and cost. The objective of this research project was to create a novel distributed shared memory architecture that uses software parameters to significantly outperform existing structural designs while handling distributed shared address spaces [14]. Additionally, as we move closer to the deployment of software distributed shared memory, a slew of considerations will come into play. Implementing a distributed shared memory system is achievable through the use of an expanded virtual address space architecture in conjunction with the application of a new operating system paradigm. Because of the use of replication and granularity selection for data transfer, this unique DSM technique (figure 4) improves the overall efficiency of the system by employing a sequential consistency mechanism. Each system node is equipped with a mapping manager, which acts as a bridge between the node's local memory and the shared virtual memory space on the network. Write-up protocols are used to keep track of what each node is looking up and performing on a given time frame.

Fig 4. Architecture of distributed multi core architecture.

Configuration data must be downloaded from off-chip memory in order to map jobs onto the FPGA, as shown in Figure 5. A certain amount of energy is used and a delay is generated for each configuration data fetch from off-chip memory. To alleviate these overheads, a memory hierarchy consisting of two memories is used. One memory is optimised for High Speed (HS), while the other is optimised for Low Energy (LE). In comparison, HS memory has a shorter time delay and uses less energy than LE memory [15] –[18]. As a result, the configuration data is mapped in the suggested memory hierarchy using a mapping technique that decreases energy usage while still satisfying deadlines.

**Fig 5.** Memory hierarchy for mapping the configuration data.

Simulates memory operations, calculates access latency, and returns the result to the sim-outorder callback function. An example of the memory\_ access latency function signature is as follows:

## unsigned int memory\_accessJatency(struct mem\_t· mem, int chunks, md\_addr\_t addr, enum mem\_cmd cmd, tick\_t now);

This option has a mem t pointer that points to the simoutorder simulation program's mem t data structure. The second input, chunks, defines the total number of bytes sought by the processor/cache when it requests memory access (in sim-outorder, it is the L2 cache block size since the L2 cache is the only cache that requests for memory access). The address that the processor/cache is looking for as the initial address is specified by the addr option. The processor cycle that happened when the processor/cache requested the memory access is the final parameter.

However, the latency number returned by memory access latency is a latency value relative to the 'now' argument, not the sum of the timing parameters (Tcmd, Trp, Trd, Teas, Twd, and data transmission).

Fig 6. Flow of Memory Access.

The function's return result can be a significant amount higher than the sum of the individual timings. Because the memory model may be idle or busy servicing the previous access when the processor/cache requests a memory access, this occurs. If the memory is processing another access, it must wait for the prior access to complete before servicing the current access. The memory access latency function (delay function) determines the earliest possible processor cycle (start time) for the memory access requested by the processor/cache. The latency function's primary goal is to achieve this. To determine if the access is a random type or a fast page type, the latency function will first call the get mem real bank, get mem bank, get mem channel, and is latched functions. The latency function will return a value after these functions have been called. The latency function will detect if the access is the initial memory access of the simulation (bus timer = 0) once the access type has been determined. If this is the case, the latency function will be disabled. If this is the case, the start time can simply be set to "now," and the access type can only be random (the initial access in a simulation must be random access). The latched row/page of all memory banks is set to row 0 when the mem t data structure is initialised, which means we must override the result of the is latch function). As a result, if this isn't the first time the simulation has been accessed, latency is determined by comparing the value of the "now" parameter to the previous command start time (cmd timestamp + Tcmd) for the channel, with the greater value being used as the temporary start time. This is owing to the fact that no access can start before the previous one. The temporary start time will be increased as the function deals with more scenarios (i.e., moved further away from the current time).

An access control method verifies whether local memory holds a valid copy of the data after it is allocated. If this is not the case, the mechanism uses an access policy to obtain up-to-date information or additional access permissions. The validity of a copy may be determined by the type of access; for example, duplicated copies are valid for reading but not for writing in most protocols [19] -[21]. Many researchers have explored the ways to restructure The Legacy C++ Program [22] –[26]. The access policy includes both the coherence protocol and the global allocation policy, which specify which node a request is forwarded to and how it is processed. Memory access policy for shared data objects residing locally and remotely is shown in Figure 6. This policy employs both messaging and access constraints. The policy may send signals telling other sites to invalidate their copies before permitting the local node to write its copy.

#### 3. Results and Discussion

The RTL schematic for the cache memory compression block is shown in Figure 7. It is a design abstraction that represents the circuit in terms of digital signals flowing between hardware registers and is used in the design of integrated circuits.

Fig. 7 RTL schematic memory block.

The compression algorithms RTL schematic is displayed in Figure 8. Figure 9 summarizes the device utilization for the implemented design. After the synthesis, this is demonstrated. The number of devices used during the design and implementation phases can be calculated using this

**Fig. 8** RTL Schematic of the distributed memory using compression algorithm.

Fig. 9 Device Utilization Summary.

The suggested shared distributed memory (SDM) algorithm's power analysis is shown Table 1. This analysis displays overall power and junction temperature. The Figure 10 gives timing summary for the distributed memory. The proposed memory device consumes very less on-chip power consumption of 0.0082 W which clearly signifies the optimization of memory to a great extent. Furthermore, junction temperature of the distributed shared memory is nearly room temperature (25.4  $^{0}$ C), which clearly depicts using SDM the current processor operating properly with out any flaw and even not dissipating more heat. Henceforth the proposed distributed memory is very efficient for the next generation high speed computing.

#### 4. Conclusion

A Scientists are now able to use high-performance computers as a viable alternative to the more out-of-date experiential and theoretical approaches. While attempting to explain the language used to create distributed memory systems, this part is included. Single-site networks are used for this memory controller. IP address of the memory controller node was utilised to establish a connection between the client machine and the memory controller node. A message on the output terminal of the memory controller verifies the connection. If all of the client processes are running on the same system, the memory controller can be connected to the local host. As a large-scale DSM system, future efforts can be prepared to improve algorithm strategies in order to expand the number of nodes. All will be able to access shared data items at the same time. To improve distributed shared memory management, this work can be improved to optimise memory controller tasks and design difficulties. It has the ability to handle an increasing number of processors at once, higher execution speed, and security.

In order to decrease the energy used by the system for the refresh operations themselves as well as the energy used during the refresh activities themselves, further scheduling techniques can be used. Also, proposed distributed memory can be useful to restructure the input legacy C++ programming system.

#### **ABSTRACT**

With the burgeoning growth of the job market and a surge in applications, the processes of job recommendation and candidate selection have become complex and labor-intensive. The advent of new technologies such as machine learning has automated these processes, yet the unstructured nature of resumes, often in PDF format, necessitates laborious data extraction for efficient skill-based candidate screening and categorization. Ineffectual recruitment can result from mismatched skills. The system proposed in this study aims to address these challenges by automatically fetching and categorizing resumes, extracting critical information, and utilizing job descriptions for candidate selection and recommendations. Unstructured data from PDF documents is extracted using a PDF reader, and machine learning algorithms, specifically logistic regression and Gaussian Naïve Bayes, are employed for generating recommendations. In an innovative approach, this system not only classifies resumes but also recommends updates or rewrites. Performance of the proposed system is evaluated in terms of classification accuracy and the effectiveness of update recommendations, and results are compared with alternative models. This research represents a significant advancement in the application of machine learning to the automation of job recommendation and candidate selection processes.

#### 1. INTRODUCTION

Resume screening represents a crucial step within a company's hiring process, permitting evaluation of potential employees prior to their recruitment. Furthermore, it facilitates the preparation of candidates for comprehensive examination [1]. The ultimate objective of resume screening is to identify suitable individuals for job vacancies, while concurrently preventing the company from overlooking exceptional candidates [1]. However, manual screening of resumes is a time-consuming and complex process, particularly given that each job vacancy typically attracts hundreds of resumes [2].

Although resumes generally adhere to a standard format, the specific skills and qualifications demanded by each role may necessitate varying levels of specificity in their creation [3]. The majority of contemporary job applications require electronic resumes. However, the development of resume screening approaches based on modern methodologies, knowledge discovery, and social networks remains in its infancy, with substantial research required prior to the implementation of commercial systems [4].

One notable limitation of resume screening is its reliance on candidate-provided content entered into job portals or electronic forms during the job application process. While job seekers may possess unique attributes that distinguish them, discrepancies may arise if the data entered does not match the content of the candidate's resume. At its most effective, resume screening could yield a list of individuals with similar

resumes, and vice versa, but this could introduce significant bias and inaccuracies particularly in the case of numerous unsupervised searches [5]. Therefore, it is imperative that uploaded resume documents are screened for an effective job-matching profile. Consequently, the extraction of useful data from these documents is essential. In this context, Natural Language Processing (NLP) can be employed to extract job-matching attributes from the resume document [6]. The extracted attribute values can then be compared to the skill set requirements for recruitment, facilitating the identification of relevant jobs with commensurate salaries.

What is Natural Language Processing?

Natural Language Processing (NLP) is a process of breaking down the given input into component parts and interpreting their meaning. The process includes converting the input into a form that a computer can understand [7]. NLP can be employed to extract high-quality information from documents and queries by developing the computer's ability to understand and communicate with humans in the human language.

The rising use of social media applications such as Facebook, LinkedIn, Twitter etc. for job-seekers' screening activities is likely to propel the growth of the NLP market. NLP being a demanded technique is used by researchers in extracting the most relevant information, identifying negative character traits, and more. In the recruitment industry resumes

need to be screened, and the process requires to be automated, and NLP is one among the appropriate method to interpret the resume [8]. Even well-written resumes will never be 100% successful without proper interpretation or extraction. The research is motivated by several factors, including the exponential growth in the job market and the subsequent increase in the number of job applications, which has made the recruitment process more complex and time-consuming. Additionally, the unstructured data in the form of pdf resumes has made it even more challenging to extract structured information to automate the screening process [9].

The proposed system is motivated by the need to ease the recruitment process by providing an automated solution to screen candidates, categorize them based on their skills, and recommend job updates or rewrites. This will help recruiters to efficiently and accurately identify the most suitable candidates for a job.

Furthermore, the proposed system is also motivated by the need to reduce the mismatch between candidate skills and the skills demanded by industries, which can lead to ineffectiveness in all phases of the recruitment process. The system aims to ensure that the skills of the candidates are aligned with the skills required by the industry, resulting in more effective job candidate selections.

Overall, the research is motivated by the need to improve the recruitment process by providing an automated and accurate system to screen candidates, categorize them, and provide job recommendations. The proposed system is expected to improve the efficiency and effectiveness of the recruitment process, resulting in more successful job placements.

This paper utilizes NLP for effective data extraction from resume documents. NLP helps in analyzing every aspect of a resume and helps not only to screen the appropriate resume but also helps in recommending candidates to update or rewrite the resume if it is not on par with a standard resume. The satisfactory resumes are then classified according to the job description.

#### 2. LITERATURE SURVEY

This section emphasizes mainly on the recent research carried out on resume classification and recommendations.

An automated resume ranking system, or screening system, is a type of bias identification mechanism that uses natural language processing (NLP) to produce human-readable ratings of an individual's educational, professional, and personal attributes that have been analyzed using a search query [10].

The resume ranking system relies on human contexts such as job titles, company names, and geography. This method measures individual attributes such as how the individual is perceived and how it is interpreted by others [11]. The Resume ranking system also known as job role assessment, is a method of matching users to positions using language patterns from resumes and job applications.

Manual assessment or screening is somewhat biased because it relies heavily on how a person perceives or interprets the resume, whereas an automated resume screening system with a machine learning approach will remove the bias in screening the resumes. NLP (Natural Language Processing) can be utilized to match job applicants with job openings based on a keyword [12].

Tejaswini et al. developed a resume ranking system [13],

which used the KNN approach to rank and pick resumes from the available resume dataset. The best candidates can be identified using content-based suggestion, which selects and ranks a large number of Curriculum Vitae (CV) based on job descriptions and uses cosine similarity to identify the CVs that are most similar to the provided job description. According to experimental findings, the proposed system performs with an average text parsing accuracy of 85% and a ranking accuracy of 92%.

A job recommendation system was developed by Mishra and Rathi using the enhanced DSSM (Deep Semantic Structure and modelling) [14]. The Deep Semantic Structure Modelling (DSSM) system employs semantic modelling of sparse data to increase system effectiveness by representing job descriptions and skill entities as character trigrams. The results of the DSSM model using two distinct datasets (Naukari.com and CareerBuilder.com) are compared, and the results of the proposed system are found to be better. Xavier initializer and Adam optimizer were used in the proposed approach.

In the paper titled "Text Analysis for Job Matching Quality Improvement" [15], the authors proposed an approach for the recruitment or staffing agency to match the quality of candidates to the job. Key factors like commute time, job location, job type, hourly rates, and skill set are matched for improved quality in identifying the candidate. Using a text-mining technique, the authors carefully examined text data that had been written by recruiters at a hiring agency in order to investigate these qualities. The authors were able to extract both positive and negative keywords that affected the matching result.

A content-based recommendation engine is developed, it finds the best possibilities for a user by matching their interests and talents to the requirements of a job ad. To provide the required suggestion, the recommended engine makes use of various text filters and feature similarity algorithms. Similarity algorithms use topic models and the bag of n-grams as parts of feature vectors [16].

Conventional job recommendation systems work on classifying the resume based on the data stored as tables or CSV or Excel files, collected through the job application portal or through web forms in the resume [17]. The proposed system extracts or scrapes the data from the resumes that are pdf files and the proposed system along with classification also recommends the resume for updates or rewriting by classifying the resume as unsatisfactory resumes. All the resumes are verified for their quality, and if the resume does not convey any clear information, then the resume is classified as unsatisfactory and other resumes that clearly states the skill set of the candidate are classified as satisfactory.

#### 3. METHODOLOGY

The aim of the proposed system is to extract the data from the pdf files and to classify the resume as satisfactory and unsatisfactory resumes, then recommend rewriting to further strengthen the unsatisfactory resume and classify the satisfactory resumes based on the skill set.

#### 3.1 Overview of the proposed system

The overview of the proposed system is depicted in Figure 1. The system can be fragmented into three major modules.

i) To Extract or scrape the essential data from the resume, that is in pdf format:

For this task 'PyPDF' package is used. PyPDF is a Python library that allows for the manipulation of PDF files. PyPDF provides functionality for extracting information from PDF documents by analyzing their internal structure.

Figure 1. Resume recommendation and classification system overview

Figure 2. NLP model

To extract information from a PDF document using PyPDF, one would typically follow the following steps:

- 1. Open the PDF file using PyPDF.
- 2. Access the desired page or pages within the document.
  - 3. Extract text or other content from the page(s).
  - 4. Close the PDF file.

To accomplish these steps, PyPDF provides a variety of operational codes that can be used to interact with PDF documents. Some of the key operational codes for extracting information from PDF documents using PyPDF include:

- **PdfFileReader**: A class that represents a PDF file and provides functionality for reading and parsing the file.
- **getPage**: A method of the **PdfFileReader** class that allows for the selection of a specific page within the document.
- **extractText**: A method of the **PdfFileReader** class that extracts text from a selected page.
- **numPages**: A property of the **PdfFileReader** class that provides the number of pages in the PDF document.

By using these operational codes, PyPDF enables users to extract information from PDF documents and perform a variety of other operations on the files.

The first step is to install the 'PyPDF' package, once the package is installed, the next step is to import the required libraries and open the PDF file using the 'PyPDF' package.

Next, we need to extract the text from the PDF file. We can do this by iterating through each page of the PDF file and extracting the text using the 'extractText()' function.

After the text is extracted, it may contain unwanted characters or formatting, which needs to be cleaned. Preprocessing can be done to clean the extracted text. This may include removing special characters, removing stop words, and tokenizing the text.

In conclusion, the 'PyPDF' package is a useful tool to extract essential data from resumes in PDF format. Once the text is extracted, it can be further processed to clean and refine the data, making it useful for various applications, including candidate screening and job matching.

ii) To classify the resume into satisfactory and unsatisfactory resumes:

The data extracted from the pdf is pre-processed so that unnecessary data that does not impact the result is removed. The important function of this pre-processing is to extract only useful data. NLP (Natural Language Processing) is utilized in pre-processing. The process of pre-processing using NLP is depicted in Figure 2 and the algorithm is discussed as follows:

Algorithm for Pre-processing the data extracted using PyPDF

**Input:** Text extracted from a PDF document using the **PyPDF** package

Output: Pre-processed text that is cleaned and refined for further use

- 1. Remove special characters from the text using regular expressions
- Initialize a regular expression pattern to match all non-alphanumeric characters
- Use the **re.sub()** function to replace all matches with a space character
  - 2. Convert the text to lowercase
- Use the **lower()** method to convert all characters to lowercase
- 3. Remove stop words from the text using the **nltk** package
- Initialize a set of stop words using the **stopwords.words('english')** method
- Tokenize the text using the word\_tokenize() function from the nltk package
- Use a list comprehension to remove all stop words from the tokenized text
  - 4. Tokenize the text using the **nltk** package
- Use the **word\_tokenize()** function to split the text into individual tokens
- 5. Perform stemming using the Porter Stemmer algorithm from the **nltk** package
  - Initialize a **PorterStemmer()** object
- Use a list comprehension to apply the stemming algorithm to each token in the tokenized text
- 6. Return the pre-processed text as a list of stemmed tokens

Further, the classification is performed using machine learning models. Four benchmark models namely logistic regression [18], Gaussian Naïve Bayes [19], SVM, and Decision tree Classifier [20] are trained using a set of satisfactory and unsatisfactory resumes. Once the model is trained, it is used for the classification of the resumes as satisfactory and unsatisfactory. Satisfactory resumes are considered for job recommendations and unsatisfactory resumes are recommended for upgrade or rewrite. The satisfaction of a training structure in machine learning approaches can be judged based on several criteria, including:

- 1. Accuracy: This measure how well the model predicts the correct class labels for the test data. Higher accuracy indicates better performance.
- 2. Precision: This is the ratio of true positive predictions to the total number of positive predictions. It measures the ability of the model to identify true positives and avoid false positives.
- 3. Recall: This is the ratio of true positive predictions to the total number of actual positive instances in the test data. It measures the ability of the model to identify all positive instances, including those that might be missed.
- 4. F1 Score: This is the harmonic mean of precision and recall. It provides a balanced measure of both metrics and is a good indicator of overall performance.

The results of the models are recorded for accuracy, Precision, Recall, and F1Score and later compared in the results section.

Figure 3. Word cloud generated for an unsatisfactory resume

Figure 4. Word cloud generated for a satisfactory resume

The output from the NLP model is fed to the machine learning models. To better understand the standard of the resume, a word cloud is generated. Word cloud is a way of visualizing content or data. The most frequently used words in the resume will be generated as a word cloud for a better

understanding of what skill set the candidate has. Figure 3 shows the word cloud of an unsatisfactory resume where the recruiter could not come to a conclusion on the expertise of the candidate, whereas the word cloud depicted in Figure 4 clearly showcases the expertise of the applicant.

iii) Classify satisfactory resumes for job recommendations based on skill set:

The skill set of the satisfactory resumes extracted using NLP is stored and the distinct skills are identified. For instance, the skillset required for Business analytics is extracted from the set of business analytics resumes as ['Tableau', 'Pandas', 'Artificial Intelligence', 'Pyspark', 'IBM Watson', 'Sklearn', 'R programming', 'Keras', Reduce', 'Modelling', 'Regression', 'Dundas Mining', 'Patterns', BI', 'Plotly', 'Data 'Text Mining', 'Oops', 'Deep Learning', 'Web Analytics', 'Time 'Regression', 'Tensorflow', 'Azure', 'Linear Regression', 'Logistic Regression', 'Decision Tree', 'Random Forest', 'Data Structure', 'Keras']. The skillset likely grows with the increase in the number of resumes used for training. As more resumes for a specific job role are used for training the model becomes more effective. The resumes are categorized based on the extracted data for each job description and the distribution of the categories is visualized in the results section. The job recommendations are done based on the category of the resume. The job description or requirement is used as the input and the appropriate candidate's resumes are fetched as recommendations based on the extracted info. The performance of the models is measured using accuracy, where accuracy is the number of correct predictions among the total predictions made, it is calculated using Eq. (1) as below.

$$Accuracy = \frac{Number\ of\ predictions\ made\ correctly}{total\ number\ of\ predictions\ made} \tag{1}$$

The percentage of accurate predictions made by the model is measured by accuracy. Accuracy alone might not be sufficient in cases with unbalanced data, where the proportion of instances in each class differs dramatically.

What percentage of the positive forecasts is actually positive, according to a criterion called precision? It shows how well the model is determining a class's true positive values.

What percentage of all the real positive records are accurately identified, according to recall? It shows how successfully a model can locate each instance that belongs to a class. Recall is calculated for each class in multiclass classification tasks and then averaged using either a macro-average or a micro-average.

Recall is a metric used to measure the ability of a model to identify all relevant instances of a particular class. Macroaverage and micro-average are two ways to calculate the average recall score across all the classes in a multiclass classification task.

In macro-average recall, the recall score for each class is first calculated separately, and then the average of those scores is taken. This approach treats each class equally, regardless of its size or frequency in the dataset.

On the other hand, in micro-average recall, the recall score for each class is calculated and then averaged, taking into account the size or frequency of each class. This approach gives more weight to classes that have more instances in the dataset.

The main difference between macro and micro-averaging is that macro-averaging gives equal weight to each class, while micro-averaging gives more weight to larger classes. Therefore, if there is a class imbalance, micro-average recall would be more appropriate than macro-average recall. In the proposed system, recall is calculated using macro average.

The weighted harmonic mean of precision and recall is known as the F-Score, and a score of 1 denotes the highest possible precision and recall values. It is a helpful indicator for assessing the model's overall performance.

#### 4. RESULTS AND DISCUSSIONS

#### 4.1 Dataset exploration

Two datasets are used in the proposed approach, one for classifying satisfactory and unsatisfactory resumes. One for categorization of the resumes as per the job description. A total of 150 resumes are used for classifying satisfactory and unsatisfactory resumes, 75 for each category. A total of 500 resumes are used for training the model for job categorization with 141 job descriptions. For every job description, a set of skill sets is stated that has around 30 to 50 keywords. The skill set generated by the model is compared with a reputed job portal website https://www.hireitpeople.com/resumedatabase/ and found that the skillset fetched using the trained models is above par as per the requirement.

#### 4.2 Model evaluation

The resumes are segregated as satisfactory and unsatisfactory and the accuracy of the models is compared. Logistic regression and Gaussian Naive Bayes perform better among the four models. Table 1 shows the accuracy attained among the models.

The frequently used words in the resume will be extracted for a better understanding of what skill set the person has. The algorithm used to find the frequency distribution of words is given as follows.

- 1. Read the sample resume file and store it as a string variable.
- 2. Clean the text data by removing any non-alphanumeric characters (punctuation, special characters, etc.), and convert all text to lowercase.
  - 3. Tokenize the cleaned text into individual words.
- 4. Create an empty dictionary to store the frequency count of each word.
- 5. Loop through each word in the list of tokenized words:
- a. If the word is not already in the dictionary, add it with a value of 1
- b. If the word is already in the dictionary, increment its value by 1.
- 6. Sort the dictionary by value in descending order to get a list of the most frequently used words.
- 7. Output the list of words and their frequency count. Most frequent words are plotted as a frequency distribution graph for a sample resume as depicted in Figure 5.

The resumes are categorized based on the job categories and once the job description is given as the input, the resumes applicable for the job are fetched and given. The number of

resumes belonging to the top 30 categories is displayed in Figure 6 as a bar graph.

Table 1. Accuracy of the models

S. No	Model Name	Accuracy
1	Logistic Regression	0.9763
2	Gaussian Naive Bayes	0.9516
3	SVM	0.333333
4	Decision Tree Classifier	0.8943

**Figure 5.** Frequency distributions of words in a sample resume

Figure 6. Resume categories with their numbers

Several resumes fall under multiple categories for example a same resume is applicable for backend developer and also for database engineers, similarly the same resume that is categorized under subject matter expert (SME) is applicable under other categories also. Hence there is an overlap in several categories. The accuracy of models was tested with a different set of resumes. The accuracy measure is depicted in

Figure 7. As the number of resumes increase during training per category the accuracy also varied. For instance, with less number of resumes logistic regression performed well, when the number of resumes increased per category, Gaussian Naive Bayes performed well. The category of PHP developer was considered for reference and a total of 30 resumes were used for training and 15 resumes were tested for accuracy. Thus logistic regression model can be utilized when less number of resumes are there and Gaussian Naive Bayes can be utilized when more resumes are available for training the data.

Figure 7. The accuracy measure

From the table, it is observed that the accuracy of models SVM and Decision Tree Classifier is lower than the accuracy of models Logistic Regression and Gaussian Naive Bayes.

The reason for the lower accuracy of model SVM could be because SVM is a linear classifier that works well when there is a clear linear separation between the classes. If the classes are not linearly separable, SVM may not perform well. In the context of resume classification, as the features are not linearly separable, such as there are overlapping skills or qualifications between job categories, hence SVM suffers to achieve the accuracy and it is not be the best model.

The reason for the lower accuracy of model Decision Tree Classifier could be because decision trees are prone to overfitting when the tree depth is too large or when there are too many features. Overfitting occurs when the model fits the training data too well, and as a result, it fails to generalize to new data. In the context of resume classification, possibility of the decision tree model for overfitting the training data is high, hence it is not able to classify new resumes accurately.

As discussed earlier accuracy calculation alone does not prove the system to be effective the other metrics precision, recall and F-measure were also measured and depicted as in the following Table 2 and also as a graph in Figure 8.

Table 2. Performance measures of the models

S. No	Model Name	Precision	Recall	F- Measure
1	Logistic Regression	1.0	0.99	0.99
2	Gaussian Naive Bayes	0.99	0.97	0.97
3	SVM	0.49	0.35	0.37
4	Decision Tree Classifier	0.96	0.91	0.92

Figure 8. Performance measures of the ML models

The performance of the models remains quite similar for all the job categories. With a resume that can be applicable for multiple jobs and with the increase in the number of applicants with multiple skill sets, the process of resume screening will lead to high complexity.

#### 5. CONCLUSION AND FUTURE SCOPE

The proposed system was able to extract the skill sets of a candidate from the resume which is in the pdf format using NLP. The NLP extracts the skillsets precisely which is evaluated for the standard resume. The machine learning models to successfully classify the satisfactory and unsatisfactory resume are implemented and the accuracy of the models were compared. Categorization of resumes for various job categories is also realized and it is observed that Gaussian Naïve Bayes and logistic regression perform well over the other two models.

The Proposed system would ease the resume screening process by reducing and recommending unsatisfactory resumes from the total resumes available. The resume categorization is also performed so that the screening will bring only the appropriate resume for the job description searched.

The system can be further enhanced by splitting the resume into sections and exactly predicting the sections of the resume to be strengthened so that the resume gains more visibility among the recruiters and falls under the satisfactory category in the next screening.

Multilingual support: The proposed system is currently designed for resumes in English. Multilingual support can be added to enable screening of resumes in different languages.

## Optimal Deep Convolutional Neural Network Based Face Detection and Emotion Recognition Model

Ambika G. N. \*,1, Yeresime Suresh

**Submitted**: 28/04/2023 **Revised**: 25/06/2023 **Accepted**: 07/07/2023

Abstract: Face detection and emotion recognition are two closely connected tasks in computer vision that include analysing facial images to identify faces and detect the emotions expressed by the individual. Face detection is the way of localizing and locating faces within image or video frames. The objective is to detect the presence and position of faces, by drawing bounding boxes around them. Facial emotion recognition (FER) aims to detect and classify the emotions expressed by individuals based on facial expressions. Typically, this task can be done after face detection, where the faces detected are analysed further for emotional cues. Emotion recognition can be advanced by means of classical deep learning (DL) or machine learning (ML) techniques. Contemporary research on emotion classification has accomplished grand performance over DL based approaches. This article introduces an Optimal Deep Convolutional Neural Network based Face Detection and Emotion Recognition model (ODCNN-FDER) technique. The aim of the ODCNN-FDER technique is to detect faces and identify the existence of different emotions in them. To achieve this, the ODCNN-FDER technique initially employs Multi-Task Cascaded Convolutional Neural Network (MCCNN) model. Next, the fusion based feature extraction process is involved using two DL models namely EfficientNetB3 and InceptionResNetV2. For emotion recognition, Convolutional Attention Gated Recurrent Neural Network (CAGRNN) model is used. Lastly, root mean square propagation (RMSProp) optimizer was exploited for the optimal hyperparameter tuning of the CAGRNN approach. The performance validation of the ODCNN-FDER methodology was tested on the FER-2013 database. The experimental values highlighted the improved face detection and FER results of the ODCNN-FDER technique over other models.

Keywords: Computer vision, Deep learning, Face detection, Facial emotion recognition, RMSProp optimizer

#### 1. Introduction

Nowadays, face recognition and detection methods including facial expressions analysis are an efficient research field in the Computer Vision (CV) community [1]. Face detection is a computer technology that can give a digital video or image, identify the facial features, and determine the sizes and positions of human faces by excluding anything else like, bodies and buildings, trees existing in the video or image. This detection and localization of human faces is a pre-requisite for recognizing faces or analysing facial expressions, which is utilized in applications like Human Computer Interface (HCI), video monitoring, and image database management [2]. A machine can recognize and detect an individual's face utilizing a normal web camera. But the factors such as a blurry or contrasting image in shadows, absence of proper brightness or lighting of an image, and viewing a person from an angle can considerably increase the complication for detecting a face [3]. In the year of investigation but still it is less dependent than face recognition and far away from being considered an effective technique of user authentication [4].

1990s, face recognition has been a prominent field of

In recent decades, Emotion recognition is a technique that has been achieving plenty of interest with the growth of Artificial Intelligence (AI) techniques. This could be obtained by investigating the facial expressions or voice tone, body postures [5]. In this research, the main focus is on recognizing emotions by applying facial expressions. Gathering the facial expression of other individuals supports human communication by understanding the purposes of others [6]. The technique of Facial Emotion Recognition (FER) is a booming area of research, which has the utilizations like Human-Machine Interaction (HMI), computer animations, and different learning processes - comprehending the internal state of attention of the learners [7]. The method of vision sensor based FER has fascinated attention in existing research and has higher capability of FER recognition in real-time. In the vision based FER, the researchers mainly concentrated on seven basic expressions like disgust, happiness, fear, anger, surprise, sad, and neutral and it categorized the FER into 2 sub-categories namely traditional and DL based approaches [8]. The requirement for intelligent

technologies for deciding a potential user has needs and desires and then selecting an effective action method has rocketed with the wide acceptance of intelligent technology in modern life. Moreover, CV and DL techniques are applied in almost all engineering domains and social spheres like manufacturing, medical imaging, speech and text recognition, and emotion recognition [9]. Despite the important achievement of traditional FER algorithm based on the extraction of manual features, in previous decades, researchers have changed their attention to the DL method because of its outstanding capability of automatic recognition [10].

This article introduces an Optimal Deep Convolutional Neural Network based Face Detection and Emotion Recognition model (ODCNN-FDER) technique. The aim of the ODCNN-FDER technique is to detect faces and identify the existence of different emotions in them. To achieve this, the ODCNN-FDER technique initially employs Multi-Task Cascaded Convolutional Neural Network (MCCNN) model. Next, the fusion based feature extraction process is involved using two DL models namely EfficientNetB3 and InceptionResNetV2. For emotion recognition, Convolutional Attention Gated Recurrent Neural Network (CAGRNN) model is used. Lastly, root mean square propagation (RMSProp) optimizer was exploited for the optimum hyperparameter tuning of the CAGRNN algorithm. The performance validation of the ODCNN-FDER method is tested on the FER-2013 dataset.

#### 2. Related Works

Jain et al. [11] present a novel Squirrel Search Optimizer with DL Enabled Facial Emotion Recognition (SSO-DLFER) approach for Autonomous Vehicle Drivers. The presented SSO-DLFER system follows 2 main procedures such as emotion recognition and face detection. The RetinaNet approach was utilized at primary step of face recognition method. For emotion detection, the SSO-DLFER approach executed the NASNet Large feature extraction with GRU method as a classification. In order to enhance the emotion detection solution, the SSO-based hyper-parameter tuning process was executed. In [12], a DL- based structure was presented for human emotion recognition. The presented structure utilizes the Gabor filtering for feature extraction and CNN for classification.

Nasri et al. [13] present a FER method from static image dependent upon Xception CNN structure and K-fold cross-validation approach. The presented method can be enhanced by utilizing the fine-tuned system. The Xception approach pre-training on ImageNet dataset for object detection can be fine-tuned for recognizing 7 emotional states. Gao et al. [14] introduce an automatic optimizer structure utilizing binary coding method and GPSO with

gradient penalties for selecting the design. Such SI optimizer methods can be employed but not widely utilized, and the present work concentrates on methods with set depth of networks. Shao and Qian [15] presented 3 new CNN approaches with various structures. A primary one is a shallow network termed Light-CNN that is fully CNN comprising 6 depthwise separable residual convolutional elements for resolving the problem of difficult topology and over-fitting. The secondary one is dual-branch CNN that extract typical LBP features and DL feature in parallel. The tertiary one is a pretraining CNN that is planned by TL system for overcoming the lack of trained instances.

In [16], a DL-based method was presented for detecting the facial expression of persons. The presented system comprises 2 parts. The previous one learns local features in face images utilizing a local gravitational force descriptor, but, in the end, the descriptor was provided as new DCNN approach. The presented DCNN contains 2 branches. A primary branch searches geometric features like curves, edges, and lines; but holistic features were extracted by secondary branch. Cui et al. [17] introduce an endwise Regional-Asymmetric CNN (RACNN) emotion detection that comprises temporal, regional, and asymmetric feature extractions. Especially, continuous 1-D convolutional layers can be employed in temporal feature extraction for learning time-frequency representations. Afterward, the regional feature extraction comprises two 2-D convolutional layers for capturing regional data amongst physically nearby channels.

#### 3. The Proposed Model

In this study, we have concentrated on the development of the ODCNN-FDER technique. The major intention of the ODCNN-FDER technique is to detect faces and identify the existence of different emotions in them. To achieve this, the ODCNN-FDER method follows two most important processes: MCNN based face detection and emotion recognition. Fig. 1 depicts the overall flow of ODCNN-FDER algorithm.

Fig. 1. Overall flow of ODCNN-FDER algorithm

#### 3.1. Face Detection using MCCNN Model

Primarily, the MCCNN algorithm is used for automated face detection process. MCCNN is used as a solution for face alignment and detection [18]. The process comprises three phases of convolution network that are capable of recognizing faces and landmark locations like mouth, nose, and eyes. Initially, it exploits a shallow CNN to rapidly generate candidate window. Next, through more complex CNN it refines the candidate window. At last, it exploits a CNN to further refine the result and output the facial landmark position which is more complex than the others. At first, take the image and rescale it to dissimilar scales for building an image pyramid viz., input of three-stage cascaded networks.

#### Stage1: Proposal Network (P-Net)

A full convolution network (FCN) is the first stage. The only distinction between a FCN and a CNN is that a FCN doesn't apply dense layer as part of the architecture. This P-Net was employed for achieving candidate windows and their bounding box regression vector. Bounding box regression is a traditional way of predicting the localization of boxes once the objective is to detect an object of some predefined classes. Some refinement can be done after attaining the bounding box vector, for combining overlapping regions. After refinement, each candidate window is used to decrease candidate counts.

#### Stage2: Refine Network (R-Net)

At the last stage, each candidate from the P-Net was given into the R-Net. Further, the R-Net decreases the volume of candidates, performs calibration with bounding box regression, and exploits non-maximum suppression (NMS) to combine overlapping candidates. The R-Net output if the input is a face or not, is a ten-element vector for the localization of facial landmarks, and a four element vector that is bounding box for faces.

#### Stage3: Output Network (O-Net)

This phase could not be unlike the R-Net, however, this Output Network purposes to define the face in further detail and output the 5 facial landmarks' place for mouth, eyes, and nose.

#### 3.2. Process involved in FER Technique

In the second phase, the FER process takes place using three subprocesses namely fusion based feature extraction, CAGRNN based classification, and RMSProp based parameter tuning.

#### 3.2.1. Fusion based Feature Extraction

In this stage, the fusion based feature extraction procedure takes place using two DL models namely EfficientNetB3 and InceptionResNetV2. EfficientNet presents an exceptional method for scaling NN by improving

precision, depth, and width [19]. The CNN method scaling model revolves around the application of compounded coefficients that uniformly scale-up the dimension, width, and depth of the network. Furthermore, EfficientNet is a kind of DL algorithm that is derived in baseline model introduction by using NN search. The basic component of EfficientNetB0 is a mobile inverted bottleneck convolution (MBConv) that is somewhat adapted due to the more of special block called a squeeze-and-excitation optimization block. Therefore, every MBConv block relies on shortcut connection and depth wise convolution layers between the blocks. EfficientNetB3 is a CNN model designed by researcher workers at Google that attained remarkable performance on the ImageNet classification tasks. The architecture belongs to the family of EfficientNet model that is developed to accomplish higher performance while being computationally effective. It exploits the synthesis of convolutional layers with diverse kernel sizes along with squeeze-andexcitation elements that selectively increase relevant features.

Inception-ResNetv2 is a deep CNN (DCNN) architecture which integrates the Inception model from the Inception network and the residual connection from the ResNet model [20]. It was developed as an improvement to the original Inception and ResNet models to enhance their accuracy and performance. The basic concept behind Inception-ResNetv2 is to resolve the problems of training deep neural networks. The deep network tends to suffer from gradient vanishing problems, where the gradient becomes very smaller during backpropagation, which makes them challenging for the network to learn efficiently. Residual connection, as presented in ResNet, lessens these problems by the network for learning residual mappings rather than direct mapping. Inception ResNetv2 integrates the Inception model, which is developed to capture multiscale features by applying dissimilar filter sizes (1x1, 3x3, 5x5) in similar branches and concatenating their output. This allows the network to capture local and global data at dissimilar scales. The residual connection skips more than one layer and directly feeds the input to the output, which makes it easier for the network to learn residual data.

#### 3.2.2. CAGRNN based Classification

For emotion detection and classification process, the CAGRNN model is exploited. Recurrent neural network (RNN) exploits historic data instead of the present data for classification. In addition, a bi-directional RNN (BRNN) architecture was introduced, which uses past and present data [21]. Hence, two RNNs are employed to implement the forward and reverse functions. The output was connected with the same output layer for recording the feature sequence. An additional bi-directional GRU

(BiGRU) model was proposed based on the BRNN model, which replaces the hidden state of BRNN with the single GRU memory units. Now, the combination of these two BiGRU models with attention mechanisms is considered an AGRNN. Fig. 2 showcases the framework of CAGRNN method.

Fig. 2. Architecture of CAGRNN model

Assume an m-dimensional input dataset as  $(y_1, y_2, ..., y_m)$ . The hidden state in the BGRU generates an output  $H_{t_1}$  at  $t_1$  time interval is given below;

$$\vec{H} = \sigma \left( w_{e_{\overrightarrow{yH}}} y_{t_1} + w_{e_{\overrightarrow{HH}}} \vec{H}_{t_1-1} + c_{\overrightarrow{H}} \right)$$

$$(1)$$

$$\overleftarrow{H}_{t_1} = \sigma \left( w_{e_{\overleftarrow{yH}}} y_{t_1} + w_{e_{\overrightarrow{HH}}} \overleftarrow{H}_{t_1 - 1} + c_{\overleftarrow{H}} \right) \tag{2}$$

$$H_{t_1} = \vec{H}_{t_1} \oplus \overleftarrow{H}_{t_1}$$
(3)

Where  $w_e$  represents the weighted factor for two connected layers, c shows the bias vector,  $\sigma$  denotes the activation function,  $\vec{H}_{t_1}$  and  $\vec{H}_{t_1}$  represents the positive and negative outputs of GRU,  $\oplus$  and denotes the bitwise operator. In the CAGRU, the convolutional layer was widely used for the feature maps or input sequences for capturing spatial data. Then, the attention module is used to calculate attention weight over the convolutional feature, which highlights the crucial region. The weighted feature was combined and fed into the GRU that sequentially process them to

capture temporal dependency. The last output of the network can be utilized for dissimilar tasks namely regression, classification, or sequence generation.

#### 3.2.3. Hyperparameter Tuning

At the final stage, the RMSProp optimizer is used. AGRNN is a hybrid network of BiGRU with the attention module. The main concept behind RMSprop is to keep the moving average of the squared gradient for all the weights [22]. In RMSProp learning rate is automatically adjusted and it selects a dissimilar learning rate for all the parameters. RMSProp splits the learning rate by the average of the exponential decay of squared gradient. The RMSprop optimizer attempts to restrict the oscillation in the vertical direction that consecutively assists in increasing the learning rate such that the model takes large step in the horizontal direction and converges faster. The calculation of RMSprop is shown in the following. The value of momentum is signified as  $\beta$  and is generally fixed as 0.9.

$$vdw = \beta \cdot vdw + (1 - \beta) \cdot dw^{2}$$
(4)

$$vdb = \beta \cdot' vdw^{-\vdash (x-\beta) \cdot db^2}$$
(5)

$$W = W - \alpha \cdot \frac{dw}{\sqrt{vvdw} + \epsilon}$$
(6)

$$b = b - \alpha \cdot \frac{db}{\sqrt{vdb} + \varepsilon}$$
(7)

In backward propagation, dW and db are used for updating W and b parameters:

$$W = W - learning \ rate * dW$$
 (8)

$$b = b - learning \ rate * db$$
 (9)

Rather than applying dW and db autonomously for all the epochs, we take the exponentially weighted average of the square of dW and db in RMSprop.

$$S_{dW} = \beta^* S_{dW} + (1 - \beta)^* dW^2$$
(10)

$$S_{db} = \beta^* S_{db} + (1 - \beta)^* db^2$$
(11)

From the expression, beta  $\beta$ ' is another hyperparameter and takes value from 0 to 1. The newly weighted average is generated by the weights, average of prior value, and present value square. The parameters are updated afterward computing exponentially weighted average.

$$W = W - learning \ rate * dW/sqrt(S_{dW})$$
(12)

$$b = b - learning \ rate * db/sqrt(S_{db})$$
(13)

If  $S_{dW}$  is relatively lesser, then we're dividing it by dW. If  $S_{db}$  is relatively larger then divide db with comparatively large number to delay the update on vertical dimension.

#### 4. Results and Discussion

In this section, the results of the ODCNN-FDER technique is tested on the FER2013 Dataset [23] which holds seven classes (Anger, Disgust, Fear, Happiness, Sadness, Surprise, and Contempt). Fig. 3 demonstrates the extraction feature maps images.

Fig. 3. Extracted Feature Maps

Fig. 4. Results on Training Dataset a) Confusion Matrix b) PR-Curve c) ROC

Fig. 4 reveals the classifier outcome of the ODCNN-FDER algorithm on training dataset. Fig. 4a describes the confusion matrix provided by the ODCNN-FDER approach. The result inferred that the ODCNN-FDER approach has detected and classified all 7 classes accurately. Followed by, Fig. 4b exposes the PR curve of the ODCNN-FDER method. The outcomes implied that the ODCNN-FDER algorithm has achieved higher PR outcomes on 7 classes. At last, Fig. 4c exemplifies the ROC curve of the ODCNN-FDER algorithm. The outcome outperformed that the ODCNN-FDER system has led to able outcomes with superior ROC values on 7 classes.

Fig. 5 depicts the classifier result of the ODCNN-FDER system on testing database. Fig. 5a showcases the confusion matrix offered by the ODCNN-FDER algorithm. The result stated that the ODCNN-FDER approach has recognized and classified all 7 classes accurately. Afterward, Fig. 5b reveals the PR outcome of the ODCNN-FDER system. The outcome depicts that the ODCNN-FDER algorithm has attained maximal PR results on 7 classes. Lastly, Fig. 5c demonstrates the ROC study of the ODCNN-FDER system. The outcome exhibited that the ODCNN-FDER approach has resulted in capable outcomes with higher ROC values on 7 class labels.

Fig. 5. Results on Testing Dataset a) Confusion Matrix b) PR-Curve c) ROC

In Table 1 and Fig. 6, the FER results of the ODCNN-FDER technique are investigated on TRS and TSS. The results indicate that the ODCNN-FDER technique reaches improved results on both TRS and TSS. On TRS, the ODCNN-FDER technique offers accu, of 95.29%,  $prec_n$  of 93.15%,  $sens_v$  of 91.85%,  $spec_v$  of 98.72%, *F<sub>score</sub>* of 92.42%, and MCC of 91.19%.

**Table 1.** FER outcome of ODCNN-FDER approach on TRS and TSS

Metrics	Training Set	Testing Set
Accuracy	95.29	94.74
Precision	93.15	92.27
Sensitivity	91.85	90.88
Specificity	98.72	98.60
F-Score	92.42	91.48
Mathew Coefficient	91.19	90.14

Also, on TSS, the ODCNN-FDER approach offers  $accu_y$  of 94.74%,  $prec_n$  of 92.27%,  $sens_y$  of 90.88%,  $spec_y$  of 98.60%,  $F_{score}$  of 91.48%, and MCC of 90.14%.

**Fig. 6.** Average outcome of ODCNN-FDER approach on TRS and TSS

Fig. 7 displaying the training accuracy  $TR\_accu_y$  and  $VL\_accu_y$  of the ODCNN-FDER method. The  $TL\_accu_y$  is defined by the evaluation of the ODCNN-FDER technique on TR dataset whereas the  $VL\_accu_y$  is computed by assessing the performance on a separate testing database. The results display that  $TR\_accu_y$  and  $VL\_accu_y$  maximum with an increase in epochs. Accordingly, the outcome of the ODCNN-FDER method gets improved on the TR and TS dataset with a rise in count of epochs.

In Fig. 8, the TR\_loss and VR\_loss curve of the ODCNN-FDER algorithm is exposed. The TR\_loss demonstrates the error among the predictive solution and original values on the TR data. The VR\_loss represents the measure of the efficiency of the ODCNN-FDER technique on individual validation data. The outcomes implied that the TR\_loss and VR\_loss tend to reduce with increasing epochs. It portrayed the enhanced performance of the ODCNN-

FDER technique and its capability to generate accurate classification. The reduced value of *TR\_loss* and *VR\_loss* demonstrates the greater performance of the ODCNN-FDER system on capturing patterns and relationships.

**Fig. 7.**  $Accu_{\nu}$  curve of the ODCNN-FDER approach

Fig. 8. Loss curve of the ODCNN-FDER approach

In Table 2 and Fig. 9, the FER results of the ODCNN-FDER technique are compared with recent DL models [24]. The experimental results imply that the Mini-Xception and CNN-transfer learning models accomplish worse performance. At the same time, three layer-CNN, six-layer-CNN, and InceptionResNetv2 models exhibit slightly enhanced results.

**Table 2.** Comparative outcome of ODCNN-FDER algorithm with recent DL systems

Methods	Accur acy	Precisi on	Sensiti vity	Specifi city	F- Scor e
Mini- Xception Model	66.00	78.77	75.19	72.44	80.8
CNN- Transfer Learning	72.00	69.78	74.26	74.37	80.2 7
Three Layer-CNN Model	88.60	87.61	90.08	90.36	90.5 1
Six Layer- CNN Model	86.78	89.75	88.87	88.37	89.8 1
InceptionRe sNetV2	87.69	88.41	89.76	90.49	89.7 3
FERVCB- DL	89.20	88.22	88.77	88.13	90.2 3

**Fig. 9.** Comparative outcome of ODCNN-FDER algorithm with recent DL systems

Although the FERVCB-DL model reaches considerable performance with  $accu_y$  of 89.20%,  $prec_n$  of 88.22%,  $sens_y$  of 88.77%,  $spec_y$  of 88.13%, and  $F_{score}$  of 90.23%, the ODCNN-FDER technique gains maximum performance with  $accu_y$  of 95.29%,  $prec_n$  of 93.15%,  $sens_y$  of 91.85%,  $spec_y$  of 98.72%, and  $F_{score}$  of 92.42%. These results confirmed the enhanced performance of the ODCNN-FDER technique on face detection and FER processes.

#### 5. Conclusion

In this study, we have concentrated on the development of the ODCNN-FDER technique. The major intention of the ODCNN-FDER technique is to detect faces and identify the existence of different emotions in them. To achieve this, the ODCNN-FDER method follows two most important processes: face detection and emotion recognition. In the primary phase, the MCCNN approach was applied for the face detection method. Next, in the second phase, the FER process takes place using three subprocesses namely fusion based feature extraction, CAGRNN based classification, and RMSProp based parameter tuning. In this work, the RMSProp optimizer is exploited for the optimum hyperparameter tuning of the CAGRNN algorithm. The performance validation of the ODCNN-FDER technique was tested on the FER-2013 database. The experimental values highlighted the improved face detection and FER results of the ODCNN-FDER technique over other models. In future, the ODCNN-FDER technique can be extended to the design of metaheuristic optimizers.

# An Efficient Deep Learning with Optimization Algorithm for Emotion Recognition in Social Networks

Ambika G N<sup>1</sup>, Dr. Yeresime Suresh<sup>2</sup>

Assistant Professor, CSE Dept., BMS Institute of Technology and Management, Bangalore-560064, India Associate Professor, CSE Dept., Ballari Institute of Technology & Management, Ballari-583104, India Associate Professor, CSE Dept., Ballari Institute of Technology & Management, Ballari-583104, India

Abstract—Emotion recognition, or computers' ability to interpret people's emotional states, is a rapidly expanding topic with many life-improving applications. However, most imagebased emotion recognition algorithms have flaws since people can disguise their emotions by changing their facial expressions. As a result, brain signals are being used to detect human emotions with increased precision. However, most proposed systems could do better because electroencephalogram (EEG) signals are challenging to classify using typical machine learning and deep methods. **Human-computer** recommendation systems, online learning, and data mining all benefit from emotion recognition in photos. However, there are challenges with removing irrelevant text aspects during emotion extraction. As a consequence, emotion prediction is inaccurate. This paper proposes Radial Basis Function Networks (RBFN) with Blue Monkey Optimization to address such challenges in human emotion recognition (BMO). The proposed RBFN-BMO detects faces on large-scale images before analyzing face landmarks to predict facial expressions for emotional acknowledgment. Patch cropping and neural networks comprise the two stages of the RBFN-BMO. Pre-processing, feature extraction, rating, and organizing are the four categories of the proposed model. In the ranking stage, appropriate features are extracted from the pre-processed information, the data are then classed, and accurate output is obtained from the classification phase. This study compares the results of the proposed RBFN-BMO algorithm to the previous state-of-the-art algorithms using publicly available datasets derived from the RBFN-BMO model. Furthermore, we demonstrated the efficacy of our framework in comparison to previous works. The results show that the projected method can progress the rate of emotion recognition on datasets of various sizes.

Keywords—Blue monkey optimization (BMO); deep learning; electroencephalograph (EEG); emotion recognition; human-computer interaction (HCI); radial basis function networks (RBFN)

#### I. INTRODUCTION

This template, modified in MS Word 2007 and saved as a "Word 97-2003 Document" for the PC, provides authors with most of the formatting specifications needed for preparing electronic versions of their papers. All standard paper components have been specified for three reasons: (1) ease of use when formatting individual papers, (2) automatic compliance to electronic requirements that facilitate the concurrent or later production of electronic products, and (3) conformity of style throughout conference proceedings.

Margins, columns widths, line spacing, and type styles are built-in; examples of the type styles are provided throughout this document and are identified in italic type, within parentheses, following the example. Some components such as multi-leveled equations, graphics, and tables are not prescribed, although the various table text styles are provided. The formatter will need to create these components, incorporating the applicable criteria that follow.

Language, text, action, and other means are all ways that people can express themselves. How to recognize and accurately detect human facial expressions has emerged as a hot research area given the rapidly expanding artificial intelligence field [1]. Numerous businesses including amusement, security, online education, and intelligent medical care, use facial expression detection technologies [2]. Facial expression is a critical factor in human emotion recognition. Since a person's facial expressions convey their emotions, "facial recognition" [3] and "emotion recognition" are often used synonymously. Significant progress has been made in the automotive industry, augmented robotics, neuromarketing, and interactive games. There is growing interests in enhancing all facets of human-computer interaction, particularly in recognizing human emotions.

Facial expression recognition can be used to monitor driver fatigue. An alarm is sent when the driver's face exhibits signs of drowsiness, and a camera records the driver's expression in real time while also analyzing the driver's mental state. This can assist with avoiding traffic accidents induced by fatigued driving. The elderly can benefit from installing a human-computer interaction system with a recognition of facial expressions feature in nursing homes or elderly homes. Facial expression recognition technology can track how each student responds to the lecture and provide the instructor with immediate feedback, which can, to some extent, advance the superiority of education [4]. During the online teaching process, it can be difficult for the instructor to keep track of each student's reaction, but it is still important to make timely adjustments to the course progress.

In the conventional method for recognizing facial expressions, a photograph is taken, its attributes are extracted, and then the image is identified using machine learning [5]. The difficult feature extraction method and the identification performance being easily influenced by the environment and a person's facial activity are some drawbacks of this strategy.

One of today's most vital and challenging techniques is emotional recognition. Applications for emotion recognition include helping to measure stress levels and blood pressure, among other things. When using emotional techniques, one can apply the functions of happy, sad, calm, and neutral facial features. The human body's inner workings can be detected using various methods and algorithms. Real-time emotional recognition can pick up on human thought processes. Identifying diseases early using emotional recognition shields can save humans from severe infections or illnesses. Emotional recognition has the main benefit of assisting in identifying human mentalities without using questions.

Machine learning algorithms accurately predict facial emotions like stress and sadness. The results for emotion recognition, such as sadness and rage, were improved when the ECG and PPG were merged with the 28 features take out from algorithms using machine learning [6]. Without knowledge sharing, facial expressions are essential for determining human mentality. In a few articles, datasets from 2010 to 2021 are combined, along with the majority of the features collected and categorized using deep learning and to support vector machine approach, hence increasing classification accuracy and outcomes.

A subset of machine learning methods called "deep learning" can be used to analyze facial expressions and identify emotions. However, the amount of data will affect how well it works. As data volume rises, performance gets better. Deep learning cannot be applied to facial expression datasets because they are too small. Several studies have found that augmentation techniques like cropping, scaling, translating, or mirroring during the pre-processing stage increase the alteration and, subsequently, the quantity of information.

In various pattern recognition and classification issues, neural networks have been used because they have the best approximation capability. Along with the back-propagation algorithm, face recognition has also used convolution neural networks and multilayer perceptron (MLPs) [7]. Because of its slow convergence rate and uncertainty about whether it will reach global optimums, the back-propagation learning procedure is computationally intensive. Due to their outstanding approximation accuracy and quick processing, radial basis function neural networks (RBFN) with a single hidden layer have been used for facial recognition applications. Radial basis functions in the hidden layer nonlinearly map the contribution face information to linearly divisible information in hidden hyperspace. Some enterprise challenges for hidden layers include defining the RBF unit centers of hidden neurons, their numbers, and the selection and shape of fundamental functions. Second, the success of blue monkey swarms naturally inspired the development of the Blue Monkey (BM) approach, a cutting-edge metaheuristic optimization method. The total number of men in a group is determined via the BM process. Like other forest guenons, blue monkey groups typically only contain one adult male outside the breeding season. With constraints and an unknown search space, this algorithm effectively finds solutions to practical problems. The BM method has some variables and the potential to produce better results [8].

Radial Basis Function Networks (RBFN) with Blue Monkey Optimization is suggested in this paper (BMO). The proposed RBFN-BMO first recognizes faces on large-scale imageries after assessing face landmarks to approximate representations for reaction acknowledgment. The two stages of the RBFN-BMO are convolutional neural networks and patch cropping. The proposed perfect is composed of four categories: feature extraction, ranking, preprocessing and organization. After preprocessing the dataset's collected data for data cleansing, the information is classified, the relevant attributes are extracted from the preprocessed data in the ranking phase, and the correct information is obtained. This study compares the results of the recommended RBFN-BMO method to earlier state-of-the-art methodologies using publicly accessible datasets inferred from the RBFN-BMO model. Furthermore, we have demonstrated that our structure is more efficient than earlier ones.

The projected work is defined in detail below. Section II goes into more excellent aspects of the work associated with the projected outcome. Section III goes over the proposed framework in depth. Section IV goes into great detail about experiment design and performance evaluation. Section V concludes the discussion of future work.

#### A. Contribution

- Data cleaning and pre-processing are performed on the dataset's collected data.
- The pre-processed data are given the appropriate characteristics during the ranking phase, and the information is then categorized.
- Pre-processing, feature extraction, ranking, and categorization are the four categories that make up the suggested model.
- Before looking at face landmarks to predict facial expressions for emotion detection, the Radial Basis Function Networks (RBFN) - Blue Monkey Optimization (BMO) proposed method first recognizes faces on large-scale images.

#### II. LITERATURE SURVEY

Chen et al. [9] used a deep sparse auto-encoder network based on Soft-max regression to identify facial expressions of emotion during human-robot interaction. This work minimizes distortion, learning efficiency is determined, and dimensional complexity is measured using the SRDSAN technique. The soft-max simple regression perfect will help categorize the input signal, while the DSAN technique helps with accurate feature extraction.

Babajee et al. [10] suggested using deep learning to recognize human expressions from facial expressions. This paper uses deep knowledge and a convolutional neural network to offer seven methods for identifying facial emotions. This study uses the Facial Action Coding System (FACS) to collect 32,398 facial expressions to identify various types of emotion. The identification approach's failure to be an effective optimization technique is the sole justification for this research.

Satyanarayana et al. [11] used deep learning and cloud access to implement emotional acknowledgment in this study. One of the most effective methods in many presentations is facial emotion recognition. Face recognition makes extensive use of the deep learning algorithm. Her thesis paper examines a variety of emotions, such as sadness, joy, serenity, and rage. The Python code generates a particular IP address for each technique to send this data.

Jayanthi et al. [12] used deep classifiers to develop an organizing strategy for emotional categorizations utilizing speech and static images. One of the most crucial methods for determining someone's stress level is emotion identification. The two traits of emotion perception and speech modulation are essential in determining the stress level in the human body.

Sati et al. [13] used NVIDIA to implement face detection, recognition, and emotion recognition in his paper. In this study by Jetson Nano, face emotion recognition and detection are combined. Facial emotional identifications have historically been among the most challenging techniques to master. This technique's accuracy and classification outcomes can be improved by adding some features. The ANN technique assists in recognizing and classifying facial expressions of emotion.

Wang et al. [14] applied a recently developed deep learning technique in this paper. The four-category deep learning model is used in this paper. Convolutional neural networks and deep architectures fall under the first category. The deep learning model has a significant impact on deep neural networks. This component of the machine learning algorithm is essential. The classification, which includes both linear and nonlinear special functions, is necessary for the accuracy of the data.

The multi-label convolution neural network was implemented by Ekundayo et al. [15] to identify facial expressions and estimate ordinal intensity. This was completed because, while many features, like FER, are consistent with the emotional recognizing method, only one is ideal for the multi-class dynamic classification method. This study utilized a multi-label convolutional neural network.

Using facial expressions, EEG, and machine learning techniques, Hassouneh et al. [16] developed a real-time emotional recognition system. The system could distinguish between smiling, remaining neutral, and losing control. In this study, virtual markers detect facial regression using the optical flow algorithm, since it acknowledges a lower level of computational complexity, the optical flow algorithm system aids in providing people with a physical challenge.

Neuro-sense was used by Tan et al. [17] to implement short-term emotion recognition and comprehension. Spiking neural network simulations of the spatiotemporal EEG patterns served as the foundation for their strategy. The SNN method is used for the first time in this paper. It aids in comprehending how the brain operates. One of the two methods used to analyze the EEG data is arousal-valence space. The various types of segments that make up the arousal-valence space include low arousal, high arousal, high

valence space techniques, and standard valence space methods.

A deep facial expression recognition survey was carried out by Li et al. [18]. One of the system's most significant challenges is recognizing a person's facial expression. The two main challenges to accurate facial expression recognition are a need for training sets and undesirable emotion variations (FER). The data set is first organized using the neural pipeline technique. Consequently, the FER technique's complex problems will be reduced.

Yang et al. [19] used a staked auto-encoder to implement three-class profound learning-based emotional expressions. This paper demonstrates that discrete entropy calculation can be used to measure the EEG signal. The deep learning algorithm's auto-encoder technique results are more accurate than those from the encoding system's calculation methods. To use the alpha, beta, and gamma values, this method assesses emotions. Classification results are produced more accurately when a deep learning procedure is used. The deep learning procedure typically yields acceptable outcomes for the various classes of emotional recognition.

Yadahalli et al. [20] used a deep learning technique to recognize facial micro expressions. This study uses six different emotional expressions—happy, sad, angry, scared, neutral, and surprised faces—to collect the eight layers of the dataset. Because it has started collecting datasets that contain the FER perfect, the paper assumes that the FER with a CNN improves accuracy and that the removed consequence produces the multimodal facial expression using a single method. Using a single algorithm, the multimodal facial expression is also added to the dataset that has been gathered.

Asaju et al. [21] used a temporal method to recognize facial emotional expressions. This study introduces a CNN-based deep learning procedure that can implement numerous kinds of emotional acknowledgment in the human body. To extract features, VGG-19 methods are used. Both the accurate mapping technique and the recognition of facial emotions method use the BiLSTM architecture.

Yolcu et al. [22] suggested a deep learning-based method for tracking consumer performance patterns that measured head pose assessment and analyzed facial expressions to gauge the level of interest in the product. To follow customer interest, this was done. Deep structured learning was suggested by Walecki et al. [23] as a technique for determining the level of facial expression intensity. Face physics and other pre-processing methods are less critical in deep learning-based face recognition. CNN's convolution layers convolve the input image using various filters. It generates a feature map with fully connected networks to recognize facial expressions.

To identify emotional expressions on faces, Asaju et al. [24] employed the temporal method. This study integrates a CNN with a deep learning technique to create dissimilar kinds of emotional identification in the human body. Use the VGG-19 methods for obtaining features. The title and precise mapping of facial expressions are then carried out using the Bi-LSTM architecture.

Ekundayo et al. [25] implemented a multilabel convolution neural network to recognize facial expressions and estimate ordinal intensities. Although many features can be used with sentimental character segmentation techniques like FER, they are only suitable for some of them for the ideal categorization emotional classification method. Convolutional neural networks with multiple labels are used in this study.

#### III. PROPOSED SYSTEM

This study suggests combining RBFN and Blue Monkey Optimization (BMO) to acknowledge faces and emotions in high-resolution images. Modules for pre-processing, feature extraction, ranking, and classification can be seen in the block diagram of the proposed system in Fig. 1.

Fig. 1. Proposed method of RBFN-BMO method.

#### A. Pre-Processing of the Images

Before using the pyramid images approach, the original photographs are downscaled by a feature of 2 until they are 128×128 in dimensions. Additionally, each pyramid image is split into 128×128 pixel-sized patches to simplify processing and reduce memory allocation.

1) Data augmentation: Dawn sampling was performed on the input photos using a ratio of 2 up to an image size of 128×128. There was no overlap between the 128×128 patches created from the pyramid photos. If the picture segment is too long for the patches, zeros will be added to make up the difference. Additionally, we employ a data augmentation technique that involves rotating, translating, and flipping the images on their axes at 45-degree perspectives. The data augmentation method increases the number of training examples and progresses the network's ability to simplify under challenging circumstances. The images have been edited to resemble actual facial recognition scenarios. Due to the GPU's memory capacity, we use a batch size of 16 pictures during training. As a result, various combinations of patches for the same image might be created. The initial photo incorporates all sensing forecasts on the same image's patches.

#### B. Feature Extraction using RBFN

Feed forward neural networks comprise RBFN. The three layers that make up the RBFN's design are the input, hidden, and output layers, as depicted in Fig. 2. Data is sent from the

user's input layer to the concealed layer [26]. Radial basis function (RBF) units, known as hidden neurons, comprise the hidden layer. Each jth RBF unit has a related basis function (

$$\varphi_j$$
), spread ( $\partial_j$ ), and centre ( $A_j$ ).

The nonlinear basis functions  $\varphi_j$  are affected by how far the input is from the center of the jth RBF unit. RBFN frequently employs the basic functions Gaussian, multiquadric, inverse multiquadric, and thin spline. The most often used Gaussian basis function was signified in this study as

$$\varphi_j(x) = e^{\frac{\|m - A_j\|^2}{2\partial_j^2}}$$
(1)

The restriction r, which also denotes the function's width, characterizes the spread of the radial basis function, where Cj stands for the jth RBF unit's center. You can think of RBFN as a mapping from (2).

$$\mathbf{R}^{d} \rightarrow \mathbf{R}^{u}(u \gg d)$$
 (2)

Where u is the amount of RBF units and  $P \in \mathbb{R}^d$  is the d-dimensional input feature vector. The ith output of the RBFNN,  $n_i(m)$ , is

$$n_i(m) = \sum_{j=1}^{u} \varphi_j(x) \times w_{i,j}$$
(3)

Where wi,j denotes the degree of connectivity between the ith output neuron and the jth RBF unit.

Fig. 2. Structure of RBFN.

#### C. Ranking with Blue Monkey Optimization (BMO)

Blue Monkeys are different from the other species. They frequently live in societies where women are the majority, meaning females stay in their natal groups. However, as soon as they reach the mature stage, the males leave their groups [27]. There are usually a lot of females and young in each group of blue monkeys, but only one male. This problem exacerbates the problem of inbreeding. The men leave the group and join another one when they're older. However, finding a new group might take some time, so the males might

initially seem to be by themselves. Regarding social interactions, blue monkeys don't have a perfect sense of intuition [28]. Social interaction only lasts for a short time, typically when playing with and grooming other people.

Babies also connect with the other adults in the group and their mothers. The source of those newborns typically avoids their male counterparts. Baby handlers are the ones who do all the work. The young females tend to the babies and carry and protect them. From this habit, infants pick up how to react like all monkeys.

- 1) Group division: The BMO algorithm imitates the actions of Blue Monkey. Each group of monkeys had to travel through the search area to simulate these interactions. Earlier, it was mentioned that when the monkeys are divided into groups, they start searching for food sources far away in an area where more robust monkeys are out of sight of conventional vision. The young Cercopithecus mitis and the male have little to no interaction. Because Cercopithecus mitis is a territorial species, young males should venture outside as soon as possible. The dominant male of another family will challenge them. If they succeed in eliminating him, they will assume control of the family and be able to provide young men with food, shelter, and socialization. Blue monkey groups typically consist of a sizable number of females and young, with only one male [29].
- 2) Position update: Each blue monkey in a group updates to the position in the best place within that group. Equations like the ones below describe this behavior:

$$Power_{m+1} = (0.7 * Power_m) + (W_{lea} - W_m) * rand * (Y_{best} - Y_m)$$
(4)

$$Y_{m+1} = Y_m + Power_{m+1} * rand$$
 (5)

Whea stands for the leader weight, Wm for the monkey weight, Ybest for the leader location, which can take any value between [0,1], Power for the monkey power rate, and so on.

Using the following equations, the blue monkey's offspring are also updated.

$$Power_{m+1}^{C} = (0.7 * Power_{m}^{C}) + (W_{lea}^{C} - W_{m}^{C}) * rand * (Y_{best}^{C} - Y_{m}^{C})$$
(6)

$$Y_{m+1}^{C} = Y_{m}^{C} + Power_{m+1}^{C} * rand$$
 (7)

 $W_{\scriptscriptstyle m}^{\scriptscriptstyle C}$  is the child weight at which all weights are random

amounts among [4, 6],  $Y_{best}^{C}$  is the child position, Ychis the leader child position, Ratechneeds to stand for the child power rate, is the leader child weight, and "rand" denotes an arbitrary amount among [0, 1]. Every cycle, the location needs to be reorganized.

#### Algorithm for Blue Monkey Optimization

Initialize the Blue Monkey and their children population Bm (m=1...,n)

Initialize power rate and weight of Blue monkey as Power and W

Where (Power  $\in [0, 1]$ ) (W  $\in [4, 6]$ )

Randomly Distribute Blue Monkey into T groups and children in one group.

Evaluate the fitness of blue monkey and children in each group

Select Worstfit and Best fit in  $Y_{lea}^{C}$  Children group T=1

While (T≤ maximum number of group)

Swap Worstfit =  $Y_{lea}^{C}$ 

Update Power and Y position of all blue monkey by Eq. (4,5)

Update Power and Y Position of children by Eq. (6,7)

Upgrade the fitness of all blue monkeys and kids.

Most recent Update

If (New best> Current best) then

New best = Current best

End if

T=T+1

End While

The best blue monkey should be returned.

#### D. Classification of Emotions Recognition

The centers of hidden neurons or RBFN units can be found using the sub-clusters produced by the proposed RBFN-BMO technique. Since the method evolves the sub-clusters based on the given training statistics, providing the number of subclusters for each participant as input for face recognition is unnecessary. Emotion recognition aims to identify a person's emotions. The capacity to perceive emotions varies significantly among people. A significant area of research is emotion recognition with technological assistance. Analyzing facial landmarks, with a focus on the lips, nose, and eyes, is the foundation for identifying emotions. Facial expressions are a huge help in recognizing emotions. The shapes of those sections represent the person's emotions. One can infer a person's emotional state from the points' locations and the distance between them. The main objective was to create the proposed methodology for finding 68 spots; A potential area for emotion detection in each of the locations. The jawline is depicted in points 1 through 17, the left and right brows in points 18 through 22, the left and right eyes in moments 37

through 48, the noise in points 28 through 36, the outer lip area in matters 49 through 60, and the inner lip structure in points 60 through 68. In studies of facial expressions, the location of those points is crucial.

In this study, we suggest using facial features as annotations for emotion recognition. The proposed RBFN-BMO accepts inputs such as high-resolution photos, facial feature annotations, and the face's position. The seven emotions portrayed in this piece are anger, disgust, fear, joy, sadness, surprise, and neutrality. More details about the data set used to train the recommended RBFM-BMO are provided in the following section.

#### IV. EXPERIMENTAL RESULTS

Details about the experimental setting that was used to develop and evaluate the suggested RBFN-BMO are provided in this section. The experiment was run on a Linux desktop with an Intel i7 processor, 32 GB RAM, and a 4 GB Nvidia GTX960 graphics card. The suggested RBFN was developing using the TensorFlow deep learning framework, cuDNN, and CUDA vibration libraries. For image manipulation, the OpenCV library was used.

#### A. Dataset Description

We suggest using the celeb datasets [30] to train the suggested RBFN-BMO. There are 202,599 RGB images of well-known people in this dataset. Face, attribute, and landmark acknowledgment was considered when creating the dataset. The CelebA dataset's images are summarised in Fig. 3. This work advocates using facial landmarks and distinctive analysis for face detection and expression acknowledgment.

A training set, a validation set, and a testing set were created from the collected data. The training set consisted of 70% of the data, the validation set of 10% of the training set, and the testing set consisted of 30% of the data.

While pre-processing reduces filter noise, 70% of the data are used as training input. The high dimensionality of the filter is reduced with the help of feature extraction. To decrease the size of the problem space, our work employs various methods for extracting features, such as edge detection. As a result, it generates clear output images with precise dimensional quality. In the data, categorization and part extraction happen simultaneously.

#### B. Performance Metrics

The effectiveness of the suggested work is assessed using the recognition rate. The classification performance is calculated by dividing the total amount of images into the data sets by the number of facial expressions successfully identified. It is shown as:

The percentage of accurate classifications is measured by precision (Prec). It can be indicated using (8):

$$Precision = \frac{TP}{TP + FP}$$
 (8)

Fig. 3. Celebrity images data set.

It is also possible to refer to the actual positive rate as the recall rate or recall. It assesses how frequently a classifier gives the right category a favorable result. It is described in (9).

$$\operatorname{Re} call = \frac{TP}{TP + FN} \tag{9}$$

The F-Measure represents the harmonic mean of sensitivity and precision (F). It is crucial since higher accuracy typically interprets into lower sensitivity. It can be calculated using (10).

$$F - Score = 2 * \frac{precision * recall}{precision + recall}$$
(10)

Accuracy: To calculate the precision of our predicted value, divide all values by the total of true negatives and true positives.

$$Accuracy = \frac{TP + TN}{TP + TN + FP + FN}$$
 (11)

Root Mean Square Error (RMSE)

The only departure from RMSE is the square root sign. The mean absolute error equation is given in (12).

$$RMSE = \sqrt{\sum_{i=1}^{n} \frac{\left(y_i - y_i\right)^2}{n}}$$
(12)

The messages TP, TN, FP, and FN are confirmed positive, true negative, true positive, and false negative, respectively. The outcome should improve as a component of precision, recall, f-measure, and sensitivity.

1) Precision analysis: In Fig. 4 and Table I, the precision of the RBFN-BMO strategy is contrasted with that of other methods currently in use. The graph demonstrates the increased efficiency and precision of the deep learning approach. In comparison to the GRU, LSTM, RNN, DNN, and ANN models, which have precision values of 89.029%, 85.536%, 90.927%, 88.435%, and 93.983% for the 1000 data, the RBFN-BMO model has a precision value of 96.425%. With different data sizes, the RBFN-BMO model has shown its greatest performance. The RBFN-BMO's precision value is 97.927% under 6000 data, compared to the GRU, LSTM, RNN, DNN, and ANN models' precision values of 89.827%, 86.324%, 93.782%, 87.625%, and 95.029%, respectively.

Fig. 4. Precision analysis for RBFN-BMO method with existing systems.

TABLE I. RBFN-BMO METHOD PRECISION ANALYSIS USING EXISTING SYSTEMS

Data from dataset	GRU	LSTM	RNN	DNN	ANN	RBFN- BMO
1000	89.029	85.536	90.927	88.435	93.983	96.425
2000	89.214	85.234	91.425	88.323	94.626	96.029
3000	90.425	85.029	91.728	87.922	95.435	97.182
4000	90.627	86.324	92.637	87.425	94.928	96.728
5000	89.526	86.973	92.938	88.937	95.227	97.632
6000	89.827	86.324	93.782	87.625	95.029	97.927

2) Recall analysis: Fig. 5 and Table II illustrate how the RBFN-BMO approach compares to other current methods in terms of recall. The figure demonstrates how the recall performance was enhanced by the deep learning approach. The RBFN-BMO model, for example, has a recall value of 93.827% with 1000 data, while the GRU, LSTM, RNN, DNN,

and ANN models have recall values of 79.637%, 80.928%, 84.938%, 86.927%, and 89.627%, respectively. However, the RBFN-BMO model worked most effectively with various data sizes. For 6000 data points, the recall value of the RBFN-BMO is 95.737% as opposed to the GRU, LSTM, RNN, DNN, and ANN models' respective recall values of 81.924%, 84.536%, 87.736%, 90.326%, and 92.413%.

Fig. 5. Recall analysis for the RBFN-BMO method with existing systems.

TABLE II. RECALL ANALYSIS FOR THE RBFN-BMO METHOD USING EXISTING SYSTEMS

Data from dataset	GRU	LSTM	RNN	DNN	ANN	RBFN- BMO
1000	79.637	80.928	84.938	86.927	89.627	93.827
2000	80.452	82.373	85.324	87.926	90.862	94.435
3000	81.252	82.938	85.738	88.322	91.627	93.324
4000	80.615	83.425	86.029	88.726	92.617	94.928
5000	81.827	83.948	86.435	89.028	91.928	95.324
6000	81.924	84.536	87.736	90.326	92.413	95.737

*3) F-Score analysis*: Fig. 6 and Table III display an f-score contrast of the RBFN-BMO strategy with other existing methods. The graph shows that the deep learning method has produced better performance regarding the f-score. The RBFN-BMO model, for example, has an f-score of 92.536% with 1000 data, while the GRU, LSTM, RNN, DNN, and ANN models have f-scores of 87.928%, 85.435%, 81.526%, 83.425%, and 90.324%, respectively. The RBFN-BMO model, on the other hand, has performed best over a range of data sizes. Similarly, the f-score value of RBFN-BMO under 6000 data is 94.627%, while for GRU, LSTM, RNN, DNN, and ANN models, it is 89.928%, 87.435%, 82.213%, 85.324%, and 91.928%, respectively.

Fig. 6. F-Score analysis for the RBFN-BMO method using existing systems.

TABLE III. F-SCORE ANALYSIS USING TRADITIONAL SYSTEMS USING THE RBFN-BMO METHOD

Data from dataset	GRU	LSTM	RNN	DNN	ANN	RBFN- BMO
1000	87.928	85.435	81.526	83.425	90.324	92.536
2000	87.526	86.928	81.029	83.928	90.928	93.727
3000	89.432	86.425	82.536	83.526	91.243	92.927
4000	88.214	87.928	82.938	84.525	91.627	93.826
5000	88.921	86.029	81.937	84.928	92.173	94.324
6000	89.928	87.435	82.213	85.324	91.928	94.627

4) Accuracy analysis: Fig. 7 and Table IV shows the accuracy of the RBFN-BMO approach as compared to that of other currently utilized approaches. The graph shows how deep learning improves performance with accuracy. The RBFN-BMO model, for example, has a 1000-data accuracy of 97.627%, whereas the GRU, LSTM, RNN, DNN, and ANN models have accuracy of 89.536%, 90.917%, 92.524%, 94.526%, and 96.425%, respectively. The RBFN-BMO model, on the other hand, fared well with varying data sizes. Similarly, the accuracy of the RBFN-BMO under 6000 data is 99.546%, while the accuracy of the respective GRU, LSTM, RNN, DNN, and ANN models is 90.716%, 92.817%, 93.926%, 95.736%, and 97.125%.

Fig. 7. Accuracy analysis for RBFN-BMO method with existing systems.

TABLE IV. ANALYSIS OF RBFN-BMO METHOD ACCURACY WITH EXISTING SYSTEMS

Data from dataset	GRU	LSTM	RNN	DNN	ANN	RBFN- BMO
1000	89.536	90.917	92.524	94.526	96.425	97.627
2000	89.029	91.783	92.314	94.213	96.837	97.983
3000	90.314	91.324	93.627	95.063	95.983	98.546
4000	89.213	92.039	94.728	95.213	96.322	98.902
5000	90.516	91.992	93.039	95.536	96.714	98.724
6000	90.716	92.817	93.926	95.736	97.125	99.546

5) RMSE analysis: Fig. 8 and Table V display an RMSE similarity between the RBFN-BMO strategy and other earlier techniques. The graph shows that the deep learning strategy has produced better results with a lower RMSE value. For instance, the RMSE value for the RBFN-BMO is 25.637% with 100 data, while the RMSE values for the GRU, LSTM, RNN, DNN, and ANN models are slightly higher at 30.526%, 26.928%, 33.626%, 36.536%, and 43.737%, respectively. The RBFN-BMO model, on the other hand, has demonstrated that it performs best with diverse data sizes while keeping a low RMSE. The RMSE value for the RBFN-BMO model under 6000 data is 26.324%, whereas it is 32.933%, 29.322%, 35.342%, 42.627%, and 47.326% for the GRU, LSTM, RNN, DNN, and ANN models, respectively.

Fig. 8. RMSE analysis of the RBFN-BMO method with existing systems.

TABLE V. RMSE ANALYSIS OF THE RBFN-BMO METHOD USING EXISTING SYSTEMS

Data from dataset	GRU	LSTM	RNN	DNN	ANN	RBFN- BMO
1000	30.526	26.928	33.626	36.536	43.737	25.637
2000	30.425	27.029	33.928	36.928	44.863	26.435
3000	31.252	28.425	34.526	40.425	43.324	25.926
4000	31.627	27.425	35.827	41.627	44.432	25.029
5000	32.737	28.926	36.324	41.911	46.732	25.627
6000	32.933	29.322	35.342	42.627	47.326	26.324

6) Execution time analysis: The execution time analysis of the RBFN-BMO technique using existing methods is described in Table VI and Fig. 9. The information clearly shows that the RBFN-BMO method has outperformed the other techniques in every way. The RBFN-BMO process, for example, took only 2.738ms to execute 1000 data, while GRU, LSTM, RNN, DNN, and ANN took 12.837ms, 10.637ms, 8.526ms, 6.938ms, and 4.837ms, respectively. Similarly, the RBFN-BMO method takes 3.624ms to execute 6000 data, whereas the other existing techniques such as GRU, LSTM, RNN, DNN, and ANN have taken 15.526ms, 11.638ms, 9.553ms, 7.425ms, and 5.029ms, respectively.

TABLE VI. ANALYSIS OF RBFN-BMO METHOD EXECUTION TIME WITH EXISTING SYSTEMS

Data from dataset	GRU	LSTM	RNN	DNN	ANN	RBFN- BMO
1000	12.837	10.637	8.526	6.938	4.837	2.738
2000	12.536	10.827	8.928	6.324	4.213	2.324
3000	13.627	10.324	8.435	6.022	4.039	3.029
4000	13.829	11.526	9.073	7.425	4.637	3.927
5000	13.425	11.627	9.224	7.829	5.324	3.526
6000	15.526	11.638	9.553	7.425	5.029	3.624

Fig. 9. Execution time analysis for the RBFN-BMO method with existing systems.

#### V. CONCLUSION

Facial expression analysis is one tool used to develop emotional intelligence, which is becoming increasingly important in many fields, including business and education. Numerous factors, such as visual contexts, point-of-view shifts, intra- and inter-class differences and more, impede the development of a reliable emotion recognition system. This paper suggests a convolutional neural network as a potential solution to the emotion recognition problem. To examine facial expressions in images, the proposed RBFN was made face-sensitive. The proposed RBFN-BMO can recognize people in high-resolution photos, evaluate facial expressions using facial features, and predict emotional states. The

recognition during testing validates the proposed efficacy. Regarding output quality, the established RBFN-BMO classification algorithms perform better than those currently used. The RBFN-BMO uses every dataset used for the analysis and achieves the highest level of accuracy possible, which is 99.54%. To evaluate the effectiveness of the proposed classifier, the performance of proposed RBFN-BMO is compared with the existing Gated Recurrent Unit (GRU), Long Short-Term Memory (LSTM), Recurrent Neural Network (RNN), Deep Neural Network (CNN), Artificial Neural Network (ANN). As a result, the RBFN-BMO can produce better results for celebs datasets. Furthermore, it can be inferred that the Blue Monkey Optimization (BMO) metaheuristic algorithm selects the input data features that are both the most informative and the most pertinent. It helps to achieve better categorization and reduces the error brought on by the Root Mean Square. The future of our research depends on adding new features, classifying facial emotions into their ten subcategories, and researching automatic facial emotion recognition.

Bidirectional recommendation Coverage mechanism Decoder attention Mixed learning objective Named entity recognition

#### **ABSTRACT**

For over a decade, online job portals have been providing their services to both job seekers and employers in search of hiring opportunities. Because of the high demand for recruitment, it is insufficient to use conventional hiring methods to find a suitable candidate to fill the position. Validating resumes online is challenging due to the potential for manual errors, making the process inherently risky. The bidirectional method comprises named entity recognition (NER) for extracting the required resumes for recruiters. Cosine similarity shows the match percentage of resumes for the job requirements and vice versa. In an attempt to tackle an issue of unregistered words, a solution called decoder attention with pointer network (DA-PN) has been introduced. This method incorporates the use of coverage mechanism to prevent word repetition through generated text summary. DA-PN+Cover method with mixed learning objective (MLO) (DA-PN+Cover+MLO) is utilized for protecting grow of increasing faults in generated text summary. Performance of proposed method is estimated using evaluation indicator recall oriented understudy for gisting evaluation (ROUGE) and attains an average of 27.47 which is comparatively higher than existing methods.

#### NOMENCLATURE

Symbol	Notation
$W_{\alpha} \& V_{\alpha}$	The weight elements
$s_t$	invisible-layer condition of decoder at moment-interval t
x	Euclidean norm of vector x
y	Euclidean norm of vector y
$p_{gen}$	Possibility of switch
$P_{vocab}(w)$	Word distribution in last output vocabulary
$W_h$	Weight matrix at hidden state
$egin{array}{c} c_t^e \ c_t^d \end{array}$	Coverage vector at encoder
$c_t^d$	Coverage vector at decoder
$h_{j}$	Hidden state
$bt_{atten}$	Bias of training iteration
$P(w_t^*)$	Final prediction vocabulary
$cover\_loss_t$	Function of coverage loss
β	Coverage mechanism weight in total loss

Journal homepage: http://beei.org

Symbol	Notation
$y^s$	Sampling sequences
$y^*$	Baseline
$W_{y}$	Mass matrix of past work $y_{i-1}$
$W_e$	Mass matrix of encoder invisible condition
$u_t^e$	Context vector of final encoder
$u_t^d$	Context vector of final decoder
$W_d$	Weight matrix of decoder hidden condition
$bt_{ptr}$	Bias term
x	Input vector
$y^{\wedge}$	Baseline output
r(y)	Reward function of output progression y
$L_{rl}$	Equivalent to conditional prospect of increased sample order $y_s$

#### 1. INTRODUCTION

Over the last decade, online enrollment platforms like Naukri.com, Boss, Indeed Hiring, Glassdoor, Monster, LinkedIn, and Zhaopin have emerged to revolutionize the job recruitment process. These platforms have streamlined the hiring process and significantly transformed the job market landscape [1]. Many researchers view a particular domain for job suggestions and introduce a method for online platforms utilizing detailed relational learning [2]. This area effortlessly scales to millions of elements as well as candidate resumes and work positions including more information in the form of candidate interactions [3]. Due to the fast variations of technology development, new work opportunities are always being created in industries with an advanced list of skill sets to face these wide changes [4]. Individuals who are looking to change their careers or looking for better opportunities meet the trouble of skill discrepancy because of those continuous changes. This paper presents an innovative approach to job suggestions that caters to the needs of both job seekers and recruiters [5]. The proposed system aims to benefit both parties by ensuring optimal job matches. Recruiters can easily identify the most suitable candidates for each job position, while job seekers also receive relevant job opportunities that align with their CVs [6]. To achieve this, the process begins with the extraction of job offers from sa.indeed.com. Subsequently, the extracted job offers undergo preprocessing, training, and matching [7]. The outcome is a streamlined and efficient job-matching process where both recruiters and job seekers actively participate in recommending and supporting candidates for the right job offers [8]. This paper aims to briefly emphasize the benefits of creating job opportunities for people with disabilities. Despite facing disproportionate levels of uncomfortable job situations, unemployment, and underemployment compared to individuals without disabilities [9], it is essential to focus on generating employment prospects for this marginalized group. The main stage is for companies to employ a change in the aspect where the responsibilities of job involvement are not mainly focused on people with autism but on variations that workers can make to permit them to succeed in the organizational context. Most of the rapid research on recruiting has aimed heavily authenticity and validity of the company's selection activities and methods [10]. Enrolling is important and concerned with finding a suitable candidate pool, attracting candidates, and acquiring them to register for open postings [11]. Despite the focus on employer responses to hiring, it is equally, if not more, important to consider the job seeker's reactions to the recruitment process [12]. Every day people employ industry-scale suggestion systems to suggest 1000s of candidates to the clients and the other way around opening to candidates. The job recommendation system is enriched on a heterogeneous collection of input information, resumes of candidates, vacancy texts, and structured information [13].

Traditional HR analytics systems importantly rely on unidirectional suggestions, where recruiters give suggestions to employees. Still, this method fails to capture the full scope of the employer-employee relationship [14]. Further, there is a need for a more comprehensive and bidirectional recommendation system that can support text summarization methods to process key data through high volumes of HR-related text information [15]. Shao *et al.* [16] implemented a wide investigation approach of external and internal operations for designing multivariate attributes in InEXIT. Initially encode the key and value of every attribute along with its source into a similar linguistic space. This paper presented a model for the internal process between multivariate attributes inside the job post and resume, further the external process between the resume and job post. In the end, the matching layer is introduced to find a matching degree. The reduction in economic costs and manpower, along with the support for InEXIT, contributes to the enhancement of online recruitment. Nonetheless, there are limitations in the implementation method, as certain aspects of InEXIT might possess reliable backups, such as pre-trained language models and fusion strategies. Ong and Lim [17] introduced an approach to information-driven work recommendation for professional vision. The skill recommendation recognizes and gathers the skill set essential for work based on work requirements released by companies recruiting for these positions. Further, the information gathering and processing

abilities, and skill recognition use word implant techniques for job title presentation, next to a feed-forward neural network for job skill recommendation related to work title representation. The method combines job title representation utilizing bidirectional encoder representations from transformers (BERT), with job skill suggestions utilizing a direct feed-forward neural network efficiently regarding accuracy and F1-score. The limitation is that it may not capture important work trends or find future skill needs. Yang et al. [18] presented job suggestions for system-based merging content and filtering approach of cost-sensitive informative relational learning. Statistical relational learning (SRL) can represent the possible dependencies between the attributes of similar objects to give an honest way to merge 2 approaches. The paper introduced a way to accept the state-of-the-art SRL methods to hybrid suggestion systems and importantly no investigation applied to current big-data-scale systems. This method can permit modulating the exchange between the recall and precision of the system in a respectable way. Obtaining high-quality data like brief job descriptions or exact candidate profiles was difficult or costly it was the drawback of the method. Yildirim et al. [19] introduced a machine for reciprocal suggestion based on multiple-objective deep factorization for online enrolment. This paper focuses on solving the problem of a shortage of information containing corresponding choices in a network. Consolidated the multiple-objective learning method into multiple stateof-the-art approaches, whose victory has been determined by the same prediction issues and obtained hopeful outcomes. The method was better than traditional methods and maximized the speed of the process by 2 times. The drawback was data sparsity for particular minimum-famous users, the machine may struggle to create exact authentic recommendations.

Alsaif et al. [20] presented a system based on NLP bi-directional recommendation for suggesting jobs to job seekers and resumes to recruiters. This article introduces a beneficial system for both recruiters and job seekers. In this, recruiters can select the best employees for each work position for their job postings likewise employers also get better jobs that are similar to their CV. The process is initially, through sa.indeed.com the job offers are extracted, and after the extraction of job offers the pre-processing, training and matching are done. Comparing the task while serving recruiters and job seekers help their job by suggesting and supporting candidates to get the right job offers. The drawback was the lack of personalization, the NLP-related suggestion model was usually based on common patterns, which could result in generic recommendations that do not align with particular preferences. Jain et al. [21] implemented an ATS for the Hindi language by utilizing real coded genetic algorithm (RCGA). The rigorous experimentation on various feature groups was evaluated for differentiating features such as named sentence similarity and named entity features were merged with others for computing the evaluation metrics. The RCGA method chooses the better chromosome that includes real-valued weights of produced features which evaluates the distance among sentence values. The limitation of the implemented method was cost efficiency and the acceptance of ATS for HR solutions. Sethi et al. [22] introduced a transformer method for generating a better summary average. The method combines with Bart and T5 methods to know which method produces the best summary average. After passing 1000 data of articles, identify that the Bart method performed well than the T5 method in each aspect. The method was much more efficient and it takes only related content and leaves the unwanted and irrelevant content. The method utilized only the limited dataset and cost efficiency. There are some drawbacks of bidirectional recommendation for HR analytics by text summarization in the above-mentioned methods such as data sparsity, specifically for minimum famous users, which may affect the accuracy, lack of personalization in NLP-related recommendation models, lack of research used to real big-data-scale systems, and potential failure to capture necessary work trends or discover future skill needs. The main contributions of this work are given as:

- a. A decoder attention with pointer network (DA-PN) model is proposed on attention mechanism at encoder and decoder ends through combining attention mechanism in present period stage and implemented PN at decoder to resolve issue of unregistered words.
- b. The proposed DA-PN+Cover method depends on coverage mechanism combining cover vector. The process involves measuring attention mechanism at encoder and decoder in prior period stage. This measurement is then used to update a loss function that helps in avoiding word repetition when generating text summary.
- c. A DA-PN+Cover+MLO method is proposed through combining MLO and implementing a self-crucial gradient technique. It takes global reward and evaluation indicator in phase of iteration of method to protect grow of increasing faults in generated text summaries.

The rest part of research is described as follows: section 2 gives informations about proposed method. Section 3 describes process of DA-PN+Cover+MLO method. Section 4 describes the results and discussion, and section 5 represents the conclusion of the paper.

#### 2. PROPOSED METHOD

The bidirectional system is presented in the proposed methodology and it gives the best possible recommendations to both the employees and recruiters. The methodology involves cleaning data, and named

entity recognition (NER) for extracting the necessary resumes. The score is assigned to resumes by calculating the similarity between resumes and job descriptions; which helps to match resumes to that of the job description. NLP techniques are utilized for pre-processing the data and cosine similarity is utilized to measure the similarity between the resume and the job description. For the summarization of resumes and text, DA-PN+Cover+MLO method is proposed. Figure 1 represents the proposed model of this research.

Figure 1. Workflow of bidirectional system

### 2.1. Data collection and integration

The resume dataset is taken for this research work, which is gathered from kaggle and the dataset includes 1,735 resumes [23]. Every profile includes fields like resume tile, location, role description, technical skills, education, certification, and additional data. There are four JDs acquired from LinkedIn on the topic of machine learning data scientist, full stack, java, and python developer. In JDs, the profile includes the job title, company name, city, description, education, and preference skills. Table 1 represents dataset description.

Table 1. Represents the dataset description

			represents the autabet act		
Job title	Company name	City	Description	Education	Preference skills
Data	Wipro	Bangalore,	Expert in problem-solving and	Bachelor's degree related	Machine/deep
scientist		Karnataka	coding skills	to computer science	learning
Full stack	Infosys	Chennai,	Well-expert in front-end and	B.E	HTML, CSS
developer		Tamilnadu	back-end development		
Java	Cognizant	Coimbatore,	Expert in software	B.E	Java
developer	_	Tamilnadu	development life cycle process		
Python	TCS	Bangalore,	Expert in writing and testing	Degree	Python
developer		Karnataka	codes	_	-

#### 2.2. Pre-processing

Unstructured data is converted to structured data by using several pre-processing steps. Pre-processing is the preliminary stage for preparing data. The job description will be compared against a pool of resumes that are priorly loaded into the system, similarly, the candidate's resume will be compared against different job descriptions which are priorly loaded into the system. NLP tools are used to extract the required information by cleaning the data, the given resume/job description may contain different symbols and integers, which are not needed for the program. So, it removes the unwanted characters from the resume like numbers, stop words, and punctuations, and makes the resume/job description ready for the next process by converting all strings to lowercase.

#### 2.3. Named entity recognition

Many times, resumes are populated with excess information, often irrelevant to what the recruiter is looking for in it. Therefore, it is tedious and hectic to evaluate resumes in bulk. Through the NER model, resumes can be evaluated at a glance, thereby reducing the effort required in shortlisting candidates among a pile of resumes. NER automatically generates summaries of resumes by extracting only primary entities like name, skills, and educational background.

## 2.4. Generating vectors

In NLP models work on numbers rather than textual data, so this textual data needs to be vectorized. Moreover, the word count of the words in each document is needed to compute the cosine similarity. The collection of text documents is converted to a matrix of token counts called bag-of-words (BoW). The output of this comes as a sparse matrix, in which each document represents a row in the matrix and each special content represents a vertical portion of the matrix. The cell value represents the count of words in the particular document. To understand the importance of words in the corpus, term frequency-inverse document frequency (TF-IDF) is used. TF-IDF is based on the logic that words that are too common in a corpus and rare and are not statistically significant in identifying a pattern. The logarithmic factor in the TF-IDF equation serves the mathematical purpose of assigning low TF-IDF values to words that are either overly common or excessively rare in the corpus. TF-IDF values a word by multiplying the word's TF equation with IDF equation.

$$TF = \frac{\text{No.of times the term appears in a document}}{\text{Total no.of terms in the document}}$$
(1)

$$IDF = log\left(\frac{No.of\ documents\ in\ the\ corpus}{No.of\ documents\ in\ the\ corpus\ that\ contains\ the\ term}\right) \tag{2}$$

$$TF - IDF = TF * IDF \tag{3}$$

The highest score of TF-IDF signifies the huge significance of words in the corpus while lower scores show lower significance. The words that have low significance for analysis can be removed, hence making the model building less complex by decreasing the input dimensions. Accurate semantic presentation methods are important in the applications of text mining. However competitive outcomes for automatic text classification may be attained with a traditional bag of words, such as the presentation method can't give satisfactory classification results in hard settings where higher text representations are needed. Both count vectorizer and TF-IDF fail to provide linguistic similarity between words and hence are only used for customizing stop word lists. To train a method on the default linguistic relationship of the words, Doc2Vec is used. Because Doc2Vec can read documents as a whole rather than working on every single word. It has a feature to provide n-Dimensional vectors. This transformation has two significant properties such as dimensionality reduction for effective representation and contextual similarity for expressive representations.

#### 2.5. Cosine similarity

Measuring the similarity or distance first requires understanding the objects of study as samples and the chunks of those objects are measured as features. For the proposed analysis, the resume of the candidate and the job description are two data samples. Two features can be represented as two dimensions and through the Cartesian coordinate system, samples can be visualized. Naturally, samples can also be visualized in three dimensions if there are three features. However, the calculation of the distance will remain the same no matter how many features or dimensions are there.

The technique used to measure distances depends on a particular working environment. For instance, in some applications, the euclidean distance can be ideal and useful for computing distances. Other areas may require a more sophisticated approach for calculating distances between observations or points like the cosine distance. Cosine analogy is a metric utilized to calculate analogy in between documents and give a

rank to the documents; it is independent of the size of the documents. Cosine similarity is more about the orientation of the two points in space rather than considering the exact distance from one another. This means that cosine distance is less affected by magnitude or how large the given numbers are [6]. Assume x & y is 2 sample vectors for comparison. The relation for calculating the analogy of cosine is given as equation.

Likewise, ||y|| represents the euclidean norm of the vector y. Cosine calculates the degree in-between vectors x & y; the value of 0 indicates two vectors are 90 degrees apart and there is no match. The value closer to 1 indicates two vectors are separated by a small angle and there is a match between two vectors.

$$os_{sin(x,y)} = \frac{x,y}{\|x\| \cdot \|y\|} \tag{4}$$

where ||x|| represents euclidean norm of the vector  $x = (x_1, x_2, x_3, \dots, x_p)$ , defined as (5):

$$\sqrt{x_1^2 + x_2^2 + x_3^2 + \dots + x_p^2} \tag{5}$$

#### 3. DA-PN+COVER+MLO BASED SUMMARIZATION

To manage out-of-vocabulary (OOV) words, PN combining DA that merge decoder context vector with context vector produced from actual text, for regulating chosen actual text and addition lexicon. To address word repetition, a multiple-attention coverage mechanism is employed, which continuously utilizes coverage vectors from both encoder and decoder for influencing attention weight. The attention data of decoder is given as an input-to-input mapping layer, so model can give attention to prior data and minimize the recurrence of words. For readability of generated text summaries, mixed learning objective (MLO) function to positioning global reward, particular discrete gradient can increased on scoring which improves readability of generated text summary.

## 3.1. Decoder attention-based pointer network method

For resolving the issue of unregistered words, the DA-PN model is developed by using DA depending the PN. In every stage, the DA-PN model determines to copy an unregistered word through actual text or pin it to other word which is already in actual vocabulary. Former action is controlled by softmax which has probability normalization, although latter is related to words determined from input information by utilizing DA mechanism. If both merged, unregistered words are determined in actual text but are not added to actual vocabulary.

DA-PN method contains two input layers for copying words through actual text or actual vocabulary. Every dimension shows one word.  $p_{gen}$  a switching mechanism utilized for producing a possibility for managing the input. The attention of the decoder compensates for the weakening data caused by huge sequences, which enables method to position main data much accurate. The distribution of attention regarding to possibility distribution of every word in actual text can be calculated as (6):

$$\alpha^{t} = softmax(V_{\alpha} tan h(W_{\alpha} s_{t}^{T}))$$
(6)

Where  $W_{\alpha}$  and  $V_{\alpha}$  represents parameters of weight and  $s_t$  represents decoder's hidden layer state at time stage t. Sum of weighted attention distribution acquired through (6) and decoder stage before present time stage represents context vector of the final decoder as (7). The possibility of the switch  $p_{gen}$  could depend through decoder/encoder context vector with real invisible-layer condition, as (8)

$$u_t^d = \sum_{i=1}^{t-1} \alpha_i^t \, s_i \tag{7}$$

$$p_{den} = \sigma(W_v y_{i-1} + W_e u_t^e + W_d u_t^d + b t_{ntr})$$
(8)

Where  $W_y$  represents a matrix of weight of prior word  $y_{j-1}$ ,  $W_e$  and  $W_d$  represents a matrix of weight of encoder and decoder hidden state at present stage respectively,  $u_t^e$  represents the context vector of last encoder,  $u_t^d$  represents context vector of final decoder, and  $bt_{ptr}$  represents bias. Bias and weight matrix in (8) are the parameters which can added during iteration of model training. The linear weight adds those parameters that are processed through sigmoid function and marked among 0 and 1 to soft switch for managing input layer source, based on data of 2 stages namely source text and vocabulary. In (9)  $s_t$ 

П

represents a sequence of the present state, V represents weight matrix, bt represents bias for iteration in training and w represents the word that is predicted. The distribution of vocabulary of the present time step is described as (9) and the possibility of the last prediction for word w is represented as (10):

$$P_{vocab} = Softmax(V'(V[s_t, w] + bt) + bt')$$
(9)

$$P_{final}(w) = p_{gen}P_{vocab}(w) + (1 - p_{gen})\sum_{i:w_i = w} a_i$$

$$\tag{10}$$

Where  $p_{gen}$  represents the possibility of managing input value,  $P_{vocab}(w)$  represents the word distribution in the last outcome vocabulary and  $\sum_{i:w_i=w} a_i$  shows the context vector of the encoder. The proposed DA-PN method easily identifies matchable words that are copied from source text. For this purpose, related weight is required to be given for every word. Words can be chosen from vocabulary that is developed based on copying words unregistered in actual vocabulary from actual text. Proposed DA-PN utilizes a limited vocabulary, resulting in savings in storage, computation power, and faster model training. Continuous attention is given for encoder and decoder, producing text summaries much accurate which suits related actual text. Figure 2 represents the overall process of DA based PN method.

Figure 2. Pictorial representation of developed DA-PN method

#### 3.2. DA-PN+Cover method

The proposed DA-PN+Cover method combines DA-PN method with a mechanism of coverage combining multiple attention. Two coverage vectors are working, by utilizing the distribution of attention of encoder and decoder in every prior time stage. Two vectors for coverage are described as follows:  $c_t^d$  represents target sequence attention (words attention produced in the decoding process)  $c_t^e$  represents the words' attention in actual text (words' attention produced in the encoding process). The coverage degree for a particular word is addition of whole attentions acquired at a specific moment. In initial phase, there is no coverage acquired, so the two coverage vectors are taken as 0.

The inclusion of attention mechanism in decoder facilitates a more effective focus on key features within the generated text summary. This is particularly important to address the problem of word recurrence. To overcome this challenge and ensure attention is given to the entire sequence, a global vector is employed

for maintenance purposes. The decoder's hidden layer utilizes a past time context vector for measuring present input, so the data acquired in the past can utilized during calculation which strengthens the previous and present time relationship. At present time, to utilize source text data in previous and target generated text summary, two coverage vectors in attention mechanism are combined as per (11):

$$e_i^t = v^T tanh(W_h h_i + W_s s_t + W_e c_t^e + W_d c_t^d) + bt_{atten}$$

$$\tag{11}$$

Where  $v^T$  and  $W_h$  represents a matrix of weight of repetitive nonlinear activation function and hidden state utilized to training respectively,  $h_j$  represents a hidden state,  $W_s$  represents a matrix of weight of repetitive present state sequence utilized to training,  $s_t$  represents present state sequence,  $W_e$  and  $W_d$  describes weight matrix of encoder and decoder hidden state in present stage respectively,  $c_t^e$  and  $c_t^d$  describes coverage vector of encoder and decoder respectively and  $bt_{atten}$  represents a bias of training iteration. The outcome of the present time stage is afflicted by past actual text and produced text summary, to ignore giving attention to similar data and also ignoring recurrence. Final loss function has the actual and coverage loss, the mathematical representation is described in (12):

$$loss_t = -log(p(w_t^*)) + \beta cover_{loss_t}$$
(12)

Where  $p(w_t^*)$  represents the final predicted vocabulary of the possibility distribution,  $cover\_loss_t$  represents the function of coverage loss and  $\beta$  represents the coverage mechanism's weight in whole loss. By utilizing attention dispensation at the encoder and decoder ends and also utilizing additional loss items, the method efficiently suppresses probable repeated items and maximizes automatic production of text summaries. Figure 3 represents the overall process of DA-PN+Cover method with two coverage vectors.

Figure 3. Pictorial representation of proposed DA-PN + Cover

#### 3.3. DA-PN+Cover+MLO method

To protect grow of accumulative bugs in produced text summaries, proposed DA-PN+Cover method includes a MLO after ending the distribution of collective mistakes in created word summaries. The model

that resulted is known as DA-PN+Cover+MLO. ROUGE is an evaluation indicator utilized for method iteration and also with global reward.

However, ROUGE cannot be utilized directly for calculating gradients because it is not differentiable in and of itself. A greedy search is evaluated at every time stage from a probability distribution  $y^s$  of  $p(y_i^s|y_1^s,...y_i^s,x)$  in every decoder's period stage and baseline outcome  $y^h$  is acquired through increasing outcome probability distribution. Determining r(y) to reward function for outcome sequence y and then this is compared with actual sequence  $y^*$ , a mathematical formula is described as (13):

$$L_{rl} = (r(y^{\wedge}) - r(y^{s})) \sum_{i=1}^{n} log \left( p(y_{i}^{s} | y_{1}^{s}, ..., y_{i-1}^{s}, x) \right)$$
(13)

Here, x represents input vector,  $y^{\wedge}$  represents output of baseline acquired through increasing outcome probability distribution and r(y) represents reward function of outcome sequence y. The decreased  $L_{rl}$  is equal to the condition of increased sampling sequence  $y^s$ . Whether  $y^s$  has huge return than baseline  $y^*$ , expected much return by method. After development, global reward is utilized and represented as Figure 4.

Figure 4. Training process of DA-PN+Cover+MLO

The proposed DA-PN method which is attention in both encoder and decoder ends by combining attention distribution in the present time stage. The implemented PN at decoder resolves issue of unregistered words. The proposed DA-PN+Cover method is depended coverage mechanism combining cover vector. It measured from attention mechanism at encoder and decoder at prior time stage by updating a loss function that ignores the word repetition in generated text summaries. The proposed DA-PN+Cover+MLO method through combining MLO by implementing self-crucial gradient technique. It takes global reward and evaluation indicator in phase of iteration of method which protects grow of increasing faults in generated text summary.

## 4. RESULTS AND DISCUSSION

This section provides a results and discussion of the proposed method. The section gives detailed explanation of the experimental setup, quantitative and qualitative analysis, comparative analysis, discussion, and conclusion of the proposed methodology. The section 4.1 provides the experimental setup utilized for research, section 4.2 provides qualitative and quantitative analysis of proposed method, section 4.3 provides comparison between proposed and existing methods and section 4.4 gives the overall discussion.

#### 4.1. Experimental setup

In this research, the proposed model is simulated by utilizing MATLAB (2018a) environment with system requirements; RAM: 16 GB, processor: intel core i7, and operating system: windows 10 (64 bit). The performance of the proposed method is estimated by utilizing the evaluation indicator ROUGE which is a software package that evaluates the automatic summarization process. Figures 5 and 6 shows the top matching resumes for recruiter and top matching jobs for candidate with respective percentage.

Figure 5. Represents top matching resumes for recruiter

Figure 6. Represents top matching jobs for candidate

## 4.2. Qualitative and quantitative analysis

The calculated values are stored in a dictionary with the job/resume name and values as its value. Later, it is sorted in descending order and suggests the job/resume that has maximum matching or similarity values. For a recruiter, a top-matching resume summary will be displayed (Figure 5). For a candidate, the top matching jobs will be displayed with the respective matching percentage (Figure 6). For a candidate, additional skills to be enhanced are recommended by comparing with the dictionary of skills by area setup.

Table 2 and Figure 7 represent the performance of the proposed method in the LCSTS dataset [24]. The evaluation indicator is utilized for the evaluation. The two baseline methods are taken for evaluation and the two DA-PN, DA-PN+Cover methods are utilized for the evaluation of the performance of the proposed method. The proposed DA-PN+Cover+MLO method attained an average of 26.73 which is better than baseline methods that attain 21.53. The evaluation indicator ROUGE-1, ROUGE-2, ROUGE-L, and an average of the ROUGE are taken for the evaluation of the performance of the proposed method. From Table 2, the proposed method shows higher performance than the other methods.

Table 2. Performance of proposed method in LCSTS data

Models	ROUGE-1	ROUGE-2	ROUGE-L	ROUGE-AVG
'Bi-LSTM+attention' (baseline)	26.47	9.09	29.03	21.53
'Seq2Seq+attention' (baseline)	28.14	10.01	30.89	23.01
'DA-PN'	32.16	13.49	31.28	25.64
'DA-PN+Cover'	32.43	14.02	31.58	26.01
'DA-PN+Cover+MLO'	32.92	15.46	31.83	26.73

Figure 7. Performance of proposed method in LCSTS dataset

Table 3 and Figure 8 represent the performance of the proposed method in the TT News Corpus dataset [25]. The evaluation indicator is utilized for the evaluation. The two baseline methods are taken for evaluation and the two DA-PN, DA-PN + cover methods are utilized for the evaluation. The proposed DA-PN+Cover+MLO attained average of 27.09 which is better than baseline methods that attain 22.53. The evaluation indicators ROUGE-1, ROUGE-2, ROUGE-L and an average of the ROUGE are taken for the evaluation of the performance of the proposed method. From Table 3, the proposed method gives higher performance than other methods.

Table 3 Perform	mance of propos	ed method in T	Tnews corpus dataset

Models	ROUGE-1	ROUGE-2	ROUGE-L	ROUGE-AVG
'Bi-LSTM+attention' (baseline)	26.48	9.23	28.43	21.38
'Seq2Seq+attention' (baseline)	28.27	9.31	30.03	22.53
'DA-PN'	32.45	13.85	30.95	25.75
'DA-PN+Cover'	32.79	14.03	31.63	26.15
'DA-PN+Cover+MLO'	33.85	14.69	32.74	27.09

Figure 8. Performance of proposed method in TT news corpus dataset

Table 4 and Figure 9 represents the performance of the proposed method in the kaggle dataset. The two baseline methods are taken for evaluation and the two DA-PN, DA-PN+Cover methods are utilized for the evaluation. The proposed DA-PN+Cover+MLO attained an average of 27.47 which is better than baseline methods that attain 21.01. The evaluation indicators ROUGE-1, ROUGE-2, ROUGE-L, and average of the ROUGE are taken for the evaluation. From Table 4, the proposed method gives higher performance than other methods.

Table 4. Performance of the proposed method in kaggle dataset

Table 4. I efformance of the proposed method in Raggle dataset							
Models	ROUGE-1	ROUGE-2	ROUGE-L	ROUGE - AVG			
'Bi-LSTM+attention' (baseline)	26.17	9.43	30.44	22.01			
'Seq2Seq+attention' (baseline)	28.57	10.43	31.36	23.45			
'DA-PN'	33.10	13.96	31.86	26.30			
'DA-PN+Cover'	33.73	14.37	33.73	27.27			
'DA-PN+Cover+MLO'	34.45	14.69	33.29	27.47			

Figure 9. Performance of proposed method in kaggle dataset

From the results mentioned above, it is clear that proposed DA-PN+Cover+MLO method outperforms existing methods and protects against grow of increasing faultss in generated text summary.

#### 4.3. Comparative analysis

The comparative analysis of the proposed methodology is described in Table 5. The proposed method is compared with existing methods like ATS [21] and TF [26] which contains the kaggle dataset. The evaluation indicator ROUGE 1 and 2 is utilized for the comparison, the proposed method shows 1.83 in ROUGE–1 and 0.74 in ROUGE–2 which is comparatively higher than existing methods.

Table 5. Represents the comparative analysis

1 4010 5.110	resents the e	omparative	anarysis
Methods	Dataset	ROUGE-1	ROUGE-2
Jain et al. [21]	Kaggle [23]	0.79	0.66
Sethi et al. [22]		1.5	-
Proposed method		1.83	0.74

#### 4.4. Discussion

The proposed bidirectional system is to present the best possible recommendations to both the employees and employers by utilizing the existing unstructured data. Instead of searching the complete dataset to find the potential candidates, the proposed method reduces the duration difficulty of finding the applicant with the highest score. The DA-PN method is utilized to address the issue of unrecorded words and the encoder and decoder both give equal attention, leading to high exact text summaries. DA-PN+Cover method provides positive attentional effects resulting in the current time step choosing more precise words to use in word reviews by eliminating repeated terms. DA-PN+Cover model can be modified to include a MLO after the end of the distribution of collective mistakes in created word summaries.

#### 5. CONCLUSION

Due to the growing demand for online recruitment, it is insufficient to use conventional hiring methods. It is not flexible to validate resumes online and is vulnerable to manual errors. The bidirectional method comprises NER for extracting the needed resumes. Cosine similarity shows the match percentage of the job requirements with the resume and vice versa. The DA-PN that has been put out to address the issue of unregistered words. DA-PN+Cover method can be modified to include MLO (DA-PN+Cover+MLO) is utilized for protecting grow of increasing faults in generated text summary. From performance analysis, it is concluded that proposed method gives better performance than other methods. Future work concentrates more on abstractive summarization techniques to enhance the quality of hire.

### **ABSTRACT**

The recognition of human faces poses a complex challenge within the domains of computer vision and artificial intelligence. Emotions play a pivotal role in human interaction, serving as a primary means of communication. This manuscript aims to develop a robust recommendation system capable of identifying individual faces from rasterized images, encompassing features such as eyes, nose, cheeks, lips, forehead, and chin. Human faces exhibit a wide array of emotions, with some emotions, including anger, sadness, happiness, surprise, fear, disgust, and neutrality, being universally recognizable. To achieve this objective, deep learning techniques are leveraged to detect objects containing human faces. Every human face exhibits common characteristics known as Haar features, which are employed to extract feature values from images containing multiple elements. The process is executed through three distinct stages, starting with the initial image and involving calculations. Real-time images from popular social media platforms like Facebook are employed as the dataset for this endeavor. The utilization of deep learning techniques offers superior results, owing to their computational demands and intricate design when compared to classical computer vision methods using OpenCV. The implementation of deep learning is carried out using PyTorch, further enhancing the precision and efficiency of face recognition.

#### 1. INTRODUCTION

The major idea is to propose a method that recognizes and detects human faces in given pictures or videos. Facial recognition is the ability to automatically detect a face. It has the potential to identify different parts of the embodiment depending on the presence of facial characteristics. It's always easy for a person to find a face in a collection of images and differentiate images correctly. However, a computer should be properly trained so that when a real-time dataset is provided, the system should be able to identify the face of a person as well as additional characteristics such as eyes, nose, mouth, cheeks, lips, forehead, and chin.

The key concept here is to build a system that can distinguish faces from non-facial elements [1]. Deep learning adapts to new images, assuming they are similar to the data it was trained on. Computer vision is an area of artificial intelligence that enables computers and systems to derive meaningful information from

binary images, videos, and other visual inputs [2]. The dataset is taken as a set of real-time images. But what is an image? An image is a collection of arrays representing different numerical values in terms of red, green, and blue (RGB) which is commonly used in computer vision. The values for these colors range from 0 to 255, where a higher value represents more intensity or brightness. Images are stored in multidimensional arrays. There are two main types of images: raster-based images and vector images. For our research, we are considering raster-based images.

There are different file formats for images such as jpg, GIF, PNG, TIFF, RAW [3], and PSD. The structures present in an image and the final output are the detected picture and a selection of the face [4]. The competitive aspect of this research article is to develop a system that can identify faces under various lighting conditions. Using convolutional neural networks (CNN), we predict the faces from different images in the dataset. Predicting information in the image is challenging, and we first need to train a CNN to correctly classify the images.

Many researchers have explored various methods for analyzing the emotions of images; outcomes of machine learning techniques are significant. Among several machine learning techniques given in Table 1, methods that depend on deep learning produce the best efficiency for face recognition from the images in the photographs.

#### 2. MATERIALS AND METHOD

CNN model [10], [11] to be trained to predict whether an image has a triangle or any other information. How would you tell a computer about the shape present in the image If the image is shifted? How would a neural network be able to predict this? CNN have many filters, which are used to scan an image and obtain a feature map. Output is obtained by implementing the different concepts of CNN, as shown in Figure 1. CNN consists of various operations: i) convolutions, ii) feature detectors, iii) padding, iv) stride, v) activation layer, vi) pooling, vii) fully connected, and viii) Softmax function [12].

Figure 1. Block diagram of CNN

#### 2.1. Convolution operation and feature detector

A scientific term to explain the method of combining two functions to obtain a third outcome is known as a feature map, as depicted in Figure 2. Convolution, also known as filter or kernel, is in a matrix form applied to an input image [13], [14].

Image \* Kernel = Feature Map

Figure 2. An example for a convolution operation

The convolution operation is used to detect the features in images; feature maps are also known as feature detectors, which can see many features in the image, as shown in Figure 3. A combination of these features is used to classify the image correctly.

Figure 3. Different features obtained from a convolution operation

#### 2.2. Padding

It allows us to manipulate the feature map size. Conv filters produce an output more minor than the input; we have taken a 5x5 image and padded it with 0's in all dimensions: left, correct, bottom, and top corners. Padding helps pass the conv filters multiple times, as shown in Figure 4.

Figure 4. An example of padding operation

#### 2.3. Stride

Stride defines how many steps the convolution window moves across the input image. Examples are illustrated for a stride of 1 and a stride of 2. An example for a stride operation is defined. A larger stride produces a smaller feature map output, and a larger stride has less overlap. Stride is used to control the size of the feature map. A larger stride has less overlap. We can calculate the feature map size using (2):

$$(n \times n) * (f \times f) = \left(\frac{n+2p-f}{s} + 1\right) \times \left(\frac{n+2p-f}{s} + 1\right)$$
 (2)

Where  $n \times n$  is input image size,  $f \times f$  is filter size, s denotes stride value and p denotes padding

#### 2.4. Activation layer

The purpose of the activation function is to enable the learning of complex patterns in our data, introduce nonlinearity to our network, and allow a nonlinear decision boundary via nonlinear combinations of the weight and inputs. There are several activation functions we can use in our CNN. Rectified linear units (ReLU) have become the activation function of choice for CNNs. ReLU function helps to train CNN. Simple computation (fast to qualify) does not saturate. The ReLu operation changes all negative values to 0 and leaves all positive values alone.

#### 2.5. Pooling layer

Pooling is the process where we reduce the size of dimensionality of a feature map, allowing us to decrease the size of parameters in our network while retaining essential features. Pooling is also known as Subsampling or downsampling. In the below operation, A 2x2 kernel is used in the first block of 2x2; a maximum value of 123 is selected, and subsequent values in the output are 253, 187, and 165 in the production.

Pooling makes our CNN model more invariant to minor transformations and distortions in our images. Pooling helps to maximize the translation invariance. Pooling reduces the output size by sub-sampling the filter response without losing information [15]. A significant stride in the pooling layer leads to high information loss. A stride of 2 and a kernel size 2x2 for the pooling layer were effective in practice.

#### 2.6. Fully connected layer

It means all the nodes in one layer are connected to the outputs of the subsequent layer. Considers 3D data output of the previous layer and flattens it into a single vector used for input in the next layer. It is also known as dense layer. A fully connected layer compiles the data/outputs extracted from previous layers to produce outcomes, easy to learn nonlinear combinations of these features.

#### 3. SYSTEM DESIGN

#### 3.1. Why convolutional neural network works well on images?

Standard neural networks don't have convolution filter inputs; for images, every pixel will be its input; therefore, a small image that's 28 X 28 would have 784 input nodes for our first layer. The first step here is how to train a CNN. Conv filters learn what the feature detectors learn, and our typical early layer of CNN learns low-level features (like edges or lines) specified in Figure 5. Mid-layers learn simple patterns, whereas high-level layers learn more structured, complex ways [16]–[19]. During training process, the following are the steps to be followed:

- Initialize random weights values for our trainable parameters.
- Forward propagate an image or batch of images through our network.
- Calculate the total error (get some output through the random values).
- We use a back propagation to update our gradients (weights) via a gradient descent.
- Propagate more images (or batch) and update weights until all images in the dataset have been propagated (one epoch).
- Repeat a few more epochs (i.e, passing all image batches through our network) until our loss reaches satisfactory values.

Figure 5. Training process of CNN

This is how we generate random weights for one input image; we get the output of arbitrary values for several images, as shown in Figure 6. If all the values generated are correct, we need to figure out how we correct our results using the CNN. We create a loss function and use the back propagation method to do this.

P	6	5	6	8	8	1
0	0	0.9	0.83	0.21	0.19	0.62
	0.73	8.0	0.89	0.7	0.92	0.07
2	0.78	0.88	0.19	0.39	0.08	0.74
	0.37	0.56	0.07	0.64	0.64	0.9
4	0.63	0.25	0.79	0.94	0.52	0.55
5	0.87	0.65	0.57	0.63	0.97	0.04
6	0.67	0.05	0.45	0.51	0.87	0.51
7	0.71	0.66	0.13	0.59	0.86	0.89
8	0.51	0.88	0.59	0.01	0.37	0.63
9	0.24	0.52	0.79	0.15	0.63	0.78

Figure 6. Result of random values during the training process in CNN for six images

#### 3.2. Loss function

The loss function is used for quantifying the loss, how bad the probabilities we predicted, and we need to quantify the degree of our prediction. Entropy loss is used for quantifying the loss; it uses two distributions,

$$L = -y \cdot \log(\hat{y}) \tag{3}$$

Here y is the ground truth vector, ^y is the predicted distribution, and '.' is the inner product. There are also other loss functions that exist. Loss function functions are also called cost functions. For binary classification problems, we use binary cross entropy loss. For regression, we often use the mean square error (MSE).

$$MSE = (Target - Predicted)^2$$
 (4)

Other loss functions used are L1, L2, hinge loss, and mean absolute error (MAE). If there are errors in the values, we will update our weights using the back propagation technique to minimize the loss.

## 3.3. Back propagation

Back propagation is very important in training the neural networks, and this process is used to know how much to change/update the gradients to reduce the overall loss, as depicted in Figure 7. The Figure 7 shows the operation of back propagation and the formulas we use in the same [20]. Using the loss value, backpropagation can tell us now, for the next iteration, how much we should increase or decrease the weights to reduce the overall loss in the network. By forward propagating input data, we can use backpropagation to lower the importance and the loss. But this tunes weights for that particular input or batch or inputs. We improve generalization (ability to make good predictions on unseen data by using all data in our training dataset.

Figure 7. An operation of back propagation technique

#### 3.4. Gradient descent

In the back propagation process, we update the individual weights or gradients given by wx+b. The main is to find the correct value of consequences where the loss is the lowest. Gradient descent is The method of achieving this goal (i.e., updating all weights to lower the total loss). It's the point at which we find the optimal weights such that failure is near the lowest. Gradients are the derivative of a function; they tell us the rate of change of one variable for another variable.

$$Gradient = \frac{dE}{dw}$$

Where E is the error or loss and w is the weights.

A positive gradient means loss increases if weight increases, and a negative gradient means loss decreases. At point A, moving right increases our weight and decreases our loss negatively; at point B, moving right increases our weight and increases our loss positively. Therefore, the negative of our gradient tells us the direction in which we are moving. The point at which a gradient is zero means that small changes to the left or right don't change the loss. In training neural networks, this is good and bad; at point C, minor changes to the left or right don't change the loss. Minimal changes to the left or right don't change the loss, and the network gets stuck during training. This is called getting stuck in a local minima. We will use the mini batch gradient descent method, which combines both ways. It takes a batch of data points (images) and forward propagates all, then updates the gradients. This leads to faster training and convergence to the global minima.

## 3.5. Optimization

This is a more advanced gradient descent method that allows us to find the lowest weights, and a few advanced optimization techniques are used. What are the problems we need to deal with standard stochastic gradient descent? These include choosing an appropriate learning rate (LR), deciding on learning rate schedules, and using the same learning rate for all parameter updates (as in the case of sparse data). Stochastic gradient descent [21] is susceptible to getting trapped in local minima or saddle points (where one dimension slopes up and the other slopes down).

Several other algorithms have been developed to solve these problems, including extensions to the stochastic gradient descent method, such as momentum and nesterov's acceleration. Several optimizers, including Adagrad, Adadelta, Adam, RMSprop, AdaMax, and Nadam. have been introduced. We have used the Adam optimizer [22]; Adam's adaptive moment estimation is a method that computes adaptive learning rates for each parameter and stores an exponentially decaying average of past gradients, similar to momentum. Adam is quite effective.

#### 4. IMPLEMENTATION

## 4.1. Dataset

Dataset considered for implementation is real-time dataset. Images are collected from the social media, different restaurants and several showrooms [23]. Below is the displayed mathematical model for face recognition. We will create a collection of facial images in the database, labeled as y1, y2, y3, ... yn. N classes are created from these sets, and each class corresponds to a registered person. We define a vector comprising K values for each image.

$$\mu = (\mu_1, \mu_2, \mu_3, \cdots, \mu_k)^T \tag{5}$$

Let T represent the transpose operator. We define a distance function, denoted as  $d(\mu 2, \mu s)$ , for the feature vector  $\mu$  that corresponds to the farthest distance in the input form and fit in to class XL, for each image.

$$d(\mu_1, \mu_s) > d(\mu_i, \mu_s) \neq j, 1, j = 0, 1, \dots, L - 1 \tag{6}$$

In the context of the provided distance function, class XL must exceed a precomputed threshold value, represented as  $d(\mu 1, \mu s) > \tau c$ . The face recognition algorithm takes an image as input and produces a sequence of face frame coordinates as output. There may be one face frame, zero face frames, or several face frames in this sequence [24].

The mathematical model for determining the integral image involves determining the pixel values of the face as (7):

$$I_{i}(y,z) = \sum_{i=1}^{y.z} i(y',z')$$
 (7)

The sum of the intensities of the pixels within the black areas is as follows: let  $I_i(y, z)$  represent the value of the ith element in the integral image with coordinates (y, z), and let (y', z') represent the brightness of the pixel in the image under consideration at coordinates (y', z').

$$s_i = \sum_{i=0}^{v,y} r_i, k - \sum_{i=0}^{z,y} r_i, f$$
 (8)

The equation above is employed for computing the total brightness of the pixels. With a threshold value of  $\tau_c$ , the classifier's expression is as (9):

$$w = \begin{cases} 1, \ f_i > \tau_c; \\ -1, \ f_i < \tau_c; \end{cases}$$
 (9)

A set of weights, denoted as wi for  $1 \le i \le n$ , corresponds to each sample. The best strong classifier is computed using a fixed number of weak classifiers, and the equation for the strong classifier is as (10), (11):

$$w = \begin{cases} 1, & \sum_{c=1}^{c} a_c w_c \ge \frac{1}{2} \sum_{c=1}^{c} a_c; \\ -0, & \sum_{c=1}^{c} a_c w_c f_i < \frac{1}{2} \sum_{c=1}^{c} a_c; \end{cases}$$
(10)

$$a_{c} = \log \frac{1}{\beta_{c}} \tag{11}$$

Where  $w_c$  represents the weak classifier, and  $a_c$  and  $\beta$  are the weight coefficients associated with the weak classifier. Here, c stands for the current number, and C=(1,...,C) represents the set of weak classifiers. The goal of this iterative technique is to build a reliable classifier. The following describes the images that show the object both before and after illumination:

$$q1(y,z) = \frac{\delta_{0,j}(y,z)}{\delta_{1,j}(y,z)} + 1 \tag{12}$$

Where j is the number of current value of the sequence y, z,  $\delta_{b,j}(y,z)$  the brightness value of the pixel of the array  $I_{b,j}$ . b is the identifier of the pixel array, with b taking values in the set (0,1).

The scientific study involves the analysis of image dispersion after applying brightness. The dispersion value is determined by calculating the sum of squared differences between the pixel values in the modified image and the mean pixel value across the width and height arrays. The dispersion value is calculated as:

$$D(I_{0,j}I_{1,j}) = \frac{1}{WH} \sum_{y=0}^{W-1} \sum_{z=0}^{H-1} (q_j(y,z) - q_j)^2$$
(13)

In image processing, this formula describes the calculation of dispersion value between two images  $(I(0.j) \text{ and } I(1,j), q_j(y,z))$  denotes the pixel value at coordinates (y,z) for the image parameter y, is the mean pixel value along the y-axis for a specific image parameter y, random variable y, which is calculated by (14):

$$q_{j} = \frac{1}{WH} \sum_{y=0}^{W-1} \sum_{z=0}^{H-1} (q_{j}(y, z))$$
(14)

#### 5. RESULTS AND DISCUSSION

Colored RGB images are captured from a camera. The images are depicted in Figure 8 and represent real-time images of my friends. These images serve as input for face recognition, which is implemented using TensorFlow and Keras libraries. To extract facial features, we employed Haar cascade features [25], including various types such as: i) edge characteristics; ii) linear characteristics; iii) center characteristics; and iv) diagonal characteristics. The face recognition model and the images used for face recognition are subsequently employed for emotion detection of individuals using deep learning techniques, as illustrated in Figures 9 and 10.

Figure 8. Input images for face detection

Figure 9. Face recognition images using deep learning techniques

Figure 10. Faces are detected through webcam

#### 5.1. Measuring the accuracy of face recognition for an image

Several images, either in groups or individually, are uploaded into the system to check their accuracy. A person should have appeared in the photos multiple times. When all the images are tested in the proposed system, the data is computed in the confusion matrix, as shown in Table 2, to calculate the system's efficiency. The accuracy of the proposed system is then computed as Table 2.

Table 2. Confusion matrix form face recognition

People	No of Images	True
Person 1	5	5
Person 2	5	5
Person 3	5	4

#### 6. CONCLUSION

In this research article, face detection and face recognition in videos are achieved through deep learning techniques. The complete process of the face detection system begins with data training using the CNN approach, followed by face recognition, which is elaborated upon. This article employs Tensorflow and Keras to test the model on various RGB images. Additionally, the system's performance is assessed for both sets of images and single images captured via a webcam, as well as for video inputs. In video processing, the system effectively extracts faces of individuals. The proposed system exhibits a high level of accuracy, achieving a recognition rate of 94% after training with a substantial number of face images. However, several factors can impact the model's accuracyp. In scenarios with insufficient light intensity or other factors affecting image clarity, accuracy tends to decrease compared to situations with higher light intensity. Furthermore, the classifier plays a pivotal role in the recognition process, and superior results are obtained when the model is trained with a large dataset of images. The generated faces can be utilized as inputs in various applications such as emotion recognition, theft identification, defense applications, and more. Deep learning techniques consistently outperform OpenCV functions in terms of accuracy.
