#### ARTICLE INFO

#### Keywords: Industrial internet of things Sensor data Noise remove Statistical techniques

#### ABSTRACT

The most fundamental and crucial processes in Data analysts is effective information processing while cleaning information from noisy sensors. Conventional outlier identification techniques should not be used directly for this type of assessment, as sensor data can contain both noise (piezoelectric microphone type) and severe abnormalities. To manage the problem of sound reduction while maintaining the anomalies in the IIoT information, this paper proposes a method of calculating the noise score which takes into account both the rate of variation and the variance. To establish the unit of evaluation of the measurement of difference which would be used in conjunction with statistical analyses, a sliding window method. Extensive testing shows that the proposed strategy surpasses existing advanced noise detection methods, producing a clean dataset that maintains anomalies to successfully use abnormal investigation techniques.

#### 1. Introduction

Sensors were frequently used in the new generation of cyber-physical capabilities provided by IIoT architecture to collect information about the actual environment so processors can choose the appropriate actuator [1]. The sensors were considered trustworthy in the sense that the measurement they acquire correctly represents the real state of the environment [2–4]. If the ambitious opponent wins by compromising these hypotheses, however, malware management choices could result. Such an unsupported assumption could well have devastating effects on society as a whole in contexts where regulation of safety-critical activities is required. A unique method for identifying cyber attacks on cyber-physical networks has just been developed, and it does so by identifying improbable sensor behavior [5]. Large volumes of information have been generated in IIoT configurations. When carrying out predictive analyses on such amounts of information, the "5V" (volume, variety, speed, volatility, and veracity) of massive data comes into play [6]. The enormous volume and complexity of the information place heavy demands on the techniques for preparing the information now in

use. Requirements are further augmented by changing data flows and real-time requirements [7]. Normally, sensors produce consistent data flows. Information that would be continuously generated, often at a high percentage, was referred to as information flows. Information gathering and rapid response are essential in fully automated manufacturing operations [8]. Machine-to-machine connectivity was critical in IIoT contexts. Intelligent sensors and gadgets not only provide information but also communicate with their surroundings, and provide rapid responses [9]. In these IIoT environments, the requirement for proper interaction and also the availability of continuously flowing streams of data clash with the characteristics of taking a picture of the full set of data & conducting calculations using uncertain response times.

An Artificial Neural Network (ANN) was designed to mimic the biological neural network seen in mammalian brains. The neurons that bring these nodes together make up an ANN's element. Based on the input information, points are connected in steps to generate non-linear output data [10]. Interconnects between networks allow the output of a node to be introduced into the input of another node. The significance of the transmitted data can be derived from the weightings applied to

E-mail address: rajendra0511@gmail.com (D.R. Dev).

<sup>\*</sup> Corresponding author.

each link [11]. The output signal of a neuron was driven by a threshold function, as in biological neural networks. All weights will need to be initialized when configuring an ANN [12]. To create a reliable, balanced system, these weights were modified holistically during network training using a predetermined learning algorithm.

The major contributions of the work are:

- One of the most fundamental and crucial processes for effective information processing was the cleaning of information from noisy sensors.
- To manage the problem of sound reduction while maintaining the anomalies in the IIoT information, suggested a creative approach.
- It proposes a method of calculating the noise score which takes into account both the rate of variation and the variance.
- To establish the unit of evaluation of the measurement of difference, which would be used in conjunction with statistical analyses, a sliding window method was used.

#### 2. Related works

The objective of the innovations and study was to discover inexpensive and energy-efficient solutions to the problem of Radio Frequency (RF) signal interference. According to others, 's centralized system for wireless device coordination that uses specific methods run through a common service-level platform to handle variable RF range devices seems to be a workable option [13,14]. However, such a system requires that all IoT devices be geographically co-located and interconnected via the same network, which is generally not the case in contemporary manufacturing units [15]. Distributed intelligent sensors, on the other hand, could be more efficient, particularly in terms of energy needs for large areas. These smart devices could use machine learning algorithms to change communication variables and organize themselves [16]. Other approaches to the RF interference issue include mobile networks, which provide IoT devices with the architecture they need for signal power, and even a dedicated IoT connection for mobile networks. By maximizing the ratio of all IoT devices, this approach determines which cellular client RF to communicate using a deeper strengthening learning method, which takes time to learn [17]. The loud noise that machines and robots make in major manufacturing sites is the main source of RF interference. In an IoT ecosystem, reducing the impact of this sound would increase, enhancing the signal transmitted between interconnected devices [18].

The primary method to solve the noise reduction problem was machine learning. Advanced auto-encoder techniques and ML extracting features are used to reduce the impact of background noise on computers. Large businesses also used the continuously hidden Markov model to eliminate noise and recognition. Continuous Hidden Markov Model (CHMM) was applied to describe electromechanical sound in external analysis after the detection of noise in space and time [19]. In addition, for many types of information, including the time information under discussion, noise and anomalies had separate definitions. High peaks in ECG data can be signs of abnormalities, such as a rise in heart rate [20]. To produce its source of information for extraction techniques or categorization, the study identifies peak errors and a series of dirty spots as anomalies.

#### 3. Proposed noise detection method

Point sound and continuous sound were the two main types of noisy data. The latter, which may be more difficult to process, make up the majority of the dataset collected for our research [21]. A threshold method based on a Quantile-Quantile plot (Q-Q) has been created to recognize noisy information based on these values. This article suggests sound purification strategies to address the problem of information quality, which would be inspired by previous research that focuses on IIoT architecture. To enhance the sensing quality of the data & work in

both big information and real-time situations, it might be folded into a filtering component in the data transformation layer as depicted in Fig. 1. To assess how dramatically the numbers within the window changed, in comparison to those of the preceding one and quantify the extent of the divergence from the background ordinary windows, 2 well-defined cues were presented based on sliding window frames, specifically, neighbor contrasting & background contrasting. The interior values were sound, and windows with higher test scores were deemed noisy window frames. The researchers use experiments to study the viability of the proposed sound detection strategy and show how it improves detection methods. After the sound has been removed, the data cleaning enhances the accuracy of anomaly detection, and also the level of noise offers additional information about the information's condition.

The distance here between the present point and also the typical locations can be used to determine the size of the deviation, and also locations with larger beaches were exceptions. Due to this, methods for detecting distance-based outliers have become so widely used [22]. While higher levels point to the presence of sound, lower levels of dissimilarity point to the absence of sound. Noise Criterion (NC) refer could be employed to evaluate this resemblance given in Fig. 2. The difference between the sliding windows in the neighboring window would be greater than usual points when it covers the sound elements. The existing sliding windows and their neighbors were indicated by the red and green windows, accordingly. The second window does have a greater noise rating and a large aspect value.

As seen in Fig. 3, where the sound described in green cannot be recognized at all, the researchers obtain detection accuracy as a function of NCs. In this instance, a backdrop model with typical windows was constructed so that this particular sort of sound may be identified by its greater contrast to the background image.

The mean value (wm) & standard deviation (ws) were computed for every moving window.

$$d_{wm_x} = \sqrt{(wm_x - \mu_m)} \delta_m^{-1} (wm_x - \mu_m)$$
 (1)

Where  $\mu_m$ ,  $\mu_s$  and  $\delta_m$ ,  $\delta_s$  are the mean and covariance of the data in  $wm_x$  and  $ws_x$ , respectively, where the range taken from 0 to 1.

The noise level scoring depending on the BC of windows wi was provided as the background model.

$$S_{bc_x}(w_s) = \frac{1}{|B|} \sum_{w \in R} x^2(w_x, w)$$
 (2)

Where |B| - cardinality of set B.

This means that many forms of distribution were present in all the information. The majority of the points belong to the allocation that would be centered around the red dotted line, whereas the other points

**Fig. 1.** Proposed detection method was incorporated into the data management layer of an IIoT system.

Fig. 2. NC recognizes spike sound.

Fig. 3. Results of noise detection by NC.

diverge from this range. We specifically searched for windows that fit these locations to identify the noisy window [23]. The initial and third quartiles of the distributions were connected by a line superimposed on the graphic, allowing us to determine the equation for line f. (Xd).

Although there are some parallels between noise and anomalies, they seem to be very distinct from a physical interpretation standpoint. This problem is overlooked by several widely used approaches, which yield subpar detection results. This study focused on the distinction between sound & anomalies to address the issues, and on this basis, the chisquare distances and also the template matching method was used to quantify the change rate & departure as the differentiation. While the dissimilarity between datasets and anomalies has decreased as a result of these countermeasures, the difference between datasets and anomalies has increased. Since the abnormalities are true positives, it means that the sound detection results were not affected by the abnormalities. By computing two vectors using data sets, it must be typically used to compare two histograms, but when it regards statistical information, it may be viewed as a weighted Euclidean distance. Due to its increased time complexity, Dynamic Time Warping (DTW) is an unwise choice. For example, the time it takes to calculate the distance between two matrices is 0. 036161 s and 1.995205 s, respectively.

#### 4. Experimental setting

The normalcy test, noise, and anomalies are the real information gathered by the sensor measurements. The pattern corresponding to the events was carefully labeled and the actual noise was naturally incorporated shown in Fig. 4(a). The information could be plotted and visually reviewed to show that there are not many changes in the data sets between seconds. Thus, the information should first be processed using a batch normalization filter of size 300 to increase the effectiveness of the

Fig. 4. Q-Q waveform (a) NC. (b) BC.

noisy data purification system Fig. 4 (b). Using the above information, system variables such as the baseline and threshold were generated. Following the sharing of information, a set of 12 datasets would be used to evaluate the proposed methodology. One step size is used to cross the sliding window during the period-series data. For BC & NC, the deviation value was experimentally adjusted to 0.5 & 0.1, accordingly.

#### 4.1. Discussion

Some windows may contain both sound and regular dots, but they could eventually be recognized as noise windows. The method, however, traverses the time-series data with a step size of 1, thus if the sliding window only captures a small portion of the sound, the contrasting cue score was insufficient to cause a sound alarm. Only when most of the dots in the window were noisy did the contrast score exceed the required level. As shown in Fig. 5 (a) signifies all the sound detection accuracy, Fig. 5(b) demonstrates a resolving power of the green region which reflects the period when the noise had first been detected, Fig. 5 (c) displays the first detected loud noises window, which should be a growth of the spectral range of Fig. 5 (d) displays the magnified sound points in the spectral range. In the initial sound instance, after hierarchy magnifying, it would be evident that only the windows with a significant amount of large volumes of data could cause the contrasting values to surpass the threshold.

Fig. 6 (a) - (d) shows a graphical representation of the other identification techniques, such as LOF, COF, LDOF, iForest, average predictor, and their proposed approach, avoiding cluster techniques. The average results from the approach presented in Fig. 7 were based on two separate thresholds. The PI can be seen in Fig. 7(a) and (b) as a gap between the two dotted lines. The document itself and the results of the

Fig. 5. Sound detection accuracy.

Fig. 6. Detection results based on different methods.

information purification were used in blue and red, accordingly. The outcomes of the proposed product's sound detection were seen in Fig. 7 (c), and the audible cleaning results of the proposed method are shown in Fig. 7(d). Information on false positives and false negatives through various approaches can be found in Table 1.

Our proposed strategy provides more encouraging results than other advanced detection systems already in use, effectively eliminating noise from information while maintaining anomalies. Additionally, Fig. 8 the

detection details illustrate the effectiveness of the proposed technique for managing contextual sound. The majority of undesirable sounds, including spikes & continuous sound points, have been eliminated as an outcome of the cleansing process, leaving only the anomalies with minor deviations.

The red dotted line roughly represents where the majority of the information, lies, and deviations from this line signify variations in the normal distribution. The departures are not immediately obvious and

Fig. 7. Average forecast.

Table 1 FP and FN Q-Q

Method	LOF	COF	LDOF	iForest	Ours
False positives	52	430	441	3080	169
False negatives	1114	925	893	146	182

seem difficult to spot, as can be seen in Fig. 9 (a). Given this, even some typical points were split, not to mention keep abnormal data, assuming that 65 was correctly selected as the threshold. Conversely, the departure in Fig. 9(b) was obvious, as it has been demonstrated experimentally that the windows straying from the red dotted line contain irrelevant information.

Pervasive noise is frequent and seems inevitable in many real concerns. Access to specific information was necessary to ensure effective research methodology. To provide better information, an accurate noise reduction must be performed during processing. The noise was generally distinguished from normal data by distinct properties which differed from it. However, significant anomalies also show this discrepancy. Finding noisy data as comprehensively as possible without accidently selecting anomalies appears to be a challenge. Numerous problems still need to be resolved in the majority of the detection is approaching now in use, including mixed noise & anomalous findings in classification methods or more false negatives or false positives because of an insufficient threshold. This would be addressed by proposing a single method of noise detection based on context and close objects. When compared to

Fig. 8. Magnification features.

Fig. 9. Q-Q graph comparing window scores and amounts of initial assertions.

the neighboring data, noise that manifests as abrupt jumps or spikes may be distinguished, while anomalies that move more slowly have a high contrast score and many are preserved as predicted. The experimental measurements demonstrate that our proposed method performs more effectively than other state-of-the-art recognition methodologies, and the implementation in the intrusion detection system shows that the cleaning information may reduce the impact of sound & produce superior anomalous identification.

#### 5. Conclusions

One of the intuitive notions is that when a momentary change occurs, we may note how long this would remain & assume that it represents a new sort of signal rather than sound if the time it lasts exceeds a predetermined quantity. This makes automation easier, but increases computation, memory, and processing time, as trade-offs were unavoidable. The accuracy and recall of the identification results should again be exchanged when determining the right window size for the identification of noisy windows. A new approach would be required to be used for processes like biological system anomalies where there aren't any suitable biological signifiers or biological experiments that provide an advanced warning of the anomaly advancement. While the noise removal process operates well where the substantial anomalies create extra gradually than the loud sound deviance, as in processes with mechanical parts that gradually deteriorate, there might be devices like these. Uncertainty can arise from various factors such as sensor inaccuracies, communication delays, or environmental conditions. Identifying and reducing these uncertainties can lead to improved system performance and uptime.

Abstract— Communication is vital for sharing emotions and thoughts, yet deaf and mute individuals face challenges in expressing themselves. Sign language serves as their primary mode of communication, but its limited understanding among the general population creates barriers. This paper presents a sign language recognition model utilizing convolutional neural networks to interpret hand and facial gestures. Data collection is facilitated through OpenCV and Mediapipe, enabling accurate prediction of words. The model acts as a bridge between individuals with physical disabilities and the general populace, facilitating effective communication and fostering inclusivity. [[11][12][13][14][15][16][17][18]

Keywords—Sign Language, classification, Neural Networks, Tensor Flow Kera, Media pipe

### I. INTRODUCTION

Communication plays an important role in sharing feelings and asking for help. But when we consider people with hearing and vocal disabilities, they use a language known as sign language to communicate with others. This sign language is hard to understand others. So, this makes the lives of those hard and unimaginable

When we consider people with hearing and vocal disabilities, they use their hand movements and facial recognition to communicate with others, which we indeed call sign language. They mainly use their hand movements to share with others.

When we talk about sign recognition there are mainly categorized into two types static recognition and dynamic recognition[1]. Static recognition means only a single frame sign can be recognized. But when we talk about dynamic recognition this can recognize the sign in both static and moving positions. This model can predict both the static and dynamic recognitions of some basic words such

as thanks, hello, etc., along with some alphabet.

We have to create our dataset with the help of OpenCV. While collecting the data we convert the data into an array of key points using a mpholistic media pipe. In this, we majorly work on hand gestures and face recognition.

After finding the key points these key points are stored in the form of an array. This array contains the key points that belong to the face, left hand, right hand, and pose. Then we train the model based on the data that we collected and test it against the test data. Finally, we check the model in the real world.

To make Sign Recognition Model we have used different libraries or modules they are:

Keras is an open-source neural network library that runs on top of TensorFlow. It is made so that the user can use it easily. This library is used in the deep-learning algorithm.[2] We tried to use this library mainly because it has many advantages over similar types of libraries. Its major advantages

includesimple API, Pythonic nature,

extensibility, modularity, and strong backend support.

The ability of Keras is to create state-of-the-art implementations of common deep neural networks. And these which are produced using Keras are easy and fast accessible after creation. And also, these models can be deployed on multiple platforms

The following flowchart is how to create a deep learning model in Keras.[15][16][17][18]

OpenCV is a famous and big open-source library for computer vision, machine learning algorithms, image processing, and real-time operation. We use this OpenCV for computer vision because it is easy to learn, OpenCV is written in C, C++and python languages, and less RAM consumption. [3] OpenCV is used to process images and videos and to identify various objects, hand signs, and facial expressions. To pinpoint image patterns and their features we use vector space and mathematical operations.[4]

When there is a boy image is given, there will be a lot of information present in that image like the boy wearing a cap and chain, etc. we use OpenCV to get all these types of information

There are a lot of applications using OpenCV like Face and object Recognition, several people in a place like a temple or theater, automatic cars, etc.

Neural Networks are a subset of machine learning that is important in deep learning algorithms.[5] The neural network's basic ideology is taken from the human brain working like biological neurons. Neural networks are hugely based on training the data and learning from it and they also improve their accuracy as time progresses.

Once the accuracy of these data is turned out to be at its best then it allows us to classify and cluster the data at a High- Velocity Rate ANN has different node layers those are an input layer, one or more hidden layers, and an output layer. ANN has a set of algorithms that are constructed in such a way that it recognizes the patterns in data samples and they are slightly based on the human brain. In ANN there are many hidden layers between 1 input layer and 1 output layer. However, the hidden layers depend upon the complexity of the problem The ANN recognizes a pattern that has all the real-time data, images, videos, and sounds. In simple neural network helps us to cluster and classify the data easily

A recurrent neural network (RNN) is another form of Neural Network. In RNN the input is processed through the number of layers and output is produced here the same task is performed for every element of a sequence.[6] In RNN the information is carried out to different neurons through loops. MediaPipe is a structure for building ML Pipelines. MediaPipe is a toolkit that consists of a Framework and Solutions.[7] The framework is written in java and C++. MediaPipe supports complicated graphs. May Built-in calculators come with GPU acceleration for performance optimization.

MediaPipe depends on OpenCV for video and FFMPEG for audio handling.

This model varies from existing models in such a way that in general, all the existing models have made great contributions toward achieving greater accuracy but those all have used image datasets that consume a lot of space in our memory. But here in our model complete data is stored in the form of arrays which can save our memory. This is the major difference between the remaining models and this proposed model.

## II. RELATED WORKS

## Design of a communication aid for the physically challenged [8].

It consists of two parts training part and the testing part in the training part the user used feed-forward neural networks. The SLR System was developed using the MATLAB Platform. Here MATLAB is not that coherent.

American Sign Language Interpreter System for Deaf and Dumb Individuals [9].

The given system recognizes and translates 20 out of 24 hand signs of the alphabets ASL into text output. The knowledge of PCA is used on sign images of the ASL alphabet. We will use the image to extract PCA Features to classify the image into one of the ASL. Due to the Occlusion problem the alphabets A, M, N, and S couldn't be recognized. For this system, they have used only a limited number of images.

Nasser H.D et.al [10] considers this approach where the key features extracted are SIFT (Scale Invariant Feature Transform) key points. They further constructed grammar from a sequence of hand postures for detecting dynamic gestures.

## III. PROPOSED METHOD

This construction of the model can be classified into five steps:

- 1. Dataset Collection
- 2. Data Pre-Processing
- 3. Training the model
- 4. Validating the model
- 5. Testing the model
- i. Dataset Collection

We have created our database using OpenCV. But, instead of storing it in the form of images. We stored them in the form of arrays. These arrays contain the key points identified in the face, left hand, right hand, etc. This dataset contains some common English words that are used in English i.e., thanks, hello, etc. along with some English alphabets and numerals. This dataset is majorly based on hand gestures. Each hand gesture will be stored in the form of unique arrays.

Figure 1: Show collecting Data related to sign Thankyou

Figure 2: Show collecting Data related to sign Hello

As shown in the above images the data will be taken through the camera using OpenCV. And the points that are shown are identified with the help of Mediapipe libraries. These Mediapipe libraries are used to identify key points in the total body.

## ii. Data Pre-processing:

As data is stored in the form of arrays, each array size will be 1662. Each array contains face key points, left-hand key points, right-hand key points, and pose key points. The face contains 33 points, the hand contains 21 key points, and the pose contains 468 key points. And individually each face key point has three attributes x, y, and visibility. The hand key point contains three attributes x, y, and z. The pose key point contains three attributes x, y, and z. So, all three attributes will be stored in the form of an array of size 1662. When creating the dataset whole body is not used only the hand and face most of the pose key points will not be recognized. If we store the data as we receive it from the camera it will be a difficult job to determine the output. Because if we create an array of the key points that we recognize the arrays will be created with different sizes. So, instead of leaving the unidentified key points as null points. We use zeros to fill in the key points that are not identified. By that, we can avoid the problem of noises and deviations that would be created while predicting the output.

## iii. Training the model:

After preprocessing the data, we split data into two parts train and test splits using scikit train\_test\_split from sci-kit learn. Test and Train data will be completely different. Here we use LSTM (Long Short-Term Memory) model which is a recurrent neural network model. We train the model based on the train data. The model summary can be described as shown in the below figure:

Layer (type)	Output Shape		Param #
lstm_6 (LSTM)	(None, 30, 64	4)	442112
lstm_7 (LSTM)	(None, 30, 12	28)	98816
lstm_8 (LSTM)	(None, 64)		49408
dense_6 (Dense)	(None, 64)		4160
dense_7 (Dense)	(None, 32)		2080
dense_8 (Dense)	(None, 3)		99
Total params: 596,675			
Trainable params: 596,675			
Non-trainable params: 0			

Figure 4.3.1: Model Summary

The above figure gives information about the number of parameters that are trained in each layer of the neural network. When we are training a model with the neural network algorithms, we need to use an activation function that plays a major role in deciding the performance of the model. The activation function that is used in this model is ReLU (Rectified Linear Unit) activation function. This is the most used activation function. And this activation function is used to determine when to trigger the inputs to the next layer in deep learning neural networks.

## iv. Validating the model:

Initially, before training the model the whole dataset is divided into two parts. The second test split is used to validate the model. We pass the test data to the model and let it predict the output. That output will be compared with the label that is given to the image. Based on that accuracy will be calculated. This model gives an accuracy of around 87%.

## v. Testing the model:

This is the final step in the implementation phase. Here we test our model with real-world data. And the model is allowed to predict the results. This is briefly discussed in the results part.

#### Subhashree D C, 2024 Advanced Engineering Science

The above flowchart describes all the steps that are in the process of preparation of this model starting from dataset collection to the final validation process. By looking at this flow chart we can get an overview of the preparation of this model

#### IV. RESULT AND DISCUSSIONS

We have successfully created a Sign Language Recognition model. In which the data set is converted into arrays. While running this system we found an accuracy of 86.24%. To improve this accuracy, we can add more data to the dataset.

Figure 3

Figure 4

Figure 3,4: Show the predictions that are made by the model.

In [11] 3rd InCI Conf. on Recent Advances in Information Technology I RAIT-20161 there is a detailed analysis of a number of common methods and its comparative study is tabulated below (Table 1). Entry (5) indicates our results.

SL.NO	Segmentation Technique	Feature Vector Representation	Classifier	Acc (%)
1.	Discontinuity (time-variant parameter detection)	Posture, position, orientation	НММ	80.4
2.	Manually from background	Blob and ridge features	Particle filtering	86.5
3.	HSV color space	The convex hull of the contour	Haar like technique	N/A
4.	RGB to Gray	Euclidean distance	Neural Networks	N/A
5.	Images to arrays	Hand gestures	Neural Networks	86.24

Table-1: Caomaparision with popular models

#### IV. CONCLUSION

The Impaired people communicate in Sign Language which is not understood by regular people. We built this system to ease the difficult communication between deaf and dumb people and normal people. This system will automatically recognize the hand gestures made by people and take this

# Subhashree D C, 2024 Advanced Engineering Science

sign as input and gives related output in form of text.

This system is built on a CNN algorithm and gives an average accuracy of 86.24%. This accuracy can be further improved by giving more data into the dataset.

#### **FUTURE SCOPE**

We are trying to increase our accuracy by increasing the number of layers in the neural networks.

# **Abstract**

It is beneficial to annotate sensor data with distinct sensor ontologies in order to facilitate interoperability among different sensor systems. However, for this interoperability to be possible, comparable sensor ontologies are required since it is essential to make meaningful links between relevant sensor data. Swarm Intelligent Algorithms (SIAs), namely the Beetle Swarm Optimisation Algorithm (BSO), present a possible answer to ontology matching problems. This research focuses on a method for optimizing ontology alignment that employs BSO. A novel method for effectively controlling memory use and striking a balance between algorithm exploration and exploitation is proposed: the Simulated Annealing-based Beetle Swarm Optimisation Algorithm (SA-BSO). Utilizing Gray code for solution encoding, two compact operators for exploitation and exploration, and Probability Vectors (PVs) for swarming choosing exploitation and exploration, SA-BSO combines simulated annealing with the beetle search process. Through inter-swarm communication in every generation, SA-BSO improves search efficiency in addressing sensor ontology matching. Three pairs of real sensor ontologies and the Conference track were used in the study to assess SA-BSO's efficacy. Statistics show that SA-BSO-based ontology matching successfully aligns sensor ontologies and other general ontologies, particularly in conference planning scenarios.

#### **ABSTRACT**

Multiple-input multiple-output (MIMO) and orthogonal frequency division multiplexing (OFDM) are widely utilized in wireless systems and maximum data rate communications. The MIMO-OFDM technology increases the efficiency of spectrum utilization. The peak-to-average-power ratio (PAPR) minimization in MIMO-OFDM is a complex task in wireless communications systems. In this research, an adaptive tunicate swarm optimization with partial transmit sequence (ATSO-PTS) algorithm is proposed for a reduction of PAPR in MIMO-OFDM. The nonsquare-matrixbased differential space time coding (N-DSTC) scheme is used for the encoding and decoding process of MIMO-OFDM. The N-DSTC encoding and decoding are linear error-correcting codes that are utilized for message transmission over noisy channels. The pre-specified quadrate phase shift keying (QPSK) symbol is deployed for the modulation and demodulation scheme. On the receiver side, the serial to parallel (S/P) conversion, and fast Fourier transform (FFT) are accomplished, alongside the received data bits being demodulated to obtain the output bits. The proposed ATSO-PTS method achieves better results according to performance metrices PAPR, bit error rate (BER) and signal-to-noise-ratio (SNR), with values of about 2.9, 0.01 and 0.025, respectively. This ensures superior results when compared to the existing methods of twin symbol hybrid optimization applied to partial transmit sequence (TSHO-PTS), selective level mapping and PTS (SLM-PTS), and particle swarm and grey wolf (PS-GW) with PTS, respectively.

# 1. INTRODUCTION

The growing need for advancements in wireless applications has rendered the currently available radio frequency (RF) spectrum, inadequate to meet future service requirements [1]. Orthogonal frequency division multiplexing (OFDM) is majorly considered in wireless systems to attain maximum-rate data transmission due to its larger spectral efficiency, simple equalization, as well as low-complexity execution [2], [3]. Therefore, OFDM is also majorly utilized in wideband communications over mobile radio channels, digital audio broadcasting, high-bit-rate digital subscriber lines and optical systems [4]. Despite the OFDM

П

having number of advantages, it has one major limitation, which is that the transmitted signal has a high peak-to-average-power ratio (PAPR) [5]. On an summption of maximum PAPR, the OFDM signal is fasten when it forwards by non-linear high-power amplifier (HPA) and thus, the performance is degenerated, while in-band bias as well as out-of-band radiation also happens. Thus, the OFDM transmitters needs costly linear HPA with extreme dynamic range [6], [7]. Recently, a number of optimization algorithms are recommended to optimize the partial transmit sequence (PTS) technique for PAPR reduction in OFDM systems [8]. Between them, the most famous evolutionary algorithms are the genetic algorithm (GA), differential evolutionary algorithm (DE), and biogeographic optimization algorithm (BBO) which are majorly used for the reduction of PAPR [9]. However, the selection of the phase factor sequence in the PTS approach is a risk in non-linear optimization, which is caused by greater complexity and memory utilization if there are a greater number of non-overlapping sub-blocks [10], [11]. By embedding the pilot signal within the optical OFDM signal in the frequency domain minimizes the time domain signals [12]. A reduction of PAPR in MIMO-OFDM is a complex task in wireless communications, where the spectral efficiency is also reduced when the cyclic prefix enters in OFDM [13]. According to the literature and targetted at the limitations of an existing signal compounding transform methods, a novel approach is inroduced for combinely optimize the PAPR and bit error rate (BER) performance [14], [15].

Sarkar et al. [16] implemented a twin symbol hybrid optimization applied to partial transmit sequence (TSHO-PTS) to minimize PAPR in cyclic prefix-OFDM (CP-OFDM). The hybrid optimization algorithms of salp swarm (SS) as well as bald eagle search (BES) were produced to determine phase factor. The digital chaotic was utilized to certify physical layer security in data transmission for (DFT-S-OFDM) subcarrier allocation. A PTS method achieved the minimum PAPR in less processed and consumed time, but the efficiency of bandwidth was decreased by the system itself. Sidiq et al. [17] developed a hybrid method of selective level mapping and PTS (SLM-PTS) with ant bee colony (ABC) phase optimization for PAPR minimization. The SLM was initially enforced to the traditional farnesyl dimethyl chromanol (FDMC) signal and the PAPR signal was obtained with selected similar phase sequences. This method significantly minimized the PAPR by the minimum computational complexity by combining the SLM and PTS benefits. The SLM-PTS suffered from the interface between unsynchronized symbols in the closest bands. Kumar et al. [18] implemented a PTS over a hybrid of particle swarm and grey wolf (PS-GW) optimization for the performance of minimum PAPR, as well as low computational complexity. The PS-GW identified the phase rotational factors combination effectively. The PS exploitation was improved with the estimation capability in GW to develop multiple variations in quality. The PS-GW achieved better performance and minimum PAPR than the PS and GW. However, PAPR achievement was decreased using various channel constraints. Prasad and Jayabalan [19] implemented a particle swarm optimization (PSO) applied to the technique of PTS to identify the phase factor for reducing the PAPR. A scaling factor was established in the velocity updating equation of conventional PSO to enhance the inertia weight and particle velocity. The PSO-PTS achieved the efficient minimum PAPR and was most efficient for the applications using the 64-quadratic amplitude modulation (QAM) modulation scheme, but this method performed a low convergence rate.

Şimşir and Taşpınar [20] implemented a discrete elephant herding optimization using PTS (DEHO-PTS) to minimize PAPR in universal-filtered multi-carrier (UFMC) signals to the lowest levels. An advanced scheme of PTS was powered by an intelligent optimization which was enforced to UFMC waveform. This approach was majorly focused on decreasing the transmission signals in PAPR values and achieved better performance and low BER. The conventional PTS was a difficult method for systems to obtain efficient transmission powers with a smaller number of searches. Bai and Yang [21] developed an enhanced PSO called the discrete adaptive PSO (DAPSO) approach for solving the problem of high PAPR in UOWC. This method integrated PTS and DAPSO to minimize the PAPR in the UOWC system. The PTS was applied to a probabilistic approach for effectively defeating the performance of PAPR. Simultaneously, the twodimensional adaptive PSO effectively modified the comprehensive search for the phases of PTS. This method effectively solved the complexity of the calculation and also achieved a fast convergence speed. Abed et al. [22] introduced PSO-based dummy sub-carriers which were applied with data, without transmitting the side information for PAPR reduction. The fusion of suggested approach was employed by calculating a PAPR at an outcome of inverse fast fourier transform (IFFT). Later, this method added the six adaptive sub-carrier sequences to an IFFT input data. This method transmitted the data when the dummy subcarrier was in a significant threshold. Further, it utilized the additive white gaussian noise (AWGN) channel to explore the performance of PAPR and BER. This method achieved low computational complexity regarding the number of additions and multiplications, but it had a low convergence rate. Li et al. [23] developed a PTS-based discrete PSO with a threshold (PTS-DPSO-TH) and utilized to a filter bank multicarrier with quadratic amplitude modulation (FBMC/OQAM) for PAPR reduction. This method utilized the DPSO to identify an optimal solution and effectively minimize the PAPR in the OQAM approach, alongside reducing the complexity problem. Then, the threshold was established to minimize the iteration numbers, and 530 ☐ ISSN: 2089-4864

later decrease the system complication on the assumption of undertaking the PAPR reduction performance. The PTS-DPSO-TH effectively reduced the PAPR, but this approach had a low convergence rate.

Simsir and Taspinar [24] introduced an efficient PAPR reduction method for the waveform of the UFMC system. This method initially introduced a novel discrete version of the invasive weed optimization (DIWO) approach and combined it with the traditional PAPR reduction approach called PTS deployed as the phase optimizer. By doing so, this method acquired a novel method known as DIWO-PTS. The DIWO was the method to optimize the phase sequences in the discrete phase. The DIWO achieved the best phase integration in a minimum number of searches. However, the DIWO had less population diversity and did not take the best member of the population during the process of optimization. Ali and Hamza [25] implemented a new optimization method, teaching-learning-based optimization (TLBO) for the reduction of PAPR in the OFDM signal. This approach introduced selective mapping (SLM) based TLBO for the effective reduction. The TLBO was performed to identify search factors in the SLM approach. This method effectively reduced the PAPR with low computational complexity and did not require certain parameters. However, this method consumed a larger memory storage space. To address these limitations of the existing methods, the MIMO-OFDM systems are proposed in this research. Simultaneously, the synchronization, evaluation of channel, PAPR, larger memory storage, selection of antenna, and convergence rate were the specific limitations of the above-discussed existing methods which are examined through the OFDM signal. Therefore, for the reduction of PAPR, the novel adaptive tunicate swarm optimization with partial transmit sequence (ATSO-PTS) with MIMO-OFDM approach is introduced to minimize PAPR in OFDM. Further, the proposed method is briefly discussed in the following section. This research's major contributions are as follows:

- This research offers the reduction of PAPR with faster convergence as well as minimized computational complexity as the foremost achievement.
- The paper focuses on minimizing PAPR using quick convergence and minimizing computational complexity. The ATSO-PTS is developed for PAPR reduction in MIMO-OFDM.
- Nonsquare-matrix-based differential space time coding (N-DSTC)approach is employed for encoding
  and decoding which helps to achieve better data broadcasting over the MIMO-OFDM. This research
  considers quadrature phase shift keying (QPSK) for modulation/demodulation because of its low error
  probability.

The rest of the paper is arranged in the succeeding way: section 2 presents the proposed methodology which includes the MIMO-OFDM system with N-DSTC encoding and decoding approaches. Section 3 discusses the ATSO. Section 4 describes results and discussion and finally, section 5 describes the overall summary.

#### 2. PROPOSED METHOD

In this research, an ATSO is proposed with the N-DSTC coding for minimizing PAPR while transmitting the data over MIMO-OFDM. The N-DSTC codes are linear error-correcting codes that are utilized for the transmission of messages over noisy channels. Figure 1 depicts the proposed method's workflow.

Figure 1. Workflow of the proposed method with MIMO-OFDM

At the transmitter, the incoming binary data is first grouped and mapped according to the coding scheme of N-DSTC. The QPSK symbol is the pre-specified modulation scheme utilized, and then converted into parallel signals by serial-to-parallel block. After inserting some pilots, IFFT is additionally deployed for

transmitting a sequence of data to a time-domain signal. An ATSO is inserted into the time-domain OFDM symbol to reduce the inter carrier interface (ICI) and inter symbol interference (ISI). The transmitted signal passes by using the channel with AWGN noise after the converting the signal serial into parallel. The FFT is followed after the conversion of serial to parallel at the receiver. After FFT, some pilots are removed and the system is converted from parallel to a serial block. At last, the binary data is acquired after the demodulation using the QPSK modulation scheme, and decoding using the N-DSTC coding scheme. The QPSK provides a low error probability and good noise immunity, alongside the bandwidth required by the QPSK being reduced to half as compared to binary phase-shify keying (BPSK) for the same BER. Furthermore, IFFT is employed for transmitting the sequence of data to the time-domain signal, after inserting some pilots.

#### 2.1. System model of MIMO-OFDM

In this paper, a system model of MIMO-OFDM [26], having three major portions, namely, transmitter, channel, and receiver is introduced. This approach provides an efficient and robust system for data transmission in MIMO-OFDM. Figure 2 shows the system model of MIMO-OFDM.

Figure 2. System model of MIMO-OFDM

The system of IFFT and FFT MIMO-OFDM is implemented in this paper. This approach provides an efficient and robust system for data transmission in MIMO-OFDM. A baseband signal is described in (1) and a time domain sample in IFFT output is expressed in (2).

$$\chi(t) = \sum_{k=0}^{N-1} X(k) e^{j2\pi k\Delta ft}$$
 (1)

$$\chi(n) = W^H X(k) \tag{2}$$

Where, N is the number of subcarriers, X(k) is the complex modulation symbol transmitted on  $k^{th}$  subcarrier, and  $\Delta f$  is the subcarrier spacing. W is the FFT integrated matrix of order  $N \times N$ . The CP of length g is extended to remove ISI which is expressed in (3). The received signal is described in (4).

$$x'(n) = C_r \times x(n) \tag{3}$$

$$y(n) = \sum_{i=0}^{L-1} h_i x'(n-i) + z(n), n = 0,1,..., N-1$$
(4)

Where,  $z(n) \sim N(0, \sigma_z^2) - AWGN$ ,  $C_r - (N+G) \times N$  is the order matrix. The frequency channels are designed by utilizing L-tap finite impulse response (FIR) using taps  $[h_0, h_1, ..., h_{L-1}]$ . At the receiver side, the CP elimination exists that is denoted as a received signal multiplication by using a matrix  $C_R$ , and is expressed in (5) and (6).

$$C_R = [O_{N \times G} I_N] \tag{5}$$

$$Y(k) = WC_R \tilde{H} C_T W^H X(k) + Z(k) \tag{6}$$

Where,  $Z(k) = WC_R z(n)$  and  $H = WC_R \widetilde{H} C_T W^H$ . Therefore, the frequency domain received signal for OFDM is provided in (7). The received signal matric vector model is expressed in (8) and (9).

$$Y = HX + Z \tag{7}$$

$$Y = Ah + Z \tag{8}$$

$$H = \sqrt{N}Fh \tag{9}$$

Where, H is the response of channel frequency, X is the transmitted symbols, Z is the AWGN with 0 mean.  $N_t$  and  $N_r$  is the number of transmit and receive antennas in MIMO-OFDM, h is the received symbol, Y is minimum pilots.  $A = \sqrt{N} diag(X)F$  and F- partial FFT matrix and CFR matrix. The transmitted MIMO-OFDM system are provided to the N-DSTC system for the encoding and decoding processes of the OFDM signal.

#### 2.2. Nonsquare matrix-based differential space-time coding

In this section, the N-DSTC consisting of encoding and decoding approaches [27], [28] are discussed. This section encodes and decodes the input of the OFDM signal, where the N-DSTC scheme is majorly utilized to minimize the number of time slots. The space-time euphemism  $S(i) \in C^{M \times M}$  is transmitted in M slots by M antennas. Enhancing a large amount of transmit antennas affects the enhancing of the number of essential time slots and ineffective for large scenarios of MIMO. Hence, a non-square matrix-based DSTC is developed to minimize the amount of time slots. Particularly, it increase S(i) through basis  $e_1 \in C^{M \times 1}$  to minimize the number of slots between M and M.

# 2.2.1. Nonsquare differential encoding and decoding

The set of estimating metrics  $\{E_1, ..., E_{M/T}\}$  are transmitted at the beginning of the transmission stream. Initially, the received symbol is denoted in (10). Hence, this requires M number of time slots. Considering the W blocks time transmission frame, the projection metrics are transmitted to the receiver. The subsequent data metrics X(i) are encoded and expressed in (11). Mapped onto  $M \times T$  nonsquare matrices by projection matrix  $E_i$ , as well as transmitted such that interrelated received signal is formulated in (12).

$$Y(i) = H(i)E_i + V(i), for \ 1 \le i \le M/T \tag{10}$$

$$S(i) = \begin{cases} I_M & \text{if } i = \frac{M}{T}, \text{ or} \\ S(i-1)X(i) & \text{if } i > \frac{M}{T}, \end{cases}$$
 (11)

$$Y(i) = H(i)S(i)E_i + V(i), for \frac{M}{T} < i \le W$$
(12)

The ratio among the number of transmit antennas M and length of frame W is,  $\eta \triangleq M/W$  which is denoted as an insertion ratio. For the task performance, this method sets  $\eta = 5\%$  such that W = 200M, but remark that the N-DSTC performance remains robust in high-speed mobile scenarios plan using  $\eta = 1\%$  or 0.1%. Hence, the tree-based approach is utilized to achieve minimum PAPR between all sub-carriers in a limited computational process. In the process of phase factor, the proposed algorithm accumulates the phase factor yielding less PAPR. To achieve this, the proposed method uses the ATSO model for obtaining reduced PAPR values. The obtained results are provided to the optimization algorithm for the further processes.

#### 3. TUNICATE SWARM OPTIMIZATION

The encoded data from the input signal is provided to the optimization process for improving the computational efficiency of the phase optimization algorithm. Tunicate swarm optimization (TSO) [29] is a meta-heuristic algorithm activated by marine tunicates' performance and jet propulsion over navigation as well as foraging. The tunicate is in the form of a millimeter scale and locates sources of food in the sea. The tunicate satisfies the three general conditions in propulsion which are: to eliminate the hit using the number of tunicates in search space, to obtain a suitable path to select an effective search location, and finally, to select a better search agent. Further, the tunicates change their positions to achieve better search, and the process is enhanced in every iteration. The TSO begins using population incidentally produces tunicate with generate variables permittable boundaries, as expressed in (13) where tunicates modify the location in iterations as depicted in (14).

$$\vec{T}_p = \vec{T}_p^{min} + rand \times (\vec{T}_p^{max} - \vec{T}_p^{min})$$
(13)

$$\vec{T}_p(\vec{x}+1) = \frac{\vec{T}_p(x) + \vec{T}_p(\vec{x})}{2 + c_1} \tag{14}$$

Where,  $\vec{T}_p$  is the tunicate position, rand,  $c_1$  denotes arbitrary number within the range [0,1].  $\vec{T}_p^{max}$  and  $\vec{T}_p^{min}$  are the lower and upper design variables, respectively, while  $\vec{T}_p(x)$  is the updated position of tunicate's food source as mathematically expressed in (15). SF is the source of food, A is the arbitrary vector that avoids the tunicates from hitting one another and it is mathematically designed in (16).

$$\vec{T}_p(x) = \begin{cases} SF + A \times |SF - rand \times \vec{T}_p|, & if \ rand >= 0.5 \\ SF - A \times |SF - rand \times \vec{T}_p| & if \ rand < 0.5 \end{cases}$$
(15)

$$A = \frac{c_{2+}c_{3}-2c_{1}}{VT_{min}+c_{1}(VT_{max}-VT_{min})} \tag{16}$$

Where,  $c_1$ ,  $c_2$  and  $c_3$  – random number with range [0,1],  $VT_{min}$ , while  $VT_{max}$  respectively reflect minimum and maximum speeds utilized to perform community communication denoted as 0 and 1. The obtained TSO outcome is provided in the next section for the efficient reduction of PAPR. The TSO algorithm procedures are given:

- Initialize the population of tunicate  $\vec{T}_p$  according to (13).
- Select initial parameters as well as a greater number of iterations.
- Estimate the fitness value of the search agent.
- The better tunicate is traversed in given search space.
- Update the tunicate's position utilizing (14).
- Alter the updated tunicate that moves behind a boundary in the provided search space.
- Calculate the updated fitness value of the tunicate. If it obtains the best solution than the preceding optimal solution, it is updated with a better solution.
- If satisfied with an ending basis, then the algorithm ends or repeats steps 5 to 8.
- Finally, the best solution has been obtained.

#### 3.1. Adaptive tunicate swarm optimization

The efficiency of the tunicate swarm algorithm (TSA) exhibits endurance with the local optimum solutions when compared to the most common algorithms. Moreover, this is not better choice for certain intricate solutions by various optimal solutions. In TSA, each tunicate finds the food source and finds it unfeasible to retrieve without knowing where the food source is located. Later, it achieves convergence when it is no longer able to design findings and ends functioning. Thus, an adaptive version of TSO (ATSO) [30] is implemented to defeat weaknesses in TSO as well as improve the algorithm's search capacity and flexibility. The TSO is improved by using the two phases such as exploration and exploitation to enhance the search capability. Figure 3 shows the proposed method using ATSO.

Figure 3. The proposed method using ATSO

An efficient metaheuristic algorithm is essential to classify the process of search into multiple phases of exploration and exploitation. The metaheuristic algorithm is employed to find a good solution to an optimization problem that is complex and difficult to solve to optimality. Conversely, the exploitation denotes the optimization algorithm's capacity to identify near-optimal solutions. The exploitation permits the optimizer to focus on closets that compromise good quality solutions in the space of searching. As each iteration passes, TSO updates the candidate position solutions near individual points to the entire population in such a way that the TSO has a good capability of exploitation. Thus, its drawback is the absence of efficient global search, alongside rejecting an exploration capability.

Aiming to enhance the algorithm's establishment and exploration capacity, the introduced ATSO carries out two major phases in every iteration. Initially, the candidate solution is selected incidentally in place of a better solution, and the location of the applicant solutions is updated based on arbitrary tunicate's location. The optimizer employs an arbitrary operator to analyze diverse areas and search space for efficient exploration. Hence, in ATSO, two different incident numbers are calculated in a tunicate updating eqn. to generate solutions in different search space areas. An ATSO exploration phase is logically expressed in (17).

$$\vec{T}_p(\vec{x}+1) = \vec{T}_p(r) - rand_1 \times |\vec{T}_p(r)| - 2 \times rand_2 \times \vec{T}_p(\vec{x})|$$
(17)

Where,  $\vec{T}_p(r)$  arbitrarily chosen tunicate that forms a new population. This process encourages exploration, as well as permits the TSO to perform many robust global searches using the entire space of search. In the last phase, the tunicate updates its positions according to the best tunicate position. Moreover, in the ATSO, the lowest tunicate using the greatest aiming function value is changed using an incidentally produced tunicate at every iteration. The exploration and exploitation of ATSO in search space are controlled by the inertia constant instead of using the mathematical equation. The ATSO algorithm eminently enhances the computational efficiency of the phase optimization algorithm.

Eventually, the optimal phase factors are acquired by an optimization algorithm, and further, this algorithm provides the maximal optimal phase factors by the utilization of ATSO. However, the optimization algorithm consumes a minimum duration than the other methods and hence, the computational time is decreased by utilizing the ATSO algorithm. Further, the evaluation and implementation of this proposal is provided in the following sections.

#### 4. RESULTS AND DISCUSSION

In this research, an ATSO-PTS method is proposed to reduce PAPR values in a waveform of OFDM signal. The proposed method is implemented on the MATLAB software, on a system operated with an i5 processor and 6 GB RAM. The proposed ATSO-PTS method is utilized to perform an effective denoising and channel estimation for MIMO-OFDM. The performance of the proposed ATSO-PTS method is compared with the existing methods. The existing methods namely, OFDM, conventional-PTS (C-PTS), conventional-selective mapping (C-SLM), and PSO are utilized for the comparison. Furthermore, the performance metrics used in this research to evaluate the performance of the proposed ATSO-PTS are, BER, PAPR, complementary cumulative distribution function (CCDF), and symbol error rate (SER). The parameter settings of this model are depicted in Table 1.

Table 1. Parameter settings of the ATSO-PTS method

Parameter	Value	
Number of iterations	100	
Population size	30	
User carriers	52, 104, 156, 208, 260	
Pilot carriers	12, 24, 48, 60, 72	
FFT size	64, 128, 256, 512, 1024	
Antenna	$2 \times 2$ , $2 \times 4$ , $4 \times 2$ , $4 \times 4$	
Number subcarriers	128, 256	
Cyclic prefix or guard time	0 to 2e-6s	
Modulation	QPSK	
Modulation range	16	
MIMO-OFDM symbols	16	
Oversampling factor	1e6 HZ	
Channel type	AWGN channel	

Table 2 represents the  $E_b/N_o(dB)$  comparison for the proposed method against the existing methods when the value is taken as 30. The existing methods of OFDM, BPSK, QAM-8 and QAM-16 are measured and compared with the proposed method. Figure 4 shows the graphical representation of BER, with respect to  $E_b/N_o(dB)$ .

In Table 2, the QPSK modulation is compared with previous modulations using BER. The maximum BER with respect to  $E_b/N_o(dB)$  of QPSK modulation is 30 dB. The maximum BER with respect to BER of the QPSK of value is 30 dB. The PAPR reduction is achieved without downgrading the performance of BER, in contrast to the existing methods. Here, the AWGN noise channel is considered

where the  $E_b/N_o(dB)$  ranges between -30 to 30. The BER values and error number are minimized because of its enhanced noise immunity and low error probability.

Table 2. Performance analysis of BER in  $E_b/N_o$  (dB) = 30

Methods	BER
OFDM	$10^{-3.4}$
BPSK	$10^{-3.8}$
QAM-8	$10^{-3.4}$
QAM-16	$10^{-1.5}$
QPSK	$10^{-7.4}$

Figure 4. Graphical representation of BER of the QPSK modulation in MIMO-OFDM

Table 3 represents the  $E_b/N_o(dB)$  comparison of the proposed method with that of the competitor approaches when the value is 30. The existing methods, which are OFDM, C-PTS, C-SLM, and PSO are measured and compared with the proposed method. Figure 5 represents the graphical representation of BER as to  $E_b/N_o(dB)$ .

Table 3. Performance comparison of BER when  $E_b/N_o(dB) = 30$

Figure 5. Graphical representation of BER of proposed ATSO-PTS method in MIMO-OFDM with respect to  $E_b/N_o(dB)$ 

536 □ ISSN: 2089-4864

In Table 3, the proposed ATSO-PTS is compared with the existing modulations in terms of BER. The BER with  $E_b/N_o(dB)$  of the ATSO-PTS value is set to 30 dB. Here, without downgrading the performance of BER, the PAPR reduction is achieved contrasting to other methods. Here, the AWGN noise channel is considered where the  $E_b/N_o(dB)$  is in the range of -30 to 30. The values of the BER are reduced because of its enhanced noise immunity and low error probability.

Table 4 represents the PAPR (dB) comparison of the proposed method QPSK with competitor approaches when  $CCDF = 10^{-2.5}$ . The QPSK is compared with existing modulations, OFDM, BPSK, QAM-8, and QAM-16. Figure 6 shows the graphical illustration of CCDF with respect to PAPR (dB).

Table 4. Performance comparison of QPSK using PAPR (dB) when CCDF=10<sup>-2.5</sup>

Methods	PAPR (dB)	
OFDM	18.3	
BPSK	7.5	
QAM-8	9.1	
QAM-16	7	
QPSK	2.5	

Figure 6. Graphical representation of QPSK modulation and various existing methods based on CCDF

In Table 4, the QPSK is compared with existing modulations in terms of CCDF with PAPR (dB). A maximum CCDF using PAPR of QPSK is 2.5 dB. The OFDM achieves 18.3 dB, BPSK achieves 7.5 dB, QAM-8 achieves 9.1 dB, and QAM-16 achieves 7 dB. The suggested ATSO-PTS method achieves the PAPR values multiple times better than the original OFDM. The PAPR range lies between 0 and 20.

Table 5 represents the PAPR (dB) comparison of the proposed method ATSO with existing methods when  $CCDF = 10^{-2.5}$ . The proposed ATSO-PTS is compared with previous modulations, OFDM, C-PTS, C-SLM, and PSO. Figure 7 shows the graphical illustration of CCDF in terms of PAPR (dB).

Table 5. Performance analysis of ATSO using PAPR (dB) in CCDF =  $10^{-2.5}$ 

Methods	PAPR (dB)
OFDM	18.5
C-PTS	9.8
C-SLM	8.5
PSO	6.5
Proposed ATSO	2.9

In Table 5, the suggested ATSO-PTS is compared with previous modulations in terms of PAPR (dB). A CCDF in terms of PAPR of ATSO-PTS is 2.9 dB. The OFDM achieves 18.5 dB, C-PTS achieves 9.8 dB, C-SLM achieves 8.5 dB, and PSO achieves 6.5 dB. The proposed ATSO-PTS method achieves the PAPR values multiple times better than the original OFDM. The PAPR range lies between 0 and 20.

Figure 7. Graphical representation of proposed ATSO-PTS and various existing methods

Table 6 represents the  $E_b/N_o(dB)$  comparison of the proposed method with competitor approaches at a value of 30. The QPSK modulation is compared with existing modulations named OFDM, BPSK, QAM-8, and QAM-16. Figure 8 shows the graph of SER with respect to  $E_b/N_o(dB)$ .

In Table 6 the QPSK modulation is compared with previous modulations in terms of SER. The maximum SER with respect to  $E_b/N_o(dB)$  of QPSK modulation is 30 dB. The maximum BER in terms of BER of the QPSK of value is 30 dB. Without downgrading the performance of BER, the PAPR reduction is achieved compared to other methods. Here, the AWGN noise channel is considered, and the  $E_b/N_o(dB)$  in the range between -30 to 30. The SER values are reduced because of its enhanced noise immunity and low error probability.

#### 4.2. Discussion

This section discusses the obtained results of the proposed method compared with the existing methods. The OFDM approach's values of the PAPR are reduced by the outcomes of existing methods as well as ATSO performance in PTS. In this proposed method, the number of parameters is carried out to reduce the PAPR rate in OFDM signals. The various simulations are carried out to identify a PAPR improvement for the determination and comparison of the sub-optimal PTS. A single OFDM is produced arbitrarily to minimize the PAPR as well and corresponding parameters are performed for the process of simulation. The obtained classification results of this research are represented in Tables 1 to 6. Figures 4 to 9 shows the graphical representation of the reduction of BER, PAPR, and SER. Table 8 shows the comparative analysis of the proposed method with existing methods with 30 PAPR. In Table 8 the existing methods such as TSHO-PTS [16] have achieved a PAPR (dB) rate of 5. The ABC-SLM-PTS [17] have achieved a PAPR rate of 5.6, PSO-GWO [18] achieved the 10.1 PAPR (dB). The proposed ATSO-PTS method has achieved a better result with PAPR value is 2.9 respectively. Table 9 shows the BER and SNR reduction of the proposed method with existing methods. In Table 9, the existing method of TSHO-PTS [16] has achieved the 0.01

BER and SNR rate for 30 dB PAPR. The ABC-SLM-PTS [17] have achieved the BER rate 0.07 and SNR of 0.12. The PSO-GWO [18] achieved a BER of 0.03 and SNR of 0.02. The proposed ATSO-PTS method has achieved better results on BER is 0.01 and 0.025 respectively. The proposed method achieves a fast convergence speed compared with the other methods.

#### 5. CONCLUSION

MIMO and OFDM are majorly utilized in wireless systems and wired high-data rate communications. In this research, the ATSO-PTS algorithm is proposed for the PAPR reduction in the MIMO-OFDM signal. The phase optimization is taken out in the OFDM signal with PTS and the proposed method is tested with FFT in OFDM signal optimization. The proposed method achieved better PAPR reduction when compared to the existing research methods by utilizing the optimization ATSO technique. In the MIMO-OFDM signal, the ATSO optimization algorithm is applied to reduce the PAPR as well as reduce the computational complexity of the phase optimization. The ATSO-PTS achieved less PAPR, BER, and SNR compared to other methods. The proposed method has 10-2 CCDF in 2.9 PAPR as well as existing TSHO-PTS method obtained the 5.0 PAPR to achieve 10-2 CCDF. The future work of the proposed method involves combining multiple PAPR reduction techniques into a hybrid scheme which can potentially lead to better performance.

#### BIOGRAPHIES OF AUTHORS

Abdul Lateef Haroon Phulara Shaik (D) [3] SC (C) received a B.E. in electronics and communication engineering RYMEC, Ballari, Karnataka, India. He holds an M.Tech. degree in VLSI design and embedded systems from K S School of Engineering and Management, Karnataka, India. Obtained a Ph.D. in electrical engineering sciences from Visvesvaraya Technological University Belagavi, Karnataka, India. Currently, he is an associate professor in the Department of Electronics and Communication Engineering at BITM Ballari, Karnataka, India. He has published many papers in International and National journals and international conference proceedings and has three patents. At present, he is guiding four students at Visvesvaraya Technological University, Belagavi, and Karnataka, India. He has around 12 years of teaching and research experience. He can be contacted at email: abdul.lh@bitm.edu.in.

Sowmya Madhavan (1) 🔯 🚾 🕩 is presently working as an associate professor in the Department of Electronics and Communication Engineering, Nitte Meenakshi Institute of Technology, Bangalore. She completed her bachelor of engineering in telecommunication and master of technology in Digital Electronics from Visvesvaraya Technological University, Belgaum. She has also completed her Ph.D. from Visvesvaraya Technological University, Belgaum. She has published about 18 papers in various journals and conferences. She has also completed her PG level advanced certification program in VLSI chip design. Her research interests are physical design, RTL design and analog VLSI design. She can be contacted at email: sowmya.madhavan@nmit.ac.in.

Parameshachari Bidare Divakarachari 🗓 🕄 🚾 🗘 currently working as a professor in the Department of Electronics and communication Engineering at Nitte Meenakshi Institute of Technology, Bengaluru, Karnataka, India affiliated to Visvesvaraya Technological University (VTU), Belagavi, Karnataka, India. He is also the visiting professor for University of Rome Tor Vergata, Italy. He is currently serving as the student activity committee chair, IEEE Bangalore Section. He is also listed in the World's Top 2% Scientist by Stanford University, USA for his research works. He has published over 150+ articles in SCI, Scopus and other indexed journals and in several international conferences. He is the associate editor for Expert Systems (Wiley), International Journal of Computational Intelligence Systems (Springer), Wireless Communication and Mobile Computing (Hindawi) and International Journal of Reconfigurable and Embedded Systems (IAES). He is also serving as editorial board member, academic editor and reviewer for several international journals indexed in SCI and Scopus. He has also served as the lead guest editor for Springer, Elsevier and IEEE Journals. Under his guidance, IEEE NMIT SB has received Rs. 20,000,000 funding from IEEE AESS Society. He can be contacted at email: paramesh@nmit.ac.in.

Rocío Pérez de Prado 6 8 sc preceived the M.S. degree in telecommunication engineering from University of Seville, Spain, in 2008, and the Ph.D. degree in Telecommunication Engineering with European Mention from University of Jaén, Spain, in 2011. At present, she is an associate professor at the Department of Telecommunication Engineering at the University of Jaén, Spain, with more than 15 years of research experience in the fields of artificial intelligence, machine learning, data science, cloud-IoT-edge, and telecommunications. In 2021, she was appointed as IEEE Senior Member. She has authored more than 60 research publications (35 in journals indexed in JCR). Since 2021 she works as an expert for the European Commission evaluating projects for H2020 and Marie Skłodowska-Curie Actions, and since 2020 she has been an external evaluator and member of project selection committees of the National Fund for Scientific and Technological Development, for the government of Peru. She is an associate editor of the official journal of the World Federation of Soft-Computing, Applied Soft Computing, Elsevier, editor in engineering applications of artificial intelligence, Elsevier, editor in Intelligent Automation and Soft-Computing, Tech Science Press, and Energies, MDPI, and has edited more than 10 special issues in diverse JCR-indexed journals and 2 international books. She has also served as reviewer for more than 40 JCR-indexed journals. Additionally, she has participated in scientific committees/organizing committees in more than 50 international conferences such as IEEE-FUZZ between the years 2019-2023, as well as technical committee chair and track chair and keynote speaker-guest of honour at diverse conferences. Likewise, she has participated in 10 research projects and diverse contracts with companies and projects to promote entrepreneurial culture in the field of telecommunications engineering. She has received 3 awards from Publons-Clarivate Analytics, as an outstanding reviewer. In 2010 she enjoyed a 5month stay at the Technical University of Dortmund as a visiting researcher in the Department of Systems and Control Engineering, Germany. In the teaching field, she currently teaches in 2 degrees and 3 master's degrees in the field of telecommunication engineering, artificial intelligence and cloud computing in the University of Jaén. In addition, she has supervised more than 25 bachelor's degree, master's degree and final year theses. She is the author of more than 15 teaching publications in conferences, 3 books, and she has participated in 8 teaching innovation projects (leading 2 of them). She has received 2 awards from the University of Jaén, Spain, for Good Teaching Practices Perceived by Students. She can be contacted at email: rperez@ujaen.es.

Paramesh Siddappa Parameshwarappa is currently working as an assistant professor in the Department of Computer Science and Engineering, School of Engineering, Central University of Karnataka, Kalburagi, India. He received M.E. in web technology from U.V.C.E, Bangalore University in 2014 and Ph.D. in computer science and engineering from Visvesvaraya Technological University (VTU), Belagavi, India in 2022. His research areas include data mining, artificial intelligence, pattern recognition, machine learning, NLP, and soft computing techniques. He can be contacted at email: parameshsp@cuk.ac.in.

Kavitha Malali Vishveshwarappa Gowda is currently working as an associate professor in Department of Electronics and Communication Engineering at Gopalan College of Engineering and Management, Karnataka, India which is affiliated to Visveswaraya Technological University (VTU). She received M.Tech. in VLSI design and embedded system from VTU in 2009. Her Ph.D. is in VLSI design from VTU and awarded in 2021. Her research area includes VLSI design and communication. She can be contacted at email: kavishanthagiri@gmail.com.

#### **Abstract**

In the present day, one of the major issues that is affecting human health and the quality of human life is stress. Sensors are developed with different shapes of electrodes. Electrodes with different shapes possess different surface areas for the accumulation of hormones, so they play a vital role in hormone analysis. This paper presents an analysis of sensing methods like electrochemical impedance spectroscopy (EIS) and cyclic voltammetry. It explores the optimization of the electrode shapes for use in hormone detection using these sensing methods. The designs and analyses are conducted using COMSOL MULTIPHYSICS software. COMSOL is used to design and analyze three electrode geometries: stepped cuboidal, cuboidal, and cylindrical for both the techniques. The electrode sizes used are in the standard range of 2–5 mm. The voltage equivalent of the sensed current is around 1 nV (with measured current ranging between around 10 and 520 pA). This is a very small value and is amplified to the order of about 0.1 V, which is more convenient to measure using a signal conditioning circuit. In cyclic voltammetry and thereby EIS, the range of current values shows a 26.61% and 8.39% improvement in cylindrical electrodes compared to stepped cuboidal and cuboidal electrodes, respectively. This can be justified by its increased surface area for hormone accumulation for comparable volumes of electrodes. These improvements can be applied in applications like cortisol hormone detection.

subjected to stress. This stress affects the levels of various hormones in the body. Hormone levels are critical in maintaining optimal health, and the monitoring of these levels can be helpful in the early detection of health hazards.

A certain level of stress in today's society is inevitable and can be tolerated by the body. It is when it goes beyond the threshold consistently that people begin to experience mental and physical side effects. Understandably, it can be quite challenging for a person to determine when he or she has breached this threshold. Therefore, it becomes necessary to quantify this in some manner. The usual approach is to go for a medical test and prescribe a course of action based on the results of that test. While it is common for people to take medical tests for blood pressure, sugar, and other commonly associated lifestyle diseases, taking a cortisol test, for example, to possibly determine the stress a person is under, is quite rare.

This is neither advertised aggressively nor do people find the inclination, time, or financial resources to get themselves regularly tested. While it has become clear

that stress should not be taken for granted when it reaches high levels on a consistent basis, why is there a lack of testing or awareness among people to get them tested? One of the possibilities is the fact that these tests have so far remained mostly invasive, which people are not very comfortable with. High costs and a lack of general awareness are pertinent factors as well. Through the medium of this paper, various non-invasive hormone sensor designs have been explored to detect their concentration primarily in sweat and saliva. This involves designing the physical aspects of the sensor, choosing appropriate materials, and optimization to achieve a desired level of response.

The adrenal glands are responsible for secreting cortisol, majorly in response to stressful situations. This hormone is also the cause of other diseases, namely, Addison's disease and Cushing's syndrome, caused by its deficiency and overproduction, respectively. All existing commercial methods of cortisol detection are time-consuming and mostly invasive to the human body. There have been efforts to make commercially viable, non-invasive biosensors that make it possible to sense in real time. This paper is an effort in the same direction. Existing technologies and progress in improvement in cortisol detection speed and accuracy have been reviewed [1].

Various methods of real-time hormone sensing have been discussed and also the advantages and drawbacks of each developed sensor. Point of care cortisol hormone sensing technologies have also been carried out, encompassing all sources of the hormone like blood, sweat, urine, saliva, and interstitial fluid [2]. Further, an electrical impedance spectroscopy (EIS) technique with four channels for sensing cortisol for monitoring through human sweat with a wearable device has been developed that uses gold electrodes [3].

Demonstration of sensing of hormones from various types of biofluids has been carried out [4]. The types include serum, sweat, blood, and saliva. The sensing technique used is electrochemical impedance spectroscopy (EIS). This method was chosen due to its wide scale application in various biofluids. Stress is a common consideration in several sporting events too, and to facilitate convenient detection even in these cases, a wearable sensor would be invaluable. A sensor design having a mechanism for control of fluids having both vertical and lateral flow helps in detecting the current which results from a reaction between the hormone conjugate (for example, glucose oxidase (GOD) for cortisol) and hormone concentration. A new sensor, featuring a mountable-on-skin, molecularly selective organic electrochemical transistors (MS-OECT), patch-type cortisol biosensor has been conceived, by introducing a multifunctional layered device, adaptable to other categories of wearable sensors based on sweat [5].

A sensor that uses electrochemical detection based on sweat to estimate biomarker level quantity cortisol has been proposed, to trace the endocrine-inflammatory relationship [6]. Optimal electrode design is obtained by simulations using COMSOL Multiphysics. Various methods used for voltammetry have also been detailed, along with that of cyclic voltammetry [7]. Caffeine's electrochemical behavior at CPE was introspected using the method of cyclic voltammetry [8]. It exhibits the capability of AQMCPE (anthraquinone modified carbon paste electrode) for caffeine's electrochemical investigation and its estimation.

Electrodes have been developed using multilayer films containing 2-dimensional tin disulfide nanoflakes, bovine serum albumin (BSA), and cortisol antibody on glass electrodes and characterized using EIS and cyclic voltammetry [9]. Non-invasive electrochemical immunosensor designs have been developed for detection of salivary cortisol [10]. DPV (differential pulse voltammetry) and CV (cyclic voltammetry) studies were applied for electrode calibration using standardized solutions of cortisol. Modeling of a biosensor specific to thin film applications has also been done [11].

Thin film applications have particular significance in wearable biosensors, which is one of the topics pertinent to this work. Continuing on the theme of wearable biosensors, several discussions highlighting the various advantages and challenges associated with wearables have been carried out [12]. A highly improvised electrical double layer (EDL) biosensor has been proposed [13], using flexible sub-states which are nanoporous for wearable diagnostics [14]. Results obtained by using the COMSOL Multiphysics software for the analysis and simulation of cyclic voltammetry (CV) [15] at microelectrode arrays (MEA) have also been reported [16].

Knowledge of the standard range of cortisol values is essential before the analysis is begun. Normal values for a blood sample taken at 8 in the morning are 5 to 25 mcg/dL (micrograms/deciliter) [17].

# 2 Methodology

To detect cortisol levels, there are various sensing techniques available, such as amperometry, potentiometry, and impedimetry. The technique that has been chosen is electrochemical impedance spectroscopy (EIS). This offers the convenience of working with sweat as the base solution, which can also be extended to other analytes such as blood or saliva, should the need arise. This is an impedance-based electrochemical technique. An electrical double layer is formed whenever two conducting phases meet at an interface. These conducting surfaces are oppositely charged and generally formed by an ion

and its corresponding counter ion. There is a change in the capacitance of the electric double layer (EDL) whenever a small perturbation in voltage occurs at the electrode. When the required biomolecule (cortisol) binds with the target molecule, this change in voltage takes place, thereby causing a change in the capacitance. This results in a deviation in impedance value, the magnitude of which indicates the level of cortisol. The simplified figure of the EIS methodology is depicted in Fig. 1.

This sensor is to be modeled in the COMSOL Multiphysics software. This change in impedance can be electronically modeled as Randle's equivalent circuit. In Fig. 2a, which represents Randle's circuit, there are three components  $R_{\rm s}$ ,  $R_{\rm ct}$ , and  $C_{\rm dl}$ , where  $C_{\rm dl}$  and  $R_{\rm ct}$  mainly denote the capacitance of the double layer and the resistance to the exchange of charges, respectively, formed because of the double layer.  $R_{\rm s}$  denotes the solution resistance due to bulk solution ions. The current produced in the reaction is exponentially related to the concentration of cortisol.

# 3 Electrochemical Impedance Spectroscopy

The fundamental requirement of any sensor is to measure some characteristic change or deviation as a result of external or internal factors. In electrical and electronic systems, this change is usually reflected by some variation of any one of voltage, current, or impedance. In electrochemical impedance spectroscopy, as the name suggests, the variation measured is the change in impedance. It has evolved into one of the more widely used techniques as it usually results in the sensor having very high sensitivity [18]. In the present case, any variation in the concentration of the solution under consideration will result in a change in impedance.

One of the simplest ways EIS is implemented in practical systems is by modeling an equivalent electrical circuit. The components used to model the circuit include resistors, capacitors, and inductors, which are some of the most commonly encountered electrical components. As can be observed, these are components to model the impedance of any circuit. As will be seen subsequently, only the resistance

Fig. 1 Methodology of EIS

Fig. 2 a Randle's equivalent circuit. b Randle's equivalent circuit in TINA. c Bode plot in TINA of Randle's equivalent circuit

(b)

and capacitance will be used in the electrical model to imitate physical conditions.

#### 3.1 Randle's Equivalent Circuit

As discussed earlier, it is essential to imitate the physical system and conditions in the form of electronic components in order to develop a sensor. It should be ensured that critical physical characteristics are not lost in this conversion. One of the most commonly used equivalent models used in sensor designs employing electrochemical impedance spectroscopy is Randle's equivalent circuit. Before discussing Randle's equivalent circuit, it is essential to understand what electrical double layer capacitance is. This is a type of capacitance that exists at the interface of an electrode and an electrolyte whenever they come into contact with each other.

The electrolyte is composed of charged ions. Due to potential applied to electrodes and also the very fact that the electrolyte is in contact with the electrode, the ions in the electrolyte get adsorbed on the electrode. There exists a small insulating layer, in the order of a few angstroms, between the electrode and the adsorbed ions. The two charged layers separated by an insulating layer result in the double layer capacitance being formed.

Randle's circuit is modeled using three main components: double layer capacitance, solution resistance, and polarization resistance. The capacitance of the double layer is in shunt with the resistance of polarization, and this combination is in series with the solution resistance. When the sensor design is simulated in COMSOL Multiphysics with appropriate values, the Nyquist plot can be obtained. The depiction of Randle's circuit using TINA software can be seen in Fig. 2b. The capacitance value has changes from 2 to 1 µF as seen in the diagram which depicts the change in electrical double layer capacitance. Also, the resistance has changes from 1 k $\Omega$  to 200  $\Omega$  indicating a decrease in solution resistance. Similarly, the Bode plot, shown in Fig. 2c, also denotes the change in capacitance between the two parts of the circuit, and this can be seen by the difference produced between the two plots obtained. In the figure, V\_Bottom represents the gain plot for circuit elements consisting of capacitance C2 and resistors R4 and R3 in the bottom part of Fig. 2c, and V\_Top represents the gain plot for circuit elements consisting of capacitance C1 and resistors R2 and R1 in the top part of Fig. 2c.

#### 3.2 Cyclic Voltammetry

Just like EIS involves measuring changes in impedance, in cyclic voltammetry, voltage is applied in a particular range, and the corresponding change in current is measured. Typically, a current–potential plot is studied. Based on the results obtained, both qualitative and quantitative analysis can be

In this paper, various methods to analyze the biosensor were discussed. Electrochemical impedance spectroscopy (EIS) is a highly sensitive process that is applied to carry out the electrical analysis of chemical systems. In EIS, the variation measured is the change in impedance. To model the physical system and conditions in the form of an electrical system, Randle's equivalent circuit is used. Randle's circuit has been simulated in TINA and the Nyquist plots and Bode plots have been shown in the previous section. The second method incorporated into the design is cyclic voltammetry. Just like EIS measurement in impedance, in cyclic voltammetry, voltage is applied in a particular range and the corresponding change in current is measured.

# 4 Design of Biosensor Structure and Incorporating EIS Model

Figure 3 represents the EIS techniques. Three types of plots have been obtained for each model:

- 1) Nyquist plot: plots real value of impedance vs imaginary impedance. The span, as shown, gives the value of  $R_s + R_r$ .
- 2) Bode plot: real value of impedance vs the frequency. The "pass-band" amplitude also shows the value of  $R_s + R_r$ .
- 3) Bode plot: imaginary value of impedance vs the frequency. Frequency at maximum value of impedance gives cutoff frequency to calculate  $C_{\rm dl}$ . Here in the diagram,  $R_{\rm s}$  is the resistance of the solution, and  $R_{\rm r}$  is the resistance of charge transfer.

Area of each electrode (cuboid) =  $2(lh + bh) + lb = 1.85 \text{ mm}^2$ 

Important parameters related to electrode dimensions: the distance between the electrodes is also an important parameter. Usually, it amounts to 1–3 mm, whereas it should be greater than the thickness of the material by 0.3–2.0 mm.

Commonly available electrode sizes are 2.0 mm, 2.5 mm, 3.2 mm, 4.0 mm, and 5.0 mm [18].

Fig. 3 Electrochemical techniques: EIS and CV

In a cuboidal electrode sensor as seen in Fig. 6a, it is noted that one face of the electrode is always in contact with the surface of the substrate and hence will not take part in the accumulation of biomolecules. The substrate material used is polyethylene terephthalate (PET) and the electrode material is gold. The spacing between the electrodes is about 0.5 mm owing to the electric field created and the conductivity of one electrode interfering with the other electrode. The dimensions of the electrode are length is 4 mm, width is 0.25 mm, and height is 0.1 mm.

Area of each electrode (cylinder) =  $2\pi r(r + h) = 2.576 \text{ mm}^2$  (1)

In the cylindrical electrode sensor as seen in Fig. 8a, it is noted that only a very small area is always in contact with the surface of the substrate and the rest of the bulk surface area takes part in the accumulation of biomolecules. The substrate material used is polyethylene terephthalate (PET) and the electrode material is gold. The spacing between the electrodes is about 0.6 mm owing to the electric field created and the conductivity of one electrode interfering with the other electrode. The dimensions of the electrode are length is 4 mm and radius is 0.1 mm. In stepped cuboidal electrode structure as seen in Fig. 4a, it is similar to cuboidal electrode in terms of surface area that takes part in the accumulation, but there is a slight decrease in the height of the electrodes in between due to the stepped structure.

The substrate material used is polyethylene terephthalate and the electrode material is gold. The spacing between the electrodes is about 0.6 mm owing to the electric field created and the conductivity of one electrode interfering with the other electrode. The dimensions of the electrode are length is 4 mm, width is 0.25 mm, and height is 0.1 mm for half of the effective length and 0.05 mm for the remaining half of the effective length. The dimensions chosen are in the millimeter range owing to the need for a small and optimal structure of biosensors applied in portable devices, which in turn are used for measurement of hormone parameters. Also, electro impedance spectroscopy and cyclic voltammetry are being applied to all these three biosensor structures and further analysis results are discussed further.

Area of each electrode (stepped cuboid) = 
$$(b * l) + ((1.5) * l * h) + (3 * b * h) = 1.65 \text{ mm}^2$$

(2)

#### 4.1 Physics Interface

COMSOL Multiphysics gives a wide range of physics modules to select from. For the application of this paper, the electrochemistry module was selected, as it offers the physics interfaces needed to model the electrochemical impedance spectroscopy (EIS) as well as the cyclic voltammetry techniques. The electrochemistry module is an application-specific feature of the COMSOL Multiphysics environment with customizable physics interfaces. This is useful in designing a model of electrochemical cells. Various tools for constructing accurate models of the configuration of electrodes and electrolytes are available. The physics interfaces include details of the electrochemical reactions. It can be used to study the effects of applying different materials, geometric configurations, and operating conditions.

In particular, the electro analysis physics interface has been selected, as it contains the necessary equations to model current distribution, electrolyte behavior, and response to external voltage perturbations. It also has equations and boundary conditions for designing transport of diluted particles in electrolytes using the diffusion-convection equation, solving for electro active particle concentrations. This physics interface contains customized functionality for designing cyclic voltammetry and EIS.

#### 5 Implementation

As discussed in theory and design, the two methods chosen to implement the biosensor in this work are electrochemical impedance spectroscopy and cyclic voltammetry. The details involving their implementation are discussed in the remainder of this paper.

#### A. Electrochemical impedance spectroscopy

Within the electro analysis physics interface, the charge conservation model was set to "electro analysis (no potential gradients)." Linear discretization was selected for the concentration parameter and quadratic discretization for the electric potential parameter.

Fig. 4 a Stepped cuboidal electrode. b Stepped cuboidal electrode Nyquist plots  $C_{\rm dl} = 100~\mu{\rm cm}^3$ . c Stepped cuboidal electrode Nyquist plots  $C_{\rm dl} = 20~\mu{\rm cm}^3$ 

(a)

(c)

#### I. Boundaries:

i. Electrolyte—for the electrolyte boundary, the governing equations are as follows:

Time-dependent study

$$\nabla J_i + u \cdot \nabla c_i + \frac{\partial c_i}{\partial t} = R_i \tag{3}$$

$$J_i = -D_i \nabla c_i \tag{4}$$

Frequency domain perturbation

$$\nabla J_i + u \cdot \nabla c_i + = R_i \tag{5}$$

$$J_i = -D_i \nabla c_i \tag{6}$$

ii. No flux—this condition of absence of flux is governed by the following expression:

$$-n \cdot J_i = 0 \tag{7}$$

iii. Insulation—insulation of the domains is defined by the following equations:

$$-n i_s = 0 (8)$$

- iv. Initial values—this boundary is used to define initial values of concentration and electric potential in the electrolyte. Here, the initial values of concentration were selected as 1 M for both the oxidizing and reducing species and the electric potential of electrode was set to 0.
- v. Electrode surface—this boundary is added to define the surface of the working electrode on which the antibodies should be coated and the hormone reaction occurs. The expressions that define the electrode surface are given below.

$$n \cdot i_1 = i_{\text{total}} \tag{9}$$

$$i_{\text{total}} = \sum_{m} i_{loc,m} + i_{dl} \tag{10}$$

$$-nJ_i = R_{i,tot}, R_{i,tot} = \sum_m R_{i,m} + R_{dl,i}$$
 (11)

A harmonic perturbation of 10 mV was given to the working electrode under this boundary to generate the impedance response, as per the requirements of EIS. The electrode surface boundary has two attributes under it.

(a) Electrode reaction—equations for this attribute are as follows: The equilibrium potential has been defined using the Nernst equation as follows:

The electrode kinetics has been defined by the Butler-Volmer equation and the exchange current density with mass action law.

$$i_0 = i_{0,\text{ref}}(T) \prod_{i:v_i > 0} \left(\frac{c_i}{c_{i,\text{ref}}}\right)^{\frac{a_c v_i}{n}} \prod_{i:v_i < 0} \left(\frac{c_i}{c_{i,\text{ref}}}\right)^{\frac{-a_a v_i}{n}}$$

$$(12)$$

(b) Double layer capacitance—double layer capacitance is the parameter that varies directly with the change in cortisol concentration. This attribute was added and the value was given as a parameter  $C_{\rm dl}$  that can be varied. The expression governing the attribute is as follows:

$$i_{dl} = \left(\frac{\partial \left(\emptyset_{s,ext} - \emptyset_1\right)}{\partial t}\right) c_{dl} \tag{13}$$

$$R_{dl,i} = \frac{-\nu_i i_d}{nF} \tag{14}$$

#### II. Mesh:

COMSOL is finite element analysis software. This means that it divides the design into many small elements and performs individual analysis based on the equations described above. Meshing in COMSOL performs this function of element division. For the purpose of this paper, a default mesh is selected based on the requirements of the electroanalysis physics interface. The size selection for mesh is kept at normal.

#### III. Study:

The study was selected as AC impedance, time-dependent, for generating the characteristic plots of electrochemical impedance spectroscopy. This has two steps: time-dependent study and frequency-domain perturbations. The former uses time values from 0 to 1 in steps of 0.1. The latter utilizes a frequency range of 1 Hz to 10 kHz on a logarithmic scale, with a step size of 0.05.

#### B. Cyclic voltammetry

The procedure for modeling cyclic voltammetry through COMSOL is similar to the procedure for modeling EIS. The model and physics interfaces selected are electrochemistry and electro analysis, respectively. The charge conservation model and discretization modes were the same.

#### I. Boundaries:

The parameters and equations for the boundaries and electrolyte, no flux, and insulation are the same

- i. Electrode surface—the governing equations remain the same, but the harmonic perturbation, which is not necessary for cyclic voltammetry, is set to 0. Linear sweep of voltage is also defined under this boundary. Voltage is varied from 0.4 V to +0.4 V to test the current response of the electrodes and the number of cycles is set to 1.
- ii. Concentration—the concentration of the reactant is defined on the counter electrode. The concentration value is set to a parametric variable *c* bulk, which was varied to perform a parametric sweep to get the voltammogram plots. The governing equations for this boundary are as follows:

$$c_i = c_{0,i} \tag{15}$$

#### II. Mesh:

The mesh selected for the finite element analysis of cyclic voltammetry is defined according to the needs of the physics interface, electro analysis, and the size is set to normal.

#### III. Study:

The study for performing cyclic voltammetry is defined within the software with the same name. An additional parametric sweep was defined with the parameter c bulk from the value of 2.75 to 82.75  $\mu$ mol/m³ in steps of 10  $\mu$ mol/m³. This corresponds to the optimal levels of cortisol hormone in the sweat of humans, i.e., 1 ng/mL to 30 ng/mL.

Reason for using polyethylene terephthalate as substrate is that they are inexpensive and display appreciable mechanical flexibility and robustness under certain bending conditions with an incredible chemical stability when

Fig. 5 a Stepped cuboidal electrode Bode—real impedance versus frequency plots for  $C_{\rm dl}$ =20  $\mu {\rm cm}^3$ . b Stepped cuboidal electrode Bode—real impedance versus frequency plots for  $C_{\rm dl}$ =100  $\mu {\rm cm}^3$ . c

Fig. 6 a Cuboidal electrode. b Cuboidal electrode Nyquist plots for  $C_{\rm dl} = 20~\mu {\rm cm}^3$ . c Cuboidal electrode Nyquist plots for  $C_{\rm dl} = 100~\mu {\rm cm}^3$ .

exposed to high temperatures. It also does not react with water or food particles [19].

The reason for using gold as an electrode material: known for its biocompatibility, high conductivity, and high corrosion resistance [20, 21]. There are various techniques of hormone detection, as discussed review work by Cifrić et al. [22], but this paper concentrates on EIS (electrochemical impedance spectroscopy) and cyclic voltammetry.

# 5.1 Plots Obtained from Electrochemical Impedance Spectroscopy (EIS)

As described in the earlier sections, EIS analysis was done on the electrode structures. The standard plots that are obtained are as follows:

- Nyquist plot—plot between real and imaginary parts of impedance.
- 2) Bode plot 1—plot between frequency and real part of impedance.
- 3) Bode plot 2—plot between frequency and imaginary part of impedance.

By varying the capacitance in EIS techniques, the double layer capacitance also changes. This affects the total impedance of the assumed Randle's circuit. For this analysis, the values of the double layer capacitance were manually varied and the response in the plots was observed. The set values for the capacitance were  $20~\mu\text{F/cm}^2$  and  $100~\mu\text{F/cm}^2$ . The calculations for this analysis were done as shown in the below example considering cortisol hormone (stress hormone) as an example for  $C_{\text{dl}}$  values and its behavior.

Example: from the plot  $R_r$ =0.005. From the plot

$$f_c = 160\mu\text{F/cm}^2 \tag{16}$$

$$W_c = 2\pi f_c \tag{17}$$

Therefore,

$$C_{\rm dl} = \frac{1}{\left(R_r W_c\right)} \tag{18}$$

$$C_{\rm dl} = 100 \mu \text{F/cm}^{1} \tag{19}$$

The plots obtained from EIS are shown in the following sections.

**Fig. 7** a Cuboidal electrode Bode—real impedance versus frequency plots  $C_{\rm dl}$ =20  $\mu {\rm cm}^3$ . b Cuboidal electrode Bode—real impedance versus frequency plots  $C_{\rm dl}$ =100  $\mu {\rm cm}^3$ . c Cuboidal electrode Bode

imaginary impedance vs frequency plots for  $C_{\rm dl}$  = 20  $\mu$ cm³. **d** Cuboidal electrode Bode imaginary impedance vs frequency plot  $C_{\rm dl}$  = 100  $\mu$ cm³

Fig. 8 a Cylinder electrode. b Cylinder electrode Nyquist plots for  $C_{\rm dl} = 20~\mu {\rm cm}^3$ . c Cylinder electrode Nyquist plots for  $C_{\rm dl} = 100~\mu {\rm cm}$ .

(c)

**Fig. 9** a Cylinder electrode Bode—real impedance versus frequency plots  $C_{\rm dl} = 100 \ \mu {\rm cm}^3$ . b Cylinder electrode Bode—real impedance versus frequency plots  $C_{\rm dl} = 20 \ \mu {\rm cm}^3$  highest point on the crest is utilized for double layer capacitance calculations. c Cylinder electrode

Bode—imaginary impedance versus frequency plots  $C_{dl} = 100 \ \mu \text{cm}^3$ . **d** Cylinder electrode Bode—imaginary impedance versus frequency plots  $C_{dl} = 20 \ \mu \text{cm}^3$ 

The x-axis in Fig. 4b, c represents the real impedance, while the y-axis depicts the imaginary part. Each graph has been plotted for a specific value of double layer capacitance, the first for  $100 \, \mu\text{F}$ , the second for  $20 \, \mu\text{F}$ . The x-axis in Fig. 5a, b represents real impedance, while the y-axis shows frequency. The particular cutoff frequency can also be seen. The peak value of this graph corresponds to the maximum value on the x-axis, obtained in the Nyquist plot seen previously. These are useful parameters to calculate double layer capacitance. The x-axis in Fig. 5c, d shows the imaginary value of impedance, while the y-axis shows frequency. The frequency at which the imaginary impedance has the highest value is used in the calculation of double layer capacitance.

Fig. 10 Voltammetry plot of stepped electrode

#### A. Cuboidal electrode

It can be observed in Fig. 6b, 6c that the plot is shifted slightly to the right, when higher double layer capacitance is used, as compared to Fig. 4b, c.

It can be observed in Fig. 7a that the plot is shifted slightly to the right, when higher double layer capacitance is used, as compared to Fig. 7b. The plot in Fig. 7c is shifted to the left in the case of the structure with higher double layer capacitance as compared to the results in Fig. 7d. Therefore, the frequency which corresponds to the highest value of the imaginary part of impedance is lower, in the case of a structure with a higher double layer capacitance.

 Table 1
 Cyclic voltammetry—stepped cuboidal

Concentration (µmol/m <sup>3</sup> )	Current (pA)	Color
2.75	406.10	Dark green
12.75	357.00	Indigo
22.75	307.86	Black
32.75	258.77	Yellow
42.75	209.78	Purple
52.75	160.68	Light blue
62.75	111.65	Brown
72.75	62.58	Light green
82.75	13.50	Dark blue

Fig. 11 Voltammetry plot of cuboidal electrode

#### B. Cylindrical electrode

Beyond a certain value of real impedance, the plot in Fig. 8b, c shoots up to higher values of imaginary impedance. For the purpose of calculations, the extrapolated value of imaginary impedance is chosen.

In Fig. 9a–d, the range of frequencies with a higher value of real impedance is higher for lower double layer capacitance. The concept of calculating the required frequency value remains the same.

#### 5.2 Plots Obtained from Cyclic Voltammetry

The next analysis conducted was cyclic voltammetry. This involves varying voltage linearly and measuring the current response of the electrode. The plot obtained is referred to as a voltammogram and depicts the variation of current with respect to voltage.

Nine different solutions' cyclic voltammograms were captured. The  $I_{\rm pc}$  (peak cathodic current) and  $I_{\rm pa}$  (peak anodic current) as functions for different concentrations are displayed on a graph with three electrodes. When doing cyclic voltammetry, the following parameters are taken into account:

Table 2 Cyclic voltammetry—cuboidal

Concentration (µmol/m³)	Current (pA)	Color
2.75	474.40	Dark green
12.75	417.00	Indigo
22.75	359.69	Black
32.75	302.40	Yellow
42.75	245.10	Purple
52.75	187.75	Light blue
62.75	130.4	Brown
72.75	73.20	Light green
82.75	15.80	Dark blue

Fig. 12 Voltammetry plot of cylindrical electrode

- Potential = -0.4 to 0.4 V
- Scan rate = 0.1 V/s
- Quiet time = 0 to 100 s
- Full scale = 10 mA/V
- Peak difference ( $\Delta E_p$ ) = 56.5 mV/n

The voltammogram obtained for the three electrode structures is as below.

#### A. Stepped cuboidal electrode

The results for the total current vs linearly swept electric potential for the stepped cuboidal are shown in Fig. 10, and the values of the maximum current through the electrode are tabulated in Table 1. It can be seen that the maximum and minimum values of current with respect to varying concentrations are 406.10 pA and 13.50 pA, respectively, for cortisol concentrations of 2.75 µmol/m<sup>3</sup> and 82.75 µmol/m<sup>3</sup>.

#### B. Cuboidal electrode

The results for the total current vs linearly sweep electric potential for the cuboidal electrode are shown in Fig. 11, and the values of the maximum current through the electrode

Table 3 Cyclic voltammetry—cylindrical

Concentration (µmol/m³)	Current (pA)	Color
2.75	514.75	Dark green
12.75	452.60	Indigo
22.75	390.40	Black
32.75	328.35	Yellow
42.75	266.20	Purple
52.75	204.05	Light blue
62.75	141.90	Brown
72.75	79.80	Light green
82.75	17.65	Dark blue

Table 4 Cyclic voltammetry—results

Electrode structure	Maximum current (pA)	Minimum current (pA)	Range (pA)
Stepped cuboid	406.10	13.50	392.60
Cuboid	474.40	15.80	458.60
Cylindrical	514.75	17.65	497.10

are tabulated in Table 2. It can be seen that the maximum and minimum values of current with respect to varying concentrations are 474.40 pA and 15.80 pA, respectively, for cortisol concentrations of 2.75 µmol/m<sup>3</sup> and 82.75 µmol/m<sup>3</sup>.

#### C. Cylindrical electrode

The results for the total current vs linearly sweep electric potential for the cylindrical electrode are shown in Fig. 12, and the values of the maximum current through the electrode

are tabulated in Table 3. It can be seen that the maximum and minimum values of current with respect to varying concentrations are 514.75 pA and 17.65 pA, respectively, for cortisol concentrations of 2.75  $\mu$ mol/m³ and 82.75  $\mu$ mol/m³. The complete results of cyclic voltammetry analysis of the three electrode designs are summarized in Table 4.

## 6 Signal Conditioning

As was observed, the output current is in the range of pA, which is a very small value. These values are very inconvenient to read and thus may not have any practical use. It is therefore necessary to design a signal conditioning circuit that can amplify the value to one which can be more conveniently measured.

Figure 13 shows the conditioning circuit, which consists of a transimpedance amplifier (TIA) based on a current amplifier [23]. The primary purpose of TIA is to provide

**Fig. 13** Signal conditioning circuit

Fig. 14 Transient plots of signal conditioning circuit is adopted from [23]

Fig. 15 Input noise of signal conditioning circuit is adopted from [23]

the optimized sensor with minimal input impedance and needed bandwidth in order to achieve low noise and high gain. Fabrication becomes challenging if the resistor linked in feedback is giga ohms (G $\Omega$ ) and the input current to TIA is in the pA level. Therefore, the feedback resistor value can be lowered to mega ohms (M $\Omega$ ) by using a current amplifier. It is possible to validate the design of a signal conditioning circuit with low noise and low feedback resistance by using optimized noise reduction techniques.

Figures 14 and 15 show the transient plots and input noise of signal conditioning circuit obtained by simulating the circuit in cadence tool using 90 nm technology.

#### 7 Conclusion

The electrochemical impedance spectroscopy (EIS) method based on the double layer capacitance is proved by plotting the Nyquist and Bode plots and mathematically the concentration values of hormone levels can be obtained from these plots. The results have been run for double layer capacitances of 20 and 100 µF, respectively. It can be inferred from the outcomes of the cyclic voltammetry experiment that both the maximum and minimum current are highest for the cylindrical electrode and lowest for the stepped cuboidal electrode. It is also seen that the range followed a similar pattern. Since range can determine the flexibility the designer can get, it is taken as the parameter of measurement. Based on the maximum values of current obtained from the electrode geometries, it can be stated that the cuboidal electrode (with maximum current read at 474.4 pA) is 16.81% better than the stepped cuboidal electrode (with maximum current read at 406.1 pA) and the cylindrical electrode (with maximum current read at 514.75 pA) is 26.61% better than stepped cuboidal electrode (with maximum current read at 406.1 pA) and 8.39% better than the cuboidal electrode (with maximum current read at 474.4 pA). This conclusion is based on the idea that higher values of current correspond to higher concentration of current. The process of measurement is done for different electrode geometries, with similar volumes.

The measured values from the electrodes are extremely small and hence difficult to measure. These are thus amplified with the help of a signal conditioning circuit to the order of about 0.1 V, which can be more conveniently measured. These improvements can be applied in detection of stress-related hormones such as cortisol and other hormones in bodily fluids like sweat, saliva, or blood.

Abstract - Multilevel Inverters (MLIs) are cascade inverters that may take several or a single DC input and produce a single AC output of the desired Frequency (F) and voltage, making them ideal for medium power applications. MLIs are better than 2L inverters in many aspects; however, implementing MLIs is becoming more difficult due to the increasing amount of switches and their configurations. For high-gain DC-AC converters, Switched Capacitor (SC) driven MLIs often demonstrate the compromise between switch count and voltage rating. A Single-Source Switched Capacitor Seven-Level Boost Inverter (S³C7LBI) is presented in this research. Since the S³C7LBI can offer intrinsic capacitor voltage balancing, triple voltage gain, and seven output levels without requiring sensors or other auxiliary operations, it is appropriate for renewable energy applications. The proposed S³C7L boost inverter design requires only one DC power source, eleven electronic switches, and two capacitors. Utilizing the sinusoidal PWM control approach, the functioning of the S³C7LB inverter is examined. The usefulness of the S³C7LBI architecture is validated by the simulation results for dynamic modulation index values, and different load conditions are presented. Additionally, hardware findings confirm that the S³C7LBI architecture is feasible.

Keywords - Boost voltage, Harmonic distortion, Multilevel Inverter, Switched Capacitor, DC-AC inverter.

## 1. Introduction

Increasing the switching frequency in a simple two-level inverter reduces the output voltage's harmonics, resulting in increased switching losses and voltage stresses due to reduced output voltage's step count. The drawbacks of the two-level inverter pique interest in Multilayer Inverters (MLIs). MLI was introduced in 1991, & its progress has been rapid.

MLIs are widely used in several industries today, especially for high-power and intermediate-voltage applications. MLIs produce a staircase waveform that closely resembles a sinusoidal signal and has less harmonic distortion by using more DC supply and switches. Over conventional two-level inverters, MLIs provide several advantages, including a greater primary output voltage, reduced switching loss and common mode voltage, decreased EMI, and decreased THD [1]. Because of these advantages, MLIs apply to various applications, including HVDC,

FACTS, electric vehicles, and solar power systems [2]. The most common MLI topologies are the CHB inverter, Flying Capacitor (FC), and NPC inverter. FC utilizes capacitors in a ladder structure, while NPC uses diodes.

NPC and FC need more power components to achieve greater inverter levels and suffer from voltage imbalance. In the CHB topology, H-bridge modules are allied in series, and the modular architecture is established by requiring each cell to possess its own DC supply [3].

This CHB architecture is advantageous for both single-phase and three-phase power conversion. CHB MLIs are suited for PV applications and are one of the three core MLI topologies. The primary block diagram of the grid-tied solar PV system is shown in Figure 1. MLI is essential in utilizing renewable resources for various applications [4]. Alternatively, all MLI research and development is limited to SC Multilevel Inverters (SCMLIs). Inherent balancing of

capacitor voltages and small size are the critical advantages of SCMLI over standard MLIs [5-11]. Within high-F AC microgrids, [12] suggests a quasi-resonant SC multilevel inverter.

A resonant inductor raises the charging current of switched capacitors. Despite being straightforward, this topology cannot be made better. In [13], a streamlined three-phase MLI is suggested. Four boosting switching capacitors are used in the individual phase of an inverter to provide different output levels. On the other hand, many capacitors and diodes are used.

Fig. 1. Block diagram grid-tied solar PV system

The adaptable multilevel inverter and the 7L inverter both employ a T-type tie and the SC method. The self-balance and symmetry of the T-type structure are investigated. The literature has other instances of seven-stage SC inverters.

The H-bridge structure of [14] is the basis for the MLI topology in [15], contrary to the active NPC inverter designs. MLIs utilize either floating or switching capacitors. The voltage of FCs is kept back at 50% of the source voltage, attributable to the SC's voltage-maintaining capabilities.

Moreover, the literature presents the multilevel output and self-balancing core modules for MLI. Their intended use is in cascaded single-phase systems [16]. Every basic module uses a switching capacitor and has a comparable twin boost factor [17]. The 3L unit's maximum output via fewer components is just half of the input in [18]. At a voltage of 120V, the 7L, three-capacitor inverter (may be seen functioning in cascade) has a gain of 1.5. Because there are two asymmetrical DC sources in the 13-level module in [19], the two SCs are charged at different voltages. The planned use of these simple modules in cascading connections enables significant output levels.

Based on results from comparison for reference and voltages of capacitors and output current direction, redundant operating modes are selected for FC and CHB-based hybrid topologies [20]. Voltage balance may, therefore, be obtained via sensors. The extra balancing techniques necessary in the preceding MLIs add more components and complexity to govern. As a result, MLIs that avoid the difficulty of voltage balancing have gained popularity. The switched-capacitor approach combines a T-type construction in the 7L inverter

[21] and the modular MLI [22]. The T-type structure's inherent balance with symmetric operation is used. The topology in [23, 24] provides further seven-level switched-capacitor inverters. The topology in [25] is based on an H-bridge structure, whereas that in [26] is based on an active NPC. The SCMLI proposed in [25] addresses this issue by including full-bridge cells. Each cell's voltage stress cannot go beyond the amplitude of the dc source.

Furthermore, involving the negative terminals of the DC source and output reduces leakage current. The topology in [27] has more diodes and capacitors and a low gain and high-cost factor for obtaining seven output levels. By adding more SC cells, the SCMLI in [28] can increase their production level. All the while, they are maintaining the ability to maintain equilibrium. Although it generates seven levels, the topology suggested in [29] has a problem with voltage stress distribution. Many different modulation techniques for controlling different MLI kinds have been presented in the literature [30-34].

This article presents the new Single-Source Switched Capacitor Seven-Level Boost Inverter (S³C7LBI) architecture, addressing the abovementioned issue. S³C7LBI uses a single source and nine power switches to provide seven output levels. Three times the input voltage is the maximum output voltage. The natural equilibrium of the SC voltages may occur even in the absence of sensors. These advantages demonstrate that the S³C7LBI that is being described is a good fit for applications that need medium-low voltage/power levels, such as REG integration.

# 2. Single Source Switched Capacitor Seven Level Boost Inverter (S<sup>3</sup>7LBI) Topology

Figure 2 depicts the proposed Single-Source Switched Capacitor Seven-Level Boost Inverter (S³C7LBI) topology. The proposed S³C7LBI has just 02 switching capacitors and 11 power switches. The voltages of SCs may be balanced on input voltage without the need for sensors or other tools. The proposed S³C7L BI max output voltage achieves three times the magnitude of  $V_{\rm in}$ . Because of this, the S³C7LBI being shown has a gain of 3. Seven levels are generated as 0,  $\pm V_{\rm DC}$ ,  $\pm 2V_{\rm DC}$  and  $\pm 3V_{\rm DC}$ .

Table 1 demonstrates the switching logic of the proposed S³C7LBI topology where 1 represents the switch is ON & 0 represents the switch is OFF. In Table 1, the red colour in the switching logic represents those switching states responsible for charging the two capacitors, which helps balance the capacitors' voltages to the voltage level of  $V_{\rm DC}$ . Figure 3 (a)-(g) shows the suggested S³C7LBI operating states at different phase output voltage levels (+3 $V_{\rm DC}$  to -3 $V_{\rm DC}$ ). At certain voltage levels, the cascadeconnected capacitors  $C_1$  and  $C_2$  act as Switching Capacitors (SC) in parallel with the  $V_{\rm DC}$  supply.

Consequently, the whole voltage of its  $C_1$  is charged to  $V_{DC}$ ; on the other hand, it discharges at output levels of  $2V_{DC}$ ,  $3V_{DC}$ , and  $-3V_{DC}$ , while  $C_2$  discharges at output levels of  $3V_{DC}$ ,  $-2V_{DC}$ , and  $-3V_{DC}$ . Due to their symmetric

discharge,  $V_{DC}$  may balance the voltages for  $C_1$  and  $C_2$ . To produce a gain of three times the input voltage  $V_{DC}$ ,  $C_1$  and  $C_2$  are coupled in a cascaded manner with a  $V_{DC}$  supply at  $3V_{DC}$  and  $-3V_{DC}$  to create the maximum output voltage.

#### 3. Results and Discussions

## 3.1. Simulation Results

In this study, MATLAB simulation analysis has been performed to validate the provided S<sup>3</sup>C7LBI architecture. The S<sup>3</sup>C7L boost inverter uses the sinusoidal PWM scheme to create gate pulses for an inverter to power electronic devices. An in-phase carrier pattern, seen in Figure 4, is considered when using the SPWM approach to generate inverter pulses.

The following are considered for the simulation parameters: RL load, whose parameter values are well thought-out as L=110mH and R=100 $\Omega$ , 100V DC source, and 1/3950Hz as switching frequency. Figure 5 shows the S³C7LBI phase voltage for a range of Modulation Index (MI) values, from 1.0 to 0.2, which validates the S³C7LBI architecture that is being proposed. The phase output

voltage's number of voltage levels drops in tandem with a decrease in the value of M.

Additionally, Table 2 displays the phase output voltage levels concerning Modulation Index (MI) variation for the 7L inverter. Figures 6a and 6b show the phase voltage and current at an M value of 1.0 for two distinct load circumstances, R and RL.

Figure 7 depicts the load current waveform with a M value of 1.0. Figure 8 displays the frequency spectrum of the phase current and voltage at the unity modulation index.

Table 3 shows the phase voltage RMS and harmonic distortion for the dynamic values of M. These waveforms demonstrate that S<sup>3</sup>C7LBI can have closed-loop capability for solar photovoltaic applications.

#### 3.2. Hardware Results

Experimental results have been reported as part of validating S<sup>3</sup>C7LBI topology. The parameters of the modulation scheme and the load utilized in this study are precisely the same as those considered in the simulation. The power electronic switches' gate signals are made using the DSP TMS32F28335 toolkit. Figure 9 displays the practical seven-level inverter output phase voltage, and Figure 10

shows the load current at an M value of 1.0. Figure 11 shows at M=1.0 displays the frequency spectrum for the load current and voltage. The hardware results confirm the practicality of the presented S<sup>3</sup>C7L boost inverter topology for real-time applications. Table 4 compares S<sup>3</sup>C7LBI with the existing MLI topologies regarding component count, gate driver requirements, increasing ability, Total Standing Voltage (TSV) and inherent capacitor voltage balancing.

#### 4. Conclusion

This paper presented a novel Single-Source Switching Capacitor Seven-Level Boost Inverter ( $S^3C7LBI$ ) architecture for solar PV applications. It has a more straightforward control method and fewer components. With a three-times boost, it produces 7-levels. Furthermore, the two capacitors may attain equilibrium at  $V_{DC}$  without the need for any further sensors or control algorithms. There is inherent capacitor balance in the circuit. Due to its simplified control mechanism, the accompanying peripheral model and sensors have been significantly reduced. Its supporting aspects are the inherent balance, low number of power switches, high voltage gain value, and affordability of the

S<sup>3</sup>C7LBI. It has been thought that the operating S<sup>3</sup>C7LBI architecture under dynamic situations is studied by using the sinusoidal PWM approach.

The MATLAB simulation results show the performance of the S³C7LBI topology, and two distinct load circumstances are taken into account in the simulation to determine the viability of the suggested topology. Additionally, experimental findings have been provided to support the viability of the S³C7LBI architecture that has been proposed. These results demonstrate that S³C7LBI can have closed-loop capability for solar photovoltaic applications.

Distributed generation Gravitational search algorithm distribution system Optimal relay coordination particle swarm optimization

#### **ABSTRACT**

This paper develops particle swarm optimization integrated with gravitational search algorithm (PSO-GSA) to coordinate the relays in a distribution system with distributed generation (DG) connectivity. This algorithm combines PSO and GSA to improve the performance of the relay protection system. To prevent relay malfunctions following DG penetration, a suitable primary and backup relay is chosen. The PSO-GSA is coded using MATLAB software and tested on an IEEE 4-bus system simulated in Simulink. Results indicate that, when compared to using regular PSO and GSA procedures individually, the PSO-GSA technique reduces the operating time of the relay significantly.

#### 1. INTRODUCTION

The topology of distribution systems has changed into a mesh structure resembling interconnected sub-transmission systems due to the integration of distributed generation (DG) into distribution networks [1]. Additionally, the direction of electrical power and short-circuit current are impacted by the integration of DG units. Short-circuit current that flows in both directions can cause safety relays to malfunction and, ultimately, bring down entire distribution networks [2]. For DG integrated distribution networks, various over-current relay safety strategies have been developed [3], [4]. However, it is noted that as the number and size of DG units in the distribution networks rise, so does the complexity of the design and coordination of protective relays [5]. Conventional protective relay solutions fail in these circumstances of offering the system the necessary protection against faults [6]. Additionally, replacing protective relays after a problem occurs entails high costs and is impractical for real-time applications. Replacements are advised to create effective coordination in protective relays [7]. To address the fundamental needs of relays, such as operation time and fault tolerance, coordination of protective relays refers to the capacity to determine appropriate setting values for overcurrent relays [8]. Power system stability is greatly influenced by proper relay coordination. Protective relays are in charge of clearing faults at each fault occurrence because, if one relay fails, the others should take over [9]. Backup relays are employed to prevent any malfunction or failure of the principal or primary protection relays. The backup relays are either put on the same or at other buses with the proper time between them. Two rules must be followed for the protective relays to operate reliably. The

flaws in the relay's protection zone should trip it initially. Second, defects outside the relay's safety zone should not cause it to trip. Back protection is advised due to the possibility that the main defense system would fail. The process of calculating the backup relay time delay is known as coordination of the protective relays [10]. The protective relays must be coordinated so that the backup relay's delay time is sufficient for the primary relay to clear the fault first in order to fulfil selective tripping. Coordination between primary and backup relays is essential to give the primary relay enough time to fix the issue before the backup relay [11]. Relays are generally utilized more frequently as protective devices in distribution networks since they tend to be radial. The working duration of every relay should be significantly reduced with optimal time multiplier setting (TMS) and plug setting (PS) to increase the stability and dependability of the distribution network [12]. To improve the protective relays' performance and reduce the tripping time in these systems, several optimization strategies have been put forth. These methods prioritize operational time as their primary objective function and maximize operational time based on the relays' characteristic curves and predetermined coordination limitations. Maintaining the reliability of the power system integrated with DG systems requires proper relay coordination. When DG is not integrated, the distribution system's power flow is unidirectional. However, many parts of the distribution system now have bidirectional power flow, making conventional protection techniques that only consider one-way power flow unsuitable.

Int J Elec & Comp Eng

It is challenging to achieve ideal coordination between the relays due to the nonlinearity of the distribution networks, especially in larger distribution systems. Additionally, in these systems, the relay's operational times should be shortened to improve the efficiency of the protective circuits [13]. By achieving the optimal settings for every relay in the power system, several researchers have suggested various optimization strategies for cutting the operational time and increasing the coordination of relays in distribution networks. When used for complicated and nonlinear optimization systems, a hybrid random walk grey wolf optimizer (RW-GWO) technique is suggested for tackling the issue of local minima and issues associated with stagnation to local optima [14]. To find the best setting for relays in extremely complex distribution networks, the proposed RW-GWO is applied. The outcomes are compared with basic GWO algorithms and other optimization strategies. The outcomes illustrated the approach's potential for achieving the ideal conditions for effective relay coordination.

In recent years, a variety of meta-heuristic and swarm intelligence-based algorithms that include simulated annealing (SA) [15], artificial bee colonies (ABC) [16], genetic algorithms (GA) [17], and particle swarm optimization (PSO) [18] have been widely used to solve the challenging and nonlinear relay coordination issues. Plug and time multiplier settings were suggested as variables that govern how over current relays (OCRs) operate by researchers who proposed optimization of directional over current relay using PSO [19]. The objective is to reduce all relays' operational times while utilizing PSO. PSO algorithm has been tested in typical 3-bus, 4-bus, and 6-bus systems. The findings suggested that the PSO had achieved reduced plug setting and time multiplier setting values with the best possible coordination for all standard bus systems. In [20], a firefly algorithm (FA) is used with a bio-inspired design to coordinate relays in the best possible way to safeguard the DG-connected power supply. The basic FA is often achieved by choosing the power systems' proper plug and time multiplier settings. However, the implementation had particular difficulties, including delayed convergence and the danger of becoming trapped in local optima. The paper developed an adaptive modified FA (AMFA) technique to get around this restriction. The AMFA was used to coordinate overcurrent relays in the best possible way. Five separate test scenarios were used to evaluate the performance of the suggested approach, and the outcomes were compared using fundamental FA and other traditional approaches. In all case studies, the results demonstrated improved performance of AMFA in terms of optimized relay coordination, with excellent time reductions of up to 40.446%. Genetic algorithm (GA)based relay coordination that is optimal was covered in [21]. Instead of employing a single curve for all relays as is done in several standard methods, the study used the characteristic curves of directional overcurrent relays as decision-making criteria. The experimental analysis was conducted using a variety of IEEE and IEC curves and the IEC benchmark. Results confirm that the suggested GA-based structure is adaptable. Additionally, this approach's outcomes were compared with other frameworks already in use, significantly reducing operational times and offering reliable protection for power systems against various faults. Distribution systems need more protection relays so problems may be cleared as rapidly as possible. The distribution system uses both primary and backup relays [22]. The two key relay characteristics of selectivity and sensitivity are crucial for the stability and reliability of the distribution network. When a fault occurs, the primary relay sends the tripping signal before the backup relay, which then serves as a supportive relay when the first relay malfunctions.

This paper investigates the optimal relay coordination in DG linked distribution networks using a hybrid heuristic technique that combines PSO and gravitational search algorithm (GSA). The proposed PSO-GSA is used to select appropriate relay settings in the distribution network. To avoid relay problems after DG penetration, a suitable primary and backup relay is selected.

#### 2. PROBLEM FORMULATION

The coordination issue in protective relays is established based on operational constraints like coordination standards and operating time. To solve the optimization problem, limits on the pickup current, operation time, and properties of the relay are applied. These restrictions are part of the goal function for optimization. In the shortest period of time, the function optimizes the functioning time of each protective relay. The objective function is expressed as (1):

$$minimize s = \sum_{i=1}^{n} t_{p,q} \tag{1}$$

where  $t_{p,q}$  is defined as the operational time of the  $p^{th}$  relay for fault in  $q^{th}$  zone. The constraints for solving the objective function are defined [23].

#### 2.1. Coordination criteria

The coordination criteria are defined as (2):

$$t_{b p,q} - t_{p,q} \ge \Delta t \tag{2}$$

where  $t_{p,q}$  is defined as the operational time of the  $p^{th}$  relay for fault in  $q^{th}$  zone and  $t_{bp,q}$  is the operating time of the backup relay for the fault in zone q, and  $\Delta t$  is defined as the coordination time interval (CTI).

#### 2.2. Limits on operating time of relay

Protective relays should be used inside the boundary limitations to ensure good coordination between the primary and backup relays. They are described in this section. Relay operational time is constrained using (3):

$$t_{p,q\,min} \le t_{p,q} \le t_{p,q\,max} \tag{3}$$

where  $t_{p,q min}$  and  $t_{p,q max}$  is defined as the minimum and maximum operating time of the protective relay for the  $p^{th}$  relay for fault in the  $q^{th}$  zone.

#### 2.3. Limits on pickup current

The maximum load current  $I_{pmax}$  and minimum fault current  $I_{pmin}$ , respectively, define the lowest and maximum values of the pickup current in a relay. The (4) provides the pickup relay current  $I_p$  limitation. This specifies the limit on relay plug setting multiplier (PSM) defined by (5).

$$I_{p\,Min} \le I_p \le I_{p\,max} \tag{4}$$

$$PSMmin \le PSM \le PSMmax \tag{5}$$

 $PSM_{max}$  and  $PSM_{min}$  are the maximum and minimum limits of PSM. Adjusting the relay tripping time for optimized coordination is possible using the TMS term. This is usually calculated from the plug setting of the relay. Hence the limit on TMS is constituting as given in (6).

$$TMSp, kmin \leq TMSp, k \leq TMSp, kmax$$
 (6)

# 2.4. Relay characteristics

In this study, all the relays are identical in nature with a uniform inverse definite minimum time (IDMT) defined as [24]:

$$top = \frac{\lambda(TMS)}{(PSM)^{\gamma} - 1} \tag{7}$$

$$t_{op} = \frac{\lambda(TMS)}{\left(\frac{l_{relay}}{PS} * CT sec rated\right)^{\gamma} - 1}$$
(8)

where  $t_{op}$  is described as the relay's operational time, and PS and TMS are described as the plug setting and time multiplier setting, respectively. Current transformer (CT) secondary rated current is known as CT sec, while relay fault current is known as  $I_{relay}$ . The values of  $\lambda$  and  $\gamma$  for the typical inverse definite minimum time (IDMT) characteristic relay are typically 0.14 and 0.02, respectively. Therefore, PS and TMS are the

two parameters we will use for PSO-GSA optimization. In this implementation, the Pug setting and the TMS of the relays are optimized for relay coordination using a PSOGSA-based method.

#### 3. OPTIMIZATION USING PSO-GSA

#### 3.1. Particle swarm optimization (PSO)

Eberhart and Kennedy created the population-based stochastic optimization called PSO method in 1995. A swarm of birds changes its direction from earlier locations to find food. This behavior of birds is converted mathematically as a PSO algorithm. An adaptive algorithm based on bird behavior [25]. Every iteration of the PSO process involves a constant updating of the particle position and velocity parameters. New determined velocity data update the position of the particles after each cycle [26]. The updated velocity value is calculated as the difference between the current location and the prior and global best positions, or p<sub>best</sub> and g<sub>best</sub>, respectively. The resulting updated value will be applied to the calculation of the swarm's next position. Velocity function of the PSO algorithm is given in (9).

$$V_{i(t+1)} = kV_{it} + C_1 * rand * (p_{best} - X_{it}) + C2 * rand * (g_{best} - X_{it})$$
(9)

Particle initially generated for the first iteration is updated using the (10):

$$X_{i(t+1)} = X_{it} + V_{i(t+1)} \tag{10}$$

where  $V_{it}$  and  $X_{it}$  is defined as the velocity and current position of particle i at iteration t, pbest is the best agent obtained at every iteration,  $g_{best}$  is the best solution obtained for all the previous iterations,  $C_I$ ,  $C_2$  and k are the weighting factor and weighting function respectively, 'rand' is the random number between 0 to 1.

## 3.2. Gravitational search algorithm (GSA)

GSA is a population-based metaheuristic technique, like PSO, that is governed by Newton's laws of motion and gravitation. In GSA, particles are known as agents. In GSA, where the agents are referred to as objects, agents are determined from their masses. Due to the gravitational pull of the items toward one another, mass is accumulated by all of the objects [27]. The force between the objects is directly equal to the product of their masses and inversely proportional to the square of the distance between them [28]. The particles in the GSA are determined by four variables: inertial mass, active and passive gravitational mass, and position of the mass in the  $d^{th}$  dimension. The values for these parameters are determined by the particles' fitness value [29]. The pressure exerted by two i particles j [11]:

$$F_{ij}^{d} = G(t) \frac{M_{pi}(t) \times M_{aj}(t)}{R_{ij}(t) + \epsilon} \left( x_j^{d}(t) - x_i^{d}(t) \right)$$
(11)

where  $M_{aj}$  and  $M_{pj}$  are described as the gravitationally-related active and passive masses for particles i and j, respectively.  $R_{ij}(t)$  is the Euclidean distance between two particles i and j, G(t) is the gravitational constant at time t, and  $\in$  is the small constant. The (12) provides a formula for calculating the gravitational constant

$$G(t) = G_0 * exp[-\alpha * (iter/max iter)]$$
(12)

where  $G_0$  and  $\alpha$  are the initial value and descending coefficient respectively, *iter* is the value of the current iteration and max *iter* defines the maximum number of iterations. In the search space of  $d^{th}$  dimension, the total force acting against particle i is expressed as given in (13):

$$F_i^d(t) = \sum_{j=1, j \neq i}^{N} rand_j F_{ij}^d(t)$$
(13)

where the random number between 0 and 1 is called  $rand_j$ . According to Newton's equation of motion, a particle's acceleration is inversely related to its mass and directly proportionate to the generated force. Consequently, the definition of each particle's acceleration is:

$$A_i^d(t) = \frac{F_i^d(t)}{M_{ii}(t)}$$
 (14)

where  $M_{ii}$  is the mass of the particle *i*. Lastly, the velocity and position of the particle *i* at  $d_{th}$  dimension space is determined as (15) and (16).

2572 □ ISSN: 2088-8708

$$Vel_{id(t+1)} = rand_i * Vel_{id(t)} + A_{id(t)}$$

$$(15)$$

$$X_{id(t+1)} = X_{id(t)} + Vel_{id(t+1)}$$
(16)

# 3.3. Hybrid particle swarm optimization gravitations search algorithm (PSO-GSA)

In this implementation, the PSO is combined with the GSA to form a hybridized algorithm known as PSO-GSA. In PSO-GSA, the characteristics and functionalities of both algorithms are integrated and both algorithms are executed in parallel. The hybrid approach is heterogeneous in nature since it involves two different algorithms. The proposed PSO-GSA possesses the ability of PSO along with the local searching ability of GSA. The velocity and position of the particle in the hybridized approach is evaluated as given in (17) and (18).

$$Vi(t + 1) = k * Vi(t) + C1 * rand * aCi(t) + C2 * rand * (gbest - Xi(t))$$
 (17)

$$Xi(t+1) = Xi(t) + Vi(t+1)$$
(18)

The flowchart of the proposed PSO-GSA is illustrated in Figure 1.

Figure 1. Flowchart of PSO-GSA

#### 4. RESULTS AND DISCUSSION

As seen in Figure 2, a 4-bus radial system is used, with an 11 kV step-down voltage for the grid. By using the PSOGSA technique, the optimal TMS and PS values of the six relays that are present in each bus are determined. Here, this optimization is accomplished using the MATLAB platform. At the very end of each relay, faults are produced. The malfunction started after 0.5 seconds. The IEEE 4 bus system contains 6 relays and the CT ratio of each relay is tabulated in Table 1.

The IEEE 4-bus system is used to verify the relay coordination utilizing PSOGSA, as shown in Figure 3. As mentioned in section 3, the relay coordination problem's objective function is formulated. The performance of the relay coordination is determined using different parameters such as Relay number, number of turns on primary of current transformer, TDS, load factor, fault current, load current, PSM. Simulation is performed using MATLAB and the Simulink model is illustrated in Figure 3.

Figure 2. Single source 4-bus radial system

Relay No	CT Ratio	
1	1000/1	
2	800/1	
3	600/1	
4	600/1	
5	600/1	
6	600/1	

Figure 3. Simulink model of the IEEE 4-bus system

#### 4.1. Case 1: without DG

The Simulink model shown in Figure 3 will be simulated without connecting the DG and the relay currents at different fault positions are shown in Figures 4, 5, and 6. The optimal values of relay settings are given in Tables 2 and 3. In Case 1, PSO and GSA provide TMS that is less than PSO-GSA for all relays, while PSO-GSA provide PSM that is less than PSO and GSA. This is even significant because overall calculations reveal that PSOGSA computes total operating time to be reduced, leading to speedier relay operation. Table 4 gives the operating time of all relays for six faults.

Figure 4. Fault current in primary side of CT for Relay 1 and 2 for fault point A

Figure 5. Fault current in primary side of CT for Relay 2 and 1 for fault point B

Figure 6. Fault current in primary side of CT for Relay 4 and 2 for fault point C

Table 2. Comparison of TMS values

Faults	PSO	GSA	PSOGSA
Fault 1	0.084	0.1	0.4
Fault 2	0.08	0.09	0.53
Fault 3	0.08	0.1	0.27
Fault 4	0.08	0.14	0.41
Fault 5	0.09	0.08	0.45
Fault 6	0.08	0.08	0.53

Table 3. Comparison of PSM values

Faults	PSO	GSA	PSOGSA
Fault 1	0.99	0.99	0.27
Fault 2	1.07	1.00	0.33
Fault 3	1.24	0.99	2.68
Fault 4	1.14	1.09	0.84
Fault 5	1.10	1.23	0.69
Fault 6	1.04	1.02	0.14

Table 4. Operating time of relays for different fault points

	10010 11	operating time of really	101 41111111111111111111111111111111111	r pomis	
Faults	Primary Relay	Operating Time in seconds	Secondary Relay	Operating Time	CTI
Fault 1	R1	0.7	R2	1.53	0.83
Fault 2	R2	0.85	R1	1.22	0.37
Fault 3	R3	1.67	R2	2.6	0.93
Fault 4	R4	1.1	R2	1.69	0.59
Fault 5	R5	1.02	R4	1.54	0.52
Fault 6	R6	0.7	R4	1.32	0.62

#### 4.2. Case II: with DG (26.6%)

When demand rises at certain of the load centers, the additional load is managed by either raising main grid generation or DG penetration levels. In order to clarify how a reliable relay function can be guaranteed under fault conditions at any of these penetration levels, a case study is given. The DG penetration level is given as:

% DG Penetration level = 
$$\frac{P_{DG}}{P_{DG} + P_{Grid}} * 100$$

As the load increases, DG penetration grows. In terms of penetration percentage, a 50% load increment is equivalent to 33.33% of DG level, which can be regarded as the upper bound [30]. Taken are two situations at 26.66% and 31.25%. In the case study, DG is inserted into the network at bus 3 with a penetration level of 26.66%. The fault current is adjusted in relay 1 for fault point 1. The values of TMS and PSM for 26.6% penetration are given in Table 5.

Table 5. TMS and PSM of relays using PSOGSA for 26.6% DG penetration

Faults	PSM	TMS
Fault 1	2.15	0.2
Fault 2	2.87	0.1
Fault 3	2.64	0.27
Fault 4	0.31	0.53
Fault 5	0.24	0.53
Fault 6	0.05	0.53

The currents that contribute to the fault current for the DG added system may flow in two directions. Although the aggregate fault current values grow with DG penetration of 26.6%, faults 2 and 3 only contribute a very little amount. As soon as a defect develops, it is seen that relays 4, 5, and 6 experience an increase in current magnitude. Table 5 shows the operation time and CTI between relays with a DG penetration level of 26.6%. The CTI measured are more than 0.3S, indicating successful coordination. Figure 7 shows the convergence graph for this scenario. This graph illustrates how PSOGSA converges to a better solution, or one that requires the least amount of operating time. Each operation's total operation time value is examined.

Figure 7. Convergence graph

2576 □ ISSN: 2088-8708

# 4.3. Case III: with DG (31.25%)

In this instance, DG is applied to Bus 3 with a 31.25% DG penetration. Table 6 displays the obtained TMS and PSM for this example, whereas Table 7 displays the operating time and CTI values for each case. Tables 6 and 8 show the operation time and CTI between relays for 26.6% and 31.25%, respectively. The CTI recorded in both situations is greater than 0.3s in the majority of the faults, demonstrating proper coordination. Additionally, it appears that as DG penetration levels climb, relay operation times shorten. For instance, at faults 1 and 2, the relay starts to run at a DG level of 26.6% after 0.53 and 1.21 S, respectively, then it decreases to 0.48 and 0.53 S when penetration increases to 31.25%. The IDMT relay operates for a shorter period of time as a result of the system's total fault current level gradually rising.

Table 6. Operating time of relays for different fault points (26.6%)

Faults	Primary Relay	Operating Time in seconds	Secondary Relay	Operating Time in seconds	CTI in seconds
Fault 1	R1	0.53	-	=	-
Fault 2	R2	1.21	R1	2.79	1.58

Total Operating Time		1.88		6.21	

#### 4.4. Comparative analysis

By contrasting the outcomes with an existing optimization strategy described in [30], the performance of the new PSO-GSA algorithm was confirmed. Tables 9 and 10, respectively, present the results of the previously completed work and the anticipated work. It can be inferred from the comparative results that the proposed algorithm reduces the operating time for both primary and backup relays. Results validate the fact that the proposed optimization technique can reduce the operating time which in turn improves the performance of the relays during fault condition.

Table 9. Performance of primary and backup relay of existing work for 26.6% DG penetration

Fault Point	Primary relay unit		Backup relay unit		CTI (sec)

#### 5. CONCLUSION

In order to reduce the total working time of the relays in an IEEE 4 bus system, an optimal PSM and TMS of six relays are found. This is done using a hybrid PSO-GSA optimization technique. The maximum load current and lowest fault current are used to determine the range of plug settings for each relay. All of the overcurrent relay situations are coordinated, and the collected data are summarized to confirm the efficiency of PSOGSA. The protective relay may operate more quickly while still meeting the coordination restrictions when the objective function is minimized, validating PSOGSA as a possible optimization strategy for relay coordination in the distribution network. Additionally, the outcomes demonstrate that the suggested optimization technique outperforms the individual standard PSO and GSA findings and can be applied to the distribution system to improve dependability. This implementation, in contrast to the previous one, uses the IEEE bus system model from Simulink. To validate the relay coordination in a future implementation, a sizable bus system must be taken into account. To achieve relay coordination and validation with prior results, a variety of hybrid optimization strategies must be used.

Abstract - The design and performance assessment of a nine-level Multi-Level Inverter (MLI) for standalone Photovoltaic (PV) systems aim to increase the inverter's efficiency and decrease the usage of power switches. Multilevel inverters synthesize a sinusoidal output waveform from multiple voltage levels, which results in lower Total Harmonic Distortion (THD) and higher power quality. The nine-level multilevel inverter incorporates a variety of Pulse Width Modulation (PWM) techniques in this configuration to control the output voltage. The inverter can efficiently regulate power flow from the PV system to the load by optimizing the PWM control methods, resulting in a stable and dependable energy supply. The inverter experiences lower conduction and switching losses with fewer switches, resulting in enhanced overall efficiency. Furthermore, simplified circuitry can result in lower production costs and increased reliability. The performance analysis must examine this multilevel inverter's output voltage waveform, THD, efficiency, and power losses. It is possible to examine findings with the results of conventional inverters utilizing simulation modelling. The nine-level multilevel inverter can be an excellent option for standalone PV systems because it lowers THD and increases efficiency, enabling better system performance and greater use of renewable energy sources.

Keywords - Number of power switches, Modified MLI, Phase disposition PWM, PV system, THD.

#### 1. Introduction

Multilevel inverters have received much attention in recent years because of their ability to overcome the constraints of conventional two-level inverters, such as increased voltage stress on semiconductor devices and harmonic distortion. These inverters are appropriate for various applications in renewable energy systems, electric vehicles, and industrial drives because of improved voltage waveforms, decreased switching losses, and higher power quality. In standalone photovoltaic systems, a multilevel inverter is an essential component which transforms the Direct Current (DC) power supplied by solar panels into Alternating Current (AC) for use in various electrical appliances.

Standalone PV systems have been increasing in popularity in rural areas as the demand for clean, sustainable energy increases because they can produce dependable, ecofriendly electricity without a connection to the grid [1-3].

Due to voltage and harmonic distortion constraints, traditional two-level inverters are less effective for highpower applications. These weaknesses are fixed by multilevel inverters, which create AC waveforms from multiple voltage levels.

They achieve this by generating increased voltage outputs using a series of power semiconductor switches and capacitors, which reduces harmonic distortion, lowers switching losses, and improves overall efficiency.

Independent PV systems need a consistent and reliable power source because they are frequently used in remote or off-grid settings. Multilevel inverters are often used in such systems because they can create superior sinusoidal waveforms, lowering the possibility of harming delicate electronic devices. Additionally, multilevel inverters enable better voltage regulation, raising standalone PV systems' overall performance and dependability [4-8].

#### 1.1. Literature Review

The neutral-point-clamped inverter, or diode-clamped MLI, is one of the most widely used multilevel inverter topologies. In order to produce various voltage levels across the output terminals, it is made up of numerous capacitors and diodes. Compared to other topologies, it requires more components because the voltage levels depend on the number of capacitors implemented. The cascaded H-bridge MLI is a different popular arrangement requiring utilising numerous H-bridge cells.

The inverter can achieve higher voltage levels by connecting more cells in series. Each H-bridge can produce three-level output voltages. Flying capacitors are used by the flying capacitor MLI to generate various voltage levels. It has fewer components than the diode-clamped MLI; however, it needs delicate voltage balancing of the flying capacitors, which is frequently complicated. In contrast to two-level inverters, it provides better voltage levels and lower switching losses [9-14].

Pulse width modulation techniques have become essential in managing the switching patterns of semiconductor devices to maximise the potential benefits of multilevel inverters. This investigation of the available information evaluates the various PWM methods utilised by multilevel inverters, their characteristics, and how these individuals affect the overall effectiveness of such inverters. One of the fundamental methods used in multilevel inverters to produce a nearly sinusoidal output voltage is sinusoidal PWM.

PWM pulses closely resembling the reference waveform are produced by comparing a sinusoidal reference waveform with a high-frequency carrier signal. Although SPWM is relatively simple to establish, it features low voltage resolution and high harmonic content, especially at low modulation indexes. A more advanced method called selective harmonic elimination PWM intends to reduce specific harmonics in the output voltage waveform.

The modulation indexes for the fundamental and a few chosen harmonic frequencies can be found by solving a series of nonlinear equations. Although the computational difficulty of this method rises with the number of desired harmonics to be removed, it provides better control over the harmonic content. In multilevel inverters, particularly in three-phase applications, Space Vector PWM is a common approach.

In contrast with SPWM, it generates a nearly sinusoidal output voltage with a higher voltage resolution. SVPWM enhances power quality, lowers voltage THD, and lowers common-mode voltage. However, its implementation necessitates more sophisticated control algorithms and mighty computing power.

Hybrid PWM techniques combine the advantages of various PWM techniques to enhance performance. As an illustration, combining SPWM and SHEPWM can improve harmonic performance while keeping the implementation process simple. Individual PWM strategies have some drawbacks, which hybrid techniques can help to offset, resulting in the development of more adaptable and practical multilevel inverter designs [15-19].

Seven- and nine-level multilevel inverters are voltage source inverters synthesising multiple output voltage levels by combining multiple DC voltage sources. The Cascaded H-Bridge (CHB) configuration is the topology these inverters use the most frequently. When using the CHB topology, each H-bridge module produces a portion of the overall output voltage, and the cumulative output is the sum of these portions. The Pulse-Width Modulation (PWM) technique manages the switches, producing the desired output voltage waveform [19-25].

The ability of multilevel inverters to lower THD in the output voltage waveform is one of their key advantages. Compared to traditional two-level inverters, they successfully minimise the distortion by synthesising a waveform that resembles a staircase and has a variety of voltage levels.

According to investigations, THD levels below 5% can be attained by seven-level and nine-level inverters, which is highly anticipated in the power grid and industrial applications. Efficiency is crucial for power electronic systems because it directly affects thermal performance and energy consumption.

Multilevel inverters are generally more efficient than conventional inverters, particularly at medium- to high output power levels. The higher efficiency of multilevel inverters results from the decreased switching losses brought on by the devices subjected to less voltage stress. The leading causes of power loss in multilevel inverters are switching losses during PWM operation and conduction losses in the switching devices. The overall power loss is significantly influenced by the switching frequency, control method, and switching device type choices [26-32].

The proposed nine-level multilevel inverter has benefits such as a lower harmonic content, less switch voltage stress, and better power quality. However, it also has certain limitations. Increased power semiconductor device and capacitor requirements lead to design complexity. To maintain stability and ensure proper voltage level balancing, control techniques become more complex.

Additionally, as levels are added, switching loss expands, decreasing efficiency. Power quality problems like voltage inconsistencies, harmonics, and electromagnetic

interference may occur, necessitating sophisticated filtering methods. Despite the advantages, implementing a nine-level multilevel inverter necessitates addressing these issues to achieve the highest levels of performance and dependability [33-36].

The proposed nine-level multilevel inverter has achieved the following objectives for standalone PV systems:

- Develop a multilevel inverter with optimum energy conversion performance and the least number of harmonic distortions suitable for standalone photovoltaic systems.
- Evaluate and enhance the voltage levels and switching devices in the multilevel inverter's topology to achieve the desired power rating and system specifications.
- Investigate control strategies and modulation techniques to change solar conditions while ensuring a reliable and smooth power transfer between the PV array and load.
- Employ computer-aided tools to simulate the designed multilevel inverter and validate its performance under various PV power levels and load conditions.
- Evaluate the benefits of the multilevel inverter in terms of efficiency, total harmonic distortion, and overall reliability in standalone PV systems.

# 2. Proposed Modified MLI and Operation

The proposed grid-connected PV power generation system effectively converts solar irradiance into usable electrical energy using a Nine Level Multilevel Inverter and a PWM control strategy. The system's main components are the PV panel, the multilevel inverter, a filter, and the grid/load connection. The PV panel is essential for converting solar radiation into direct current electricity. The PV panel's surface receives sunlight, which causes a current flow that is proportional to the amount of incident irradiance.

The temperature of the PV panel also has an impact on its performance, as higher temperatures can reduce the efficiency of the process of converting energy. A Nine Level Multilevel Inverter changes the PV panel's DC output into AC compatible with the grid. This type of inverter has multiple voltage levels, allowing it to generate a smoother and higher-quality output waveform compared to traditional two-level inverters.

Additionally, the multilevel inverter increases system effectiveness and lowers harmonic distortion. The PWM control strategy is utilised to manage the inverter's output voltage. The inverter can maintain the intended voltage output level and achieve Maximum Power Point Tracking (MPPT) by adjusting the duty cycle of the switching signals. A filter has been integrated into the system, ensuring the generated AC power is unambiguous and devoid of harmonic distortions. The filter reduces any high-frequency

noise produced while the inverter switches, ensuring adherence to grid connection requirements and safeguarding delicate loads. When the PV panels produce more electricity than the connected loads need, the system can supply the excess power to the grid using the grid/load-connected operation. In addition, when a load requires more power than a PV panel can provide, the system uses additional power from the grid to satisfy the load's requirements.

The design for a modified multilevel inverter connected to solar panels is illustrated in Figure 1. The proposed nine-level multilevel inverter employs ten IGBT power components, a load (R and RL), and four symmetrical DC voltage sources to produce better voltage waveform quality and less harmonic distortion. The inverter generates nine voltage levels by carefully regulating the IGBTs' switching patterns, enabling finer voltage resolution and a smoother output waveform.

The connected load is less strained while the inverter's efficiency and performance improve. Additionally, the multilevel topology allows for lower switching frequencies, which reduces switching losses and boosts overall system efficiency. The inverter is appropriate for various applications, including grid-tie inverters, motor drives, and renewable energy systems, because it can generate high-quality AC voltage. Figure 2 illustrates the proposed nine-level multilevel inverter.

The proposed nine-level multilevel inverter is designed to operate with various voltage levels, including -4 $V_{DC}$ , -3 $V_{DC}$ , -2 $V_{DC}$ , - $V_{DC}$ , 0 $V_{DC}$ , + $V_{DC}$ , +2 $V_{DC}$ , +3 $V_{DC}$ , and +4 $V_{DC}$ . This inverter topology offers increased voltage resolution and reduced harmonic distortion compared to conventional inverters. Utilizing multiple voltage levels can generate more accurate and smoother output waveforms, improving efficiency and lowering electromagnetic interference. The inverter's operation involves controlling the switching states of its power semiconductor devices to achieve the desired output voltage level.

The proposed MLI operates in a specific mode in which switches S1, S3, S5, S9, and S7 are turned on. In this configuration, dc voltage sources V1, V2, V3, and V4 are also utilised. This configuration leads to the inverter's output voltage being -4VDC. Figure 3 illustrates the operating mode of +4VDC output voltage.

A negative output voltage value results from the output voltage being inverted concerning the dc voltage Vdc, as indicated by the negative sign. The MLI is suitable for various power conversion applications because of this specific mode of operation, which enables the MLI to produce a controlled output voltage waveform with multiple voltage levels. The proposed MLI is operated in a specific mode by turning on switches S1, S3, S5, S9, and S10.

Fig. 1 PV interconnected modified MLI

Fig. 2 Proposed nine-level multilevel inverter

Fig. 3  $\pm 4V_{DC}$  output voltage

Fig. 4 +3V<sub>DC</sub> output voltage

The MLI is powered by DC voltage sources  $V_1$ ,  $V_2$ , and  $V_3$ . The MLI provides a  $-3V_{DC}$  output voltage in this configuration. This  $-3V_{DC}$  output voltage has to be utilised to power the connected load to the MLI.

Fig. 7  $0V_{DC}$  output voltage

Figure 4 illustrates the operating mode of +3VDC output voltage. The operation of an inverter entails converting a DC input voltage from sources  $V_1$ ,  $V_2$ , and  $V_3$  into an AC output voltage. The associated voltage sources are connected to the load when switches  $S_1$ ,  $S_4$ ,  $S_6$ ,  $S_7$ , and  $S_8$  are turned on.

Fig. 10 -3  $V_{\text{DC}}$  output voltage  $\,$ 

Because of the particular combination of switches, the output voltage is negative (- $2V_{DC}$ ), indicating that the polarity of the AC waveform is inverted. Similarly, operating specific switches and DC voltage sources results in the output voltages - $V_{DC}$ , 0, + $V_{DC}$ , + $2V_{DC}$ , + $3V_{DC}$ , and + $4V_{DC}$ . Figure 5 to Figure 11 depict the various operational modes of the proposed MLI. A reference sinusoidal signal and eight carrier waveforms are synthesised in the modulation technique called Pulse Width Modulation with Phase Disposition (PD-PWM).

Fig. 11 -4 $V_{\text{DC}}$  output voltage

It attains effective signal transmission and control by different pulse widths of the carriers concerning the phase of the reference waveform. The instantaneous amplitude of a reference sinusoidal signal provides the basis for adjusting the pulse widths of each carrier, each of which corresponds to a particular phase angle. In addition to reducing power loss and improving overall system performance, PD-PWM maintains precise regulation. Figure 12 illustrates the pulse width modulation with phase disposition for the proposed nine-level inverter.

#### 3. Results and Discussion

A proposed nine-level multilevel inverter is connected to a PV system in MATLAB/Simulink which, by Figure 1, operates at a temperature of 35°C and has an irradiance of 1000 W/m². Figure 13 illustrates the PV panel irradiance,

and Figure 14 illustrates the temperature of the PV panel system. The boost converter must consider the PV panel voltage and maximum power in a solar power system. The input voltage range the boost converter has to handle is determined by the PV panel voltage.

It has to be suitable for the converter's operating range for effective energy transfer. The boost converter then increases the voltage to meet the system's needs, enabling the most efficient possible power transfer to the load or energy storage system. Solar energy is utilised efficiently and consistently when the voltage of the PV panels and the boost converter are proportionally correct. PV panel voltage of 288V and maximum output power are shown in Figures 15 and Figure 16, respectively.

The proposed nine-level inverter with a resistive load operates in a staircase mode, with voltage and current ratings of 230V and 10A, respectively. It achieves higher output harmonics, improved output waveform quality, and increased output voltage resolution. There is a higher harmonic distortion in the output current due to the resistive load. Figure 17 illustrates the output voltage and current waveform of nine-level inverters with resistive load. It attains staircase output voltage using a multi-level topology with a resistive and inductive load, maintaining a constant 230V and 8A current. This design significantly decreases output current harmonics, improving power quality and decreasing losses. THD is decreased due to improved voltage waveform approximation transformed possible by a higher proportion of voltage levels.

Fig. 21 Current analysis of proposed and conventional MLI

Table 2. Performance parameters proposed topology	y
---	---

S.No.	Parameters	Proposed MLI
1	No. of DC supplies	4
2	DC Voltage	60 V
3	RMS Voltage	240 V
4	No. of IGBTs	10
5	Driver Circuits	10
6	Carrier frequency	3 kHz
7	%THD (Current)	7.12 (RL load)
8	Switching loss	00.42 W
9	Conduction loss	41.31 W
10	Total loss	41.73 W
11	Efficiency	98.20 %

The ability of the inverter to produce lesser voltage steps reduces switching losses and improves efficiency. Figure 18 illustrates nine-level output voltage and current (RL load). The harmonic analysis of a 9-level inverter with an R load is shown in Figure 19. The output voltage waveform exhibits significant distortion, as indicated by the voltage Total Harmonic Distortion (THD), which is found to be 18.99%. Additionally, the output current waveform has a 7.12% current THD, which indicates the degree of distortion. These findings indicate that the proposed MLI outperforms

traditional topologies regarding harmonic content. A comparison of the proposed MLI and the current conventional topologies is shown in Figure 20. The proposed MLI outperforms conventional topologies with an impressive efficiency of 98.2%. This demonstrates the improved energy conversion efficiency and reduced power losses the suggested MLI design provides. Figure 21 also compares recent research on the proposed MLI and traditional topologies. Comparing the proposed MLI to conventional topologies, the proposed MLI shows a lower current THD of about 7.1%. This suggests improved output power quality and current wave shaping, making the proposed MLI a good option for real-world applications. Overall, the findings exhibit that the proposed MLI has several advantages over traditional alternatives, including improved harmonic performance, increased efficiency, and current quality.

The configurations for handling DC sources, power switches, power diodes, DC bus capacitors, and balancing capacitors differ between the nine-level proposed and conventional MLI topologies are compared in Table 1. The proposed nine-level MLI requires fewer power switches to achieve additional intermediate voltage levels, which improves output waveform quality and lowers harmonic distortion. Conversely, traditional MLI typically operates with limited voltage levels, producing higher harmonic content. The proposed configuration improves system effectiveness, reduces stress on power devices, and offers increased voltage and power capability. The efficiency analysis of the proposed and conventional MLI is presented in Figure 20. The current analysis of proposed and conventional MLI is given in Figure 21.

The nine-level MLI that has been proposed performs effectively, with few losses and high output efficiency

overall. An efficient power conversion during switching operations is indicated by the switching loss of only 0.42 W. The conduction loss of 41.31 W shows that the inverter efficiently circulates current. Unexpectedly the total loss of 41.73 W shows exceptional system optimisation and minimal energy wasteful. The inverter's notable overall output efficiency of 98.20% highlights its capacity to convert input power into useful output power precisely. Table 2 illustrates the various performance parameters of the proposed MLI.

#### 4. Conclusion

The proposed nine-level MLI performs admirably with ten power switches, with an exceptional total loss of only 41.73W. Its significant % efficiency rate of 98.20%

demonstrates how much it can decrease energy consumption. Additionally, the 7.12% current THD according to load conditions ensures a stable and efficient operation, lowering the possibility of undesirable harmonics and enhancing the overall system reliability.

The advanced MLI design described here is a promising option for high-power applications because it balances performance and efficiency, promoting the efficient and sustainable use of electrical energy. It has the potential for effective renewable energy integration, advanced motor drives, and innovative grid applications due to higher voltage levels and reduced harmonics, opening up the possibility of a greener and more sustainable energy environment.

Abstract - This work discusses a Fault-Tolerant (FT), highly Reliable Five-Level (RFL) Multilevel Inverter (MLI) that can persist to function still if one or more power switches have an open single switch fault or a specific multi-switch fault. Consecutively to provide quality output voltage profile, the requirement of power switches such as IGBTs used in DC-AC converters is high in number; as a result, they are more likely to fail. Consequently, reliability is among the most critical challenges in MLIs in numerous applications. At the same time, while compromising crucial components (such as FT, charge balance management, and so on), reduced component MLIs may deliver the highest precision in output voltage waveform. For MLIs to function faulttolerantly, redundant switching states have been stressed regarding switch failures. This work is aimed to provide a unique RFLI during an Open Circuit (OC) failure on a single or several switches for obtaining reliable operation. As a result, the suggested Reliable Five-Level Inverter (RFLI) structure is thought to have fewer components and must fulfill the functioning criteria for the time being. A suitable FT switching method is used in concurrence with appropriate fault clearing to obtain the requisite output voltage waveforms, resulting in dependability. The proposed RFLI architecture offers superior results regarding THD, cost, and efficiency during FT operation. The presented RFLI topology has been validated by using the MATLAB tool.

Keywords - Fault-tolerant, Reliability, Reduced switch count, Multilevel Inverter, Harmonic distortion.

#### 1. Introduction

One of the most critical and challenging tasks is maintaining the continuity and reliability of DC-AC converters in the industrial process and energy systems. This has resulted in fault-tolerant architectures focusing on reliability and system availability. Multi-Level Converters (MLI) are popular for medium-to-high-voltage applications due to their adaptability and high performance [1].

High-Voltage Direct Current (HVDC), renewable energy systems, variable-speed drives, hybrid electric vehicles, alternating current motor drives, solar diversification, and many applications all necessitate power electronic converters [2-5].

The block diagram of integrating renewable energy resources to critical loads using the reliable MLI is shown in Figure 1. Furthermore, because of the vast and rising demand in many applications, there is an issue with the overall dependability of the converter system. MLIs are more commonly used than two-level inverters because they can produce a range of voltages from medium to high power with a lower harmonic distortion, among other characteristics [6-11]. According to certain studies, 38% of total failures in inverters are caused by the inability of switches [10, 11], and new research indicates that any system dependability to be examined by using some system factors [12-15].

Several decades of research have been undertaken on the issue of fault-tolerant operation and fault detection of MLIs. The work in [16] establishes a fault-tolerant topology; nevertheless, all sorts of single switch failures are not addressed, and the component count is rather enormous. The architecture in [17] contains more redundant components and is unsuitable for multi-switch failure. [18] proposes a topology that does not accommodate all forms of individual switch failures. [18-21] topologies do not support multiple-switch failures, and the need for controlled power switches increases. To address the reliability issue of DC-AC converters, a range of FT topologies are proposed in [22].

Fig. 1 Block diagram of integration of renewable energy resources to critical loads

The main problem with classical 2L inverters is their lack of reliability; MLIs are used instead of switches because of how vulnerable and standard switching devices are. A bidirectional controller is coupled to a CHB inverter so the affected cell can't be seen elsewhere.

Switching components can switch diodes and make NPC structures functional for faulty cases. The new version of the NPC 3L structure has one bidirectional power switch, a half-bridge, and one segment of diode-clamped inverter, all in a hybrid design, which adds up to more inverters and more cost. The FCFT structure is pretty detailed in [23-25].

The circuit can handle mistakes independently, but the complexity of balancing the capacitor and the number of devices is the leading cause of worry. You need to add extra circuitry to keep the inverter safe. Several modulation schemes for controlling MLIs are described in the literature [26-36]. To tackle these concerns, this paper presents a fault-resistant multisystem inverter capable of resolving all single-switch faults and specific multi-switch issues. In this work, only open circuit faults are analysed.

Consecutively, the proposed FTL MLI is presented as a single stage of this study to address the issues previously identified. The switching control scheme, Sinusoidal Pulse Width Modulation (SPWM) is adjusted minimally to improve MLI reliability. The lowest likely occurrence of a power equipment failure is presented in the tabulated version of the reported FTL MLI. In the case of an open switch fault, the output voltages generated by the fault are the minimum levels needed to keep the systems in working order. The suggested FTL MLI may offer a high degree of redundancy.

## 2. Proposed Reliable Five Level (RFL) Multilevel Inverter

As illustrated in Figure 2, the presented FT5L inverter includes four two-quadrant switches ( $S_1$ ,  $S_2$ ,  $S_5$ , and  $S_6$ ) and two four-quadrant switches ( $S_3$  and  $S_4$ ). It also contains two capacitors, i.e.,  $C_1$  and  $C_2$ ) across a DC source  $V_{DC}$ . Capacitors are utilized to split the voltage of the DC supply into two equal

parts, allowing 02 four-quadrant switches to reach five voltage levels (i.e.  $\pm V_{DC}$ ,  $\pm 0.5 V_{DC}$  and 0).

Table 1 shows the available switching combinations for obtaining different amounts of output voltage. The voltage levels of  $+0.5V_{DC}$  and  $-0.5V_{DC}$  have 02 switching states each, whereas the zero voltage has 03 changing conditions, indicating that the presented RFLI architecture provides switching state redundancy. When a fault is found in any of the switches, the gate pulse associated with the fault must be deactivated, and a symmetric output voltage can be achieved by utilizing the redundancy switching logic listed in Table 1.

The inverter provides output voltage with five levels in this mode, and ripple-less capacitor voltages must be attained using the suitable control scheme. Table 1 lists the switching instants of RFLI. In this table, logic '1' indicates the switch ON, while logic '0' indicates the switch OFF. To maintain the same level of stress and load between the switches, the zero voltage interval is divided into three possible combinations.

The faults investigated among the switches are opencircuit and are analyzed independently on every switch. The PWM modulation method shall be adjusted for all fault conditions considered to endure the RFLI faults, as outlined in Table 2. The fault cases shall be analyzed according to Table 2. In the faulty state of any power switch, the preferred voltage profile shall be obtained by the subsequent switching instants, as indicated in Tables 1 and 2. If S<sub>1</sub>, S<sub>2</sub>, S<sub>3</sub>, or S<sub>6</sub> are defective, the RFLI can generate 3L on the output with a lower basic RMS value of output voltage. If the issue is in S<sub>3</sub>, S<sub>6</sub>, or S<sub>7</sub>, the inverter shall provide the desired voltage and power, and the operation shall be restored to normal.

#### 2.1. OC Fault in S<sub>1</sub> and/or S<sub>2</sub>

The FLFLI cannot achieve a  $V_{DC}$  voltage level since this state contains just a single redundant state. Table 1 shows that the desired voltages of +0.5VDC, 0VDC, and -0.5VDC may be realized by employing state numbers c, e, and h. When this issue occurs,  $C_2$  feeds the inverter to achieve fault tolerance. In this case, higher ripple voltage may be detected across  $C_1$ .

Table 1. Switching states of proposed RFLI

State	Voltage State	S <sub>1</sub>	S <sub>2</sub>	<b>S</b> <sub>3</sub>	S <sub>4</sub>	<b>S</b> 5	S <sub>6</sub>
a	+V <sub>DC</sub>	0	1	0	0	1	0
b	+0.5V <sub>DC</sub>	0	1	0	1	0	0
С	+0.5V <sub>DC</sub>	0	0	1	0	1	0
d	0	0	0	1	1	0	0
e	0	0	0	0	0	1	1
f	0	1	1	0	0	0	0
g	-0.5V <sub>DC</sub>	1	0	1	0	0	0
h	-0.5V <sub>DC</sub>	0	0	0	1	0	1
i	-V <sub>DC</sub>	1	0	0	0	0	1

Fig. 2 Proposed Reliable Five Level Inverter (RFLI)

Table 2. Switching states under various fault conditions

Faulty Switch		Output				
Faulty Switch	+V <sub>DC</sub>	+0.5V <sub>DC</sub>	0	-0.5V <sub>DC</sub>	-V <sub>DC</sub>	Levels
Normal	a	b/c	d/e/f	g/h	i	5
S <sub>1</sub> and/or S <sub>2</sub>	-	С	e	h	-	3
S <sub>5</sub> and/or S <sub>6</sub>	-	b	f	g	-	3
$S_3$	a	b	e	h	i	5
S <sub>4</sub>	a	С	f	g	i	5

#### 2.2. OC Fault in S<sub>5</sub> and/or S<sub>6</sub>

In this circumstance, the inverter can only provide three levels ( $+0.5V_{DC}$ ,  $0V_{DC}$ , and  $-0.5V_{DC}$ ). These voltage levels are to be achieved using the state numbers b, f, and g, as shown in Table 1. When this happens,  $C_1$  alone feeds the inverter to provide FT operation. As a result, under this circumstance, there is a higher ripple voltage across  $C_1$ .

#### 2.3. OC Fault in S3 and/or S4

In this case, the inverter outputs all the voltage levels. The voltage states may be realized by employing state numbers a, b, e, h, and i for an open circuit in  $S_3$  and a, c, f, g, and i for an open circuit in  $S_4$ , as shown in Table 1. When this happens, the two capacitors supply power simultaneously, so there won't be much voltage ripple in your output voltage.

#### 2.4. Voltage Balancing of Capacitors

The voltage balance will be obtained here by employing multiple redundant states of the suggested inverter, which has two redundant states during no-fault conditions, such as  $+0.5V_{DC}$  and  $-0.5V_{DC}$ . The method was devised by supposing a specific switch (Sf) malfunction and monitoring voltages across two capacitors.  $S_f$ ,  $V_{C1}$  and  $V_{C2}$  are used as inputs to the method.

If  $V_{C1}$  is greater than  $V_{C2}$ ,  $C_1$  must be discharged until  $V_{C1}$  equals  $V_{C2}$  to preserve the capacitor voltage balance. So, to generate  $+0.5V_{DC}$  and  $-0.5V_{DC}$  voltage levels,  $C_1$  will be employed as the source (state numbers b and g in Table 1). If  $V_{C2}$  is greater than  $V_{C1}$ ,  $V_{C2}$  is used as a source to create  $+0.5V_{DC}$  and  $-0.5V_{DC}$  voltage levels (state numbers c and h, respectively, in Table 1) until  $V_{C1}$  equals  $V_{C2}$ . Voltage balancing is only possible under healthy conditions due to the availability of various redundant states for  $+0.5V_{DC}$ ,  $-0.5V_{DC}$ ,  $-0.5V_{DC}$ ,

and  $0V_{DC}$  voltage levels, but voltage balancing is not possible under  $S_3$  and/or  $S_4$  failure because there is only one redundant state for  $+0.5V_{DC}$ ,  $-0.5V_{DC}$ .

#### 3. Control Strategy

The control technique includes pre-calculated output current and voltage statistics for switch malfunction combinations.  $S_f$  serves as a control indicator for the level generation blocks. If  $S_f$  is 0/3/4, the inverter may function in 5-level mode; otherwise, if  $S_f$  is 1 and/or 2 (or) 5 and/or 6, the inverter can work in 3L mode. The sinusoidal PWM approach is employed in all modes to create control pulses. To make 'n' levels in output side AC voltage, this approach requires one orientation and 'n' levels shifted in-phase carriers.

#### 4. Results and Discussion

The DC voltage is 330V to create an AC voltage of 230V at an inverter side the simulation parameters of  $C_1=C_2=220\mu F$ ,  $F_c=1500$ Hz,  $R_I=75\Omega$  and  $L_I=50$ mH. FTMLI's performance is calculated in terms of efficiency and losses. The loss study was performed by building a thermal model of the IGBT switch. MATLAB/Simulink software in the proposed RFLI gives efficiency of 95.5% and THD of 20.96%. Figures 3 and 4 show the capacitor voltages (V<sub>C1</sub>, V<sub>C2</sub>) and voltage difference waveforms under typical operating conditions. Figures 5-10 illustrate the corresponding output voltages and voltages, as well as the defective switch currents, for the default and post-failure scenarios. Faulty S1, S2 and S5, S6 and S<sub>4</sub> switches are assumed at the 0.06-second mark, and associated problematic modules are replaced at the 0.14second mark. Table 3 displays the total component count for the proposed architecture, which includes switching devices, diodes, capacitors and DC sources. It was observed that the component count was higher in [10, 11] than in [13, 16].

Table 3. Comparison of RFLI with existing topologies	S
--	---

Topology	IGBTs	4 Quadrant Switches	Diodes	Capacitors	DC Sources	Reliability
[17]	6	9	2	0	2	No
[19]	6	1	12	0	4	Yes
[20]	20	0	0	0	4	Yes
[22]	22	0	0	7	1	Yes
RFLI	4	2	0	2	1	Yes

#### 5. Conclusion

This paper proposes a novel architecture for an increased Reliability fault tolerant single phase Five Level Inverter (RFLI). It can withstand an open circuit failure in any switch and certain multiple switch combinations. For capacitor voltage balancing, a control algorithm is incorporated. The capacitor voltages are correctly balanced, with a voltage differential of roughly 0.1 volts between the two capacitor

voltages. An inverter's output voltage is always equal to the rated voltage. The proposed RFLI is validated in MATLAB Simulink platforms for various single/multiple open switch faults. A valid fault tolerant switching strategy is utilized with adequate fault clearance to obtain the necessary output voltage waveforms to achieve the reliability of the RFLI. The suggested FTFL inverter contains fewer devices than existing similar FTMLI topologies.

Abstract - Renewable energy output, particularly from wind power, is dependent on unpredictability due to its reliance on climate conditions. Due to this fluctuation, relying only on these sources for a steady power supply is impractical. A constant power source becomes even more crucial in areas where grid electrification is difficult, such as distant locations. To address this problem, the concept of an Isolated Wind Power Generation System (IWPGS) has arisen, designed to operate under variable wind and load situations. However, IWPGS systems suffer power quality issues. Power electronic interfaces can cause harmonics and power quality degradation, nonlinear loads coupled to the system, and the reactive power consumption generated by these loads. This paper presents an Active Power Filter (APF) to solve the power quality issues related to IWPGS. The APF is a device that improves power quality by adjusting for harmonics, reactive power, and other electrical system disturbances. A thorough analysis of numerous indexes proves the APF's performance. These metrics assess the APF's performance in reducing harmonics, improving power factor, and improving the overall power output quality in the IWPGS. This research aims to demonstrate that including an APF into an IWPGS can significantly enhance its power quality, making it a more stable and sustainable energy source, especially in distant places where grid connection is not always possible.

**Keywords -** Power quality enhancement, Wind energy integration, Voltage regulation, Pulse Width Modulation, Total Harmonic Distortion.

#### 1. Introduction

Off-grid wind power systems gained popularity as sustainable and dependable sources of electricity in isolated and rural areas where grid connectivity was either absent or unreliable. These systems harnessed the wind's kinetic energy to generate electricity, offering a clean and environmentally friendly alternative to conventional diesel generators or expensive grid upgrades. However, integrating wind power into off-grid systems presented several challenges, with power quality emerging as a significant concern. Voltage stability, frequency regulation, and harmonic distortion were all examples of power quality issues that must be addressed.

High power quality was a critical requirement in off-grid wind power systems to ensure the efficient and stable operation of connected loads and to minimize potential damage to sensitive equipment. To achieve this, engineers and designers of these systems employed various techniques and technologies. They implemented voltage regulation mechanisms to maintain a consistent voltage level, ensuring connected devices received a reliable power supply. Frequency regulation systems were also employed to keep the electrical frequency within acceptable limits, preventing disruptions to the performance of electrical appliances. Furthermore, measures were taken to minimize harmonic distortion, which could lead to electrical noise and interference in the system. Filters and power conditioning equipment were commonly used to reduce harmonic distortion and ensure the power output met the required quality standards [1-3].

In the past, ensuring power quality in off-grid wind power systems presented many challenges that required advanced control solutions. The variable nature of wind speeds led to frequent fluctuations in power output, necessitating the implementation of complex control algorithms. These algorithms were crucial for maintaining stable voltage and frequency levels within the off-grid system. One of the significant developments in the past was integrating energy storage systems. These systems played a pivotal role in mitigating power outages caused by the inherent variability of wind power. Sophisticated control systems were developed to efficiently manage energy storage, ensuring a continuous and reliable power supply.

Off-grid wind power systems also faced issues related to harmonic distortion and voltage sags. To address these problems, complex filtering and compensation approaches were employed. These solutions helped maintain a clean and stable electrical supply for sensitive electronic equipment and appliances. Another significant challenge in the past was coordinating multiple distributed energy resources, including wind turbines, solar panels, and diesel engines. Optimizing power quality and system efficiency required intricate control strategies to balance the contribution of each energy source and ensure a reliable power supply. In retrospect, addressing these complex control challenges was of utmost importance for the reliability and performance of off-grid wind power systems in the past. These advancements paved the way for more dependable and efficient off-grid renewable energy solutions, contributing to a greener and more sustainable energy landscape [4-8].

#### 2. Literature Review

Off-grid wind power systems have received significant attention recently as a promising way to offer clean, renewable energy to remote or isolated areas. These devices created power by harnessing the kinetic energy of the wind, providing an environmentally acceptable alternative to fossil fuels. Despite their enormous potential, off-grid wind power systems have advantages and disadvantages. One of the key benefits was their capacity to supply a dependable and sustainable source of electricity, reducing reliance on traditional grid infrastructure and lowering greenhouse gas emissions. Off-grid wind power systems were especially useful in rural and off-grid areas with limited or no connection to centralized power grids. They helped achieve energy independence and could drastically lower long-term energy bills. One significant difficulty was the intermittent nature of wind energy, which was affected by wind speed and direction. Energy storage devices, such as batteries, were critical for storing extra wind energy and releasing it when needed. Furthermore, the upfront expenses of off-grid wind power systems could be very substantial, making them less accessible to some communities. Maintenance and technical skills were also required to ensure these systems' long-term reliability [9-11].

The amount by which the electrical waveform generated by the wind turbine deviated from a pure sinusoidal waveform was referred to as Total Harmonic Distortion (THD). This distortion caused several issues with off-grid wind power systems. To begin with, high THD levels harmed sensitive electrical equipment such as inverters, appliances, and electronic devices. These devices were intended to operate on a pure sinusoidal waveform, and harmonic distortion caused overheating and premature failure.

Furthermore, THD caused system inefficiencies, lowered overall performance, and reduced energy generation. Harmonics in the electrical system caused increased energy losses, resulting in a lower wind turbine power output. These challenges were significant considerations for those managing and maintaining off-grid wind power systems in the past. The impact on the system's reliability and economic sustainability affected the off-grid area's energy demands and jeopardized its long-term viability. Mitigating THD in off-grid wind power systems has presented significant challenges. It often required the deployment of expensive harmonic filters, which proved challenging to maintain in remote locations. Additionally, ensuring these filters' correct sizing and installation was crucial for effectively addressing the issue during that time [11-15].

The charge controller was a typical type used in off-grid wind power systems. It regulated the charging and discharging of batteries to store extra energy for later use. These controllers frequently faced battery maintenance issues, such as sulfation and overcharging, which could impact battery longevity and system efficiency. Regular monitoring and maintenance were essential for mitigating these problems. The inverter, which converted Direct Current (DC) generated by wind turbines and stored in batteries into Alternating Current (AC) for household or industrial usage, was another crucial controller. Voltage fluctuations and harmonic distortions could occur in inverters, impacting the quality of power delivered to appliances.

Furthermore, in the past, off-grid wind power systems had to contend with intermittent wind conditions, necessitating the incorporation of energy storage and backup power sources. The controller algorithms of these systems had to be exceptionally clever to effectively handle the unpredictability of wind energy, all while ensuring a consistent power supply. Moreover, sizing the system and ensuring component compatibility posed significant challenges.

Diverse components had to seamlessly work together to optimize power generation and storage in these systems. This required careful consideration of various factors, including the capacity of the wind turbine, the capacity and type of energy storage, and the efficiency of the entire system. Engineers and designers of off-grid wind power systems had to grapple with these complexities to create reliable and efficient solutions in the past [16-21].

The most renowned applications of Renewable Energy Systems (RES) in the past were Photovoltaic panels (PV) and Wind Turbines (WT). A notable drawback of RES systems has historically been their intermittent nature. Speed control for WT was a crucial aspect of power generation, as it was heavily influenced by connecting the generator to loads or the grid. Options included a total converter with the generator, a wound rotor generator equipped with resistance, or a Double Feed Induction Generator (DFIG), all operated at fixed speeds.

In the past, grid-connected WT systems often featured a 12-kW variable speed asynchronous generator and a 600 V DC link. These systems utilized an AC-DC-AC converter with a back-to-back break chopper, resulting in the highest recorded power losses of 430 W. In a previous study, a 1,050 V DC link converter was employed in conjunction with a Permanent Magnet Synchronous Generator (PMSG) to enhance Power Quality (PQ) and achieve Maximum Power Point Tracking (MPPT). This control structure encompassed a fuzzy logic controller on the turbine side and a PI controller on the load side. The generator employed in this research possessed specifications of 2 KVA output capacity, operated at a speed of 1,800 rpm, and notably, did not require slip rings and brushes.

Furthermore, this generator was designed to be maintenance-free, eliminating the need for rare earth magnets. To regulate the current in the system, a hysteresis current control technique was implemented in conjunction with an AC-DC inverter, as described in [5]. This technique necessitated the incorporation of peak and valley current detectors, constructed using RC integrators and RS flip-flops to enable real-time monitoring of current values [22-25].

A novel control approach was employed for a back-to-back converter with a DC connection linked to a Permanent Magnet Synchronous Generator (PMSG) to enhance Power Quality (PQ) and Maximum Power Point Tracking (MPPT) performance. The introduced APF method reduced source current harmonics without necessitating intricate component adjustments while maintaining a power factor close to unity across a broad range of loads. The APF technique enhanced PQ in an isolated wind turbine WT system equipped with a PMSG supplying power to a nonlinear load. The outcomes were compared between the APF method and the traditional approach involving tuning inductors and capacitors [26-29].

Voltage fluctuations and frequency oscillations in isolated hybrid power systems demanded robust control strategies in the past, and these were achieved by opting for suitable soft computing algorithms like the Genetic Algorithm (GA), Particle Swarm (PS) algorithm, mine blast algorithm, and various other Artificial Intelligence (AI) applications. In the past, addressing voltage fluctuations and frequency oscillations in isolated hybrid power systems

required implementing resilient control strategies. These were effectively attained through carefully selecting appropriate soft computing algorithms, including but not limited to the Genetic Algorithm (GA) and a diverse range of Artificial Intelligence (AI) applications [30].

In off-grid wind power systems, one of the primary challenges was the intermittent nature of wind energy. Wind speeds could vary dramatically, leading to fluctuations in power output. Advanced control techniques, such as predictive control and energy storage integration, were pivotal in mitigating these issues. Predictive control algorithms were employed to anticipate changes in wind conditions and adjust the operation of the wind turbines and energy storage systems accordingly, ensuring a smooth and uninterrupted power supply [31, 32].

On the other hand, on-grid wind power systems faced challenges related to grid integration and power quality. Wind turbines generated power that had to be synchronized with the grid's frequency and voltage levels. Variations in wind speed often lead to voltage and frequency fluctuations, causing power quality issues like voltage sags and flicker. To address these problems, advanced control techniques were employed, including using grid-connected inverters equipped with active power filters. These inverters could rapidly adjust their output to compensate for fluctuations in wind power, maintaining stable grid conditions.

Another critical issue that both off-grid and on-grid systems faced in the past was the introduction of harmonics by power electronic converters. These harmonics could potentially distort voltage and current waveforms, significantly impacting overall power quality. Advanced control techniques such as model predictive and resonant controllers were applied to mitigate these effects, minimizing harmonics and ensuring clean and sinusoidal waveforms.

Moreover, cybersecurity emerged as a concern in past wind power systems. As these systems became more connected and reliant on digital control and communication networks, they became increasingly vulnerable to cyberattacks. Advanced control techniques from the past had to incorporate robust cybersecurity measures to protect against unauthorized access and tampering, safeguarding the integrity and reliability of wind power systems [33-37].

A PMSG connected with a WT, nonlinear loads, and advanced control approaches to improve power quality in off-grid wind power systems. It had been mentioned the following objectives:

Implement a closed-loop controller for the PMSG to maintain stable mechanical torque production, ensuring optimal energy extraction from varying wind conditions.

Fig. 1 Structure of isolated wind turbine conversion system

- To design an efficient controller to regulate the output voltage amplitude, maintaining it within acceptable limits to avoid voltage sag or swell during load changes.
- To employ advanced control algorithms and active filters to mitigate harmonics generated by nonlinear loads, ensuring a clean power supply to connected loads.
- To develop a robust inverter control strategy to efficiently convert the variable DC output of the PMSG into stable AC power for the load.
- To optimize the LC filter design to suppress highfrequency voltage components and filter out switching harmonics, improving the overall power quality.
- To implement an intelligent energy management system to balance power supply and demand, ensuring reliable operation and efficient energy utilization in off-grid scenarios.

## 3. Structure of Isolated Wind Turbine with PMSG

The isolated wind turbine conversion system, formed of several connected parts, was essential for capturing and incorporating wind energy into the grid. A Permanent Magnet Synchronous Generator (PMSG) was at the heart of the system to transform the wind's kinetic energy into electrical energy. The generated AC power was then rectified into DC electricity using a diode rectifier. A DC-DC converter adjusted the voltage levels to guarantee effective power transfer.

The DC power was subsequently transformed into AC power using a DC-AC converter, making it eligible for grid integration. In reaction to shifting wind conditions, wind turbine control systems continuously monitor and improve the turbine's performance. In addition, the grid operator control system made sure that the electrical grid and the wind turbine had constant communication, enabling effective power injection. An active power reference converter and reactive power reference grid were utilized to control the active and reactive power output to keep the system stable. The voltage levels were maintained within acceptable bounds using a voltage reference DC.

Generator control systems made sure the PMSG was running at its best. While transformers made it easier to transform voltage for grid connection, filters were used to reduce harmonics and voltage swings. In the end, this integrated system made it easier to convert wind energy into a dependable supply of electricity, which assisted in creating a sustainable and environmentally friendly energy landscape. Figure 1 illustrates the structure of the isolated wind turbine conversion system.

The kinetic energy of an object is given by in expression (1),

$$E = \frac{1}{2}m\upsilon^2\tag{1}$$

Where, m is mass (kg) and  $\nu$  (m/s) is the velocity.

The power available in wind can be defined in equation (2),

$$P = \frac{1}{2}\rho v^3 A \tag{2}$$

Where A is the cross-sectional area (m<sup>2</sup>) of the wind turbine and  $\rho$  is the air density.

The coefficient factor Cp for the WT can be expressed in equation (3),

$$C_p = \frac{P_0}{P} \tag{3}$$

The power converted from the wind speed is expressed in equation (4),

$$P_0 = C_P \frac{1}{2} \rho A \upsilon^3 \tag{4}$$

Tip-speed ratio of wind turbine can be expressed in equation (5),

$$\lambda = \frac{R \ \omega}{D} \tag{5}$$

Where R is the radius of the wind turbine, and  $\omega$  is the angular speed of the wind turbine.

Permanent Magnet Synchronous Generator d and q axis change in current, it can be expressed in equation (6) and (7) respectively,

$$\frac{dI_d}{dt} = -\left(\frac{R_a}{L_d}\right)I_d + \omega_s \frac{L_q}{L_d}I_q + \frac{1}{L_d}U_d \tag{6}$$

$$\frac{dI_q}{dt} = -\frac{R_a}{L_q}I_d - \omega_s \left(\frac{L_d}{L_q}I_d + \frac{1}{L_q}\psi_p\right) + \frac{1}{L_q}U_q \quad (7)$$

Where  $R_a$  is the resistance,  $L_d$  is the d axis inductance,  $L_q$  is the q axis inductance,  $\omega_s$  is the angular speed of the rotor,  $\psi_p$  is the permanent flux,  $U_d$  is the d-axis voltage, and Uq is the q-axis voltage.

An extensive procedure was required to integrate renewable energy into the connectivity of a wind turbine generator. A three-phase full bridge diode rectifier was the first component, and its primary function was to change the alternating current produced by the wind turbine into direct current. This rectifier was essential in guaranteeing a reliable and constant DC output.

The DC boost converter came next and was in charge of increasing the DC voltage to a level appropriate for effective power transmission. This increase in voltage was required to reduce power losses during the energy transfer to the grid. The three-phase inverter, the last component of this complex system, was created to transform the amplified DC power back into grid-compatible AC.

The inverter's function was crucial in ensuring that the electricity produced by the wind turbine could integrate easily into the current grid system. In the end, this networked system enabled the clean, renewable energy produced by the wind turbine to be effectively transmitted to the grid, supplying a dependable source of electricity to power homes and businesses while lowering carbon emissions and dependence on non-renewable energy sources. Figure 2 illustrates the interconnection of three three-phase diode rectifiers, boost converter, and three-phase inverter to load and generator.

The electro-mechanical torque produced by the wind turbine can be expressed in equation (8),

$$T_e = -1.5 \frac{P}{2} \left[ \left( \psi_p I_q + I_d I_q \left( L_d - L_q \right) \right) \right]$$
 (8)

The phase voltage transformation of the three-axis system can be expressed in equations (9), (10), and (11), respectively,

$$U_{ga} = U_{Ia} - L\frac{dI_a}{dt} - IR_a \tag{9}$$

$$U_{gb} = U_{Ib} - L\frac{dI_b}{dt} - IR_b \tag{10}$$

$$U_{gc} = U_{Ic} - L\frac{dI_c}{dt} - IR_c \tag{11}$$

The axis voltage transformation system can be expressed in equations (12) and (13), respectively,

$$U_d = R_a I_d - \omega_s L_q I_q + \frac{dI_d}{dt} L_d \tag{12}$$

$$U_q = R_a I_q + \omega_s L_d I_d + \frac{dI_q}{dt} L_q + E_s \tag{13}$$

Fig. 2 Interconnection of diode rectifier-DC boost converter-three phase inverter to load

Fig. 3 Controller of DC-DC converter and diode rectifier and inverter system

Transformed d and q axis, controllers can be expressed in equations (14) and (15), respectively,

$$U_d = e_d - RI_d + \omega L I_q - L \frac{dI_d}{dt}$$
 (14)

$$U_q = -R_a I_q - \omega L I_d - L \frac{dI_q}{dt}$$
 (15)

Simplifying the above two equations final simplified expression can be illustrated in equation (16),

$$\begin{bmatrix} U_d \\ U_q \\ U_0 \end{bmatrix} = \sqrt{\frac{2}{3}} \begin{bmatrix} \cos(\omega t - \theta) \\ \sin(\omega t - \theta) \\ 0 \end{bmatrix}$$
 (16)

 $\theta$  is the Estimated angle in e a-b-c to d-q transformation.

The performance of a wind turbine is essential for producing energy efficiently, and incorporating a Proportional-Integral (PI) controller within its DC-DC converter is critical to optimizing this procedure. A typical control technique called the PI controller modifies the duty cycle of the converter's switching components to control the output voltage.

It balances the trade-off between transient reaction and steady-state precision to ensure that the wind turbine runs at its peak power for optimum energy extraction. A diode rectifier works with a DC-DC converter to change the changing AC output from the wind turbine generator into a steady DC voltage.

As a device for unidirectional current flow, the diode rectifier only permits forward current to pass from the generator to the DC connection. The DC voltage is then converted into AC by the inverter system's last component, making it eligible for grid connection. The PI controller in the inverter system makes seamless integration with the electrical grid possible, ensuring the output voltage and frequency precisely match the grid's needs.

This system, which includes a wind turbine, a DC-DC converter with a PI controller, a diode rectifier, and an inverter, guarantees effective energy conversion, grid synchronization, and overall optimal performance, promoting renewable energy sources and sustainable power generation.

Fig. 4 Three-two axis transformation and two-three-axis transformation of controller from diode rectifier and grid

Advanced techniques such as clark/park three-axis transformation are used to improve control and effectiveness. By transforming the AC variables into a two-axis reference frame using this transformation, the analysis is made more straightforward, and the DC voltage can controlled precisely. The next stage includes using an inverter to change the DC voltage into an alternating voltage. Popular techniques include sinusoidal Pulse Width Modulation (PWM), which synthesizes the inverter's output voltage by adjusting its power components' switching timings.

However, this conversion process frequently includes harmonics into the output voltage, which must be filtered away to provide a clean AC waveform. To accomplish that, filters are used, assuring adherence to grid requirements and minimizing electromagnetic interference. Utilizing a PI controller to manage the output voltage and current is standard practice. This controller improves system stability and transient response by continuously adjusting the inverter's output to maintain optimal performance. Figure 4 illustrates the Three-two-axis transformation and two-three-axis transformation of the controller from the diode rectifier and grid.

#### 4. Results and Discussion

Figure 5 shows the Permanent Magnet Synchronous Generator's (PMSG) speed in (a), the rotor current in (b), and the stator current in (c). The Wind Energy Conversion

System's (WECS) performance and behaviour can be examined through these crucial factors. The output voltage of the three-phase diode bridge rectifier, which is necessary for converting the alternating current produced by the PMSG into direct current for further processing, is shown in Figure 6. The boost converter's DC link output voltage, which represents the voltage level following the rectification and boosting stages, is shown in Figure 7. Figure 8 provides a thorough overview of the power generation and use inside the system by displaying the Active and Reactive Power generated in the WECS. The pulse signal supplied to the three-phase inverter, which regulates the production of three-phase AC output, is shown in Figure 9. Figure 10 compares the three-phase output voltage with and without a filter to show how well the filter works to lower voltage aberrations.

Understanding the voltage gain of the DC Link Boost Converter, which is essential for improving the energy conversion process, is provided in Figure 11. Figure 12 examines the three-phase inverter Total Harmonic Distortion (THD), contrasting the performance with and without a filter to judge the ability of the generated three-phase output voltage. These statistics help with the investigation, control, and optimization of the WECS by forming a complete visual narrative of its different components. Table 1 illustrates the overall performance parameters of the wind energy conversion system.

#### 5. Conclusion

The critical issue of power quality in isolated wind power generation systems is discussed in this paper, and an effective solution in the form of an active power filter has been proposed. Despite being crucial for remote and grid-challenged areas, IWPGS systems experience power quality issues for various reasons, such as harmonics, reactive power consumption, and nonlinear loads. The APF is promoted as a workable solution to these problems, capable of strengthening system stability and improving power quality by reducing harmonics and reactive power. This research investigation proves the effectiveness of the APF in lowering harmonics, boosting power factor, and raising the general Caliber of power output in IWPGS settings by a thorough

review of numerous performance measures. These results suggest that adding an APF to an IWPGS can significantly improve its dependability and sustainability, particularly in rural areas where grid access is inconsistent or insufficient. Future improvements in control methods could substantially improve the power quality of off-grid wind power installations. The creation of advanced predictive control algorithms that can foresee and immediately address power quality problems is a crucial field of investigation. These algorithms can increase system performance using updated sensor technologies and data analytics. A continuous power supply can be ensured under various wind situations by integrating energy storage solutions, such as innovative batteries, which can further stabilize power output.

Abstract- The main objective of this work is to model, control and simulate an electrical microgrid. To achieve this objective, models of the subsystems or associated elements (generators, power interfaces, electrical loads, etc.) are built, the control strategies necessary for the integration of each subsystem in the microgrid are implemented, and it is proposed an optimization algorithm that allows the economic dispatch of the system to be carried out under different generation and demand conditions. Finally, after simulating the model, its behavior is validated in a considered operating scenario. The work environmentselected to develop this project is Simulink, a toolintegrated into MATLAB, due to the ease it offers when modeling and simulating dynamic systems, allowing you to customize the included libraries and export data to MATLAB for subsequent analysis. At the end of this work, it is intended to have a simulated environment to validate the behavior of the proposed microgrid, which allows considering different generation and demand scenarios, and an optimizationalgorithm that allows carrying out the economic dispatch of the system under the operating conditions.considered, without taking into account the randomness of generation sources and energy demand. Keywords- Integrated Control, Modeling, Renewable Energy Integration, Photovoltaic (PV), Wind Energy, Hybrid Power System

#### I. INTRODUCTION

The increasing global demand for sustainable and decentralized energy solutions has prompted the exploration of innovative approaches to harness renewable energy sources. Photovoltaic (PV) and wind energy systems have emerged as promising contributors to the renewable energy landscape, offering clean and abundant sources of power [1-3]. In the pursuit of enhancing the efficiency and

reliability of renewable energy systems, the integration of multiple sources, such as PV and wind, has gained significant attention [4-7].

Traditional power distribution systems often suffer from energy losses during transmission and distribution, making them less efficient, especially in remote or off-grid areas. The motivation behind this research stems from the need to address these challenges by developing a robust, integratedrenewable energy system tailored for DC micronetworks. The combination of PV and wind sources presents a synergetic solution, leveraging the intermittent nature of both resources to ensure a consistent and reliable power supply [8-10].

Different architectures have been proposed for the implementation of microgrids, each with its advantages and disadvantages, and are classified into six (6) different groups depending on how the alternating current (AC) and direct current (DC) transmission buses are connected. Among them, the AC microgrid ( $\mu$ GAC) and the DC microgrid ( $\mu$ GDC) stand out [16-17].

#### II. LITERATURE REVIEW

In addition to the proposed grid of [11], microgrid CO2 emissions, total current costs, and net energy costs are optimized. All possible optionswere analyzed in HOMER software, and power system response and reliability analyzes using DIgSILENT PowerFactory Study findings would beuseful for optimizing hybrid mix and availability ofresources for off-grid microgrids have been successfully implemented using various deploymentmethods.

A simulation model [12] has been developed to analyze the performance of hybrid systems, and examines the effect of varying anaerobic digester size and biogas storage capacity on key performance indices and compares two different operatingstrategies to evaluate energy savings and demand which may require reduction. Finally, a preliminary financial analysis is performed. The results demonstrate the benefits and improvements in plant efficiency factors and performance resulting from appropriate optimization of biogas separation.

The proposed microgrids [13] with diesel generators, renewables, storage, and 23.31 kW demand are optimized for five specific load management methods: using HOMER forecasting for, load continuity, generator sequence, cycle charging and combined discharge system net currentcost, gas air emissions and energy costs. From their analysis the following load minimum operating cost 3738 USD, net current cost 152,023 USD, CO 2 emission 3375 kg/year and energy cost 0.208 USD

/kWh with constant voltage is generated by an optimal method than the highest mean - frequency output.

This work [14] investigates islanded hybrid microgrid design and its optimization for load transmission by analyzing the optimal size of each element, power system response and microgrid costanalyzes Appendix four located in North Bangladesh For example, Mymensingh, Rangpur, Rajshahi and Sylhet are hybrid microgridsconsisting of solar PV, wind turbines, battery storage, diesel generators and 27.31 kW load optimized for five different dispatch channels. The proposed microgrids are optimized to reduce current costs, CO2 emissions, and absolute energy costs.

A real IMG system model [15] was developed in MATLAB/Simulink software to analyze the peak shaving performance. The model has four main components such as PV, BESS, variable load and gas turbine generator (GTG) dispatch models for the proposed algorithm, in which BESS and PV models are not suitable for capacity addition technique. The simulation results confirm the effectiveness of the CVDTA algorithm in reducing the maximum demand compared to the power combination method.

The primary objectives of this study encompass the development of a comprehensive control

strategy and accurate modeling techniques for a PV-

wind hybrid system in the context of DC electric micronetworks. Through advanced control algorithms and precise modeling, we aim to optimize energy harvesting, storage, and distributionprocesses, ultimately improving the overall

performance and sustainability of the micro-network.

The integration of control and modeling in a PV-wind hybrid system for DC electric micro- networks is related to the economic dispatch problem by optimizing the allocation of power generation from renewable sources to meet demand efficiently and economically. In this context, the economic dispatch problem involves determining the optimal operation of the PV-wind hybrid system components, such as photovoltaic panels, wind turbines, and energy storage devices, to minimize operational costs while satisfying the load demand. By employing control strategies and modeling techniques, the system can dynamically adjust the power output from each source based on factors like weather conditions, electricity demand, and energy storage levels, thereby addressing the economic dispatch problem to achieve cost-effective and sustainable energy supply within the micro-network.

#### III. ECONOMIC DISPATCH

#### A. Definition of the problem

Economic dispatch (ED) is a very important optimization task in power systems. It is the process of distributing generation among the available units to satisfy the energy demand in a period, minimizing the cost of operating the network and complying with the restrictions of the generators. On the other hand, and unlike traditional dispatch, where the powers of each generator are defined for each period independently, dynamic economic dispatch (DED) takes into consideration the limits on the power change rates of each generator, relating consecutive dispatch periods.

The ED problem, for the micro-network proposed in this work, is posed as in Equation 1: Letthe sets be:

亞: The set of all generators.

K: The set of dispatch periods. Let the parameters

 $P_{\text{max,i}}^{k}$ : Maximum power of generator i in period k.

 $P_{\min,i}^{k}$ : Minimum power of generator i in period k.

 $P_{\text{Load}}^{k}$ : Power demanded in period k.

 $C_i^k$ : Generation cost per unit of energy from generator i in period k.

 $\alpha$ ,  $\beta$ ,  $\delta$ : Real constants.

Let the variables be:

$$P_i^k$$
: Power assigned to generator i in period  $k$ .

 $M^k = \{ \begin{cases} 1 \text{ fb} & \frac{|\Sigma_{i \in I} P_i^k - Load}{P^k} > \delta, \forall k \in K \\ 0, Otherwise \end{cases}$ 
(1)

Then, the objective function and constraints of the problem are (Equation 2-3):  $\min z = \sum \forall_{k \in K} \sum \forall_{i \in \mathbb{Z}} C^k \cdot P^k_i + \alpha \cdot \sum_{\forall k \in K} M^k \cdot (\sum_{\forall i \in \mathbb{Z}} P^k_i - P^k_{\text{Load}})^2 +$ 

$$\beta. \sum_{\forall k \in K} \sum_{\forall i \in \Xi} (P_i^{k+1} - P_i^k)^2$$

$$\sum_{k} t. \leq P^k \leq P^k , \forall i \in \Xi, \forall k \in K$$

$$(3)$$

The first term of the cost function refers to the generation cost of the system. In a traditional economic office, this term is the most important, considering that the objective of the problem is to minimize the cost of network operation. The secondterm, dependent on the variable Mk, penalizes all possible solutions that deviate from the demanded power by a percentage  $\eth$ . This expression corresponds to the power balance constraint of the system, necessary to maintain the operation of the microgrid at the desired operating point. The last term relates the powers of each generator in consecutive dispatch periods; This term seeks to minimize the changes in power required for each generator at two successive moments k and k+1, considering the limitations presented by some particular generation technologies.

 $P^k$ ,  $P^k_{max}$ ,  $qnd_mf^k_{n,i}$  are estimated for each period depending on the availability of the energy resource, both solar and wind, in said period.

#### B. Particle Swarm Optimization

In this algorithm, the position of each particle corresponds to a possible solution within the D-dimensional search space. In each iteration k, the particles adjust their position X and speed V along each dimension d, depending on the best solution found by each one (Pbest) and the best solution found by the swarm (Gbest). The equations that represent the dynamics of the swarm are presented below (Equation 4-5):

$$V^{k+1} = W. V^k + c_1. r_1. (P_{best}^k - X^k) + c_2. r_2. (G_{best}^k - X^k)$$
 (4)

$$X^{k+1} = X^k + V^{k+1} (5)$$

where:

W: Inertia. Confidence of the particle in its movement or speed.

 $c_1$ : Constant. It represents the attraction of the particle towards its best position found so far (*Pbest*).

 $c_2$ : Constant. It represents the attraction of the particle towards the best position found by the swarm (*Gbest*).

 $r_1$ ,  $r_2$ : Random numbers. Samples from a uniform distribution on the interval [0,1].

For the implementation of the algorithm, the following stages were taken into account:

#### IV. SIMULATION AND RESULTS

To build the simulation scenario, data obtained from the National Renewable Energy Laboratory's (NREL's). The data was recorded as follows: For photovoltaic system 1 (PV1), the data were averaged, period by period, during the year 2010. For photovoltaic system 2 (PV2), the data

corresponding to the spring of that year were averaged. Finally, for photovoltaic system 3 (PV3), the information was averaged over the summer months of the corresponding year. The solar radiation curves for each generator are presented below (Fig 1):

Fig. 1. Solar radiation profiles for photovoltaic systems.

The wind speed profile was taken from [39], and was scaled considering the measurement unit of the record (miles per hour) and the unit required in the simulation environment (m/s) (Fig 2).

Fig. 2. Wind speed profile.

To estimate the generation costs of each generator, the behavior of the energy supply within the market was taken into account, that is, the higherthe supply, the lower the cost, and vice versa. The estimated generation costs for each source considered were taken from [40]. Generation cost from wind energy: US\$ 0.0665 - 0.0772 / kWhGeneration cost from solar energy: US\$ 0.0074 - 0.0994 / kWh

Considering a linear relationship between the generation costs and the maximum and minimum values of each generation unit, and taking into account an exchange rate of \$COP 3000, the following cost profile is obtained (see Image 18) foreach generator for the 24 dispatch periods considered (Fig 3): Now, with the information available at this point, and after 1 million iterations of the PSO algorithm per dispatch period, the system ED problem solution for the proposed simulation scenario is presented (Table 1):

Fig. 3. Generation costs.

Table 1. Economic dispatch solution.

Table 1 presents the solution proposed by the PSO for each dispatch period. The first column means the estimate of the power demanded for each period. The following 4 columns represent the power references for each generation unit, that is, the3 photovoltaic generators and the wind generator, respectively.

The variable  $P_{ESS}$  is the power that must be supplied, or absorbed, by the energy storage system(ESS) to satisfy the power balance of the system. This variable is calculated as [11]:

$$P_{ESS}(k) = P_{LO \not = D}(k) - \sum P^{k}$$
,  $\forall k \in K$ ,  $\forall i \in \cancel{\oplus}(7)$  where:

 $P_{ESS}(k)$ : Reference power of the energy storage system in the dispatch period k.

 $P_{LO \not \in D}(k)$ : Estimated power demand in the dispatch period k.

 $P_i^{k}$ : Reference power of generator i in the dispatch period k.

Finally, the average generation costs per dispatch period, and the total generation cost for each period, are presented. It should be noted that the published cost does not consider the penalty for not satisfying the power balance, nor the cost linkedto sudden changes in reference power for each generator; Only the system generation cost is included.

The economic dispatch solution is presented

#### graphically below:

Fig. 4. Economic office solution.

Fig 4 can be divided into 3 sections; between t = 0s and t = 8s, between t = 8s and t = 18s, and between t = 18s and t = 24s. In the second section, that is, between t = 8s and t = 18s, the maximum power available in the system (green) is greater than the power demanded (red) for each period, validating that the sum of the power dispatched by each generator (blue) is equal to the power demanded (red) in each period, satisfying the power balance of the system.

In the first and third sections, where the demanded power (red) is greater than the available power (green), the system operates at the maximumpower point to minimize the power imbalance caused by the inability of the generators to satisfy the demand. demand in the corresponding dispatch periods. In these cases, the ESS is responsible for supplying the energy necessary to satisfy the powerbalance constraint of the system.

Below are the responses of each of the generators linked to the microgrid, solar and wind, during the 24 dispatch periods (Fig 5):

Fig. 5. Power delivered by the wind generator.

Fig. 6. Power delivered by photovoltaic systems.

In general, and during the 24 dispatch periods, the generators follow the power reference adequately, with tracking errors of less than 1%. Only the photovoltaic generators, in period 18, show erroneous behavior. This behavior is due to the fact that the maximum and minimum powers of each array were calculated with the solar radiation at the beginning of each period, without taking into

account the increase or decrease of this variable as a function of time. Then, as for the solar radiation conditions the system is not capable of generating the required power, the control system enters a region of unstable operation, resulting in the behavior evidenced in Fig 6.

Next, to validate the behavior of the energy storage system (Fig 7), it is necessary to take into account the difference between the estimated demand profile and the one proposed from the switching of different loads, at different times, overover the simulation time. Although the ESS power reference was calculated for the estimated demand profile, the system actually operates with the proposed load model.

From Fig 7, in the periods where the difference between the estimated demand minus the proposed demand is positive, such as in periods 6, 9 and 10, the power generated by the ESS is lower than the reference because, as The estimated power is greaterthan the actual power consumed, the ESS power reference is also greater for these periods.

In the opposite case, when the difference between the estimated demand minus the proposed demand is negative, as in periods 7 and 17, the ESSpower reference is lower than the power supplied to the network during said periods.

Fig. 7. Power of the energy storage system (ESS).

The high frequency content present in the behavior of the energy storage system is caused by the chattering effect in the modulation signal of the bidirectional buck-boost converter. To improve the response of this system, it is necessary to calculate new parameters for the PI control implemented in the current loop of the converter or, failing that, design a new control strategy for this subsystem.

Next, and considering its importance in the operation of DC microgrids, the behavior of the voltage of the main transmission bus is validated, to evaluate the performance of the control strategy implemented for its regulation:

Fig. 8. DC bus voltage.

The Fig 8 shows the transients coinciding with the power changes of the generators in each

979-8-3503-6118-6/24/\$31.00 ©2024 IEEE

new dispatch period. The maximum amplitude (over-peak) of these transient states is less than 4%, demonstrating good performance of the control strategy implemented for regulating the voltage of the main bus of the microgrid.

Finally, after the analysis carried out for the generation systems, the energy storage system and the control strategies, Fig 9 shows the powers injected into the system by the generation units and the ESS (blue), the power demanded by the electric load model (red) and the estimated demand profile (green).

Fig. 9. Power generated, power demanded and demand profile.

It is verified that the power delivered to the system (blue), despite the high frequency component it presents (chattering), is equal to the power demanded by the load (red), satisfying the power balance constraint and resembling the profile of estimated demand (green), demonstrating the validity of the proposed models, validating the performance of the control strategies and corroborating the selection of the implemented optimization algorithm, objective of the economic dispatch for the 24 periods, under the simulation scenario considered, to the micro-grid proposed in this work.

#### V. CONCLUSIONS

Each of the subsystems considered for the construction of the proposed microgrid were modeled: the solar and wind generators, the energy storage system (ESS), the electrical load of the system and the corresponding power interfaces. In addition, the necessary control strategies were implemented to link each subsystem to the microgrid, with tracking errors of less than 1%.Particle Swarm Optimization was programmed to solve the economic dispatch problem, for an electrical microgrid with generators based on solar and wind energy, and without considering the randomness of variables such as solar radiation, speed of wind or variation in electrical demand. To improve the reliability and flexibility of DC microgrids, the droop control strategy, which takes advantage of the resistive nature of this architecture, is proven to be adequate and effective, allowing the integration of different generators, without the need to implement a communication network between these. Starting from the use of power interfaces (DC/DC converters, inverter and three-phase rectifier) as tools to achieve the stated objectives and validate the results, and not as results of the work developed, there were some design parameters that were not considered at all. when modeling each converter. Therefore, although the simulated environment has allowed the simulation of these models, there are limitations or restrictions that prevent the real implementation of the proposed architectures.

The results obtained during the development of this project allow us to propose new approaches when studying the economic dispatch problem, the algorithms to solve it and the analysis of power transmission systems in simulated environments.

**ABSTRACT:** This major project presents a Iot Based Smart Water Quality Monitoring. The polluted water is basic cause of the main threats in recent times as drinking water is getting contaminated and polluted. The polluted water can cause various diseases to humans and animals, which in turn affects the life cycle of the ecosystem. If water pollution is detected in an early stage, by suitable measures can be taken and critical situations may be avoided. The quality of the water should be properly examined in real-time condition. The project proposes a less cost effective and efficient IoT based smart water quality monitoring system which monitors the quality parameters uninterruptedly. The main developed of this model is test with three water samples and the parameters of sensors are transmitted to the cloud server for further action can be taken.

**KEYWORDS:** Wifi Module, pH Sensor, Turbidity Sensor, Temperature Sensor, Conductivity Sensor, Oled Display, Cloud DB Server, Blynk Application and Quality Monitoring

#### I. INTRODUCTION

In the beginning of the 21st century able to providing apure drinking water is becoming the major challenge in the recent times The United Nations and World Health Organization as well as the recognized human right to sufficient works, continuous, safe, secure and acceptable, physically accessible, and affordable, portable water for personal and for domestic use. The future alarmingly estimates that every year diarrhea alone is causing around death of people. The physiochemical parameters that include in the electrical view of conductivity, pH, turbidity, temperature with normal hot or cool, chlorine content and flow. These parameters can be analyzed quickly and at less cost than the bacterial parameters. This with the monitoring helps sensor technology to move still not very effective, as they do not require always meet the practical needs in the table shown about the data of specific utility although cheaper than traditional equipment, cost, reliability and maintenance issues still exist; and data handling and management can also be improved. In this projectwere the development of a lowcost, wireless connectivity of sensors, multi-sensor network for measuring the physicochemical methods water parameters; enabling real-time monitoring, is presented. The tables below describes about the sensor data visibility of the devices of the system.

The cost related with machine communication over to the mobile networks are usually cheaper than fixed networks. Now people can have connectivity from anywhere and anytime for anything. The Internet of Things is being used in number of sectors, from automation, transportation, energy, healthcare, financial services, wearable devices, security, agriculture to nanotechnology.

The pH sensor is used to show the acidity or alkalinity of water. It has a range of 0 to 14, with 7 being neutral. A pH value less than 7 indicates acidity, while a pH value greater than 7 indicates alkalinity. The turbidity sensor is used to show the amount of suspended solids particles in the water. It has a range of some 0 to 1000 NTU, with 0 being the clear water and 1000 being very cloudy water. The temperature sensor is used to show the temperature of thewater. It has a range of -50 to 150 degrees Celsius values. The Tds sensor also able give us the proper real time values.

 $Table \hbox{-} 1: Threshold \ values \ of \ pH \ and \ Turbidity \ Sensors$ 

The sensor	Safe water	Unsafe water
pH	6.5-8.5	<6.49 and >8.5
Turbidity	<5	>5

#### II. RELATED WORK

The concept of water qualit ywas introduced by Avinash Kumarhis title in the research of "IoT Based Water Quality Monitoring System" in 2018.By integrating sensors and internet connectivity, the system can collect data on various water quality parameters and transmit it for analysis. This enables us to monitor water quality remotely and make informed decisions about water management and treatment.

The author Anantha Naik G. Dhis titlein the research of "IoT based Real-Time Water Quality Monitoring System using smart Sensors" in 2020. This system likely employs smart sensors to measure various water quality parameters and transmits the data continuously via the internet. This allows for constant monitoring and quick identification of any changes in water quality, potentially leading to improved water management and the safety concerns.

The author Salem Garfan his title in the research of "IoT-Based Water Monitoring Systems: A Systematic Review" in 2022. Conducted a comprehensive review of IoT-based water monitoring systems, covering a wide range of topics, including system architectures, sensor technologies, data transmission methods, and data analysis techniques, while highlighting challenges and future directions in the field.

In the present conditions of the methods for the monitoring water quality parameters are the manual, time consuming, and labor intensive and also risker in the data handling. This can lead to delays in the detecting of the water quality problems, related which that can result in the health risks, environmental damage, and economic loss also. An Iot based smart of water quality monitoring of the system could that address these several challenges by providing real time value data on water quality parameters, such as pH, temperature, turbidity, and conductivity. This data could be used to detect water quality problems early on, allowing for timely corrective action. Additionally, the system could be used to track recent water quality trends over the time, which could help to identify potential sources of contamination and inform long terms water management strategies.

#### III. METHODOLOGY

#### International Journal of Innovative Research in Science, Engineering and Technology (IJIRSET)

|e-ISSN: 2319-8753, p-ISSN: 2347-6710| www.ijirset.com | Impact Factor: 8.423| A Monthly Peer Reviewed & Refereed Journal |

#### | DOI:10.15680/IJIRSET.2024.1305413 |

The methodology encompasses Sensors measure water quality parameters are placed in the water to measure various parameters like pH, turbidity, temperature, chlorine level, and conductivity. The microcontroller collects to the sensor data and sends to the microcontroller is connected to the sensors and collects the data they measure. Data is processed and prepared for transmission and the microcontroller processes the data to ensure its accuracy and prepares it for sending to a cloud platform. The figure (a) is the Methodology diagram

The data is transmitted to the cloud and the processed data is securely transmitted to a cloud platform like Blynk. The system is continuously monitored and improved and the system is regularly reviewed and updated to ensure it is operating effectively.

Data is visualized and analyzed and by the cloud platform provides tools to visualize the data in graphs and analyze trends and anomalies. These are embedded devices that measure specific water quality parameters. Different types of sensors are used depending on the desired parameters to be monitored. This is a small-scale computer that collects and processes data from the sensors.

It also controls the communication between the sensors and the cloud platform. This module transmits data from the microcontroller to a cloud platform via wireless networks like Wi-Fi network. This is a remote server that stores and analyzes the collected data. It can also provide visualizations of the data and generate alerts for potential water quality issues. This is an interface through which users can access the data and visualizations provided by the cloud platform. This can be a web interface, a mobile app, or a dedicated dashboard.

#### IV. IMPLEMENGTATION

(b)

**Working:** The whole design of the system is generally related to IOT which is newly introduced concept in the world of development and technology. There is basically two parts included, the first one is hardware & second one is software.

The hardware part consists of sensors which help to measure the real time values of sensers, OLED shows the displays by the output from the sensors, The wi-fi module gives the connection between hardware and software section. In software we developed a program based on the embedded c language structure. Classification based decision tree algorithm is used to predict the water quality classes using software. The figure (b) is the parts of hardware and software components of the project.

Once the all hardware is interfaced to the core we need to program for sensor and communication devices, power the module to measure water parameters from sensor, each sensor value is measured at different interval time and displayed on the OLED alternatively accumulate the measured value and send to cloud using ESP32 Wi-fi module. Here Blynk is used as a cloud server. User can view the real time measured value by login the account, where we can monitor the real time water parameters.

#### International Journal of Innovative Research in Science, Engineering and Technology (IJIRSET)

#### V. EXPERIMENTAL RESULTS

The water quality monitoring is important for the many applications such as the figures shows the drinking water distribution and measurement and environment monitoring of pond, lank and ecosystem etc. The realtime water monitoring system having four different in sensors which are connected to a core system of the project. The sensors are which senses or read the real values of time water parameter by using microcontroller and send to the cloud using wi-fi module, here we can monitor the water quality parameter on the internet server by using cloud computing. We use Blynk or Thingspeak as a cloud server to store the water parameters these parameters can be obtained in numerical values display on the screen.

(c) (d)

While turning on the system initialization takes place and display the system name on Oled display as we code. Alternatively once the data is initially, then wi-fi module is get connect to the network using ip address and connecting progress display on serial monitor window and also on lcd display like as connecting to wi-fi, both serial monitor window and lcd display. If the wi-fi get connected to network shows wi-fi connected message on both serial and lcd window or else shows wi-fi connected. The pH of the water is visible to show. We took three different samples for demo purpose. One is pure water, second one is salt water and third one is added acidic water each samples parameters are measured continuously and obtained result is real time on both Oled display and on web. The figure (c) and figure (d) where the expected result can be viewed in the website and the monitor.

#### VI. CONCLUSION

The conclusion tells that of the Iot based smart water quality monitoring system is more and more suitable for real time value monitoring and analysis of water quality parameters compared to the existing systems. It is automatic and does not require human intervention, reducing errors. The system utilizes temperature, pH, conductivity and turbidity sensors, along with a Wi-Fi module for wireless data transmission. The last process is that microcontroller processes system sensor data and transmits it to the cloud with Wi-Fi module. The data is stored and analyzed in the cloud using Blynk web service provided. The system can predict future water quality parameters and provide real-time notifications to users through a mobile application.

ABSTRACT: Petroleum is the foremost and mainstay of modern civilization. It is one of the nature's rare and valuable creation. Its formation takes millions of years which insist proper utilization of the resource. In present scenario, fuel stations are operated manually which consist a controlling unit to perform various tasks. The present manual fuel stations consume more time and requires substantial man power. Moreover, it is prone to malpractices and higher probability of human initiated errors. These limitations restrict installation of fuel stations in distant areas. The main aim of this paper is to deal with all stated problems by developing an automated petrol dispensing system using RFID technology. Such a system enables a user to use a RFID based prepaid card to access petrol at fuel stations. Whenever the user wants to fill the tank from the fuel dispenser, user has to enter the amount first and then place the RFID card near the RFID reader. The Arduino Uno manages to read the data from the RFID reader and perform action according to the customer requirements as well as the amount is deducted from the user's card. The RFID and Arduino Uno are used for improvement of present petrol dispensing system by reducing human work and providing an auto guided mechanism to carry out the tasks consecutively. These systems are highly reliable and conserves the time. At the same time will be using GSM-GPS module to get amount deduction via mail and track down the vehicle with the help of latitude and longitude parameters.

#### I. INTRODUCTION

India became the fourth largest auto market in 2017-18 and was the seventh largest manufacturer of commercial vehicles in 2018. Around 2.19 million cars were sold in India in 2017–18. According to the Ministry of Road Transport and Highways (MoRTH), there is a tremendous increase in India's Registered Motor Vehicles in the recent years. These increase in the number of vehicles in India has led to a huge usage of petroleum as well. This phenomenon has been represented in graph which is shown in figure A. The consumption volume of petroleum products in India was estimated to be approximately 202.6 million metric tons in fiscal year 2018. The country was ranked third with regard to primary energy and fuel consumption across the globe. Petroleum is the non-renewable resource and it is present in a limited quantity. Its formation takes millions of years. It cannot be replaced rapidly enough to cope up with its current consumption. Thus, it is extremely crucial to ensure the right utilization and consumption of petroleum products so as to preserve it for future generations as well. The dispense of fuel to this large number of vehicles in India attains major interest as numerous complications may involve. A long queue in front of a fuel station due to huge rush at the station is a common scenario. This leads to the wastage of valuable time, energy as well as human hours. The manual pump operation at present leads to various malpractices such as delivering less quantity to the customers and adulteration of fuel. These issues inspire us for automation of fuel stations which is quite necessary to deal with all these recent era problems. The main aim of the project is to design a system which is capable of automatically deducting the amount of petrol dispensed from user card based on RFID technology and controller Arduino Uno. The RFID reader verifies the user from RFID tag placed nearer to it. The amount of required fuel is entered in terms of amount at the unit. These all activities as well as dispense of fuel is monitored and controlled by the Arduino Uno.

#### II. RELATED WORK

The RFID system is comprised of two components: the RFID reader and the tags. They are also called PCD (Proximity Coupling Device) and PICC (Proximity Integrated Circuit Card).

The RFID reader consists of an antenna to emit high-frequency EM waves and a reader/writer. MFRC522 from NXP is an example of such an integrated circuit. Since we are using high-frequency waves in the megahertz range, the size of the antenna can be small.

The RFID tag can be either passive or active. Active tags are powered by batteries while the passive RFID tags are powered by energy from the reader's interrogating EM waves. The tags are available in different forms or shapes like cards, tags, key forbs, or stickers. Whatever the shape, the RFID tag will consist of an antenna and the RFID chip, which will store all the data.

|e-ISSN: 2319-8753, p-ISSN: 2347-6710| www.ijirset.com | Impact Factor: 8.423| A Monthly Peer Reviewed & Refereed Journal |

|| Volume 13, Issue 5, May 2024 ||

#### | DOI:10.15680/IJIRSET.2024.1305412 |

When triggered by an electromagnetic interrogation pulse from a nearby RFID reader, the tag will transmit data back to the reader. The reader will then analyse this data to identify the tag. Unlike a barcode or a QR code, the tag does not need to be within the reader's line of sight. This makes it easier to process and can be used for tracking objects in closed space

#### III. METHODOLOGY

The project revolves around using an Arduino Uno board in conjunction with an RFID reader module to automate the fuel dispensing process at gas stations. The methodology begins with setting up the required hardware components, including the Arduino board, RFID reader, solenoid valve or relay module for pump control, and a display unit. A database is created to store registered RFID tag IDs and associated user information like vehicle details and fuel quotas. The Arduino is programmed to read RFID tag data, search the database for the corresponding user, calculate the allowed fuel amount, and control the solenoid valve to activate the pump for the specified duration. The system displays relevant details on the LCD and incorporates error handling and safety measures. After thorough testing, the system is installed at the fuel station, integrated with existing infrastructure, and deployed with staff training for operation and maintenance. Optional enhancements may include payment gateways, remote monitoring, improved user interfaces, and advanced security features. The system undergoes rigorous testing and calibration to ensure accurate fuel dispensing and optimal performance, followed by careful integration with the existing fuel station infrastructure. Detailed procedures for regular maintenance and updates are established to keep the system functioning optimally.

Furthermore, the methodology allows for optional enhancements, such as integrating the system with payment gateways or billing systems for automated payment processing, implementing remote monitoring and control capabilities for centralized management, enhancing the user interface with touch screens or mobile apps, and incorporating advanced security measures like biometric authentication or camera-based vehicle recognition. These enhancements can further improve the system's functionality, convenience, and security, adapting it to the evolving needs of fuel station operations.

FIG A: BLOCK DIAGRAM OF RFID BASED AUTOMATION FUEL STATION

#### IV. EXPERIMENTAL RESULTS

The results could include measurements of the system's response time, which is the time taken from when a rfid tag is detected to when the fuel pump is activated. this could be measured in milliseconds or seconds, and it would be important to ensure that the response time is within acceptable limits for a smooth user experience.

Fuel dispensing accuracy: experiments could be conducted to measure the accuracy of the fuel dispensing process. this could involve comparing the amount of fuel dispensed by the system with the expected amount based on the user's fuel quota or the amount requested. the results could be presented as a percentage of deviation from the expected amount.

|e-ISSN: 2319-8753, p-ISSN: 2347-6710| www.ijirset.com | Impact Factor: 8.423| A Monthly Peer Reviewed & Refereed Journal |

|| Volume 13, Issue 5, May 2024 ||

#### | DOI:10.15680/IJIRSET.2024.1305412 |

User experience and satisfaction: experimental data could include user feedback and satisfaction ratings from individuals who have interacted with the rfid-based fuel station automation system. this could be collected through surveys or interviews, and the results could provide insights into the ease of use, efficiency, and overall user experience of the system.

#### V. CONCLUSION

The above-mentioned model proposes to remove all the shortcomings of the manually operated petrol pumps by replacing them with automated ones. RFID is a versatile technology, easy to use and it can be efficiently used in this real time application. The proposed model consists of certain goals like ensuring right amount of fuel dispensed, removing all human errors by the use of RFID cards and ensuring customer's trust for a fair sale of the product [9]. These automated fuel stations provide a lot more advantages as they reduce man power with the automated self-service. With this simple technology in use, any person can easily access for fuel at Fuel Stations. Apart from this all, these systems are less time consuming compared to the traditional ones. The technology proposed is very cost efficient and has low power consumption as well, which sets the major benchmark in today's scenario.

## CERTAIN TOPOLOGICAL INDICES AND RELATED POLYNOMIALS FOR POLYSACCHARIDES

V. LOKESHA<sup>1\*</sup>, V. R. KULLI<sup>2</sup>, S. JAIN<sup>1</sup>, A. S. MARAGADAM<sup>1</sup>, §

ABSTRACT. A polysaccharide is a large molecule made of many smaller monosaccharides. Monosaccharides are simple sugars, like glucose. Special enzymes bind these small monomers together creating large sugar polymers or polysaccharides. A polysaccharide is also called a glycan. Starch, glycogen, and cellulose are examples of polysaccharides. Depending on their structure, polysaccharides can have a wide variety of functions in nature. Some polysaccharides are used for storing energy, some for sending cellular messages, and others for providing support to cells and tissues. In the present work, we focus on the polysaccharides, namely, amylose and blue starch-iodine complex. Several topological indices and polynomials are determined in view of edge dividing methods. Also, depict their graphic behavior.

Keywords: Amylose, blue starch-iodine complex, topological indices and polynomials.

2020 AMS Subject Classification: 05Cxx, 05C09, 05C31.

#### 1. Introduction

Polysaccharides, particularly of plant origin, are prominent components in the diets are herbivores and omnivores. Amylose is a polysaccharide used in various industries as a functional biomaterial. It is mainly a linear component consisting of about 100 - 10,000 glucose monomers linked by  $\alpha(1 \to 4)$  bindings.

Amylose are used in permanent textile finishes, plastics, film making and paper pulp fibre bonding. High amylose starches have been used together with an instant starch or food gum as a binder to provide a crisp coating for french fries which also reduces oil absorption. Used as starches in the usage of sausage casings and food wrappers, incorporation into bread crusts and pasta for more uniform heating in the microwave.

They are also used in foods legumes and beans, whole grains, vegetables and starchy fruits, rice and potatoes.

In 1814, Colin and Claubry discovered the starch-iodine reaction, which is well renowned to any chemist from basic courses in qualitative and quantitative analysis.

A topological index, which is a graph invariant it does not depend on the labeling or pictorial representation of the graph, is a numerical constant mathematically obtain from the graph structure. In Chemistry, topological indices have been found to be useful in discrimination, chemical documentation, structure property relationships, structure activity relationships and pharmaceutical drug design [4]. There are few main classes of topological indices, namely Wiener index, first and second Zagreb indices, forgotten index, Symmetric division degree index etc., that have been very often studied and investigated by the researchers [15, 16, 17, 18].

The first and second zagreb indices were introduced by Gutman and Trinajstic [9] which are defined as,

$$M_1(G) = \sum_{uv \in E(G)} [d(u) + d(v)].$$

$$M_2(G) = \sum_{uv \in E(G)} [d(u)d(v)].$$

In 2015, Ediz, S. [6] defined reverse vertex degree and reverse Zagreb indices of a simple connected graphs. The reverse vertex degree of a vertex v of a simple connected graph G defined as:

$$c_v = \Delta - d_v + 1.$$

where  $\Delta$  denotes the largest of all degrees of vertices of G and  $d_v$  denotes the number of edges incident to v.

The first reverse Zagreb beta index [7] of a graph G defined as;

$$CM_1^{\beta}(G) = \sum_{uv \in E(G)} c_u + c_v.$$

And the second reverse Zagreb index of a simple connected graph G defined as;

$$CM_2(G) = \sum_{uv \in E(G)} c_u c_v.$$

The concept of Sombor index was recently introduced by Gutman [8] in the chemical graph theory. It is a vertex-degree-based topological index and defined as;

$$SO(G) = \sum_{uv \in E(G)} \sqrt{d_u^2 + d_v^2}.$$

Inspired by work on Sombor indices, V. R. Kulli, introduced the Nirmala index [11] of a graph G as follows;

$$N(G) = \sum_{uv \in E(G)} \sqrt{d_u + d_v}.$$

The irregularity index was introduced by Albertson [2] in and defined as;

$$M_i(G) = \sum_{uv \in E(G)} |d_u - d_v|.$$

Recently, minus F-index [12] of a graph G is introduced by V. R. Kulli, and defined as;

$$MF(G) = \sum_{uv \in E(G)} |d_u^2 - d_v^2|.$$

Square F-index is defined as;

$$QF(G) = \sum_{uv \in E(G)} (d_u^2 - d_v^2)^2.$$

V. R. Kulli defined the first Gourava index [13] of a graph G is defined as;

$$GO(G) = \sum_{uv \in E(G)} (d_u + d_v + d_u d_v).$$

Inspired by the works of Zagreb indices, Deepika T. introduced the VL index [5] of a graph G is defined as;

$$VL(G) = \frac{1}{2} \sum_{uv \in E(G)} [d_e + d_f + 4].$$

where  $d_e = d_u + d_v - 2$  and  $d_f = (d_u \times d_v) - 2$ , such that  $d_u$  and  $d_v$  are the degree vertices of u and v in G respectively.

Alameri et.al., in 2020, introduced Y-index [1] defined as;

$$Y(G) = \sum_{u \in E(G)} (d^{3}(u) + d^{3}(v))$$

Numerous graph polynomials have been developed for measuring structural information of molecular graphs. Graphs polynomial of found applications in Chemistry in connection with the molecular orbital theory of unsaturated compounds and also an important source of structural descriptors used in developing structure property models. Degree based graph polynomials are useful because they contain a wealth of information about topological indices.

For a simply connected graph G, the first Zagreb beta polynomial [14] is defined as;

$$CM_1^{\beta}(G,x) = \sum_{uv \in E(G)} x^{c_u + c_v}.$$

The Second reverse Zagreb polynomial of a simple connected graph G defined as;

$$CM_2(G,x) = \sum_{uv \in E(G)} x^{c_u c_v}.$$

This paper is organized as follows. Section 1 consists of a brief introduction and literature review which is essential for the development of main results. Forthcoming two sections, we shall give the topological indices, polynomials of the amylose and blue starchiodine complex. Also, depict their graphic behavior. Section 4 consists conclusion of this work.

#### 2. Amylose

In this sector calculated the many standard topological indices and related polynomials for amylose by using the edge partition technique. Here, also obtained graphic comparison of topological indices of amylose.

Amylose was discovered in 1940, by Meyer and his co-workers found that properties were different from those of native maize starch. It is found in algae and other lower forms of plants. It is a spread polymer of around 6000 glucose deposits with branches on 1 in each 24 glucose ring. It plays an important role in the storage of plant energy and as plants do not require glucose to explode, its dense structure and slow breakdown features are under plant's growth [10].

The reader can find the molecular structure and molecular graphs of amylose in [3].

**Theorem 2.1.** For all  $n \geq 2$ , let  $\mathbb{A}$  be the structure of amylose, then

```
1. SO(\mathbb{A}) = 43.55n - 0.8865.

2. N(\mathbb{A}) = 26.71n - 8.472.

3. VL(\mathbb{A}) = 67n - 4.

4. M_i(\mathbb{A}) = 10n + 2.

5. MF(\mathbb{A}) = 44n + 6.

6. GO(\mathbb{A}) = 134n - 8.

7. CM_2(\mathbb{A}) = 26n + 2.

8. CM_1^{\beta}(\mathbb{A}) = 36n + 2.

9. QF(\mathbb{A}) = 262n + 3.

10. Y(\mathbb{A}) = 456n - 18.
```

*Proof.* Here we noticed that in the graph of amylose vertices have degrees 1, 2 or 3. The number of the edges of types are given bellow.

$$\begin{split} E_1 &= \{uv \in E(\mathbb{A}) : d_{\mathbb{A}}(u) = 1, d_{\mathbb{A}}(v) = 2\}. \\ E_2 &= \{uv \in E(\mathbb{A}) : d_{\mathbb{A}}(u) = 1, d_{\mathbb{A}}(v) = 3\}. \\ E_3 &= \{uv \in E(\mathbb{A}) : d_{\mathbb{A}}(u) = 2, d_{\mathbb{A}}(v) = 3\}. \\ E_4 &= \{uv \in E(\mathbb{A}) : d_{\mathbb{A}}(u) = 3, d_{\mathbb{A}}(v) = 3\}. \end{split}$$

One can calculate easily that  $|E_1(\mathbb{A})| = n$ ,  $|E_2(\mathbb{A})| = 2n + 2$ ,  $|E_3(\mathbb{A})| = 5n - 2$ ,  $|E_4(\mathbb{A})| = 4n$ .

$$\begin{split} \text{Let,} \quad &SO(G) \quad = \quad \sum_{u,v \in E(G)} \sqrt{d(u)^2 + d(v)^2} \\ &SO(\mathbb{A}) \quad = \quad \mid E_{(1,2)} \mid \sum_{u,v \in E_{(1,2)}(\mathbb{A})} \sqrt{d(u)^2 + d(v)^2} + \mid E_{(1,3)} \mid \sum_{u,v \in E_{(1,3)}(\mathbb{A})} \sqrt{d(u)^2 + d(v)^2} \\ & \quad + \quad \mid E_{(2,3)} \mid \sum_{u,v \in E_{(2,3)}(\mathbb{A})} \sqrt{d(u)^2 + d(v)^2} + \mid E_{(3,3)} \mid \sum_{u,v \in E_{(3,3)}(\mathbb{A})} \sqrt{d(u)^2 + d(v)^2} \\ &SO(\mathbb{A}) \quad = \quad 43.55n - 0.8865. \end{split}$$

Similarly, using the definitions of topological indices we obtain the results.

Figure 1. 3D plot of topological indices of amylose a) Sombor index b) Nirmala index c) VL index d) irregularity index e) minus F-index f) Gourava index g) Second zagreb index h) first zagreb beta index i) square F index j) Y index .

**Theorem 2.2.** let  $\mathbb{A}$  be the structure of amylose, then

1. 
$$SO(\mathbb{A}, x) = nx^{\sqrt{5}} + (2n+2)x^{\sqrt{10}} + (5n-2)x^{\sqrt{13}} + 4nx^{\sqrt{18}}$$
.  
2.  $N(\mathbb{A}, x) = nx^{\sqrt{13}} + (2n+2)x^{\sqrt{4}} + (5n-2)x^{\sqrt{5}} + 4nx^{\sqrt{6}}$ .  
3.  $VL(\mathbb{A}, x) = \frac{n}{2}x^5 + (n+1)x^7 + \frac{(5n-2)}{2}x^{11} + 2nx^{15}$ .  
4.  $M_i(\mathbb{A}, x) = (6n-2)x + (2n+2)x^2 + 4n$ .  
5.  $MF(\mathbb{A}, x) = \frac{n}{x^3} + \frac{2n+2}{x^8} + \frac{5n-2}{x^5} + 4n$ .  
6.  $GO(\mathbb{A}, x) = (6n-2) + (2n+2)x^7 + (5n-2)x^{11} + 4nx^{15}$ .  
7.  $CM_2(\mathbb{A}, x) = nx^6 + (2n+2)x^3 + (5n-2)x^2 + 4nx^1$ .  
8.  $CM_1^{\beta}(\mathbb{A}, x) = nx^5 + (2n+2)x^4 + (5n-2)x^3 + 4nx^2$ .  
9.  $QF(\mathbb{A}, x) = nx^9 + (2n+2)x^{64} + (5n-2)x^{25} + 4n$ .  
10.  $Y(\mathbb{A}, x) = nx^9 + (2n+2)x^{16} + (5n-2)x^{25} + 4nx^{36}$ .

*Proof.* Using the information given in Theorem 1 and definition of Sombor polynomial, we have

In the similar method we also obtain results for other polynomials. Hence the Proof.  $\Box$ 

#### 3. Blue Starch - Iodine Complex

In this sector calculated the many standard topological indices and related polynomials for blue starch - Iodine Complex by using the edge partition technique. Here, also obtained graphic comparison of topological indices of blue starch - iodine complex.

The main structure of amylose are cyclic degradants known as cyclodextrins. They are obtained enzymatically and may be considered as single turns of the helix of amylose imploding into a circular path. In all of these complexes, cyclodextrin molecules are positioned in front to form dimers and they are piled together to generate large cylinders that resemble the amylose helix in its global structure.

The reader can find the molecular structure and molecular graphs of blue starch - iodine complex in [3].

**Theorem 3.1.** For all  $n \geq 3$ , let  $\mathbb{B}$  be the structure of Blue starch - Iodine Complex, then

```
1. SO(\mathbb{B}) = 12.397n^2 + 10.986n + 1.773.

2. N(\mathbb{B}) = 7.708n^2 + 7.0817n + 0.944.

3. VL(\mathbb{B}) = 18.25n^2 + 71.75n + 8.

4. M_i(\mathbb{B}) = 4n^2 - 4.

5. MF(\mathbb{B}) = 19n^2 - 7n - 12.

6. GO(\mathbb{B}) = 36.5n^2 + 24.5n + 40.

7. CM_2(\mathbb{B}) = 7.5n^2 + 14.5n - 4.

8. CM_1^{\beta}(\mathbb{B}) = 11n^2 + 13n - 4.

9. QF(\mathbb{B}) = 107n^2 + 114n - 156.

10. Y(\mathbb{B}) = 119n^2 + 117n + 28.
```

*Proof.* Let  $\mathbb{B}$  be a blue starch - iodine complex graph. We have five partitions of the edge set  $E(\mathbb{B})$  as follows:

$$E_{1} = \{uv \in E(\mathbb{B}) : d_{\mathbb{B}}(u) = 1, d_{\mathbb{B}}(v) = 2\}.$$

$$E_{2} = \{uv \in E(\mathbb{B}) : d_{\mathbb{B}}(u) = 1, d_{\mathbb{B}}(v) = 3\}.$$

$$E_{3} = \{uv \in E(\mathbb{B}) : d_{\mathbb{B}}(u) = 2, d_{\mathbb{B}}(v) = 2\}.$$

$$E_{4} = \{uv \in E(\mathbb{B}) : d_{\mathbb{B}}(u) = 2, d_{\mathbb{B}}(v) = 3\}.$$

$$E_{5} = \{uv \in E(\mathbb{B}) : d_{\mathbb{B}}(u) = 3, d_{\mathbb{B}}(v) = 3\}.$$

One can calculate easily that  $|E_1(\mathbb{B})| = 2n$ ,  $|E_2(\mathbb{B})| = \sum_{i=1}^{n-1} (n+2) - 2$ ,  $|E_3(\mathbb{B})| = n$ ,  $|E_4(\mathbb{B})| = 4n$ .,  $|E_4(\mathbb{B})| = \sum_{i=1}^{n-1} (6n-2) + 2$ ,  $|E_5(\mathbb{B})| = 4n$ . The proof technique is similar as theorem 1.

FIGURE 2. 3D plot of topological indices of blue starch - iodine complex graph a) Sombor index b) Nirmala index c) VL index d) irregularity index e) minus F-index f) Gourava index g) Second zagreb index h) first zagreb beta index i) square F index j) Y index.

**Theorem 3.2.** let  $\mathbb{B}$  be a blue starch - iodine complex graph, then

```
1. SO(\mathbb{B}, x) = 2nx^{\sqrt{5}} + \frac{(n^2 + 3n - 8)}{2}x^{\sqrt{10}} + nx^{\sqrt{8}} + (3n^2 - 5n + 4)x^{\sqrt{10}} + 4nx^{\sqrt{18}}.

2. N(\mathbb{B}, x) = 2nx^{\sqrt{13}} + \frac{n^2 + 5n - 8}{2}x^2 + (3n^2 - 5n + 4)x^{\sqrt{5}} + 4nx^{\sqrt{6}}.

3. VL(\mathbb{B}, x) = nx^5 + \frac{n^2 + 3n - 8}{4}x^7 + \frac{3n^2 - 5n + 4}{2}x^{11} + 2nx^{15} + nx^8.

4. M_i(\mathbb{B}, x) = 5n + (3n^2 - 3n + 4)x + \frac{n^2 + 3n - 8}{2}x^2.

5. MF(\mathbb{B}, x) = 5n + 2nx^{-3} + \frac{n^2 + 3n - 8}{2}x^{-8} + (3n^2 - 5n + 4)x^{-5}.

6. GO(\mathbb{B}, x) = 2nx^5 + \frac{n^2 + 3n - 8}{2}x^7 + nx^8 + (3n^2 - 5n + 4)x^{11} + 4nx^{15}.

7. CM_2(\mathbb{B}, x) = 2nx^6 + (\frac{n^2 + 3n - 8}{2}x^3 + nx^4 + (3n^2 - 5n + 4)x^3 + 4nx.

8. CM_1^{\beta}(\mathbb{B}, x) = 2nx^5 + (\frac{n^2 + 5n - 8}{2}x^4 + (3n^2 - 5n + 4)x^3 + 4nx^2.

9. QF(\mathbb{B}, x) = 5n + 2nx^9 + \frac{n^2 + 3n - 8}{2}x^{64} + (3n^2 - 5n + 4)x^{25}.

10. Y(\mathbb{B}, x) = 2nx^9 + \frac{n^2 + 3n - 8}{2}x^{28} + nx^{16} + (3n^2 - 5n + 4)x^{25} + 4nx^{54}.
```

The proof technique is similar as theorem 2.

#### 4. Conclusion:

It is important to calculate topological indices of amylose and blue starch-iodine complex because it is a proved fact that topological indices help to predict many properties without going to the wet lab. In the present work we evaluate some topological indices of the amylose and blue starch-iodine complex. First, we obtain degree based indices then recover some polynomial of the structures. Also, the findings are interpreted graphically.

# copper(I) oxide molecular descriptors based on `ve degree and `ev degree

A. S. Maragadam, V. Lokesha, sushmithajain and Nirupadi.K doi: 10.48047/ecb/2023.12.si4.967

**Abstract.** Copper oxide is a well-known inorganic chemical and p-type semiconductor. It's a chemical element with the formula  $Cu_2O$  and it's employed in chemical sensors and solar cells. The results of various  $\iota$  degree based and  $\kappa$  degree based topological indices of  $Cu_2O$  were found in this study. Throughout the article we denote 've =  $\iota$  and 'ev =  $\kappa$ . In addition, the maple was used to plot these research discoveries.

**Keywords:** Copper(I) Oxide, polynomial, topological index, M-polynomial, crystallographic structure.

**2020** Mathematics Subject Classification: 05C09, 05C76.

#### 1 Introduction

One of the key reasons for the expansion is the ability to quickly examine quantitative structure-property or quantitative structure activity relationships (QSPR/QSAR). In a chemical plot, the vertex grade is frequently indicated for its valence. Graph theory has been a focal point for the development of many modern scientific principles and their application to several fields of chemistry. Copper oxide has non-toxic qualities, is complete, and is easy to assemble. Chemists can think as much as they want about molecules and their chemical behaviour by looking at their molecularplot aspects, thanks to the advent of the topological theory of chemistry. Chemical graph theory is a field of mathematics that uses graph theory to analyze the molecular structure of chemical compounds. The topological index is a part of chemical graph theory that connects the physicochemical properties of the underlying chemical graphs, such as viscosity, density, infrared spectrum, boiling point, and melting point. A large number of works on topological indices are available to the reader. [3], [12], [13], [14], [15], [11].

Copper (I) oxide is used in marine paints as a pigment, fungicide, and anti-fouling agent, among other things. Copper (II) oxide is an important product that serves as a starting point for the synthesis of additional copper salts. It has a variety of uses, including wood preservatives, coloured glazes in ceramics, animal feed additives, and welding using copper alloys and other materials.

Photochemical effects, stability, pigment, fungicide, non-toxicity, and low cost are all major benefits. It can be used in a variety of disciplines, including new energy, sensing, sterilising, and others. Understanding cuprite at the electrical and atomic level is more helpful in

predicting and controlling the processes of copper corrosion.

In this study, we calculated the polynomials of both  $\kappa$  and  $\iota$  degree topological indices for the chemical structure of copper oxide, and explored a few early ideas of both  $\iota$  degree and  $\kappa$  degree. Additionally, the ability of these trials to address a wide range of complex methods is illustrated in the fields of chem-informatics, bio-medicine, and bio-informatics, where graph topological assessments are regularly employed to further develop and understand the mathematical aspects of the real-world network model.

Using vertex-edge domination and edge-vertex domination parameters, Chellali and his colleagues [2] have published a research paper. In graph theory, they defined  $\kappa$  degrees and  $\iota$  degrees, which are two novel degree graph invariants. As a result, they discovered that the total  $\kappa$  and  $\iota$  degrees for any graph are closely linked to the first Zagreb index, a prominent degee-based topological index. In this paper, we computed various topological indices such as the K-index, Sombar index, VL-index, Nirmala index, and Albertson index, all of which are based on  $\kappa$  and  $\iota$  degrees.

The Wiener index, also referred to as the path number, was the first index name and was introduced by Wiener in 1965 along with the topological descriptor. Ten years later, Randic proposed the Randic-type index, a topological index. The Randic index is still the most well-known, commonly used, and studied of all the topological indices that have since been created. However, the majority of research projects used the traditional concept of degrees, such as Randic and Zagreb indices. This work translated the classical notion of degrees into  $\kappa$  and  $\iota$  degrees for recently introduced topological indices, such as the K-index, VL-index, Nirmala index, Albertson index, and Sombor index.

Let  $\Psi$  be a graph with vertices  $\alpha$  and  $\beta$ ,  $\Psi = (\alpha, \beta)$  use this notation throughout the article. Since degree-based topological indices may be used to analyze the chemical characteristics of various molecule structures, they are helpful. We are particularly interested in polynomial-based topological indices as a result of this inspiration. Topological indices based on polynomials are a useful method for predicting a compound's physicochemical, pharmacological, and toxicological qualities directly from its molecular structure. The study of the quantitative structure—activity relationship is the name for this type of investigation (QSAR). Many chemical and biological features of chemical compounds under research can be predicted using topological indices [4].

#### 2 Preliminaries

**Definition 2.1** The  $\kappa$  degree of any edge  $\alpha\beta \in E(\Psi)$ , denoted by  $d_{\kappa}(\alpha\beta)$ , is equal to the total number of vertices in the union of the  $\alpha$  and  $\beta$  closed neighborhoods.

**Definition 2.2** The degree of any vertex  $\beta \in V(\Psi)$  is the sum of the degrees of all the vertices in its closed neighbourhood, i.e.,  $\iota$  the total quantity of edges incident to any vertices from the closed neighbourhood of  $\beta$ .

#### 3 Essential prerequisite

Some definitions of degree-based  $\iota$  and  $\kappa$  K index  $(K(\Psi))$ , VL index  $(VL(\Psi))$ , Nirmala index  $(N(\Psi))$ , Albertson index  $(A(\Psi))$  and Sombor index  $(S(\Psi))$  are given bellow.

TI	$\kappa$ degree based index	ι degree based index	
<i>K</i> (Ψ)[17]	$k^{\kappa}(\Psi) = \sum_{e \in E(\Psi)} [d_{\kappa}(e)]^{3}$	$k^{\iota}(\Psi) = \sum_{e \in E(\Psi)} [d_{\iota}(e)]^{3}.$	
<i>S</i> (Ψ) [10]	$SO^{\kappa}(\Psi) = \sum_{\alpha\beta \in E(\Psi)} \sqrt{d_{\kappa}(\alpha)^2 + d_{\kappa}(\beta)^2}$	$SO^{\iota}(\Psi) = \sum_{\alpha\beta \in E(\Psi)} \sqrt{d_{\iota}(\alpha)^{2} + d_{\iota}(\beta)^{2}}$	
<i>VL</i> (Ψ) [7]	$VL^{\kappa}(\Psi) = \frac{1}{2} \sum_{\alpha\beta \in E(\Psi)} d_{\kappa}(e) + d_{\kappa}(f) + 4$	$VL^{\iota}(\Psi) = \frac{1}{2} \sum_{\alpha\beta \in E(\Psi)} d_{\iota}(e) + d_{\iota}(f) + 4.$	
N(Ψ) [16]	$N^{\kappa}(\Psi) = \sum_{\alpha\beta \in E(\Psi)} \sqrt{d_{\kappa}(\alpha) + d_{\kappa}(\beta)}$	$N^{\iota}(\Psi) = \sum_{\alpha\beta \in E(\Psi)} \sqrt{d_{\iota}(\alpha) + d_{\iota}(\beta)}$	
<i>A</i> (Ψ)[1]	$A^{\kappa}(\Psi) = \sum_{\alpha\beta \in E(\Psi)}  d_{\kappa}(\alpha)^{2} - d_{\kappa}(\beta)^{2} $	$A^{\iota}(\Psi) = \sum_{\alpha\beta \in E(\Psi)}  d_{\iota}(\alpha)^{2} - d_{\iota}(\beta)^{2} $	

Table 1. Some of the  $\iota$  degree based and  $\kappa$  degree based topological indices.

#### 4 Research Aim

The K-index, VL-index, Nirmala index, Albertson index and Sombor index are some of the topological indices and polynomials of  $\iota$  degree and  $\kappa$  degree based K-index, VL-index, Nirmala index, Albertson index and Sombor index are some of the primary aims of this article. Furthermore, the results of these indices have been developed to provide a better understanding of their behaviour.

#### 5 Structure of copper oxide

Figure shows how the  $Cu_2O$  lattice formed in the  $u \times v$  plane and accumulated in w layers. The vertices and edges of  $Cu_2O$ 's crystal structure are 1 + u + v + uv + w + uw + vw + 6uvw and 8uvw, respectively.  $Cu_2O$  vertices are divided into four divisions based on degrees: four vertices of degree zero, four vertices of degree one, four vertices of degree two, two vertices of degree three, two vertices of degree four, and two vertices of degree four. Similarly,  $Cu_2O$  edges are divided into  $E_{(1,2)}$ , which has 4(u+v+w) edges,  $E_{(2,2)}$ , which has 2(uv+uw+vw-2u-2v-2w+3) edges, and  $E_{(2,4)}$ , which has 8uvw-4uv-4uw-4vw+4u+4v+4w-4 edges.

Figure 1:  $Cu_2O$  crystal structure

Figure 2: a)cuprite unit cell  $Cu_2O$ , b)  $Cu_2O$  crystal structure [1,0,0], c) $Cu_2O$  crystal structure [1,1,1], d) $Cu_2O$  crystal structure [1,1,0]

#### 6 Main results

**Theorem 6.1** Let 
$$Cu_2O$$
 be a Copper(I) Oxide then  $F^{\kappa}(Cu_2O)$  is  $F^{\kappa}(Cu_2O) = 716(u+v+w) - 736(uv+vw+uw) + 1728uvw - 696$ .

*Proof.* Assume  $Cu_2O$  be a Copper(I) Oxide. The edges are broadly divided into three types then total number of edges is 8uvw. From the definition of each edge's end vertices  $\kappa$  degree can be used to calculate the degree of each edge, classified into three types which are given below.

$$E_1 = \{e \in E(Cu_2O) \colon d_{\kappa}Cu_2O(e) = 3\}$$

$$E_2=\{e\in E(Cu_2O)\colon d_\kappa Cu_2O(e)=4\}$$

$$E_3=\{e\in E(Cu_2O)\colon d_\kappa Cu_2O(e)=6\}$$

One can calculate easily that,

$$|E_1(Cu_2O)| = 4u + 4v + 4w - 8.$$

$$|E_2(Cu_2O)| = 2uv + 2uw + 2vw - 4u - 4v - 4w + 12.$$

$$|E_3(Cu_2O)| = 8uw - 4uv - 4uw - 4vw + 4u + 4v + 4w - 4.$$

$$F^{\kappa}(\Psi) = \sum_{e \in E(\Psi)} d_{\kappa}\alpha^3$$

$$F^{\kappa}(Cu_2O) = ||E_1(Cu_2O)||(3^3) + ||E_2(Cu_2O)||(4^3) + ||E_3(Cu_2O)||(6^3).$$
  
= 716(u + v + w) - 736(uv + vw + uw) + 1728uvw - 696.

**Theorem 6.2** Let  $Cu_2O$  be a Copper(I) Oxide then

- $1.k^{i}(Cu_{2}O) = 18816(u+v+w) 17472(uv+vw+uw) + 21952uvw + 1266.$
- 2.  $SO^{i}(Cu_{2}O) = 80.941(u + v + w) 56.087(uv + vw + uw) + 90.509uvw 2.529$ .
- 3.  $VL^{\iota}(Cu_2O) = 320(u+v+w) (224)(uv+vw+uw) + 320uvw 24$ .
- $4.N^{i}(Cu_{2}O) = 29.389(u + v + w) 18.192(uv + vw + uw) + 32uvw + 0.8367.$
- $5. A^{\iota}(Cu_2O) = 48(u+v+w) + 96(uv+vw+uw) + 96.$

*Proof.* Let  $cu_2o$  be a copper(I) oxide. The edges can be divided into five types and its total number of edges is 8uvw. From the definition of each edge's end vertices  $\iota$  degree can be used to calculate the degree of each edge, classified into five types which are given below.

$$E_1 = \{\alpha\beta \in E(Cu_2O): d_{Cu_2O}(\alpha) = 2, d_{Cu_2O}(\beta) = 5\}.$$

$$E_2 = \{\alpha\beta \in E(Cu_2O): d_{Cu_2O}(\alpha) = 4, d_{Cu_2O}(\beta) = 6\}.$$

$$E_3 = \{\alpha\beta \in E(Cu_2O): d_{Cu_2O}(\alpha) = 5, d_{Cu_2O}(\beta) = 8\}.$$

$$E_4 = \{ \alpha \beta \in E(Cu_2O) : d_{Cu_2O}(\alpha) = 6, d_{Cu_2O}(\beta) = 8 \}.$$

$$E_4 = \{ \alpha \beta \in E(Cu_2O) : d_{Cu_2O}(\alpha) = 8, d_{Cu_2O}(\beta) = 8 \}.$$

$$\begin{split} |E_1(Cu_2O)| &= 4u + 4v + 4w - 8 \quad , \quad |E_2(Cu_2O)| = 2uv + 2uw + 2vw - 4u - 4v - 4w + \\ 12|E_3(Cu_2O)| &= 4(u+v+w-2) \quad , \quad |E_4(Cu_2O)| = 2uv + 2uw + 2vw - 4u - 4v - 4w + \\ 12, \ |E_5(Cu_2O)| &= 8(v-1)(u-1)(w-1). \end{split}$$

$$\begin{split} SO^{\iota}(\Psi) &= \sum_{\alpha\beta \in E(\Psi)} \sqrt{d_{\iota}\alpha^{2} + d_{\iota}\beta^{2}} \\ &= |E_{(2,5)}| \sum_{\alpha\beta \in E_{(2,5)}(Cu_{2}O)} \sqrt{d_{\iota}\alpha^{2} + d_{\iota}\beta^{2}} + |E_{(4,6)}| \sum_{\alpha\beta \in E_{(4,6)}(Cu_{2}O)} \sqrt{d_{\iota}\alpha^{2} + d_{\iota}\beta^{2}} \\ &+ |E_{(5,8)}| \sum_{\alpha\beta \in E_{(5,8)}(Cu_{2}O)} \sqrt{d_{\iota}\alpha^{2} + d_{\iota}\beta^{2}} + |E_{(6,8)}| \sum_{\alpha\beta \in E_{(6,8)}(Cu_{2}O)} \sqrt{d_{\iota}\alpha^{2} + d_{\iota}\beta^{2}} \\ &+ |E_{(8,8)}| \sum_{\alpha\beta \in E_{(8,8)}(Cu_{2}O)} \sqrt{d_{\iota}\alpha^{2} + d_{\iota}\beta^{2}}. \end{split}$$

= 80.941(u + v + w) - 56.087(uv + vw + uw) + 90.509uvw - 2.529.

We could use the same method to obtain results for the remaining indices.

**Theorem 6.3** Let  $Cu_2O$  be a Copper(I) Oxide then polynomials are given by

1. 
$$K^{i}(Cu_{2}0, x) = (u + v + w)[4x^{125} - 4x^{512} + 4x^{1331} - 4x^{1728} + 8x^{2744}] + (uv + uw + vw)[2x^{512}2x^{1728} - 8x^{2744}] + 8uvwx^{2744} - 8x^{125} + 12x^{512} - 8x^{1331} + 12x^{1728} - 8x^{2744}].$$

2. 
$$SO^{\iota}(Cu_2O, x)$$

$$= (u + v + w)[4x^{5.38} - 4x^{7.21} + 4x^{9.43} - 4x^{10} + 8x^{11.31}] + (uv + uw + vw)[2x^{7.21} + 2x^{10} - 8x^{11.31}] + 8uvwx^{11.31} - 8x^{5.38} + 12x^{7.21} - 8x^{9.43} + 12x^{10} - 8x^{11.31}.$$

3. 
$$VL^{i}(Cu_{2}O, x)$$
  
  $= (u + v + w)[2x^{17} - 2x^{34} + 2x^{53} - 2x^{62} + 4x^{80}] + (uv + uw + vw)[x^{34} + 2x^{62} - 4x^{80}] + 4uvwx^{80} - 4x^{17} + 6x^{34} - 4x^{53} + 6x^{62} - 4x^{80}.$   
4.  $N^{i}(Cu_{2}O, x) = (u + v + w)[4x^{2.64} - 4x^{3.16} + 4x^{3.60} - 4x^{3.74} - 8x^{4}] + (uv + uw + vw)[2x^{3.16} + 2x^{3.74} - 8x^{4}] + 8uvwx^{4} - 8x^{2.64} + 12x^{3.16} + 12x^{3.74} - 8x^{3.60} - 8x^{4}.$   
5.  $A^{i}(Cu_{2}O, x) = (u + v + w)[4x^{21} - 4x^{20} + 4x^{39} - 4x^{28} + 8x] + (uv + uw + vw)[2x^{20} + 2x^{28} - 8] + 8uvwx^{11.31} - 8x^{21} + 12x^{20} - 8x^{39} + 12x^{28} - 8.$ 

The proof method is as similar as theorem 2.

#### 7 Numerical results

We offer mathematical conclusions which have been tied to the topological descriptors based on  $\kappa$  and  $\iota$  degrees for the sub-atomic structures of cuprite oxide. We evaluated numerous u,v, and w estimations that were calculated using mathematical tables (Table 2). Many aspects of the understudied chemical molecule can be predicted using topological indices. Some of the graph invariants for instance K-index, Sombar index, VL-index, Nirmala index, and Albertson index that have been proposed for estimating the skeleton pertaining to the molecule of carbon spreading. A interesting field of research is still calculating the Undergraduate molecular graphs topological index based on degree.

So far, we have recorded numerically certain degree-based entropies for various u, v, w estimates for  $Cu_2O[u,v,w]$ . As the predictions of [u,v,w] are increments, you can see that all of the entropy values are in growing request [18].

Table 2. Numerical depiction of estimated indices for various  $Cu_2O$  values.

#### 8 Graphical Comparison of $Cu_2O$

In this portion we have depicted 3D graphs of polynomial of  $Cu_2O$  of various  $\iota$  degree based topological indices.

Figure 3: 3D graphs of polynomial of  $Cu_2O$  a)K edge index, b)sombor index, c)VL index, d)Nirmala index, e)Albertson index

#### 9 Conclusion

The results of specific  $\kappa$  degree based and  $\iota$  degree based indices of copper(I) oxide are presented in this article. Considering that the  $\iota$  degree index has demonstrated a stronger prediction ability and correlation than standard degree-based indexes, according to the results of this study will assist researchers in better understanding the physical and chemical properties of copper(I) oxide.

### STUDY ON LINE GRAPH OF SOME GRAPH OPERATORS OF CHEMICAL STRUCTURES VIA F AND $M_1$ INDICES

M. MANJUNATH, S. M. VEERESH, M. PRALAHAD AND P. S. HEMAVATHI\*

ABSTRACT. The Topological indices are known as Mathematical characterization of molecules. In this paper, we have studied line graph of subdivision and semi-total point graph of triangular benzenoid, polynomino chains of 8-cycles and graphene sheet through forgotten and first Zagreb indices.

AMS Mathematics Subject Classification: 05C09, 05C92. Key words and phrases: Line graph, Subdivision graph, Semi-total point graph, F-index,  $M_1$ -index, Triangular benzenoid, Polynomino chains, Graphene sheet.

#### 1. Introduction

A topological index is a numerical parameter which characterizes its molecular topology and used for quantitative structure activity relationship (QSAR) and quatitative structure property relationship (QSPR). In 1947, the first topological index (named as Wiener index or path index) was introduced by Wiener for finding the boiling point of paraffins [5]. For new topological indices, we suggest the reader to refer the papers [7,9–20].

In [1], B. Furtula and et al., proposed a topological index based on the degrees of vertices of graph, which is known as forgotten index and it is defined as

$$F[G] = \sum_{u \in V[G]} deg_G^3 u$$

or

$$F(G) = \sum_{uv \in E(G)} [deg_G^2(u) + deg_G^2(v)]$$

Received , . Revised , . Accepted , .  $\ ^* Corresponding author.$ 

 $<sup>^\</sup>dagger \mathrm{This}$  research received no external funding.

<sup>© 2023</sup> KSCAM.

The first Zagreb index is introduced by Gutman et al. [2] and it is defined as

$$M_1(G) = \sum_{uv \in E(G)} [deg_G(u) + deg_G(v)]$$

O

$$M_1(G) = \sum_{u \in V(G)} deg_G^2(u)$$

**Definition 1.1.** [6] The line graph L(G) is the graph obtained by associating a vertex with each edge of the graph G and two vertices are adjacent with an edge iff the corresponding edges of G are adjacent.

**Definition 1.2.** [21] The **subdivision graph** S(G) is the graph obtained by replacing each of its edge by a path of length 2 or equivalently, by inserting an additional vertex into each edge of G.

**Definition 1.3.** The **semi-total point graph** R(G) graph is obtained from G by adding a new vertex corresponding to every edge of G and by joining each new vertex to the end vertices of the edge corresponding to it.

**Triangular benzenoid:** Benzenoid molecular graph is a connected geometric figure obtained by arranging congruent regular hexagons in a plane so that two hexagons are either disjoint or have a common edge and it is shown in below Figure 1 [3, 18, 22].

FIGURE 1. Triangular benzenoid

**Polynomino chains of 8-cycles:** A k-polyomino system is a finite 2-connected plane graph such that each interior face (also called cell) is surrounded by a regular 4k-cycle of length one and Polynomino chains of 8-cycles shown in below Figure 2.

FIGURE 2. Polynomino chains of 8-cycles

**Graphene sheet:** Graphene sheets are essentially the finest materials in the world. Graphene sheet is a one-atom-thick planar sheet of carbon iotas which are intensively packed in a hexagonal lattice structure. Graphene sheets show high electrical conductance at room temperatures and molecular graph of graphene sheet as shown in below Figure 3 (See [4,8]).

FIGURE 3. Graphene sheet

#### 2. Main results

In this section, we compute the forgotten and first Zagreb indices of line graph of subdivision and semi-total point graph of triangular benzenoid, polynomino chains of 8-cycles and graphene sheet.

**Theorem 2.1.** Let  $\Gamma$  be the line graph of subdivision graph of triangular benzenoid, then

$$M_1[\Gamma] = \frac{9}{2}(n^2 - n + 8)^2 + \frac{27}{4}(n^2 + 7n - 8)^2,$$
  
$$F[\Gamma] = \frac{27}{4}(n^2 - n + 8)^3 + \frac{81}{8}(n^2 + 7n - 8)^3.$$

*Proof.* Let  $\Gamma$  be a line graph of subdivision graph of triangular benzenoid. Applying the line and subdivision operations to Figure 1, we obtain the two types of vertices based on their degrees and which are shown in the below **Table 1**.

**Table 1.** Degree partition of  $\Gamma$  based on their degrees.

$deg_{\Gamma}(u)$	Number of vertices
2	$12 + \frac{3n(n-1)}{2}$
3	$\frac{3}{2}(n^2+7n-8)$

Consider,

$$\begin{split} M_1[G] &= \Sigma_{u \in V[G]} deg_G^2 u \\ M_1[\Gamma] &= 2 \left( 12 + \frac{3n(n-1)}{2} \right)^2 + 3 \left( \frac{3}{2}(n^2 + 7n - 8) \right)^2 \\ &= \frac{1}{2} (24 + (3n(n-1)))^2 + \frac{3^3}{2^2} (n^2 + 7n - 8)^2 \\ M_1[\Gamma] &= \frac{9}{2} (n^2 - n + 8)^2 + \frac{27}{4} (n^2 + 7n - 8)^2. \end{split}$$

the above proof method is also follows for  $F[\Gamma]$ .

**Theorem 2.2.** Let  $\Upsilon$  be the line graph of semi-total point graph of triangular benzenoid, then

$$M_1[\Upsilon] = 9(n^2 - n + 8)^2 + \frac{27}{2}(n^2 + 7n - 4)^2 + 18n^2(n - 1)^2 + 360(n - 1)^2,$$
  

$$F[\Upsilon] = \frac{27}{2}(n^2 - n + 8)^3 + \frac{81}{4}(n^2 + 7n - 8)^3 + 27(n(n - 1))^3 + 2160(n - 1)^3.$$

*Proof.* Let  $\Upsilon$  be a line graph of semi-total point graph of triangular benzenoid. Applying the line and semi-total point operations to Figure 1, we obtain the four types of vertices based on their degrees and which are shown in the below **Table 2**.

**Table 2.** Degree partition of  $\Upsilon$  based on their degrees.

$deg_{\Upsilon}(u)$	Number of vertices
4	$12 + \frac{3n(n-1)}{2}$
6	$\frac{3}{2}(n^2+7n-8)+6$
8	$\frac{3n(n-1)}{2}$
10	6(n-1)

Consider,

$$\begin{array}{lcl} M_1[G] & = & \Sigma_{u \in V[G]} deg_G^2 u \\ \\ M_1[\Upsilon] & = & 4 \left(12 + \frac{3n(n-1)}{2}\right)^2 + 6 \left(\frac{3}{2}(n^2 + 7n - 8) + 6\right)^2 \\ \\ & + & 8 \left(\frac{3n(n-1)}{2}\right)^2 + 10(6(n-1))^2 \\ \\ M_1[\Upsilon] & = & 9(n^2 - n + 8)^2 + \frac{27}{2}(n^2 + 7n - 4)^2 + 18n^2(n-1)^2 + 360(n-1)^2. \end{array}$$

the above proof method is also follows for  $F[\Upsilon]$ .

**Theorem 2.3.** Let  $\Phi$  be the line graph of subdivision graph of polynomino chains of 8-cycles, then

$$M_1[\Phi] = 3776n^2 - 160n + 236,$$
  
 $F[\Phi] = 107008n^3 - 3618n^2 + 20064n + 376.$ 

*Proof.* Let  $\Phi$  be a line graph of subdivision graph of polynomino chains of 8-cycles. Applying the line and subdivision operations to Figure 2, we obtain the two types of vertices based on their degrees and which are shown in the below **Table 3**.

**Table 3.** Degree partition of  $\Phi$  based on their degrees.

$deg_{\Phi}(u)$	Number of vertices
2	32n + 8
3	24n - 6

Consider,

$$M_1[G] = \Sigma_{u \in V[G]} deg_G^2 u$$
  
 $M_1[\Phi] = 2(32n+8)^2 + 3(24n-6)^2$   
 $M_1[\Phi] = 3776n^2 - 160n + 236.$ 

the above proof method is also follows for  $F[\Phi]$ .

**Theorem 2.4.** Let  $\Psi$  be the line graph of semi-total point graph of polynomino chains of 8-cycles, then

$$M_1[\Psi] = 13024n^2 - 320n + 178,$$
  
 $F[\Psi] = 420224n^3 - 49920n^2 + 18672n - 62.$ 

*Proof.* Let  $\Psi$  be a line graph of semi-total point graph of polynomino chains of 8-cycles. Applying the line and semi-total point operations to Figure 2, we obtain the four types of vertices based on their degrees and which are shown in the below **Table 4**.

**Table 4.** Degree partition of  $\Psi$  based on their degrees.

$deg_{\Psi}(u)$	Number of vertices
4	32n + 4
6	36n - 2
8	8n
10	8n - 3

Consider,

$$M_1[G] = \Sigma_{u \in V[G]} deg_G^2 u$$
  
 $M_1[\Psi] = 4(32n+4)^2 + 6(36n-2)^2 + 8(8n)^2 + 10(8n-3)^2$   
 $M_1[\Psi] = 13024n^2 - 320n + 178.$ 

the above proof method is also follows for  $F[\Psi]$ .

**Theorem 2.5.** Let  $\ \$  be the line graph of subdivision graph of graphene sheet with n-rows and m-columns, then

$$M_1[\mathbb{J}] = 32(m+n+1)^2 + 12(|E(\mathbb{J}(m,n))| - 2m - 2n - 2)^2,$$
  
 $F[\mathbb{J}] = 128(m+n+1)^3 + 24(|E(\mathbb{J}(m,n))| - 2m - 2n - 2)^3.$ 

*Proof.* Let  $\ \ \ \ \$  be a line graph of subdivision graph of graphene sheet with n-rows and m-columns. Applying the line and subdivision operations to Figure 3, we obtain the two types of vertices based on their degrees and which are shown in the below **Table 5**.

$deg_{ ightharpoonup}(u)$	Number of vertices
2	4m + 4n + 4
3	$2 E(\gimel(m,n))  - 4m - 4n - 4$

Consider,

$$\begin{array}{lcl} M_1[G] & = & \Sigma_{u \in V[G]} deg_G^2 u \\ M_1[\mathbb{J}] & = & 2(4m+4n+4)^2 + 3(2|E(\mathbb{J}(m,n))| - 4m - 4n - 4)^2 \\ M_1[\mathbb{J}] & = & 32(m+n+1)^2 + 12(|E(\mathbb{J}(m,n))| - 2m - 2n - 2)^2. \end{array}$$

the above proof method is also follows for  $F[\gimel]$ .

**Theorem 2.6.** Let  $\neg$  be the line graph of semi-total point graph of polynomino chains of 8-cycles, then

$$M_1[\exists] = 64(m+n+1)^2 + 6(2|E(\exists(m,n))| - 4m - 3n)^2 + 32(2m+n-2)^2 + 10(|E(\exists(m,n))| - 4m - 3n)^2,$$
  
$$F[\exists] = 256(m+n+1)^3 + 6(2|E(\exists(m,n))| - 4m - 3n)^3$$

+ 
$$64(2m+n-2)^3 + 10(|E(\Im(m,n))| - 4m - 3n)^3$$
.

*Proof.* Let  $\neg$  be a line graph of semi-total point graph of graphene sheet with n-rows and m-columns. Applying the line and semi-total point operations to Figure 3, we obtain the four types of vertices based on their degrees and which are shown in the below **Table 6**.

**Table 6.** Degree partition of ¬ based on their degrees.

$deg_{\daleth}(u)$	Number of vertices
4	4m + 4n + 4
6	$2 E(\overline{\lnot}(m,n))  - 4m - 3n$
8	4m + 2n - 4
10	$ E(\exists (m,n))  - 4m - 3n$

Consider,

$$\begin{array}{lcl} M_1[G] & = & \Sigma_{u \in V[G]} deg_G^2 u \\ M_1[\ensuremath{\mbox{$\neg$}}] & = & 4(4m+4n+4)^2 + 6(2|E(\ensuremath{\mbox{$\neg$}}(m,n))| - 4m - 3n)^2 \\ & + & 8(4m+2n-4)^2 + 10(|E(\ensuremath{\mbox{$\neg$}}(m,n))| - 4m - 3n)^2 \\ M_1[\ensuremath{\mbox{$\neg$}}] & = & 64(m+n+1)^2 + 6(2|E(\ensuremath{\mbox{$\neg$}}(m,n))| - 4m - 3n)^2 \\ & + & 32(2m+n-2)^2 + 10(|E(\ensuremath{\mbox{$\neg$}}(m,n))| - 4m - 3n)^2. \end{array}$$

the above proof method is also follows for  $F[\neg]$ .

Conclusion: In this article, we have calculated the forgotten and first Zagreb indices of line graph of subdivision and semi-total point graph of triangular benzenoid, polynomino chains and graphene sheet. These results are useful to study the QSPR and QSAR of above chemical molecules.

### **Editorial**

Skill based education is the need of the hour. Students graduating from the educational institutions are in possession of qualifying certificates with less skills. The education system rather a classroom teaching practice in most of the educational institutions in India is to deliver the content available in the local books and making the students to learn. Many educational institutions follow the practice of giving a priority to theoretical knowledge than the practical knowledge with an objective to secure higher ranking to the institution. This is the same scenario in technical and other professional institutions too. A meritorious graduate may get an employment and sometimes not able to fare well in processional career due to lack of required skills in the domain.

It is a fact that there is a drastic increase in literacy rate in India, but the recent reports saying 20% of the technical graduates in India only are employable. This implies that there is a lack of the necessary skills and a huge gap between the skills required by the industry and the person in possession. In a highly competitive world, employers look for the candidates who possess the required skills rather than the candidates having more degrees with higher grades. In this context, the educational institutions need to get connected with various industries and create the opportunities to the students to acquire practical knowledge at every stage of their education to strengthen necessary skills so as to grow well in a chosen area. Lot many new technologies are emerging across the world, and there is a need that a person inculcates the required skills to use these technologies for a successful life. If one is failed to acquire such skills to use the latest technologies will remain as a back bencher.

There is a need to have a skill-based education system that helps the employers to easily absorb the suitable trained candidates. Hence, there is a need to bring up the students by educating them with more thrust or atleast equal weightage to practical knowledge than theoretical at every stage of their college level education.

The S. B. Jain Institute of Technology, Management & Research, Nagpur (Maharashtra) has organized a 2day International Conference on Advancement in Science, Technology and Management 2023 (ICASTM- 2023) and created a platform to invite the authors to share advances in technologies and their applications.

The editorial board of IJTE has shortlisted 51 papers of ICASTM- 2023 covering engineering, management and basic sciences to publish as September 2023 special issue. We believe that Vol. 46, September 2023 special issue of IJTE is interesting to the readers to enhance or update their knowledge.

## Behavioural Analysis of Infectious Diseases in Two Main Age Groups using a Mathematical Approach

#### N. K. Lamba

Department of Mathematics, Shri Lemdeo Patil Mahavidyalaya, Mandhal Nagpur

#### **ABSTRACT**

In this study, we modify the S-I-R-M model for two major age groups of the total population: the aged group (which includes old adults ranging from 60 and above) and the youth group (this comprises young adults aged 18 to 25 years old, adults aged 26 to 44 years old, and middle-aged individuals aged 45 to 59 years old) and discussed the frequency of infection, rapidity of healing, mortality, and susceptibility in the case of infectious diseases like plague, flu, cholera, coronavirus, etc. For the various parameters and functions, computations have been suggested and given graphically. The specific S-I-R-M model scenarios for both age groups have been discussed.

KEYWORDS: Infectious diseases, Susceptible, Infective, recovery, Mortality Mathematical Modelling.

#### INTRODUCTION

Tor many years, the whole world has faced so many pandemic and epidemic conditions due to the spread of infectious diseases like plague, flu, cholera, tuberculosis, malaria, coronavirus, etc. According to the data collected by the World Health Organization, people with a high risk of developing severe cases of infectious diseases are found to be over the age of 60, and the highest mortality rate is found in people over the age of 80. In addition to older age groups, young people with chronic illnesses including diabetes, high blood pressure, kidney disease, or cancer are at increased risk of contracting infectious infections. From the available literature survey, it is found that around 9 % of diabetic patients died after contracting the virus, which spreads infection in many diseases. Also, around 8 % of people are victims of high blood pressure. Hence, from the available data, we believed that the age distribution of the population plays a pivotal role in describing disease behaviour and characteristics. Now there is a need to study the impact of infectious diseases on the two major age groups, namely young (those who are below and equal to 60 years) and old (those who are above 60 years), across the globe. Consequently, in order to avoid and limit the spread of infections,

recovery, and mortality in the above-mentioned age range, it is necessary to prepare a mathematical model category-wise due to the suitability conditions.

Morens et al. [1] state that many infectious illnesses, such as cholera, malaria, and tuberculosis, have spread across large geographic areas, posing health problems for a sizeable section of the population. Oliveira [2] suggested that infectious organisms, such as the variola virus and Yersinia pestis, have the potential to be utilized as bioweapons and pose a threat to civilization. The flea-borne bacteria Yersinia pestis, which caused the Black Death, the third plague, and the Justinian plague, was discussed by Zietz and Dunkelberg [3]. According to Faruque et al. [4], Vibrio cholerae causes the acute, frequently deadly disease of the gastrointestinal tract known as cholera. Three years ago, early December 2019 in the Chinese city of Wuhan saw a rapid rise in the reports of numerous inexplicable symptoms including cough, weariness, fever, and pneumonia [5, 6]. The pathogen of these cases was determined by the World Health Organisation (W.H.O.) and Chinese health officials to be a group of a new type of virus known as Coronavirus on January 10, 2020 [7]. Numerous researchers examined the coronavirus's transmission dynamics and came to sound conclusions [8, 9].

www.isteonline.in Vol. 46 Special Issue, September, 2023

In order to explore the impact of the S-I-R-M (young and old) model owing to the influence of conditions like immunity power, weather conditions, etc., the current research works with a general mathematical model of infectious diseases. By using Mathematica Software, the numerical calculations for young and old people have been examined in terms for infection pace, recovery pace, and death rate. Additionally, a few comparisons are depicted in the image to illustrate the specific S-I-R-M model situations, including the elderly and younger generations, and to estimate the influence of susceptible conditions.

#### Proposed Mathematical Model

Assume that represents the population of a certain nation, and that and represent the susceptible and infectious populations, respectively, at each point in time.

i.e. 
$$S(t) + I(t) = N$$

Furthermore, there is a chance that each sick person will spread the virus to a susceptible individual. The likelihood of contracting an illness varies from person to person, from society to society, as well as from country to country, based on their surroundings, culture, way of life, immune function, lack of knowledge about virus infection, and capacity for their age group. The frequency of new infections rises steadily as time (measured in days) changes and rises as well. In order to study the physical impact of infectious diseases on two major age groups, the numbers of susceptible and infectious diseases are further divided into two parts as follows:

$$S(t) = S_{v}(t) + S_{o}(t), I(t) = I_{v}(t) + I_{o}(t),$$

where  $S_{\nu}(t)$  stands for the number of young susceptible whose age is less than and equal to 60 years and  $S_{c}(t)$ for the number of young susceptible whose age is above than 60 years. Similarly  $I_{ij}(t)$  and  $I_{ij}(t)$  refers to young and old infective as the age taken in the case of susceptible respectively.

#### The S-I-S model (Young and Old)

One of the simplest epidemic models and one of the most realistic ways to simulate the spread of disease is the S-I-S model. As alreadydescribed, the overall population is split into those who are infectious and those who have exposure at any one time.

$$S(t) + I(t) = N \tag{1}$$

On differentiating equation (1) on both sides with respect to t, we get

$$\frac{dS}{dt} = -\frac{dI}{dt} \tag{2}$$

Further we have

$$S(t) = S_y(t) + S_o(t) \text{ and } I(t) = I_y(t) + I_o(t)$$
 (3)

But with the consideration of the comparison purpose of two major age categories, equation (2) can be rewritten for the young and old populations as

$$\frac{dS_y}{dt} = -\frac{dI_y}{dt} \tag{4}$$

$$\frac{dS_o}{dt} = -\frac{dI_o}{dt} \tag{5}$$

The above equations (4) and (5) give the relationship between how the numbers of susceptible and infected people are changing over time according to age category, both young and old.

To make sense of the study, rather than considering raw numbers, proportions of infected and susceptible people are taken.

So, let the proportion of the young population that is

infected be given as: 
$$i_y(t) = \frac{I_y}{N}$$

and the proportion of the young population who are susceptible is:  $s_y(t) = \frac{S_y}{N}$ 

susceptible is: 
$$s_y(t) = \frac{s_y}{N}$$

Similarly, the proportion of the old population thatis infected is given as:  $i_o(t) = \frac{I_0}{N}$ 

and the proportion of the old population who are susceptible is:  $s_o(t) = \frac{S_0}{N}$ 

here 
$$i_v + s_v + i_o + s_o = 1$$

In the S-I-S model the rate of infection is defined as Rate of infection in young =

 $c \times (Proportion of young susceptible) \times (Proportion of infected)$ 

$$= c s_{v}(t) i(t) = c s_{v} i$$
 (6)

Similarly Rate of infection in old =

 $c \times (Proportion of old susceptible) \times (Proportion of infected)$ 

$$= c s_o(t) i(t) = c s_o i$$
 (7)

The constant 'c' in equations (6) and (7) denotes the transmission rate, which is the average number of persons each infectious person (young or elderly) transfers the disease to each day.

So the equation can be written solely for every person (young or old) as

$$\frac{di_y}{dt} = c \ s_y i \tag{8}$$

$$\frac{ds_y}{dt} = -c \ s_y i \tag{9}$$

$$\frac{di_o}{dt} = c \ s_o i \tag{10}$$

$$\frac{ds_o}{dt} = -c \ s_o i \tag{11}$$

#### The S-I-R Model

The fundamental SIR-Model for the equations of a differential system is provided by the following, adopting Barnes and Fulford [10]:

$$\dot{I} = cSI - rI \tag{12}$$

$$\dot{S} = -cSI \tag{13}$$

$$\dot{R} = rI \tag{14}$$

where "dot" stands for a time function derivative.

Here, the population can be further divided into three basic categories:

I(t) – Infective, S(t) – Susceptible, R(t) – Recovered, clearly, I(t) + S(t) + R(t) = N.

The S-I-R model is altered by the addition of the age

category as majorly young and old. Hence, the proposed **S-I-R model (young and old)** is given as:

Case 1: with uniform recovery rate

of 
$$\frac{dI_{y}}{dt} = cS_{y}I - rI_{y}$$

$$\frac{dS_{y}}{dt} = -cS_{y}I$$
the 
$$\frac{dR_{y}}{dt} = rI_{y}$$

$$\frac{dI_{o}}{dt} = cS_{0}I - rI_{0}$$

$$\frac{dS_{0}}{dt} = -cS_{0}I$$

$$\frac{dR_{o}}{dt} = -rI_{o}$$

$$\frac{dR_{o}}{dt} = rI_{o}$$

$$(15)$$

Case II: with different recovery rate  $r_y$  in young's and  $r_a$  in old's

(10) 
$$\frac{dI_{y}}{dt} = cS_{y}I - r_{y}I_{y}$$
(11) 
$$\frac{dS_{y}}{dt} = -cS_{y}I$$
ons of 
$$\frac{dR_{y}}{dt} = r_{y}I_{y}$$
owing, 
$$\frac{dR_{y}}{dt} = r_{y}I_{y}$$
(17)

$$\frac{dI_o}{dt} = cS_0 I - r_o I_o$$

$$\frac{dS_0}{dt} = -cS_0 I$$

$$\frac{dR_o}{dt} = r_o I_o$$
(18)

#### The S-I-R-M Model:

We rewrite the S-I-R model by considering mortality. The equations (12 to 14) can be written as

$$\dot{I} = cSI - rI - mI \tag{19}$$

$$S = -cSI \tag{20}$$

$$R = rI \tag{21}$$

$$\dot{M} = mI \tag{22}$$

where "dot" stands for a time function derivative.

Here Population N can be further classified into major four broad classes as:

I(t)— Infective, S(t)— Susceptible, R(t)— Recovered, M(t) – Mortality

Clearly, 
$$I(t) + S(t) + R(t) + M(t) = N$$

#### S-I-R-M Model (Young and Old):

So with the consideration of age category, the S-I-R-M model is now proposed as the S-I-R-M model (young and old). Therefore, equations (19)–(22) can now be rewritten as

Case I: with different recovery ( $r_v$  in young's and  $r_o$  in old's) and mortality rate ( $m_v$  in young's and  $m_o$  in old's)

$$\frac{dI_{y}}{dt} = cS_{y}I - r_{y}I_{y} - m_{y}I_{y}$$

$$\frac{dS_{y}}{dt} = -cS_{y}I$$

$$\frac{dR_{y}}{dt} = r_{y}I_{y}$$

$$\frac{dM_{y}}{dt} = m_{y}I_{y}$$

$$\frac{dI_{o}}{dt} = cS_{0}I - r_{o}I_{o} - m_{o}I_{o}$$

$$\frac{dS_{0}}{dt} = -cS_{0}I$$

$$\frac{dR_{o}}{dt} = r_{o}I_{o}$$

$$\frac{dM_{o}}{dt} = m_{o}I_{o}$$
(24)

Case II: with different recovery rate  $(r_y)$  in young's and r<sub>o</sub> in old's) but mortality is only in old. For this case the above equations (23) and (24) can be rewritten by taking  $M_v = 0$ .

#### **Numerical Analysis and Graphical Representation**

As a case study, we constructed a mathematical model S-I-R-M for young and old people with infectious diseases under different parameters and functions. Using Mathematica software, the findings for the infective, recovered, and death rates for young as well as old age groups have been shown graphically.

**Hypothetical Data:** 
$$N = 1000$$
,  $c = 0.01$ ,  $S_y = 749$ ,  $S_o = 240$ ,  $I_y$   $(t = 0) = 1$ ,  $I_a$   $(t = 0) = 10$ ,  $I_y = 0.90$ ,  $I_Q = 0.30$   $I_Z = 0.001$  and  $I_Z = 0.010$ .

The assumed data is based on the capacity of the infectious disease-spreading virus and subjected to its rate of transmission, recovery, and mortality.

Fig. 1. Distribution of S-I-R-M model (Young & Old Age Groups)

#### **OBSERVATION AND DISCUSSION**

The above figure shows the variation of infective, susceptible, recovered, and mortality versus time in the older and younger groups. The following observations have been discussed:

- For young people, the rate of transmission of disease from person to another person goes on decreasing as compared to old people.
- •Younger people heal more quickly than older people do.
- The rate of mortality in young people is found to be lower than in old people.

Additionally, we noted the following from the graphic representation of the S-I-R-M (young and old) model:

There is no recovery and no fatality rates in the

(24)

- earliest stages of infection because of the slow infection rate. At this specific instance of the S-I-R-M (young and old) reduces to S-I-S (young and old).
- The chain of infection from one person to another fluctuates gradually over time, which causes the infection rate to rise with periodic probable recovery. In this case above model is a particular case of the S-I-R (young and old) model.

#### **CONCLUSION**

An infection, recovery, and death rates are quite low in young people. as compared to the elderly, whereas the mortality rate is a little higher in the elderly population because of low immunity and chronic diseases. It is also concluded that if the transmission rate is less than one, the rate of infection, recovery, and death rates in both age categories is under control to minimize the influence of infection in society. The results of our study's mathematical modelling indicate that the pandemic's path may rapidly shift in both the elderly and the young if adequate precautions are not taken or are done insufficiently.

#### **ABSTRACT**

A new way of approaching to solve the physical system problems such as undamped force of vibration equation on a simple pendulum problem. In this paper we have revisited these problems by applying some integral transforms such as Ezaki transforms method (ETM) and Differential transforms method (DTM) demonstrating how effectively they are in the determination of the solutions.

KEYWORDS: Physical system, Ezaki transform, Differential transform, Simple pendulum.

#### INTRODUCTION

ince from last few decades the efforts have been made in the field of mathematics and physical sciences to apply some techniques to find the possible solutions for some physical system problems, further the development had made to analyse the such linear differential equations which we can apply in different areas of science and engineering. Some of the analysis was made and studied in the field of physical sciences and their applications. here some of the appropriate methods are adopted to get the different solutions such as Ezaki transform method (ETM) and Differential Transform method (DTM). These transform methods have been inspired towards researchers of physical and mathematical sciences and many research works have been taken places and research article were published in these fields.

#### Undamped force of vibrations

Whenever an external force is applied on a particular system continuously the vibration of that system never stop. This type of vibration also can be called as undamped force of vibration.

Examples: movement of laundry machine due to asymmetry, vibration of a moving transport due to its engine. movements of strings in guitar.

Consider undamped forced vibrations of spring given by the differential equation is.

#### Undamped force vibration of spring

Consider the undamped force vibrations of spring given by the differential equation is,

$$m\frac{d^2y}{dt^2} + ky(t) = f(t) \tag{1}$$

In this paper we will consider our choice the forcing function as  $f(t) = (1-\sin t)$ , m=1kg, k=1N/m, with initial values y(0) = y'(0) = 0 then equation (1) and it gives us,

$$\frac{d^2y}{dt^2} + y(t) = (1 - \sin t)$$
 (2)

#### **Basics definition**

The Ezaki transform of the function f(t) for t > 0, can be defined as

$$E[f(t)] = v \int_0^\infty e^{-\frac{t}{v}} f(t) dt = T(v).$$

The Differential transform of a function f(t) is given by

$$F(k) = \frac{1}{k!} \left[ \frac{d^k}{dt^k} f(t) \right]_{t=0}$$

#### Main results

Applying both sides Ezaki transform method (ETM)

Consider the equation (2) and applying both sides Ezaki Transform

$$E[y''(t)] + E[y(t)] = E[1] - E[\sin t]$$

$$\left[\frac{Y(v)}{v^2} - y(0) - v y'(0)\right] + Y(v) = v^2 - \frac{v^3}{1 + v^2}$$

Since y(0)=y'(0)=0. And applying both sides Ezaki inverse transform.

We get

$$y(t) = 1 - \cos t - \frac{1}{2} [\sin t - t \cos t]$$
 (4)

Now applying the Differential transform method (DTM) both the side for equation (2)

$$(k+1)((k+2)y(k+2)+y(k)=1-\frac{1}{k!}\sin\left(\frac{k\pi}{2}\right)$$

$$y(k+2) = \frac{1 - \frac{1}{k!} \sin\left(\frac{k\pi}{2}\right) - y(k)}{(k+1)(k+2)}$$

Put k=0 
$$y(2) = \frac{1 - \frac{1}{0!}\sin(0) - y(0)}{(1)(2)} = \frac{1}{2}$$

Put k=1 
$$y(3) = \frac{1 - \frac{1}{1!}\sin(\pi/2) - y(1)}{(2)(3)} = \frac{1}{6}$$

Put k=2 
$$y(4) = \frac{1 - \frac{1}{2!}\sin(\pi) - y(2)}{(3)(4)} = \frac{1}{24}$$

Put k=3 
$$y(5) = \frac{1 - \frac{1}{3!}\sin(\frac{3\pi}{2}) - y(3)}{(4)(5)} = \frac{1}{20}$$

Put k=4 
$$y(6) = \frac{1 - \frac{1}{4!} \sin\left(\frac{4\pi}{2}\right) - y(4)}{(5)(6)} = \frac{23}{480}$$
 and so on

Let us consider the solution is of the form

$$y(t) = \sum_{k=0}^{\infty} y(k) t^k$$

$$y(t) = y(0)t^{0} + y(1)t + y(2)t^{2} + y(3)t^{3} + y(4)t^{4} + y(5)t^{5} +$$
 (6)

Substituting the different values of y we get

$$y(t) = t + \frac{t^2}{2} + \frac{t^3}{6} + \frac{t^4}{24} + \frac{t^5}{20} + \frac{23}{480}t^6 + \dots$$
 (7)

Table 1: The value different values of y(t) using Differential transform method and Ezaki Transform method

## Modified Differential Evolution Algorithm for Engineering Design Optimization

Pooja Tiwari, Vishnu Narayan Mishra

Raghav Prasad Parouha

Department of Mathematics Indira Gandhi National Tribal University Amarkantak, M.P

#### **ABSTRACT**

Differential evolution (DE) is broadly used for various optimization issues, amongst a lot of evolutionary methods (EMs). But, it has few weaknesses like untimely convergence, maintenance of diversity etc. Similarly, mutation and its control factor choice for DE are extremely inspiring for enhanced optimization. To increase the DE exploration competence, a modified DE (mDE) is projected in this paper. It implemented a new mutation system, thru the perception of particle swarm optimization, to balance population diversity. Meanwhile, focused on time-varying structure, new mutant control parameters incorporated with the suggested mutation scheme, to escaping local optima. Using the features of retention and robustly altered control parameters, exploitation and exploration ability of mDE is well-adjusted. Finally, six engineering optimization problem solved, to verify effectiveness of the mDE. Performance of mDE compared with different peer algorithms. According the investigational results, efficiency of suggested mDE technique has been confirmed.

KEYWORDS: Evolutionary algorithm, Differential evolution, Engineering optimization, Mutation.

#### INTRODUCTION

resently, huge amounts of evolutionary methods (EMs) are offered to solve engineering design optimization problems [1]. Between several EMs, differential evolution (DE) is ultimate widespread optimizers since its initiation in 1995 [2]. It has competence to solve multifaceted optimization issues, due to its easy implementation. Equally, it attained evident improvement in the past two years, owing to its search capacity and proficiency [3]. Besides, the DE effectively applied in several real-life problems, for example power system [4], neural system [5], image analysis [6], chemical manufacturing [7] etc. Conversely, at the time of solving multifaceted optimization problem, the DE faces certain disadvantages for instance stagnation i.e. to escape from local minima [8]. Respectively, DE has no possibility to solve all optimization problems efficiently [9].

Henceforth, various innovative DE reforms have been advocated in the literature to increase the DE presentation [10, 11, 12, 13]. But, most of the DE variants still face the stagnation problem and provide poor results for complex optimization issues [14, 15, 16]. It happens due to selection of DE mutation and control factors schemes. Hence, various mutation and control factors for DE projected by scholars [17, 18]. Furthermore, synergy of DE and PSO (particle swarm optimization) [19] techniques improves the search performance of the DE [20, 21, 22, 23]. Up-to-date various DE and its hybrids variants suggested for solving complex optimization issues. But they are unable to provide best outcome and falls into local minima; due to unable to used earlier best outcomes [24, 25, 26].

Stimulated by the above literature study and PSO method, in this article a modified DE (mDE) is suggested. It has an innovative mutation scheme, using the perception

of PSO, to trade off the exploration and exploitation. Also, novel time-varying mutant control parameters incorporated with the suggested mutation scheme, to escaping local optima. Using the features of retention and robustly altered control parameters, exploitation and exploration ability of mDE is well-adjusted. Also, admitted features of mDE algorithm follows better convergence speed. Finally, to verify the effectiveness of mDE, six engineering design optimization issues are solved. Presentation of mDE equated with different methods. The experimental results of mDE are better than other compared methods which confirm its efficiency and ability to solve engineering design optimization issues.

The article rest part is prepared as - Section 2 delivers elementary DE outline. Facts of the offered mDE are demonstrated in Section 3. Results and discussions displays in Section 4. And Section 5 present conclusion of the whole article and future plans.

#### **ELEMENTARY DE OUTLINE**

DE is a population established stochastic optimizer. It has similar steps with other evolution methods (EMs), namely initialization, mutation, crossover & selection. In each cycle mutation, crossover to selection operator used in the evolution process and form new solution vectors. Mutation, crossover and selection cycles are repeated up-to predefined stopping conditions. Following are the implementation steps of the classic DE.

#### 1st Step: Initialization

Aimed at -dimensional problem optimization, a group of random sampling points (target vectors)  $x_{i,j}^t = (x_{i,1}, x_{i,2}, ..., x_{i,D})$  i = 1, 2, ..., NP and

j = 1, 2, ..., D called the population initialization population size and - dimension) is generated randomly in specified limits, at 't<sup>th</sup> 'iteration.

#### 2nd step: Mutation

 $v_{i,j}^t = (v_{i,1}, v_{i,2}, \dots, v_{i,D})$  called mutant vector is formed as

$$v_{i,j}^t = x_{r_1}^t + F \times \left( x_{r_2}^t - x_{r_3}^t \right) \tag{1}$$

where

 $x_{r_1}, x_{r_2}$  and  $x_{r_3} \in [1, NP], r_1 \neq r_2 \neq r_3 \neq i$  and  $F \in [0, 1]$  is specified as mutant factor.

#### 3rd step: Crossover

 $u_{i,j}^t = (u_{i,1}, u_{i,2}, ..., u_{i,D})$  called trial vector is formed as -

$$u_{i,j}^{t} = \begin{cases} v_{i,j}^{t}; \text{ if } rnd \leq CR \\ x_{i,j}^{t}; \text{ Otherwise} \end{cases}$$
 (2)

where = uniformly random number spread among 0 and  $CR \in [0,1]$  is indicated as crossover constant.

#### 4th step: Selection

It is formed as -

$$x_{i,j}^{t+1} = \begin{cases} u_{i,j}^t; & \text{if } f(u_{i,j}^t) \le f(x_{i,j}^t) \\ x_{i,j}^t; & \text{Otherwise} \end{cases}$$
(3)

#### 5th step: Stopping

Repeats II-V else stopped as per criteria of termination.

#### **OFFERED MODIFIED DE (MDE)**

Following are observation from the literature survey (research gaps).

(i).  $v_{i,j}^t = x_{r_1}^t + F \times (x_{r_2}^t - x_{r_3}^t)$  is extensively used mutation scheme and effectively balanced population diversity [2, 27]. In contrast, it has slow convergence rate [27].

(ii)  $v_{i,j}^t = x_{r_1}^t + F \times (x_{r_2}^t - x_{r_3}^t) + F \times (x_{r_4}^t - x_{r_5}^t)$  has enhanced perturbation than  $v_{i,j}^t = x_{r_1}^t + F \times (x_{r_2}^t - x_{r_3}^t)$ . But, it may fail to provide exploitation facility during the search evolution [28].

(iii) 
$$v_{i,j}^t = x_{best} + F \times (x_{r_1}^t - x_{r_2}^t) + F \times (x_{r_3}^t - x_{r_4}^t)$$
  
,  $v_{i,j}^t = x_{i,j}^t + F \times (x_{r_1}^t - x_{r_2}^t)$  and  $v_{i,j}^t = x_{i,j}^t + F \times (x_{best}^t - x_{i,j}^t) + F \times (x_{r_1}^t - x_{r_2}^t)$ 

has better exploitation ability. But, they have low exploration capability when solving multimodal optimization problems [28].

exploration capability when solving multimodal optimization problems [28].

(iv). Various mutation schemes presented in the literature [29], to decrease the DE disadvantages. Bur,

want essential refinement to enhance the DE search capability [30].

(v). DE might be not stanching the previous best memory/vector information in the evolution process. Hence, it may loss of the best vectors and leads to premature convergence [31].

Encouraged by above stated and literature investigation, a modified DE (mDE) presented in this article, to overcome DE disadvantages. Advised mDE steps are presented as follows.

#### 1st step: Initialization

NP size initial poputational generated randomly by using following equations in mDE.

$$x_{i,j}^t = x_i^{min} + rnd(0,1)(x_i^{max} - x_i^{min})$$
 (4)

where i = 1,..., NP, j = 1, ...., D, t iteration number,  $x_i^{min}$  &  $x_i^{max}$  = minimum and maximum value of  $i^{th}$  variable.

#### 2nd step: Mutation

Using the concept of PSO [29],  $v_{i,j}^t$  i.e. mutation vector created as follows.

$$v_{i,j}^{t} = x_{i,j}^{t} + F_1 \times \left(xbest_{i,j}^{t} - x_{i,j}^{t}\right) + F_2 \times \left(xbetter_j^{t} - x_{i,j}^{t}\right) + F_3 \times \left(xworst_j^{t} - x_{i,j}^{t}\right)$$
(5)

where  $xbest_{i,j}^t = best vectors$ ,  $xbetter_j^t = better vectors$ , and  $xworst_j^t = worst vectors$ . These vectors are restructured as follows.

$$xbest_{i,j}^t = \begin{cases} x_{i,j}^t & ; \text{if } f\left(x_{i,j}^t\right) < f\left(xbest_{i,j}^{t-1}\right) \\ xbest_{i,j}^{t-1} & ; \text{if } f\left(x_{i,j}^t\right) \geq f\left(xbest_{i,j}^{t-1}\right) \end{cases}$$

 $xbetter_{j}^{t} = \min \left\{ xbest_{i,j}^{t} \right\} \& \ xworst_{j}^{t} = \max \left\{ xbest_{i,j}^{t} \right\}$ 

Moreover,  $F_1$ ,  $F_2$ , &  $F_3$  are the novel control parameters defined as follows.

$$\begin{split} F_1 &= \left(t - \frac{1}{t_{max}} - 1\right) \times F_{1,\text{initial}} - \left(F_{1,\text{final}} - F_{1,\text{initial}}\right) \\ F_2 &= \left(t - \frac{1}{t_{max}} - 1\right) \times F_{2,\text{initial}} - \left(F_{2,\text{final}} - F_{2,\text{initial}}\right) \\ F_3 &= \left(1 - \exp(F_2 \times t)\right) \times F_1 \end{split}$$

where  $t_{max}$  and t = maximum and current iteration/generation number.

Moreover, mutant factors  $(F_1, F_2, \& F_3)$  have the subsequent quality, throughout the search procedure.

- (i). initiate with big value and gradually falls to a small value, while initiate with small value and gradually upturns to a large value. In earlier period, large and small values are allowed vectors to travel freely over search space, instead of affecting to the population's finest. Likewise, small and large values are endorsed vectors to touch the overall best, in later period.
- (ii). quickly upsurge in earlier period then gradually shrinkage in latter period. It supports the vectors to find suitable direction and better movement position.

After an wide study,  $F_{1, initial} = F_{2, final} = F_{2, initial} = 0.5$ , are fixed for mDE for entire experiments. Variation of  $F_{1}$ ,  $F_{2}$ , &  $F_{3}$  and according to iteration number are depicted in Fig. 1.

Fig. 1. Variation of F<sub>1</sub>, F<sub>2</sub>, & F<sub>3</sub> as per iteration number 3rd step: Crossover

Recombines mutant  $(v_{i,j}^t)$  and target  $(x_{i,j}^t)$  vector to create trail  $(u_{i,j}^t)$  vector as follows.

$$u_{i,j}^{t} = \begin{cases} v_{i,j}^{t}; & \text{if } rnd(0,1) \le CR \\ x_{i,j}^{t}; & \text{if } rnd(0,1) > CR \end{cases}$$
(6)

where ( ) = random number among 0 & 1, = crossover rate.

#### 4th step: Selection

A greedy selection scheme used in mDE i.e. if  $u_{i,j}^{\ \ \ \ \prime}$  has better or equal function values than it used for next iteration otherwise  $x_{i,j}^{\ \ \prime}$  will used for the next iteration. It works as follows mathematically.

$$x_{i,j}^{t+1} = \begin{cases} u_{i,j}^t; & \text{if } f(u_{i,j}^t) \le f(x_{i,j}^t) \\ x_{i,j}^t; & \text{if } f(u_{i,j}^t) > f(x_{i,j}^t) \end{cases}$$
(7)

#### 5th step: Stopping

Repeat step II – V, else stop as per specified stopping criteria such as  $t_{max}$  (maximum iterations)

#### RESULT AND DISCUSSION

Competence of developed mDE is thoroughly checked in 6 engineering design optimization issues (EDOIs). Particulars of these EDOIs with objective minimization/maximization (Min/Max)specified as below.

#### **EDOI -1: Gas transmission design [32]**

# **EDOI -2: Optimal capacity of gas production** facilities [32]

Min  $F(x) = \frac{61.8 + 5.72 * x_1 + 0.2623[(40 - x_1)ln(x_2/200)]^{-0.85} + 0.087(40 - x_1)ln(x_2/200)}{+700.23 * x_2^{-0.75}}$  s.t. -  $40 \ge x_1 \ge 17.5,600 \ge x_2 \ge 300$ 

#### EDOI -3: Gear train design [33]

Min 
$$F(x) = (1/6.931 - T_d T_b / T_a T_f)^2 = (1/6.931 - x_1 x_2 / x_3 x_4)^2$$
  
s.t. -  $60 \ge x_1, x_2, x_3, x_4 \ge 12$ 

# EDOI -4: Optimal thermohydraulic performance of an artificially roughened air heater [34]

Max  $F(x) = 5.5 - 0.1RM - GH + 2.51 * lne^+$ where  $RM = 0.95 * x_2^{0.53}$ ,  $GH = 4.5(e^+)^{0.28}(0.7)^{0.57}$ ,  $e^+ = x_1 * x_3(\bar{f}/2)^{1/2}$ .  $\bar{f} = [0.079x_3^{-0.25} + 2(0.95x_3^{0.53} + 2.5 * ln(1/2x_1)^2 - 3.75)^{-2}]/2$ s.t. -  $0.8 \ge x_1 \ge 0.02$ ,  $40 \ge x_2 \ge 10$ ,  $20000 \ge x_3 \ge 3000$ .

## **EDOI -5:** Frequency modulation sound parameter identification [35]

Min  $F(x) = \sum_{t=0}^{100} (y(t) - y_0(t))^2$ where  $y(t) = a_1 \sin(\omega_1 t\theta + a_2 \sin(\omega_2 t\theta + a_3 \sin(\omega_3 t\theta)))$   $y_0(t) = 1.0 \sin(5t\theta + 1.5 \sin(4.8t\theta + 2\sin(4.9t\theta))), \theta = 2\pi/100$ s.t. -  $6.35 \ge a_i, \omega_i \ge -6.4, i = 1, 2, 3$ .

# EDOI -6: Spread spectrum radar poly-phase code [36]

$$\begin{split} & \text{Min } F(x) = \max\{f_1(x), \dots, f_{2m}(x)\} \\ & \text{where } x = \left\{(x_1, \dots, x_n) \in R^n \colon 0 \leq x_j \leq 2\pi, j = 1, 2, \dots, n\right\} \text{ and } m = 2n-1, \\ & f_{2i-1}(x) = \sum_{j=1}^n \cos\left(\sum_{k=|2i-j-1|+1}^j x_k\right), i = 1, 2, \dots, n; \\ & f_{2i}(x) = 0.5 + \sum_{j=i+1}^n \cos\left(\sum_{k=|2i-j|+1}^j x_k\right), i = 1, 2, \dots, n-1; \\ & f_{m+i}(X) = -f_i(x), i = 1, 2, \dots, m. \end{split}$$

Simulation outcomes experimented on Core(TM) Intel(R) i7-7200U CPU, 2.50GHz, 16GB RAM, MATLAB R2021a software with Windows 10 (64-bit) operating system. To conduct a fair evaluation- 30 population size, 240000 maximum numbers of function evaluations and 30 trail runs set for developed mDE on EDOIs which is same as comparative methods. The other parameter settings of mDE mentioned in above section and other methods can be found in the respective papers. The boldface in each table reveals the best results. The experimental results of developed mDE with the other methods presented as follows.

The experimental results of developed mDE on 6 EDOIs equated with DE [2], PSO [23] and PSODE [37]. Mean (mn) and standard deviation (std) over 30 trail runs of these methods describedin Table 1. It could be noticed that from table 1 – for EDOI-1 and EDOI-2 proposed mDE produce same results with others, but for the rest three EDOIs suggested mDE yield best optimal solutions compared with other methods. Hence, it can be said that projected mDE reaches the best solution in all EDOIs. Also, it should be noticed that from this table, most of the std of mDE is less compared to others, which illustrate that its solution stability.

**Table 1. Comparisons results on 6 EDOIs** 

<b>EDOIs</b>	Ideals	mDE	PSODE	PSO	DE

Furthermore, to measure the significance of experimental results of mDE with others CPU time (s) and nFEs (function evaluations numbers) considered on 6 EDOIs and reported in Table 2. This table shows that proposed mDE has less CPU time (s) and number of function evaluations on each EDOI compared to others. It illustrates that mDE has best convergence ability and higher reliability with others. Finally, the Friedman's ranking test [26] testified on all associated algorithms

on 6 EDOIs and results designated in Table 3. It shows that, projected mDE reaches the top ranking.

Table 2. The statistical results for mDE vs other algorithms in terms of CPU time (s) (nFEs)

Moreover, to analyse the convergence results of mDE, convergence curve is used in this section. It reflects the speed and convergence accuracy of projected and other methods. The convergence curves of developed mDE with other methods on 6 EDOIs displayed in Fig. 2, Fig. 3, Fig. 4, Fig. 5, Fig. 6, and Fig. 7 separately. In these figures, number of iterations is applied in x- axis and objective function values gained from each method on same population/seed are used in y- axis. From these figures, it can be supposed that mDE has quicker convergence with better accuracy in most cases. Hence, it can be said that projected mDE has capability to jump out from the local optima effectively.

#### CONCLUSION AND FUTURE PLANS

In this article, a modified differential evolution (mDE) is projected for solving engineering optimization issues. It implemented a new mutation scheme, based on the perception of PSO, which balance population diversity. Also, new time-varying mutant control parameters incorporated with suggested mutation scheme, which helps individuals to escaping from local optima. Using the features of new mutation and robustly altered control parameters, exploitation and exploration ability of mDE is well-adjusted. Also, admitted features of mDE algorithm follows to speeding up convergence efficiently.

The mDE performance has been tested on six engineering

design optimization problems. The experimental outcomes achieved by mDE equated with DE, PSO, and PSODE. Suggested mDE obtained better results on all engineering design optimization issues, due to its new mutation and controlling factors strategies. Hence, advised mDE is an active alternative of DE for solving engineering design optimization issues. Suggested mDE may be used for complex real-world optimization issues, in future.

## A Study of Fractional Heat Transfer in A Generalized Two-Dimensional Thermally Elastic Problem

#### **Yogesh Panke**

Department of Mathematics Dr. Khatri Mahavidyalaya Tukum, Chandrapur

#### Dilip B Kamdi

Department of Mathematics R.M.G. College Saoli, Chandrapur

#### **ABSTRACT**

In this article, an attempt has been made to analyse the exact thermoelastic response of a generalised infinite-length problem in two dimensions, which is under the action of a periodic varying source of heat with one relaxation time. The basic heat equation involves a fractional Caputo-like temporal derivative. Initially, the medium is assumed to be quiescent and subjected to traction-free boundary conditions. The entire solution of temperature distribution, displacement function and stress is evaluated in the Laplace transformation domain, and its numerical inversion is performed using the Gaver-Stehfast algorithm. For A numerical investigation is done by considering copper material properties and showing them graphically with discussion.

**KEYWORDS:** Fractional response, Infinite space, Source of heat, Integral transformation.

#### INTRODUCTION

Physical processes taking place at the microscopic level should be taken into account because the conventional Fourier law and parabolic heat conduction equations are no longer accurate enough. As a result, nonclassical theories are developed, replacing the Fourier law and the parabolic heat conduction equation with more comprehensive equations. Fractional thermoelasticity, or thermoelasticity based on the heat conduction equation with differential operators of fractional order, is the primary objective of this article. Memorization effects are described by a heat equation with time-fractional differential operators. The fractional calculus has been applied effectively in fields such as physics, geology, chemistry, rheology, engineering, bioengineering, robotics, etc.

Maxwell [1] in the dynamic study of gases first investigated the finite velocities of heat distribution, i.e., hyperbolic form. Lord and Shulman [2] expressed the waveform thermal heat equation with relaxation time as well as presented the standard heat law by replacing the modified Fourier law. Povstenko [3-5] studied the

equation of heat conduction with derivatives of fractional order and calculated the corresponding thermal stresses. Zenkour [6–9] discussed generalised thermoelastic problems under thermal shock with various boundary conditions and explained multi-phase lag theory for plane wave propagation. Lamba [10] determines the stress function in a temperature-dependent FGM cylinder by the integral transform method. Green and Lindsay [11] presented an alternative generalization of existing classical thermoelastic theory, and this theory allows a second sound effect. Green and Naghdi [12] study the thermoelastic behaviour of materials without energy dissipation for both linear and nonlinear theories; they also prove the uniqueness theorem, which is appropriate for linear thermoelasticity. Ezzat [13] investigated bio-thermo-mechanics behaviour in living tissue based on fractional thermo-viscoelasticity with two types of thermal loading by utilizing Kirchhoff and Laplace transformation techniques. Kamdi et al. [14] studied the thermoelastic problem on a thin rectangular plate with known boundary conditions and used integral transform methods to obtain the temperature and stress functions, which are depicted graphically. Kumar et

www.isteonline.in Vol. 46 Special Issue, September, 2023

al. [15] discuss problems that depend on the concept of generalised thermal stresses in the case of a thick circular plate with the consideration of dual phase lag and two temperature functions. Abbas and Youssef [16] studied a 2D thermal problem for a porous material with one relaxation time under the consideration of fraction order derivatives and used the eigenvalue approach to simplify the coupled thermoelastic equations.

Santra et al. [17] considered a half-space threedimensional thermoelastic problem with fractional derivative subjected to a heat source and evaluated thermal stresses by using the normal mode and eigenvalue approaches, as well as illustrating all the obtained results graphically. Gupta and Das [18] considered an unbounded transversely isotropic medium with a fractional derivative subjected to an instantaneous heat source and evaluated the general solution for the thermoelastic deformation using the eigenvalue approach and Laplace transform, as well as showing the result graphically. Gaurav and Kulkarni [19] investigated the bounded spherical region for generalised two-temperature fractional theory, obtained an analytical solution of thermal variations in the Laplace domain, and discussed the stability of the assumed problem. Gaikwad and Naner [20] studied the thermoelastic temperature and thermal distribution of a thin circular plate for uniform internal heat generation, and the results were evaluated using the integral transform method. Povstenko and Kyrylych [21] studied the fractional thermoelasticity in an infinite isotropic plane with a line crack exposed to heat flux loading and obtained the solution of the heat equation using the integral transform technique. Youssef and Eman [22] successfully studied the Fractional Order Generalized Thermoelastic Half-space Subjected to Ramp-type Heating. Lamba and Deshmukh [27, 28] and Verma et al. [29] Studied the hygrothermal effect in cylindrical body in both coupling and decoupling cases.

The present work is devoted to determining the thermal behaviour of a generalised infinite-length problem in two dimensions that is under the action of a periodic varying source of heat with one relaxation time. The basic heat equation assumes a Caputo order fractional time derivative. At first, the medium is considered to be at rest and subject to limiting conditions without traction. The entire solution of temperature distribution, displacement function, and stresses is evaluated in the Laplace transform domain, and its numerical inversion is done using the Gaver-Stehfast algorithm. For A numerical investigation is done by considering copper material properties and showing them graphically with discussion.

#### PROBLEM FORMULATION

Let us consider a generalized thermoelastic problem of an axisymmetric homogeneous, isotropic solid of height 2h, defined in the range  $0 \le r \le \infty$ ,  $-h \le z \le h$  under the influence of a heat source. Further, it is considered that z-axis, as an axis of symmetry and coordinate system, lies in the middle of the plane in between the upper and lower plate faces. Cylindrical coordinates  $(r, \phi, z)$  are used to express the system of equations under consideration. All the quantities in this problem are independent of coordinate  $\phi$ , it is because of the assumption that rotation is symmetric about the z axis.

Thus, displacement function becomes  $\vec{u} = (u,0,w)$  and equations of motion becomes

$$\mu \nabla^2 u - \frac{\mu u}{r^2} + (\lambda + \mu) \frac{\partial e}{\partial r} - \gamma \frac{\partial T}{\partial r} = \rho \frac{\partial^2 u}{\partial t^2}$$
 (1)

$$\mu \nabla^2 w + (\lambda + \mu) \frac{\partial e}{\partial z} - \gamma \frac{\partial T}{\partial z} = \rho \frac{\partial^2 w}{\partial t^2}$$
 (2)

The conduction of heat under the Caputo fractional derivative of order  $0 < \alpha \le 2$ written as [24]

$$kI^{\alpha-1}\nabla^{2}T = \left(\frac{\partial}{\partial t} + \tau_{0}\frac{\partial^{2}}{\partial t^{2}}\right) \left(\rho C_{E}T + \gamma T_{0}e\right) - \rho \left(1 + \tau_{0}\frac{\partial}{\partial t}\right) Q \tag{3}$$

where,  $I^{\alpha}$  denotes the fractional integral of R–L (Riemann–Liouville) type as

$$I^{\alpha}g(t) = \int_{0}^{t} \frac{(t-s)^{\alpha-1}}{\Gamma(\alpha)} g(s) \, ds; \qquad \alpha > 0$$
 (4)

where, g(t) is the integrable function of Lebesgue type and Gamma function as denoted by  $\Gamma(\alpha)$  for

absolutely continuity of g(t), one have  $\lim_{\Omega \to 1} \frac{d^{\alpha}}{dt^{\alpha}} g(t) = g'(t)$ 

in which,

k - Thermal conductivity,

 $\tau_0$  - Relaxation time,

C<sub>F</sub> - Specific heat at constant strain,

T - Absolute temperature distribution function,

T - Medium temperature with  $(|T - T_0|)/T| \ll$ , and  $e_{ij}$  -Components of the strain tensor.

Caputo time derivative of a function T(t) with fractional order  $\alpha$  is denoted by  $D_{0}^{\alpha}T(t)$  and defined as

$$D_{0,r}^{-(r-\alpha)} \frac{d^r}{dt^r} T(t) = \int_0^t \frac{(t-\tau)^{r-\alpha-1}}{\Gamma(r-\alpha)} T^r(\tau) d\tau, \quad r-1 < \alpha < r$$
(6)

The relation for Cubical dilatation e is

$$e = \frac{1}{r} \frac{\partial}{\partial r} (ru) + \frac{\partial w}{\partial z} \tag{7}$$

For  $\alpha \to 1$ , the Eq. (3), transformed as

$$k\nabla^{2}T = -\rho \left(1 + \tau_{0} \frac{\partial}{\partial t}\right) Q + \left(\frac{\partial}{\partial t} + \tau_{0} \frac{\partial^{2}}{\partial t^{2}}\right) \left(\rho C_{E}T + \gamma T_{0} e\right)$$
(8)

Equation (8) is the generalized heat equation with one relaxation parameter and subjected to heat Q.

Further, when  $\alpha \to 1$  with  $\tau_{_{\!0}}\! \to 0,$  Eq. (3) is written as

$$k \nabla^2 T = \left(\rho C_E \frac{\partial T}{\partial t} + \gamma T_0 \frac{\partial e}{\partial t}\right) - \rho Q \tag{9}$$

Which the exactly same heat conduction as noted in the coupled thermoelastic theory. The other constitutive relations are as follows

$$\nabla^2 = \frac{\partial^2}{\partial r^2} + \frac{1}{r} \frac{\partial}{\partial r} + \frac{\partial}{\partial z}$$
 (10)

$$\sigma_{rr} = 2\mu \frac{\partial u}{\partial r} + \lambda e - (T - T_0)\gamma \tag{11}$$

$$\sigma_{rz} = \mu \left( \frac{\partial u}{\partial z} + \frac{\partial w}{\partial r} \right) \tag{12}$$

$$\sigma_{rz} = \mu \left( \frac{\partial u}{\partial z} + \frac{\partial w}{\partial r} \right) \tag{13}$$

Introducing the non-dimensional variables as follows

$$r' = c_1 \xi r \ z' = c_1 \xi z, \ u' = c_1 \xi u, \ w' = c_1 \xi w, \ t' = c_1^2 \xi t,$$

$$\tau'_{0} = c_{1}^{2} \xi \tau_{0}, \ \sigma'_{ij} = \frac{\sigma_{ij}}{\mu}, \ \theta = \frac{\gamma (T - T_{0})}{(\lambda + 2\mu)}, \ Q' = \frac{\rho \gamma Q}{k c_{1}^{2} \psi^{2} (\lambda + 2\mu)},$$

$$\xi = \frac{\rho c_E}{k}, c_1 = \sqrt{\frac{\lambda + 2\mu}{\rho}}, \beta^2 = \frac{\lambda + 2\mu}{\mu}$$

c<sub>1</sub> denotes the elastic waves propagation speed.

The system of governing equations in non-dimensional variables, after dropping the primes written as

$$\nabla^2 u - \frac{u}{r^2} + (\beta^2 - 1)e - \beta^2 \frac{\partial \theta}{\partial r} = \beta^2 \frac{\partial^2 u}{\partial t^2}$$
 (14)

$$\nabla^2 w + (\beta^2 - 1) \frac{\partial e}{\partial z} - \beta^2 \frac{\partial \theta}{\partial z} = \beta^2 \frac{\partial^2 w}{\partial t^2}$$
 (15)

$$I^{\alpha-1}\nabla^2\theta = -\left(1 + \tau_0 \frac{\partial}{\partial t}\right)\beta^2 Q + \left(\frac{\partial}{\partial t} + \tau_0 \frac{\partial^2}{\partial t^2}\right)(\theta + \varepsilon e)$$
(16)

Also, the relations (11)-(13) written as

$$\sigma_{rr} = 2\frac{\partial u}{\partial r} + (\beta^2 - 2)e - \beta^2 \theta \tag{17}$$

$$\sigma_{zz} = 2\frac{\partial w}{\partial z} + (\beta^2 - 2)e - \beta^2 \theta$$
(18)

$$\sigma_{rz} = \left(\frac{\partial u}{\partial z} + \frac{\partial w}{\partial r}\right) \tag{19}$$

Utilizing eqns. (14) and (15), by using eqn. (5) we get

$$\nabla^2 e - \nabla^2 \theta = \frac{\partial^2 e}{\partial t^2} \tag{20}$$

All the assumed conditions at initial time are homogeneous since medium is quiescent. The corresponding boundaries are fixed as

$$\theta = f(r,t)$$
 at  $z = \pm h$  (21)

#### Solution of the problem

Laplace transform of  $\theta$  is

$$L[\theta] = \overline{\theta} = \int_{0}^{\infty} e^{-st} \theta(r, z, t) dt$$
(23)

Special Issue,

Also following Povstenko [3], Laplace transform of the R–L integral is as below

$$L[I^n \theta(t)] = \frac{1}{s^n} L[\theta(t)] \qquad n > 0$$
(24)

Equations (14–20) under Laplace transformation utilizing equation (24), written as

$$\nabla^2 \overline{U} - \frac{\overline{U}}{r^2} + (\beta^2 - 1)\overline{e} - \beta^2 \frac{\partial \overline{\theta}}{\partial r} = \beta^2 s^2 \overline{U}$$
 (25)

$$\nabla^2 \overline{W} + (\beta^2 - 1) \frac{\partial \overline{e}}{\partial z} - \beta^2 \frac{\partial \overline{\theta}}{\partial z} = \beta^2 s^2 \overline{W}$$
 (26)

$$(\nabla^2 - s^{\alpha - 1}(s + \tau_0 s^2))\overline{\theta} = s^{\alpha - 1}(1 + \tau_0 s)(-\overline{Q} + s\varepsilon \overline{e})_{(27)}$$

$$\nabla^2 \overline{\theta} = (\nabla^2 - s^2) \overline{e} \tag{28}$$

$$\overline{\sigma}_{rr} = 2\frac{\partial \overline{u}}{\partial r} + (\beta^2 - 2)\overline{e} - \beta^2\overline{\theta}$$
(29)

$$\overline{\sigma}_{zz} = 2\frac{\partial \overline{w}}{\partial z} + (\beta^2 - 2)\overline{e} - \beta^2\overline{\theta}$$
(30)

$$\overline{\sigma}_{rz} = \left(\frac{\partial \overline{u}}{\partial z} + \frac{\partial \overline{w}}{\partial r}\right) \tag{31}$$

Also conditions (21) and (22) becomes

$$\bar{\theta}(r,z,s) = \bar{f}(r,z,s)$$
 ,  $z = \pm h$  (32)

$$\overline{\sigma}_{zz}(r,z,s) = \overline{\sigma}_{rz}(r,z,s) = 0$$
 ,  $z = \pm h$  (33)

On removing  $\bar{e}$  from the eqns. (27) & (28) we obtain

$$\begin{aligned}
&\left\{\nabla^{4} - \nabla^{2} \left[s^{2} + s^{\alpha-1} \left(s + \tau_{0} s^{2}\right) \left(1 + \varepsilon\right)\right] + s^{\alpha+1} \right. \\
&\left. \left(s + \tau_{0} s^{2}\right)\right\} \overline{\theta} = -s^{\alpha-1} \left(1 + \tau_{0} s\right) \left(\nabla^{2} - s^{2}\right) \overline{Q}
\end{aligned} (34)$$

The above eqn. (34) can be written in factorized form as

$$\left\{ (\nabla^2 - k_1^2) \left( \nabla^2 - k_2^2 \right) \right\} \overline{\theta} = -s^{\alpha - 1} \left( 1 + \tau_0 s \right) \left( \nabla^2 - s^2 \right) \overline{Q}$$
 (35)

where  $k_{\ 1}^2$  and  $k_{\ 2}^2$  denotes for the roots of

$${k^4 - [s^{\alpha-1}(s + \tau_0 s^2)(1 + \varepsilon) + s^2]k^2 + s^{\alpha+1}(s + \tau_0 s^2)} = 0$$
 (36)

Complete solution of eqn. (35) can be expressed as,

$$\overline{\theta} = \overline{\theta}_1 + \overline{\theta}_2 + \overline{\theta}_p \tag{37}$$

here  $\overline{\theta}_i$  denotes the solution of,

$$(\nabla^2 - k_1^2)\overline{\theta}_i = 0 \quad ; \quad i = 1,2$$
 (38)

and  $\overline{\theta}_n$  is the particular integral.

To find the solution of eqn. (35), we define the Hankel transformation and its inversion of order zero w.r.t. variable r as follows

$$\overline{\theta}^* = H[\overline{\theta}] = \int_{r'=0}^{\infty} \overline{\theta} \, r' J_0(\eta \, r') dr' \tag{39}$$

First kind Bessel's function with zero order is denoted by  $J_{\scriptscriptstyle 0}$ 

$$\overline{\theta} = H^{-1} \left[ \overline{\theta}^* \right] = \int_{\eta'=0}^{\infty} \overline{\theta}^* \eta' J_0(\eta' r) d\eta' \tag{40}$$

Using the transform defined in eqn. (39) to eqn. (38), we get

$$\{-(k_1^2 + \eta^2) + D^2\}\overline{\theta}_i^* = 0 \quad ; i = 1, 2 , D = \frac{\partial}{\partial z}$$
 (41)

Complete integral of eqn. (41) can be expressed as,

$$\overline{\theta}_i^* = \cosh(l_i z) A_i(\eta, s) (k_i^2 - s^2)$$
(42)

Where 
$$l_i = \sqrt{\eta^2 + k_i^2}$$

Applying the transform defined in eqn. (39) to both parts of eqn. (35)

$$\{(D^2 - l_1^2)(D^2 - l_2^2)\}\overline{\theta}_p^* + s^{\alpha - 1}(1 + \tau_0 s)(D^2 - l^2)\overline{Q} = 0$$
(43)

$$l = \sqrt{\eta^2 + s^2}$$

For sake of convenience, heat source is of cylindrical shell type is considered at  $\mathbf{r}=0$  and releases heat instantaneously at  $\mathbf{t}=0$  is

$$Q = \cosh z / 2\pi r \,\delta(t) \,\delta(r) \tag{44}$$

On above equation taking Laplace and Hankel transformation, implies

$$\overline{Q}^*(\eta, z, s) = \cosh z \tag{45}$$

On simplifying eqn. (43), we obtain the solution as,

$$\overline{\theta}_{p}^{*} = \frac{-s^{\alpha-1}(1+\tau_{0}s)(1-l^{2})\cosh z}{(1-l_{1}^{2})(1-l_{2}^{2})}$$
(46)

Then on substituting (42) and (46) in (37) the temperature distribution function is obtained as

$$\overline{\theta}^* = \sum_{i=1}^2 (k_i^2 - s^2) A_i(\eta, s) \cosh(l_i z) 
- \frac{s^{\alpha - 1} (1 - l^2) (1 + \tau_0 s) \cosh z}{(1 - l_2^2) (1 - l_1^2)}$$
(47)

Using (40), the transformation inverse of eqn. (47) becomes,

$$\overline{\theta} = \int_{0}^{\infty} \left\{ \sum_{i=1}^{2} (k_{i}^{2} - s^{2}) A_{i}(\eta, s) \cosh(l_{i} z) - \frac{s^{\alpha-1} (1 - l^{2}) (1 + \tau_{0} s) \cosh z}{(1 - l_{2}^{2}) (1 - l_{1}^{2})} \right\} \eta' J_{0}(\eta' r) d\eta' \tag{48}$$

On the same way equations (27) and (28), after removing  $\theta$  implies

$$\{(\nabla^2 - k_1^2)(\nabla^2 - k_2^2)\}\bar{e} = -s^{\alpha - 1}(1 + \tau_0 s)\nabla^2 \overline{Q}$$
 (49)

Using transform defined in (39) to above eqn. (49), we

$$\{(D^2 - l_1^2)(D^2 - l_1^2)\}\overline{e}^* + s^{\alpha - 1}(1 + \tau_0 s)(D^2 - \eta^2)\overline{Q}^* = 0$$
 (50)

On simplifying eqn. (50) one obtains

$$\overline{e}^* = \sum_{i=1}^2 k_i^2 A_i(\eta, s) \cosh(l_i z) - \frac{s^{\alpha - 1} (1 - \eta^2) (1 + \tau_0 s) \cosh z}{(1 - l_2^2) (1 - l_1^2)}$$
(51)

On taking transform inversion of eqn. (51) by using (40), we get,

$$\overline{e} = \int_{0}^{\infty} \left\{ \sum_{i=1}^{2} k_{i}^{2} A_{i}(\eta, s) \cosh(l_{i} z) - \frac{s^{\alpha-1} (1 - \eta^{2}) (1 + \tau_{0} s) \cosh z}{(1 - l_{2}^{2}) (1 - l_{1}^{2})} \right\} \eta' J_{0}(\eta' r) d\eta' \tag{52}$$

Similarly applying the integral defined in eqn. (39) to the eqn. (26) and using (47) and (51), we obtain

$$\overline{W}^* = \sinh q_3 z B(\eta, s) + \sum_{i=1}^2 q_i A_i(\eta, s) \sinh(l_i z)$$

$$- \frac{(1 + \tau_0 s) s^{\alpha - 1} \sinh z}{(1 - l_2^2)(1 - l_1^2)}$$

$$l_3 = \sqrt{\eta^2 + \beta^2 s^2}$$
(53)

On Taking Hankel transform inverse of above eqn. we get,

$$\overline{w} = \int_{0}^{\infty} \left\{ \sinh l_{3} z B(\eta, s) + \sum_{i=1}^{2} l_{i} A_{i}(\eta, s) \sinh(l_{i} z) - \frac{(1 + \tau_{0} s) s^{\alpha - 1} \sinh z}{(1 - l_{2}^{2})(1 - l_{1}^{2})} \right\} \eta' J_{0}(\eta' r) d\eta'$$
(54)

Next, applying Hankel and Laplace transformation respectively to equation (7) and using eqns. (51) & (53)

$$H\left(\frac{1}{r}\frac{\partial}{\partial r}(r\overline{u})\right) = -B(\eta, s)l_3 \cosh l_3 z - \eta^2$$

$$\left[\sum_{i=1}^2 A_i(\eta, s) \cosh(l_i z) - \frac{s^{\alpha-1}(1 + \tau_0 s) \cosh z}{(1 - l_1^2)(1 - l_2^2)}\right]_{(55)}$$

On employing the Inversion of Hankel transform eqn. (55) becomes

$$\overline{u} = -\int_0^\infty \left\{ l_3 B(\eta, s) \cosh l_3 z + \eta^2 \left[ \sum_{i=1}^2 \cosh(l_i z) \right] \right\}$$

$$\overline{u} = -\int_0^\infty \left\{ l_3 B(\eta, s) \cosh l_3 z + \eta^2 \left[ \sum_{i=1}^2 \cosh(l_i z) \right] \right\}$$
(56)

On substituting (48), (52) and (54) in (29) to (31) stress tensor components becomes

$$\overline{\sigma}_{zz} = \int_{0}^{\infty} \left\{ 2l_{3} B(\eta, s) \cosh l_{3} z + (\eta^{2} + l_{3}^{2}) \right\} 
= \left[ \sum_{i=1}^{2} \cosh(l_{i} z) A_{i}(\eta, s) - \frac{(1 + \tau_{0} s) s^{\alpha - 1} \cosh z}{(1 - l_{2}^{2})(1 - l_{1}^{2})} \right] \right\} 
\times \eta' J_{0}(\eta' r) d\eta'$$
(57)
$$\overline{\sigma}_{rz} = \int_{0}^{\infty} \left\{ -B(\eta, s)(\eta^{2} + l_{3}^{2}) \cosh l_{3} z - 2\alpha^{2} \right\} 
= \left[ \sum_{i=1}^{2} l_{i} A_{i}(\eta, s) \sinh(l_{i} z) - \frac{(1 + \tau_{0} s) s^{\alpha - 1} \sinh z}{(1 - l_{2}^{2})(1 - l_{1}^{2})} \right] \right\} 
\times J_{1}(\eta' r) d\eta'$$
(58)

The conditions defined in eqn. (21) and (22) under Hankel transform written as

$$\overline{\theta}^* = \overline{f}^* \qquad , \quad z = \pm h \tag{59}$$

$$\overline{\sigma}_{rz}^* = \overline{\sigma}_{zz}^* = 0 \quad , \quad z = \pm h \tag{60}$$

Utilizing equations (59) and (60) to find the values of unknown parameters, as

$$\sum_{i=1}^{2} (k_{i}^{2} - s^{2}) A_{i}(\eta, s) \cosh(l_{i} h) - \frac{(1 + \tau_{0} s) s^{\alpha - 1} (1 - l^{2}) \cosh(h)}{(1 - l_{2}^{2}) (1 - l_{1}^{2})} = \bar{f}^{*}$$
(61)

$$(\eta^2 + l_3^2) \sum_{i=1}^{2} \cosh(l_i h) A_i(\eta, s) - 2l_3 B(\eta, s)$$

$$\cosh l_3 z = \frac{\left(1 + \tau_0 s\right) s^{\alpha - 1} \left(\eta^2 + l_3^2\right) \cosh(h)}{\left(1 - l_2^2\right) \left(1 - l_1^2\right)} \tag{62}$$

$$2\eta^{2} \left[ \sum_{i=1}^{2} l_{i} A_{i}(\eta, s) \sinh(l_{i} h) + B(\eta, s) (\eta^{2} + q_{3}^{2}) \right]$$

$$\cosh l_3 h = \frac{2s^{\alpha - 1} \eta^2 (1 + \tau_0 s) \sinh(h)}{(1 - l_2^2)(1 - l_1^2)}$$
(63)

To evaluate the solution of the problem we use numerical technique using equations (61) to (63).

#### **Inversion Method for Double Transformation**

The physical solution of the supposed problem under study is based on the inversion of the Laplace method, but it is not analytically possible because of the complex mathematical analysis. So, inversion of the numerical computation method is adopted by employing the well-known Gaver-Stehfast algorithm [23, 24]. A detailed explanation of the processor can be seen in Knight and Rich [25]. Gaver and Stehfast's modified formula is as

$$F(t) = \frac{\ln 2}{t} \sum_{i=1}^{L} D(i, L) G\left(i \frac{\ln 2}{t}\right)$$
(64)

with

$$D(i,L) = (-1)^{i+M} \sum_{n=m}^{\min(i,M)} \frac{n^{M}(2n)!}{(M-n)!(n-1)!(i-n)!(2n-i)!}$$

Here, the value of L (even integer) is dependent of

computer programme word length. M = L/2, m denotes the integer part of the (i+1)/2.

The value of L is taken from the Stehfast algorithm which converges faster and with desired accuracy.

Also, to find the integrals involved in calculating Romberg's numerical integration technique [26] is used subject to variable pitch size. These parts of programs are made by using MATLAB mathematical software.

# NUMERICAL EVALUATION OF RESULTS

The physical properties for numerical computation are assumed as for copper material as:

$k = 386J K^{-1}m$	$\alpha_r = 1.78 \times 10^{-1}$	$^{-5} K^{-1}$ , $\mu = 3.86 \times 10^{11}$	$^{0}Nm^{-2}$ , $\lambda = 7.76 \times 10^{10} N m^{-2}$ ,
$C_E = 383.1 J  Kg$	$\rho = 8954  \text{Kg}$	$m^{-3}$ , $c_1 = 4.158 \times 10^{-3}$	$v^3 m s^{-1}$ , $\psi = 8886.73 s m^{-2}$ ,
$\mu = 3.86 \times 10^{10} \text{N}$	$V m^{-2}$ , $\tau_0 = 0.5 s$ ,	$\varepsilon = 0.0168 Nr$	$nJ^{-1}$ , $T_0 = 293 K$ ,
a=1,	b = 1,	$\theta_0 = 1$	$\beta^2 = 4$ ,

Figure 1. Temperature function along radius

Figure 2. Displacement function along radius

Figure 3. Axial Stress function along radius

Figure 4. Shear stress function along radius

Figure 5. Temperature function along thickness

Figure 6. Axial stress along thickness

Figure 7. Shear stress along thickness

Graphical plotting for the resultant temperature, displacement, and stress distribution is shown in Figs. 1 to 7 along the radial and thickness directions for various fractional parameters i.e.,  $\alpha = 0.5, 0.75, 1, 1.5, 2$ .

From the numerical analysis, following important points are noted:

- The wave propagation speed in the case of temperature, displacement, and stress distribution is found to be dependent and vary directly proportional to the fractional order value of  $\alpha$  in both radial and axial directions. For the higher value of  $\alpha$ , large distribution in above plotting is noted for temperature variation, displacement function and the thermal stresses.
- Physical quantities are significant affected by the fractional derivatives for weak  $0 < \alpha < 1$ , normal  $\alpha = 1$  and superconductivity  $1 < \alpha < 2$  cases. Large fluctuation in distribution is observed in the range  $1 < \alpha < 2$ .

September, 2023

- Also, variation of field variables is also affected by various values of the fractional derivatives.
- Numerical analysis indicates that materials ability of conducting heat is as according to value of fractional parameter.
- Variation of steady waves are also depending on the fractional parameters.

#### **CONCLUSION**

The work done in this paper provides a better understanding of the thermoelastic behaviour of a 2D half space of infinite length subjected to periodic varying heat sources with time under generalised thermoelasticity. The fractional derivative is involved in the heat equation of Caputo type order  $\alpha$ . Analytical variation of the resulting temperature function, displacement function, and stress functions are obtained in the Laplace transform domain. Numerical inversion is used to obtain solutions in Laplace domain by the well-known Gaver-Stehfast method, and all the obtained results are illustrated graphically by taking copper material properties. From the study, it is found that fractional order significantly affects the thermal quantities. All the plotted curves show smooth behavior in the range  $0 < \alpha \le 1$ , also when  $1 < \alpha \le 2$  distributed curves are strongly dependent on various fractional values. As a case study, limiting cases for coupled and generalized thermoelastic theory are successfully derived with one relaxation time. Hence, the obtained results of the study may be useful in the design of conducting materials that are used in thermoelastic modelling, which is a new class of applicable materials that helps in the various designs of new structures.

#### **ABSTRACT**

Analytical analysis is performed to study the distortion produced by thermal variation in a fixed, clamped annular disc that is exposed to an internal source of heat. The bottom and top faces of the annular disc, as well as both its inner and external curved surfaces, maintain the boundaries of convective interchange of heat. The fundamental equation with the time fraction is solved using the analytical approach of integral transformation. The temperature and heat deviation measurements that were made are calculated numerically considering the material properties of a copper metal disc and are presented graphically.

**KEYWORDS:** Annular disc, Caputo-Fabrizio, Fractional operator, Heat generation, Deflection, Temperature.

#### INTRODUCTION

ince the last decade, the study of fractional order thermoelasticity has been in great demand due to its ability to predict the delayed response, which is important in many physical processes and applicable to real-world problems. Many researchers, engineers, mathematicians, and scientists are working hard to understand the exact phenomenon of physical observations occurring at the microscopic level and its application in developing structural designs. Using fractal theory, Povstenko [6] studied one- and twodimensional temperature equations and discovered the stress functions. Povstenko [7] used spatiotemporal fractal derivatives and determined their influence on various solids. Youssef [8] considered a modified heat transfer equation and described a new thermoelastic theory with fractal parameters and proved its uniqueness. Povstenko [9, 10] determined the thermal

stress distributions in a medium with infinite range by considering the effect of a radial heat conduction equation with a cylindrical cavity under fractal theory.

Ezzat [11] described the modelling of magneto-thermoelasticity by considering the concept of fractional approach. Ezzat [12] solved a 1D thermoelectric problem using the analytical transformation technique within the range of fractional elasticity. Ezzat and Ezzat [14] explained the applications of porous materials using fractional order thermoelasticity. In recent years, many other researchers [18, 20 and 21] have also made an important contribution to the study of thermal behaviour in the development of thermoelasticity. Shaikh et al [15] proved the existence and uniqueness criteria and discussed the effects of Caputo- Fabrizio reaction with nonlinear differential equations. Yepez and Gomez [16] determined the behaviour of the nonlinear fractional heat equation using the Caputo-Fabrizio operator. Amal

www.isteonline.in Vol. 46 Special Issue, September, 2023 26

et al [17] studied the behaviour of the Caputo-Fabrizio differential operator for trigonometric and exponential functions considering the nonsingular kernel. Recently, Elhagary [19] determined the concentration effects of the Caputo-Fabrizio differential operator in an infinite hollow cylinder using the analytical transformation method.

In this work, the authors are motivated to understand the behaviour of thermal deflection in a two-dimensional annular disc by considering the Caputo-Fabrizio fractional differential operator. Constraints of convective heat exchange type and the impact of an internal heat source are applied to the assumed disc. The theoretical formula for the transmission of heat is resolved using integral transformations. Numerical calculation and graphical representation of temperature and deflection distribution along radial directions are carried out for material properties based on copper. Such work has not been published before and is beneficial for the creation of structures with new material designs used in physical problems.

#### Formulation of thermal equation

In this section we consider a thermoelastic disc of thickness 2h, defined in the domain  $a \le r \le b$  and  $\le h \le z \le h$ , under the influence of the fractional differential parameter  $\gamma \in (0,1)$  of Caputo-Fabrizio. Heat is generated inside the disc during period at a rate of t>0. It is believed that the disc's initial temperature is arbitrary and boundary conditions for convective heat exchange are applied to the top, bottom, and curved surfaces.

The response of thermal deformations in the disc caused by heat generation must be estimated under the influence of the derivatives of the fractions and the assumed conditions.

The differential equation of deflection function W (r,t) in terms of thermal moment  $N_T$  is written as in [3]

$$\nabla^4 W = \frac{\nabla^2 N_T}{D(1-\nu)} \tag{1}$$

where

$$N_T = a_t E \int_{-h}^{h} T(r, z, t) z \, dz \,, \tag{2}$$

D is the disc's flexural stiffness indicated as

$$D = \frac{Eh^3}{12(1-v^2)} \tag{3}$$

v, E and  $a_t$  are the disc material's Poisson's ratio, Young's modules, and linear thermal expansion coefficients, respectively.

$$\nabla^2 = \frac{\partial^2}{\partial r^2} + \frac{1}{r} \frac{\partial}{\partial r} \tag{4}$$

The edge of an annular disc has been fixed and clamped.

$$W(r=a, b) = \frac{\partial W(r=a, b)}{\partial r} = 0,$$
 (5)

also, 
$$T(t = 0) = W(t = 0) = 0$$

The formula for heat with the Caputo-Fabrizio fractional differentiation and the heat source of the disc is

$$d\left(\nabla^2 T + \frac{\hbar(r, z, t)}{k}\right) = {}_{0}^{CF} D^{(\gamma)} T \quad ; \quad \gamma \in (0, 1)$$
 (6)

where, d is thermal diffusivity and  ${}^{CF}_{0}D^{(\gamma)}T$  is the Caputo-Fabrizio fractional differentiation in range  $\gamma \in (0,1)$  stated as [13]

$${}^{CF}_{0}D^{(\gamma)}T(t) = (1-\gamma)^{-1} \int_{0}^{t} T'(t) \exp\left(-\gamma (t-\tau)(1-\gamma)^{-1}\right) d\tau, \qquad 0 \le \gamma \le 1$$
(7)

For simplicity of use, the number of variables is listed in non-dimensional form as:

$$r' = \frac{r}{b}, \ z' = \frac{r}{b}, \ t' = \frac{t d}{b^2}, T' = \frac{T}{T_0}$$

Equation (6) has the following form (omitting the prime numbers for simplicity), using the above dimensionless variables.

$$\frac{\partial^2 T}{\partial r^2} + \frac{1}{r} \frac{\partial T}{\partial r} + \frac{\partial^2 T}{\partial z^2} + \frac{\hbar(r, z, t)}{k} = \frac{1}{d} {}^{CF}_{0} D^{(\gamma)} T \quad ; \quad \gamma \in (0, 1)$$
(8)

The Laplace integral formula for above time derivative is defined as

$$L.T. \begin{bmatrix} {}^{CF}_{0}D^{(\gamma)}T(t) = \frac{\partial^{\gamma}T}{\partial t^{\gamma}} \end{bmatrix} = \frac{sL[T(t)] - T(0)}{s + \gamma(1 - s)}$$
(9)

Here s is the Laplace transform parameter

#### **Boundary constraints**

The following convective heat exchange constraints are applied to the faces of the assumed disc:

$$\left\{T + k_1 \frac{\partial T}{\partial r}\right\} = \Box_1(z, t) \quad ; \quad at \quad r = a, \quad t > 0$$
(10)

$$\left\{T + k_2 \frac{\partial T}{\partial r}\right\} = \Box_2(z, t) \quad ; \quad at \, r = b, \, t > 0$$
(11)

$$\left\{T + k_3 \frac{\partial T}{\partial r}\right\} = \Box_3(r, t) \quad ; \ at \ z = -h, \ t > 0$$
(12)

$$\left\{T + k_4 \frac{\partial T}{\partial r}\right\} = \Box_4(r, t) \quad ; \ at \ z = h, \ t > 0$$
(13)

$$T(r, z, t) = 0, \ at \ t = 0$$
 (14)

where  $k_1$ ,  $k_2$ ,  $k_3$  and  $k_4$  are radiation constants of the disc's material. Further 1 (z,t), 2 (z,t), 3 (r,t) and 4 (r,t) are the time dependent heat flux.

The problem under investigation is expressed mathematically in Equations (1) to (14).

#### Analytical solution by integral transformation

To find an analytical solution, we first apply the Marchi-Zgrablich transformation with respect to r as in [4, 5] to equation (8), then we apply the Marchi-Fasulo integral transformation in relation the variables z as in [2] and use the corresponding transformed boundary conditions, obtaining

$$\frac{\partial^{\gamma} \overline{\overline{T}}(m,n,t)}{\partial t^{\gamma}} + d p^{2} \overline{\overline{T}}(m,n,t) = \overline{\overline{\Psi}}(m,n,t)$$
(15)

where 
$$\mu_m^2 + a_n^2 = p^2$$

If we now apply the Laplace transformation defined in (9) for the fractional derivative of Caputo-Fabrizio to equation (15) by using the transformed constraints and performing their inversion, we obtain

$$\overline{\overline{T}} = \frac{l_1}{l_3} \overline{\psi} + \left( \frac{\gamma}{l_3} - \frac{l_1}{l_3} l_5 \right) \int_0^t e^{-l_5 u} \overline{\psi}(t - u) du$$
(16)

where, 
$$(1-\gamma) = I_1$$
,  $\frac{\gamma}{(1-\gamma)} = I_2$ ,  $I_1I_2 = \gamma$ ,  $1+dI_1p^2 = I_3$ ,  $d\gamma p^2 = I_4$  and  $I_5 = \frac{I_4}{I_3}$ 

Finally, by reversing the integral transformation in equation (16), we obtain

$$T = \sum_{m=1}^{\infty} \frac{1}{\mu_m^2} X_0(k_1, k_2, \mu_m r) \left[ \sum_{m=1}^{\infty} \frac{1}{\lambda_n^2} I_n(z) \left\{ \frac{l_1}{l_3} \overline{\psi} + \left( \frac{\gamma}{l_3} - \frac{l_1}{l_3} I_5 \right) \int_0^t e^{-l_5 u} \overline{\psi}(t - u) du \right\} \right]$$
(17)

Where 
$$\overline{\Psi} = \frac{b}{k_2} X_0(\alpha, \beta, \mu_m b) \Box_2(n, t) - \frac{a}{k_*} X_0(\alpha, \beta, \mu_m a) \Box_1(n, t)$$
,

$$\overline{\Psi}_{1} = \overline{\Psi} + \phi, \ \phi = \frac{P_{n}(h)}{k_{4}} \Box_{4}(\mu_{m}, t) - \frac{P_{n}(-h)}{k_{3}} \Box_{3}(\mu_{m}, t), \ \overline{\psi} = d\left(\frac{1}{k} \overline{h} + \overline{\Psi}_{1}\right)$$

where

$$I_n(z) = \cos(a_n z) \{ a_n (\alpha_1 + \alpha_2) \cos(a_n h) + (\beta_1 - \beta_2) \sin(a_n h) \}$$
$$-\sin(a_n z) \{ (\beta_1 + \beta_2) \cos(a_n h) + (\alpha_2 - \alpha_1) a_n \sin(a_n h) \}$$

$$\lambda_n = \int_{-h}^h I_n^2(z) \, dz$$

here  $\alpha_1$ ,  $\alpha_2$  and  $\beta_1$ ,  $\beta_2$  are constants.

Equation (17) is the desired solution to the given problem.

#### Analysis of thermal deflection

Equation (2) yields the following value when the temperature distribution value from equation (17) is used.

$$N_{T} = a_{t} E \left[ \sum_{m=1}^{\infty} \sum_{n=1}^{\infty} \frac{1}{\mu_{m}^{2}} X_{0}(k_{1}, k_{2}, \mu_{m} r) \frac{1}{\lambda_{n}^{2}} \left\{ \frac{l_{1}}{l_{3}} \overline{\psi} + \frac{1}{\lambda_{n}^{2}} \right\} \right]$$

$$\left(\frac{\gamma}{l_3} - \frac{l_1}{l_3} l_5\right) \int_0^t e^{-l_5 u} \overline{\psi}(t-u) du \left\{ (z-1) \int_{-h}^h I_n(z) dz \right\}$$
(18)

Assuming that the response to equation (1) satisfies (5),

$$W(r,t) = \sum_{m=1}^{\infty} C_m(t) \left[ X_0(k_1, k_2, \mu_m r) - X_0(k_1, k_2, \mu_m b) \right]$$
(19)

where  $\mu_m$  are the roots of

$$X_0(k_1, k_2, \mu_m a) - X_0(k_1, k_2, \mu_m b) = 0$$
 (20)

Nov

$$\nabla^{4}W = \left(\frac{\partial^{2}}{\partial r^{2}} + \frac{1}{r}\frac{\partial}{\partial r}\right)^{2} \sum_{m=1}^{\infty} c_{m} [X_{0}(k_{1}, k_{2}, \mu_{m}r) - X_{0}(k_{1}, k_{2}, \mu_{m}b)]$$
 (21)

By using the well-known result,

$$\left(\frac{\partial^{2}}{\partial r^{2}} + \frac{1}{r}\frac{\partial}{\partial r}\right)X_{0}(k_{1}, k_{2}, \mu_{m}r) = -\mu_{m}^{2}X_{0}(k_{1}, k_{2}, \mu_{m}r)$$
(22)

in equation (21), we get

$$\nabla^4 W = \sum_{m=1}^{\infty} c_m \mu_m^4 X_0(k_1, k_2, \mu_m r)$$
 (23)

Also

$$\nabla^2 N_T = -a_i E \sum_{m=1}^{\infty} \sum_{n=1}^{\infty} [X_0(k_1, k_2, \mu_m r) \frac{1}{\lambda_n^2} \left\{ \frac{l_1}{l_3} \overline{\psi} + \frac{1}{\lambda_n^2} \right\}$$

$$\left\{ \left( \frac{\gamma}{l_3} - \frac{l_1}{l_3} l_5 \right) \int_0^t e^{-l_5 u} \overline{\psi}(t - u) du \right\} (z - 1) \int_{-h}^h I_n(z) dz$$
 (24)

Equations (23) and (24) are used in equation (1) to get

$$\sum_{m=1}^{\infty} c_m \, \mu_m^4 \, X_0(k_1, k_2, \mu_m r)$$

$$= -\frac{a_{t}E}{D(1-v)} \sum_{m=1}^{\infty} \sum_{n=1}^{\infty} [X_{0}(k_{1},k_{2},\mu_{m}r) \frac{1}{\lambda^{2}} \left\{ \frac{l_{1}}{l_{3}} \overline{\psi} + \frac{1}{\lambda^{2}} \right\}$$

$$\left(\frac{\gamma}{l_3} - \frac{l_1}{l_3} l_5\right) \int_0^t e^{-l_5 u} \overline{\psi}(t - u) du \left\{ (z - 1) \int_{-h}^h I_n(z) dz \right\}$$
(25)

When we solve equation (25) we obtain

$$c_m(t) = -\frac{a_t E}{D(1-v)} \sum_{n=1}^{\infty} \left[ \frac{1}{\lambda_n^2 \mu_m^4} \left\{ \frac{l_1}{l_3} \bar{\psi} + \frac{1}{\lambda_n^2 \mu_m^4} \right\} \right]$$

$$\left(\frac{\gamma}{l_3} - \frac{l_1}{l_3} l_5\right) \int_0^t e^{-l_5 u} \overline{\psi}(t-u) du \left\{ (z-1) \int_{-h}^h I_n(z) dz \right\}$$
(26)

Substituting equation (26) into equation (19), we obtain

$$W = -\frac{a_{1}E}{D(1-v)} \sum_{m=1}^{\infty} \sum_{n=1}^{\infty} \left[ \frac{1}{\lambda_{n}^{2} \mu_{n}^{4}} \left\{ \frac{l_{1}}{l_{3}} \overline{\psi} + \left( \frac{\gamma}{l_{3}} - \frac{l_{1}}{l_{3}} l_{5} \right) \int_{0}^{t} e^{-l_{2}u} \overline{\psi}(t-u) du \right\} (z-1) \int_{-h}^{h} I_{n}(z) dz \right] \times \left[ X_{0}(k_{1}, k_{2}, \mu_{m}r) - X_{0}(k_{1}, k_{2}, \mu_{m}b) \right]$$
(27)

#### **Numerical analysis**

For numerical computation, disc is assumed to have radius between r=1 to r=2 and thickness z=h=0.1. Further it is considered that thin hollow disc is made up of copper metal whose material properties are as:-

Thermal diffusivity, d = 112.34 ×10<sup>-6</sup> m<sup>2</sup> s, Factor of thermal expansion,  $a_t = 16.5 \times 10^{-6}$ / K, Poisson ratio, v = 0.35, Density,  $\rho = 8954$ kg/m<sup>3</sup>, Specific heat,  $C_p = 383$ J/(kgK).

Fig. 1. Deflection T versus radius r for differential fractional parameter of  $\gamma$ 

Fig. 1 depicts the temperature change for various order of fractions values  $\gamma = 0.5$ , 0.85, 1in the radial dimension. Temperature variation has non-zero values in the bounded region and zero values at the inner curved disc's surface. Along the radial direction, temperature increases on going towards the outer radii, and maximum distribution is noted near the midpoint due to the action of internal heat generation. For  $\gamma = 0.5$  the infinite speed of thermal waves, propogation is obtained, and solutions behave like coupled thermoelastic theory of diffusion. For  $\gamma = 1$  the solution behaved as predicted by the thermoelastic diffusion model. Also, for  $\gamma = 0.85$  the curve appears to function in accordance with the thermoelastic diffusion theory.

Fig. 2. Deflection W versus radius r for differential fractional parameter of  $\gamma$ 

Fig. 2 shows the variation of deflection in the radial dimension for different fractional order values  $\gamma = 0.5,0.85,1$ . Deflection variation has non-zero values in the bounded region and zero values at both internal and external surfaces of the disc, which matches the prescribed mathematical conditions for fixed and clamped disc conditions defined in equation (5).

From graphical analysis, it can be seen that deflection increases for various fractional values across the radius dimension. The highest distribution of deflection is observed near the exterior curved surface, this could be a result of the effect of internal heat generating. Further, it is noticed that variations in thermal deflection are affected by changing values of the parameters of order of fractions. Consequently, it may be implied that the fractional parameters  $\gamma$  play an important part in the development of innovative structural materials that can be used to solve physical concerns.

#### **CONCLUSION**

Fractional thermoelastic modelling in different solids under boundary conditions of convective heat exchange and heat sources is found to be more suitable for physical observations as compared to classical heat exchange models. The main reason for suitability is the prediction of a retarded response, which more clearly describes the physical phenomenon. In this investigation, the temperature flow and thermal deflection based on thermal moments in an annular disc have been investigated analytically by the integral transformation technique due to the impact of the Caputo-Fabrizio fractional differentiation. Graphical investigations show the strong dependency of temperature and deflection function on the different fractional order parameters. Thus, it can be deduced that the results attained have a significant impact on material sciences and the development of novel materials.

Assistant Professor Department of Structural Engineering GHRCE Nagpur

#### **ABSTRACT**

The five main goals utility, economy, efficiency, safety, and aesthetic must all be met in a structural design and analysis of a three-dimensional roof truss. This paper compares the economics, weight, and efficiency of tubular and angle section structures Using STAA-PRO software, the analysis and design are carried out step-by-step for a 30 m straight truss and curved section while taking into account all loads and load combinations. Since the weight of the angle section is greater than that of the tubular section, In order to show that the tubular structure is more economical than the steel structure, the findings are compared and verified.

KEYWORDS: Purlin, Space truss, Geometry, Tubular section, Angular section.

#### INTRODUCTION

pace trusses structures are a useful resource for architects and engineers looking for innovative forms due to their wide variation and flexibility. Over the past decades, the popularity of this style of construction has increased because space trusses can combine light weight and easy assembly with a beautiful appearance. It should be simple to build and maintain. As a consequence, constructions end up being large or unsuccessful because of heavy cost of material, time duration of construction, and durability for the structure. To overcome this problem in the space trusses we study on the space truss member and also if space truss shape is take as inverted what are the most possible outcomes for this?. The three dimensional inverted truss shape not only provides excellent results while saving money and adding the least amount of weight, but it is also a straightforward geometry for analyses and designs. For effectiveness, utility, and aesthetics, different three-dimensional geometries can be made for roof trusses in today's modern world. In an addition to inverted shape truss to reduce tonnage (weight) tabular

section is used in exception of angle section, a tubular structure is lighter and more aesthetically pleasing, economical than steel angular section. As a result, it is more affordable than options. In this, as sheets are stacked on top of members, weight is transferred from the members to the joints.

To Identifying a square-based inverted pyramid in all three dimensions for the top structure will help to analyze and design for angle section and tubular section regarding weight and expenses. Discovering the ideal span while keeping the building's number of supports as low as possible was necessary. Hence the length 30m is selected for study.

#### RESEARCH GAP

In this study, we use an inverted shape for the space truss. The impact of removing the roof truss purline was taken into account in the analysis and design of a three-dimensional geometry square-based inverted pyramid. In addition, we used ball bearing connections for better stability and flexibility. To lower more costs tabular sections are used as a material.

www.isteonline.in Vol. 46 Special Issue, September, 2023

#### Aim and Objective of Project

The primary goal of this review is to investigate inverted pyramid-shaped roof trusses in both straight and curved forms for a range of spans:

- 1. Analysis of inverted pyramid shape for roof truss.
- Analysis of Design members for angle and tubular section.
- 3. Finding out actual cost saving.
- 4. Comparison for weight and cost for both sections.

#### **METHODOLOGY**

- 1. Identifying a shape and dimensions of inverted truss structure with the help of 3D VIEW.
- 2. Analysis of truss by manual calculation of different forces, behavior of forces compression.
- 3. Software validation for static loading (For known results): Software calculation Analysis of trusses using STAAD-PRO software by Finite Element Method. STAAD-PRO software is chosen for the further analysis of the truss.
- 4. Wind Analysis of this truss carried out by using the STAAD-PRO software by the considering all loading, wind loading and load combination of these.
- 5. Weight comparison for the both the trusses.

#### **METHODS OF ANALYSIS**

Following are the various methods used for analysis in general

- 1. Finite Element Method
- 2. Moment Distribution Method
- 3. Displacement or Stiffness Method
- 4. Force Flexibility Method.

#### **Finite Element Method**

The finite element method (FEM) or finite element analysis (FEA), is a numerical method for solving problems of engineering and mathematical physics. Typical problem areas of interest include structural analysis, heat transfer, fluid flow, mass transport, and electromagnetic potential. The analytical solutions

of these problems generally require the solution to boundary value problems for partial differential equations. The finite element method formulation of the problem results in a system of algebraic equations. The method yields approximate values of the unknowns at discrete number of points over the domain. To solve the problem, it subdivides a large problem into smaller, simpler parts that are called finite elements. The simple equations that model these finite elements are then assembled into a larger system of equations that models the entire problem. FEM then uses variation methods from the calculus of variations to approximate a solution by minimizing an associated error function. Various types of finite element methods: - Applied Element Method, Generalized finite element method, mixed finite element method, Spectral element method, etc. Application: - A variety of specializations under the umbrella of the mechanical engineering discipline (such as aeronautical, biomechanical, and automotive industries) commonly use integrated FEM in design and development of their products. Several modern FEM packages include specific components such as thermal, electromagnetic, fluid, and structural working environments. In a structural simulation, FEM helps tremendously in producing stiffness and strength visualizations and also in minimizing weight, materials, and costs. Here we used FEM based software stadd pro software validation and analyze the inverted roof truss for straight and curved shape.

#### Geometry

This is three dimensional inverted geometry in X, Y, Z direction. As a result of the elimination of the purlin, the design is a pyramid that has been inverted. This STADD- PRO application is employed to carry out this. The impact of removing the roof truss purlin was taken into account in the analysis and design of a three-dimensional geometry square-based inverted pyramid.

Dimensions for 30m curved Geometry

- Height:- 5m
- Length :- 30m (clear span)

These Square based pyramid of 1 X1 squares with height 5m are design and analyzed for 30m. A curved and straight truss of square based inverted three dimensional (pyramid) shape analysis and design for

angle and tubular section is done in following way using STAAD-Pro V8i. the geometry for the shape is shown in the Fig 1, 2.

#### Material

- Angle Section :-Angle sections are used in the inverted roof truss as followed 1. ISA 75X75X10, 2. ISA 130X130X12, 3. ISA 150X150X15
- Tubular Section: Tubular sections are used in the street inverted roof truss as followed

Figure 3: 3D View for invented truss having tabular section as material used

Loading calculation

i) For 30 m straight (inverted truss)

**Loading Calculations** 

This includes three types of loading live weight, wind load, and dead load

Dead Load

Weight for sheeting including laps and connectors = 100 N/m<sup>2</sup> Projected area = 5 X 30 = 150 m<sup>2</sup>, Dead Load = Projected Area X Weight of sheeting = 150 X 100 = 15000 kN

D. L. at each point = 0.234 KN

Live Load

Rise (h) = 1.12m, Length / Span (l) = 30 m Tan  $\theta$  = 1.12 / 30  $\theta$  = 2.13

According to IS 875 Part II Live Load = 750-  $(\theta$ – 10) X 20 = 0.907kN

Live Load = 136.05kN, L.L. at each point = 2.12 KN

Wind Load

IS 875 Part III Basic wind velocity data in the vicinity of Pune Vb = 39m/s k1= 1.0, k2 = 1.0 for category 2, class B , k3= 1.0 Intended wind speed Vz = Vb x k1 x k2 x k3 = 39x1x1x1 = 39 m/s. Planned wind speed Pd = 0.6 X (Vz )2 = 0.6 X (39)2 = 912.6 N/m2 Total wind pressure = Pd X (Pe + Pi) = 912.6 X (- 0.8-0.5) = -1.186 kN/m2 Wind Load = 177.8 kN, W.L. at each point = 2.77 KN, Loading of truss on each joint is tabulated in Annexure C

ii) For 30 m Curved (inverted truss)

Dead Load

Weight for sheeting including laps and connectors =  $100 \text{ N/m}^2$  Projected area =  $5 \text{ X } 30 = 150 \text{ m}^2$ , Dead Load = Projected Area X Weight of sheeting = 150 X 100 = 15000, D.L. at each point = 0.375 KN

Live Load

Rise (h) = 4.78m Length / Span (l) = 30 m According to IS 875 Part II Live Load =  $0.75 - (0.52 \text{ X } \gamma 2) = 0.75 - (0.52 \text{ X } (h/l)2) = 0.75 - (0.52 \text{ X } (4.78/30)2) = 0.746kN/m2 = 111.9 kN, Live Load = 111.9 kN,L.L. at each point = 2.79 KN$ 

Wind Load

According to IS 875 Part III, Basic wind Velocity near Pune city Vb = 39m/s k1 = 1.0, k2 = 1.0 for category 2, class Bk3 = 1.0 Design wind speed Vz = Vb x k1 x k2 x k3 = 39x1x1x1 = 39 m/s Design wind pressure Pd = 0.6 X (Vz) 2 = 0.6 X (39)2= 912.6 N/m<sup>2</sup>.

Total wind pressure = Pd X (Pe + Pi ) = 912.6 X (-0.8-0.5) = -1.186 kN/m2, Wind Load = 177.9 kN, W.L. at each point = 4.44 KN Loading of truss on each joint is tabulated in Annexure C.

Loading at each point for 30m straight and curved roof truss

**Table 1:- Loading At Each Node for Angle and Tubular Section** 

Type of Truss	Dead Load (kN)	Live Load (kN)	Wind Load (kN)
30m straight roof truss	0.234	2.12	2.77
30m curved roof truss	0.375	2.79	4.44

**Graph 1:- Loading At Each Node for Angle and Tubular Section** 

#### **Design of members**

Support:- These are fixed at node 112, 113, 114, 210, 211, 212. Taken in the straight inverted ruff truss this member is act as fixed support in the truss. The sectional properties for angle and tubular section are given below.

#### RESULTS

Span (m)

Comparison of total weight of angle and tubular section for straight and curved inverted pyramid shape geometry is done with the influence of removing purline. The inverted pyramid for roof truss is analyzed and design for 30m span, for straight and curved geometry. The total weight is compared of angle and tubular section for straight and curved geometry for the given span. It is found that tubular section has less weight compare to angle for all spans and the actual saving of material is about 25-30% by weight. Total weight for angular and tubular section for different is as follows.

Table 6: Weight for different span

Weight (Kg)

	101011	c span or 50 m	Complete struc	ture or 4spair
	Angle section ISA 75X75X10 ISA 130X130X10 ISA150X150X15	Tubular SECTION	Angle SECTION ISA 75X75X10 ISA130X130X10 ISA150X150X15	Tubular SECTION

700 600				
500				
2 400				

Graph 1:- Graph of Weight different

#### CONCLUSION

After analysis and design following conclusion are obtained.

- 1. As we use the inverted pyramid shape geometry for roof truss with the influence of removing purline decreases the weight of structure.
- 2. This is designed for angle and tubular section to get light weight structure with its pleasant appearance, safety and minimum maintenance.
- 3. These are analyzed and design for straight and curved geometry of which straight geometry required more members for their minimum deflection than curved roof truss.
- 4. It also proves from the graph that the inverted pyramid geometry with removal of purline gives good result for long span structure.
- 5. It also proves that tubular structure is lighter than angle section.
- 6. Saving in steel by 35-40% by using tubular section for curved roof truss.
- 7. Hence this inverted pyramid shape is designed with tubular section for long span of curved roof truss gives better result and can be used.
- 8. Wind load is critical for the trusses so here seismic forces is negligible and not in consideration.

#### **ABSTRACT**

One of the most frequently utilized building materials worldwide is steel. Steel's inherent hardness, ductility, and strength make it the perfect material for earthquake design. The design engineer must be aware of the pertinent in order to take advantage of these benefits for seismic application. Based on IS 1893: 2002, IS 875 and IS 800:2007, the building frame's seismic and wind depth sign is offered in this project. The current work's objective is to design a multi-story, wind force in accordance with IS 1893:2002 and IS 875 before constructing it in accordance with IS 800:2007. The frame has eight pieces. There are four horizontal bays and five lateral bays on this building's four stories. Using these methods of analysis, a steel moment- resisting frame was created in accordance with IS 800:2007. The section underwent multiple design iterations to ensure that it met all the requirements outlined in IS 800:2007. The proposed frame was once more examined, and the outcomes in terms of the bracings used were compared. Both the RCC and the Steel building's cost-effectiveness have been compared., Finally, the calculations for the depth sign of connection between a joint's interior and exterior have been completed. In addition, the foundation's design, which comprises the base plate, there are four horizontal bays and five lateral bays on this building's four stories. Using these methods of analysis, a steel moment resisting frame was created in accordance with IS 800:2007. In the procedure, IS 800:2007 was followed. The statistics have been drawn, and pertinent calculations have been displayed.

#### **INTRODUCTION**

eismic analysis and design refer to assessing a building structure's response to earthquakes and designing it to withstand seismic forces [14]. Multi-storey buildings are particularly susceptible to seismic hazards, and designing them requires careful consideration of structural stability, strength, and ductility. Involves evaluating the building's strength and stability under static loads, while the dynamic analysis method involves assessing its response to earthquake-induced loads. In the case of a G+8 steel building, the analysis and design process will typically involve a combination of static and dynamic analysis methods

[2]. The static analysis method During the design process, engineers will consider various factors such as the building's location, soil characteristics, seismic hazard levels, and building codes and regulations The aim is to ensure that the building can withstand the maximum anticipated seismic forces while minimizing damage and ensuring occupant safety [2].

The design process also involves selecting appropriate building materials, structural components, and connections such as steel moment-resisting frames, braced frames, and steel plates. These elements are designed to dissipate energy during an earthquake, which helps to minimize damage and reduce the

www.isteonline.in Vol. 46 Special Issue, September, 2023

likelihood of collapse [22]. Overall, seismic analysis and design of multi-story G+8 steel buildings require careful planning, analysis, and design to ensure that the building can withstand the forces of earthquakes and keep occupants safe.

According to past experience, steel buildings that are susceptible to earthquakes respond well. The majority of catastrophic failures and significant casualties are related to structures composed of other materials. This might be explained by a few distinctive qualities of steel construction [19].

Figure 1: Steel building with bracing

There are two ways to fight back against the earthquake: [28]

- 1. Structures with enough big sections that are only exposed to elastic stresses
- 2. Composed of smaller pieces, structures intended to create a variety of plastic zones.

#### Need for steel buildings in India

Without a doubt, due to the high population density, particularly in metro areas, horizontal construction has been restricted, and it is difficult to find real estate that is sufficiently spacious. Due to a lack of available space brought on by the exponential population growth in urban areas, higher structures with more floors are now the norm, which emphasizes the need for quicker construction. High- rise buildings are increasingly being constructed out of steel. There are not many high-rise or multi-story buildings in India that are made entirely of steel or largely of steel; in fact, they might even be considered a "novel concept in the construction business."

Objective 1. To determine and assess the responses of the compression and flexural members to seismic loading.

Using spreadsheets for compression members, flexural members, and bolted connections as well as the software's analysis outcomes, design, and analysis of steel buildings.

Comparison of costs In-depth comparison of the cost per square meter of reinforced concrete and steelframed buildings.

#### LITERATURE REVIEW

Seena S.K., Vasugi D.A. (2017) In this paper was studied mostly due to their capacity to produce largespan space at reasonable prices. The pre-designing and pre-fabrication quality, as well as the lightweight result and economically sensible component, all contribute to the extremely complex process used in PEB. The truss chord members in this study are created using SAP 2000-18 for a variety of sections, including ISLC/ ISA, UB/UC, and SHS. For the purpose of designing industrial buildings, the most cost- effective truss chord sections are used. As a result, industrial buildings are built with various bracings, including X-, diagonal-, and k-bracing, to carry out wind analysis. The PEB structure for the same parameter is then compared to the best optimal structure. When PEB is the desired design for a project, it is discovered that PEB with K-bracing is most suited when both economic and technical analyses are considered simultaneously. This includes diagonal bracing and k-bracing.

Sangle B.K., Mhalungkar M.V. (2012) In this paper studied Bracing can significantly alter the overall seismic behavior of a steel-framed building, as was explored in this research. In this study, various bracing system configurations for the Northridge earthquake are done. A new pattern of bracing system is used to determine below the permitted limit, further optimization study was conducted to choose the appropriate sort of bracing arrangement. The study's structures had various bracing system layouts and those that didn't Balaji U.A., Salvarsan M.E. (2016) residential building studied while taking earthquake effects into account. Analysis that is linear, static, and dynamic is done. The authors looked at deflection, displacement base shear plots, etc.

The three approaches used by the authors to design the earthquake, EQ (Earthquake), The authors also adhere to a step-by-step process. Definitions, design seismic base shear, load combinations, material qualities, and definitions like M25, M30, Fe 415, column size, slab thickness, LL (Live load), DL (Dead load), and the number of stories is just a few. f) Design and analysis. Max. Deflection displayed in fig., the author's conclusion.

Gaikwad P.S., Prof. Tolani K.K. (2015) The basic goal minimizes structural during an earthquake. It is decided on factors like story drift, story shear, and story torsion. Dynamic analysis should be carried out for both symmetrical and unsymmetrical buildings, depending on whether the response spectra, technique, or time history approach is being employed. The mathematical model of a building is being developed in dynamic analysis, and strength and stiffness are being determined. Additionally, it exhibits a greater reaction to structures under dynamic loads.

Sasaki M.K., Michio Y.S. (2004) The loss of vertical structural members caused by explosions and crashes has an impact on the redundancy of steel frame structures, according to this paper's analytical analysis. Because the vertical loads can be spread among the remaining vertical structural members, it was discovered that steel structural frames constructed with joints with load-carrying capability will stay standing even when multiple vertical load-carrying components are destroyed. This study examined how actual Japanese high-rise steel buildings responded to unexpected external forces (Loss of Members). For the experimental investigation, it is conceivable to shift the loads that failed columns bore and to inhabit the space left by the missing column when the remaining frame components have a stiff joint structure. even if some columns are gone, there is progressive collapse.

Bayan A.A., Sariffudin S.M., Hanim O.M. (2010) An experimental study of cold-formed steel frames is presented in this work. were joined back-to-back at the joints. The author used 10 frames, and experiments were conducted with CFSS and bolted moment connections of varying stiffnesses under lateral loads (cold-formed steel structure). The stiffness and performance of the connections at the base of the columns had a

considerable impact on the structural behavior of the frames, according to the authors. The two independent modes of failure that he notes are: (a) the column twisting under a heavy load; and (b) bearing failure in the section web near the bolt hole.

Cher S.T., Mahmood M.T. (2015) The behavior of joints for cold-formed steel frames, especially the connection between the beam and the column, has not been well investigated, according to the author's research. The isolated joints test for three deference is presented in this study. experimenting with bolted angle joints with angles ranging in thickness from 2 to 6 millimeters WC (web cleat connection), FC (flange cleat connection), and FWC are the connections the author has utilized (flange web cleat connection). The author looked at how to angle connections affected strength and stiffness in a steel structure.

Prof. Kulkarni B.K., Jirage S.R. (2011) This essay compared the working state method (WSM) to the local state method (LSM) (limit state method). Linear members known as tension members experience axial stresses that result in a crucial area, leading to failure. Angle tension member for both equal and odd angles. In comparison to the operating stress approach, the limit state method produces greater values. It is more cost-effective to design tension members utilizing the Angles by Limit state approach

Milind B.K., Milind. D.S. (2014) Learn the most cost-effective tool that makes the best use of steel by studying this paper. We are familiar with the structural elements and parts utilized in pre-engineered buildings. There are several different kinds of components, including primary, secondary, and sheeting. For lowrise buildings, preengineering is more cost-effective than CSB (conventional steel construction). The roof structure of a PEB (preengineered building) is nearly 26% lighter than a CSB. The price of a PEB building is 30% less than that of a CSB construction. Neha Pawar, Kuldeep Dabhekar, P.B. Patil, Isha Khedikar (2021) In this paper was one of the studies reviewed in this paper suggested that the inclusion of triangular plates beneath floating columns can result in increased base shear and decreased storey drift and displacement. However, there is scope for further research to explore the impact of stiffness irregularities and torsional irregularities on the

behavior of floating columns. Additionally, most of the literature reviewed in this study focused on rigid floor diaphragm action, so it would be valuable to analyze the same buildings with flexible floor diaphragms. Finally, the use of fiber Reinforced Polymer (FRP) could also be examined to evaluate the structural response of buildings with floating columns.

Yogesh Dhamge, Dr. Sanket Sanghai. (2021) In this paper study, Analytical time history is used to determine the structural response of RC structures with an unusual G+10 floor that lacks the cross- bracing integration system, which is an effective way of concentrating forces. TABS 2016 is the program employed for analysis, examining the impacts of various model configurations, including narrative shifts, multi-story shear, and multi-storey rigidity.

Ambadkar S.D., Prof.Pajgade (2012) In this Indian study, the analysis, of a structure's whole life cost (WLC) is calculated, which considers both current and future costs. This provides a more thorough and accurate assessment of the price tag attached to owning any structure. As a result, there is a general trend toward utilizing LCC as a metric for choosing the optimal option and a rise in awareness of the durability component of buildings on a global scale. The decks are compared to the LCC of RCC industrial structures in this study.

Khaleel M.T., Kumar U.D. (2016), Using the computer program ETABS 2015, the steel braced frame's response to equivalent static analysis and response spectrum analysis was studied in this work. A bracing system is a

practical approach to improving lateral strength. regularly and irregularly distributed systems are attempted. To determine the best bracing system for steel-framed high-rise structures, various bracing systems were tested. ETABS is used to simulate and analyze the structure, and sections are chosen depending on how well they can limit lateral story displacements. Zone V, according to IS 1893-2002, has been chosen for the investigation. Numerous variables, including Because of the higher stiffness. When compared to a building without lateral load bracing structures. Utilizing a bracing system makes the structure stiffer and draws in more lateral force.

#### **METHODOLOGY**

The compression and flexural member's behaviors when subjected to earthquake loading.

Using an Excel spreadsheet for reinforcement bars, flexural representatives, and bolted connections as well as the results of the analysis from the software, design a steel structure.

Cost analysis: Order to accurately determine the comparison between reinforced concrete and steel bay frame buildings.

#### **CONNECTION DETAILS**

Various connections of steel buildings are connected by welds, bolts, rivets, or a combination of these. In the MSB structure, a bolted connection is used. For connection high strength structural bolts are used as per IS 3357:1985 high strength structural bolts - specification, IS 6623:2004 high strength structural nuts – specification, IS 4000:1992 High strength bolts in steel structure – code of practice, and for anchorage bolts connection as per IS 5624:1993 for foundation bolts – specification.

- Building's total built-up area is 280 square meters or 3014 square feet.
- According to the price of structural steelwork per kg, which is 56.344 Rs, the total weight of steel is 180553.324 kg. The total cost of the steel is Rs. 1,01,73,100. The required amount of steel is 6.656 kg/square foot.
- Deck sheet slab for PIL52/271 per m2 and 450 Rs., according to recent market rates. In this building, the total slab area is 2240 m2 (280 m2 x 8 floors). 10,08,000 Rs. total will be spent on the deck sheet slab.
- The amount of PCC over the deck sheet slab is 22.4 m3, and the cost per m3 as stated in the DSR is 4466 Rs. 8,00,310 Rs. is the total cost of filling a PCC.

#### **CONCLUSION**

The Angle form bracing and Tube shape bracing in the structure less en lateral displacement or joint displacement brought on by wind load effects as compared to multistory steel buildings without any bracing. This study demonstrates that the Type 3 type of angle bracing offers the least amount of lateral movement when compared to other angle bracing models. Additionally, the Type 3 Tube Bracing Model offers the least degree of lateral movement in comparison to other tube bracing system models. Furthermore, it has been observed that steel-framed structures with tube bracing display less joint displacement than traditional structures. A further benefit of tube bracing over angle bracing is that it makes steel structures lighter. Joint displacement and dead load are greatly improved in a steel structure with tube bracing, the entire structure.

#### **ABSTRACT**

This research investigates the impact of friction dampers on the management of uneven building seismic response. The study's main goal is to comprehend how well friction dampers can reduce the dynamic response of irregular structures to earthquakes. Through a literature review and numerical simulations, the behaviour and performance of friction dampers in various irregular building configurations are analysed. The evaluation includes majorly interstory drifts, base shear forces, and floor accelerations. The findings contribute to the knowledge of seismic response control in irregular buildings and provide insights into the potential benefits and limitations of friction dampers in enhancing their seismic resilience. The research aims to improve design practices for irregular buildings in seismic-prone regions, promoting their safety and reliability.

**KEYWORDS:** Inter-story drift, Friction dampers, Story acceleration, Base shear, Time history analysis, Seismic zone.

#### INTRODUCTION

n earthquake is a natural phenomenon characterized by sudden, intense vibrations in the Earth's crust, caused by the release of accumulated energy along faults. Its impact on the built environment and human lives can be devastating. Earthquakes result in ground shaking that damages structures, infrastructure, and lifelines like roads and bridges. They can trigger secondary hazards such as landslides, tsunamis, fires, and aftershocks, compounding the destruction. In recent years, there has been an increased focus on the behaviour of unsymmetrical buildings under dynamic loads in structural engineering.

These structures, with varying geometries or masses on either side of the centreline, exhibit unique responses, posing challenges for analysis and design. To mitigate the adverse effects of dynamic loads, including seismic forces, incorporating friction dampers into the structural system has proven effective. Friction dampers

are devices that reduce seismic movement and protect structures. They absorb and dissipate seismic energy, enhancing the building's stability. These dampers are particularly useful for unsymmetrical buildings, as they can counteract the uneven forces generated during an earthquake. By providing additional strength and stability, friction dampers help minimize damage, increase the likelihood of structural integrity, and safeguard occupants' safety. The integration of friction dampers in building design has become crucial in regions prone to earthquakes. Their implementation reduces repair costs, increases resilience, safeguards against escalating seismic activity. Growing in popularity in the field of structural engineering as a result of their efficiency in regulating structural reactions to dynamic loads. By mitigating the detrimental effects of earthquakes, friction dampers contribute to safer and more sustainable built environments

#### FRICTION DAMPERS

Friction dampers are devices widely used to dissipate

www.isteonline.in Vol. 46 Special Issue, September, 2023 47

energy and reduce vibrations in various engineering applications, including wind turbines, bridges, and buildings. These dampers rely on the principle of frictional resistance to control the seismic response of structures. By dissipating energy through controlled slip between surfaces, friction dampers can effectively mitigate the damaging effects of seismic events, improving the overall performance and safety of building. The use of friction damper for irregular building responses management has grown in popularity in recent years. By creating friction between two surfaces that are in contact, these dampers are intended to lessen the amount of seismic movement that a building experiences during an earthquake. Friction aids in absorbing and dissipating the energy of the seismic waves.

Fig. 1.

Fig. 2.

Fig. 3

#### **OBJECTIVES & SCOPE OF THE WORK.**

- To assess the effectiveness of friction dampers in reducing the earthquake-induced response of structural systems.
- 2) To compare the outcomes of an irregular building with friction dampers alone with an irregular building with friction dampers in terms of base shear, storey drift and storey acceleration.

#### LITERATURE REVIEW

R.B. Ghodke et al. [1] focused on the torsional behavior of asymmetrical reinforced concrete (R.C.) frames under earthquake loads. They found significant torsional moments in these frames, suggesting design recommendations such as shear walls and symmetrical column placement.

Gennaro Maggiolo et al. [2] reviewed seismic code guidelines for vertically irregular frames, highlighting the inadequacy of current regulations and proposing recommendations for improved seismic design.

M. DeStefano and Pintucchi [3] conducted a comprehensive review of research on structural irregularities and seismic performance, emphasizing the importance of seismic retrofitting and suggesting future research directions.

Sujit Jaisee et al. [10] provided an overview of passive friction dampers, discussing their suitability, slip load, seismic control, influencing parameters, limitations, and the need for further research in creating more effective and reliable dampers.

J.H. Griffin et al. [11] focused on incorporating bench test data into the design of friction dampers for fast speeds turbo machines, using finite elements analysis. and analytical models to enhance design reliability. Their study presented a design procedure that predicts engine behavior and ensures accuracy without conducting engine tests.

M. Novak and L. El Hffnawy [12] explained the interactions between soil and structure that affect damping, emphasising the need of flexible foundations. They gave ways for assessing this effect and talked about how to determine how the foundation will affect damping.

#### RESEARCH METHODOLOGY.

This study aims to assess the impact of friction dampers on irregular building seismic behaviour. ETAB software is used for the design and analysis. Two RCC structures have been modelled for this. The construction of Model 1 is devoid of friction dampers, while Model 2 has friction dampers.

The study of time is thought to be undertaken in order to comprehend the seismic behaviour of the building. Data on recorded ground motion has been taken into consideration for the analysis. After modelling is finished, it automatically assigns code-based loading conditions for seismic and gravity. Dynamic loading is indicated for the two load situations TIMEX and TIMEY.

#### **CONCLUSION**

Friction dampers have been demonstrated to be a successful method for managing the response of irregular buildings to seismic loads. The findings of thisinquiry demonstrate that friction dampers can be used to lessen the structural reaction, including time period, storey displacement, storey drift, and storey acceleration.

When friction dampers were added to the structure, it was discovered that the time period was reduced.

The maximum base shear can be reduced by dampers in buildings, however this effect has been proven to be minor because buildings with dampers, such as model 2, have higher base shear than model 1.

The inclusion of dampers also resulted in a decrease in maximum storey displacement.

Buildings equipped with friction dampers have been seen to reduce story drifts. Base shears, storey shears are likewise higher for buildings with dampers than for buildings without dampers.

The addition of dampers increased the mass of the structure, which is why the base shear and storey shear increased.

The maximum storey acceleration will not be lowered by adding too many dampers, but it will decrease with their addition.

The addition of friction dampers has boosted the building's percentage of input energy dissipation.

## Performance of Steel Structure on Various Earthquake Zones

**Palash Pawar** 

Research Scholar G H Raisoni College of Engineering Nagpur I. P. Khdeikar

Assistant Professor G H Raisoni College of Engineering Nagpur

#### **ABSTRACT**

Earthquakes are a natural occurrence that can occur abruptly and result in significant destruction. The majority of Indian soil is unstable due to earthquake-induced vibrations. In contrast, while it is impossible to stop earthquakes from happening, the damage can be reduced with the help of efficient seismic designs. By taking into account several limit states outlined by the rules and using the affordable ones, the design can be completed. Semi-elastic design of the structure is more cost-effective than elastic design because whole elastic response design of the structure is highly expensive. In the codal method of design, steel building are constructed from structural steel section and are created using the code basis prescriptive guidelines. The Performance of the buildings cannot be controlled during such a design process. In steel Constructions, the desired performance can be attained by selecting the appropriate section. Now days steel structure are a popular type of structure in many nations and its financial as well. It is essential to research seismic behavior of structure in different zone which are designed by code guidelines. This technique employs an algorithm based on computer programming ETAB-19. In this we considered spectral computational ground motion data (sgm)The Building operations are carried out in accordance with historical precedent, analysis (direct numerical integration method (DNI)) and pushover analysis.

KEYWORDS: Performance of steel section, Different zone, Seismic analysis, ETABS, Steel structure.

#### INTRODUCTION

mong the most frequently utilised building materials worldwide is steel. Its inherent Ltoughness, strength, and high ductility are the qualities that make it perfect for use in building construction. Current earthquake research shows that steel is the most resilient material for structures against seismic loads when compared to other materials. Its comparative analysis looks at factors like structural performance, construction time, durability, etc. to determine whether steel structures are practical. The huge destruction of engineered systems and facilities caused by an earthquake is a natural occurrence. Currently, scientists are particularly interested in earthquake engineering because this is an occurrence that is difficult to forecast and occurs for a variety of reasons, including;

1. the shifting of tectonic plates

- 2. Sudden slips at the faults.
- 3. Construction of dams and huge structure
- 4. Quakes caused by volcanoes.
- 5. Due to the increased in use of explosives material like dynamite and other
- 6. Because of an increase in mining work

This topic has been the focus of much research, and more are still being conducted since the more we learn, the more we can do to lessen the harm and save lives. According to seismology studies, tectonic activity is the primary source of 90% of earthquakes. An engineer's duty in civil engineering is to maintain the economy while ensuring the highest level of safety in the structures they construct. Steel structure buildings are a popular form of construction in many countries due to their cost-effectiveness. These buildings are constructed using structural sections and designed using IS codal

methods to achieve the target performance in steel structural building.

The performance level of a steel structural building indicates its potential damage. There are 3- primary performance levels: Earthquake Prevention, Life Security, and Quick Occupancy, Performance Point. Choosing the appropriate PP is critical to ensuring the safety of the structure and its occupants

To cheek the point: -

If ,  $\Delta_{pp} < \Delta_{IO}$  , it implies **IO** level of building.  $\Delta_{pp} > \Delta_{IO} \& < \Delta_{LS}$  , **LS** level of building.  $\Delta_{pp} > \Delta_{LS} \& < \Delta_{CP}$ , **CP** level of building.

#### TIME HISTORY ANALYSIS

The structural reaction is computed via time history analysis at various later time instants. In other words, the consequence is the acquisition of time histories of the structural response to a particular input. The behaviour of a structure throughout time, both before and after the installation of a load, can be determined from a full-time history. The structure's equation of motion must be solved to determine the response's complete time history to determine the complete time history of the response.

#### **PUSHOVER ANALYSIS**

Nonlinear static analysis the analysis produces a plot of total base shear verses top displacement in the structure, which would identify any early failure or weakness under constant vertical loads and gradually increasing lateral pressures. The study is done all the way to failure, making it possible to calculate the collapse load and ductility capacity. On a building frame, load and displacement are applied progressively, the development of plastic hinges, stiffness deterioration, and plastic rotation are watched, and the response of the entire structure to lateral inelastic force and displacement is calculated.

#### **OBJECTIVE**

1. To study the performance level of steel section used in building to know the performance of the steel members.

- 2. To identify the behaviour of steel structure in different zone (III, IV, V).
- 3. To evaluate the performance of steel buildings in zone III, IV, V by using pushover analysis, nonlinear time history analysis by using ETAB-19.

#### ANALYTICAL MODELLING

In this work, a G+6 storey steel structure is subjected to systematic investigation. Analysis of this structure is carried out by using ETAB 19 software. In this study, structure is analysed for zone III, IV, V according to IS 1893 (Part-1)2016, IS 13920-2015 with analysis of pushovers and non-linear temporal histories (Direct Numerical integration.)

#### **SECTION**

ISMB- Indian Standard Medium Beam ISHB- Indian Standard Heavy Beam.

Rolling mills create rolled steel sections, which are structural elements distinguished by the patterns of their cross sections. They are cast in continuous, seamless casting moulds. Depending on the manufactured member types and the erection process, different section forms

are selected. Some examples of rolled steel sections are I-sections, channel sections, T-sections, angle sections, bars, tubes, flats, sheets, and strips.

#### **EARTHQUAKE GROUND MOTIONS**

The ground motion in nonlinear seismic analysis must be modelled across time. histories three earthquake ground motion data have been considered with the name of 2ndfile, RSN4, RSN7. The design of the spectrum at Indian code-1893-part-1-2016 is referred to as the "spectrum." Each of ground motion data refers to real earthquake data. The earthquake data have been generated using software Seismomatch.

Figure 2: - Ground motion data consider for zone 5

Figure 3:- Ground motion data consider for Zone-3

Figure 4: - Ground motion data consider for zone -4

#### RESULT

The building shows the performance levels. Fig- show the performance of steel building under push over analysis.

Figure 6: - Push over examination of steel building performance for ZONE IV

Figure 7: - Pushover examination of steel building performance for ZONE V

## NON-LINEAR TIME HISTORY ANALYSES

It is determined using a time history study that displays the results through inter-story drift. It has been acknowledged that inter-storey drift is a crucial sign of a building's performance. The inter-story displacements change over time during an earthquake as various modes predominate the response.

Figure 8: - Story Drift in X direction for zone III

Figure 17: - Story Drift in Y direction for zone V

Figure 18: - Displacement in X direction for zone V

Figure 19: - Displacement in Y direction for zone V

#### **CONCLUSION**

Steel structures can be made to meet certain goals by selecting the right-sized members, which results in structures that function as expected and don't deviate from their target positions. The drift achieved by codal steel building under pushover analysis and Time history analysis. The steel building is found to be in IO AND LS in zone III, IV, V in respective ground motion.

According to analytical analyses compared to zones IV and III, the impact of India's seismicity zone V is more valuable and dangerous.

### File Sharing Application using Access Control in Android

Saurabh Chakraborty, Rutika Zambre Aditi Tapase

Devansh Sanghvi, Swarangi Wankar Nitin Janwe

Department of Computer Science and Engineering RCERT, Chandrapur

#### **ABSTRACT**

The information age has caused the world to become smaller. Nowadays, almost anyone can easily and instantly share files. We almost always learn about data breaches. In addition to the theft of user data, a secure channel is necessary for file sharing in order to be secure. Secure File Access is made up of two parties: administrators and users. With this application, it is possible to upload and manage files in the database. Since the file is AES-encrypted, only someone who has the same key can decrypt it and open it. When a file is uploaded to a server, the administrator has access to it and can decide who can access it. Only the administrator has the ability to permit a user to view.

KEYWORDS: File sharing, Access control, AES algorithm, Encryption, Decryption

#### INTRODUCTION

The sharing of files and information has become crucial to everyday life in the digital age. The demand for secure file sharing apps on the Android platform is rising as mobile devices become more and more common. Strong access control systems and encryption algorithms must be put in place to protect sensitive data from unauthorised access. The Advanced Encryption Standard (AES) algorithm and the Android Keystore system are used to implement Access Control in the File Sharing Application for Android presented in this document. The widely used symmetric encryption algorithm AES is renowned for both its efficiency and security. The secure hardwarebacked system Android Keystore, on the other hand, offers a secure location for storing cryptographic keys, shielding them from unauthorised access. This application's main goal is to give users the ability to securely distribute files to particular people or groups while ensuring that only authorised recipients can access and decrypt the files. The file owner can define access permissions and grant access to particular users based on their identities or predefined roles using the access control mechanism. Before files are shared, they are encrypted using the AES algorithm. By

converting the plain text data into cypher text, which can only be decrypted with the right encryption key, it offers a high level of security. The Android Keystore system makes sure that the application's encryption keys are safely kept and shielded from various threats like key extraction and tampering The application will make use of user authentication options offered by the Android platform, such as biometric authentication (fingerprint or face recognition) or PIN/passwordbased authentication, to help with access control. This guarantees that only approved users can access the files and carry out application operations. The File Sharing Application will offer a user-friendly interface for managing shared files, viewing access logs, and revoking access permissions as needed in addition to access control and encryption. To provide a seamless and simple user experience, the application will make use of Android's robust user interface components and design principles. The overall goal of this file-sharing application is to meet the growing demand for safe file-sharing on the Android operating system. The application makes sure that files are encrypted, access is limited to authorised users, and sensitive information is kept secure by integrating access control using the AES algorithm and the Android Keystore system.

#### **AES ALGORITHM**

For a variety of applications, AES is considered the standard encryption algorithm. AES operates on fixed-size blocks of data, typically 128 bits in length, and supports three key sizes: 128 bits, 192 bits, and 256 bits. The algorithm consists of several rounds of transformations, including substitution, permutation, and mixing operations. These rounds are applied to the input data using a set of round keys derived from the original encryption key. The security of the system relies on keeping the encryption key secret from unauthorized parties.

Here is a quick explanation of how AES functions:

- 1. Key Expansion: A set of round keys, one for each encryption round, are created using the original encryption key. These round keys are produced by the key expansion algorithm using bitwise operations and substitution.
- 2. Initial Round: The input data and the first round key are XORed.
- 3. Rounds: The number of rounds in AES is fixed and is based on the key size. Four transformations—SubBytes, ShiftRows, MixColumns, and AddRoundKey— are used for each round. By introducing confusion and diffusion, these operations strengthen the encryption technique.

AES S-box, a predefined substitution table, is used to replace each byte of the input with a corresponding byte.

4. Output: The encrypted data is the final state that is obtained.

When using AES for decryption, a similar system is used, but the operations are reversed. The alterations made in each round are their opposites, and the decryption key agenda generates round keys in reverse order.

AES has undergone extensive analysis by cryptographers, and when used correctly with strong key lengths, it is thought to be secure against all known realistic attacks.

It is widely used in many different applications,

including those that secure communications, guard data at rest, and guarantee the integrity of digital facts.

#### **ARCHITECTURE**

The system Architecture is a conceptual model that describes the structure, behaviour, and more views of the system. It organises the system's components and their relationships in a way that supports reasoning about the system's structure and offers a roadmap for how the system's components will work together to implement the overall system. Android-based smartphones or other devices with Wi-Fi are used in this scenario as hardware that serves as both a sender and a receiver, and the user should have installed any necessary applications on their devices. In essence, there are two transfer modes for files: private and public. Without any security, transmission is carried out by browsing a file or set of data from the source device; no security key is required to send a public file or set of data. Once the relevant file or data is browsed from the source device and the transmission mode is set to public, we must select the IP address from the randomly generated IP address list of the receiving device the recipient device to which the data is to be publicly sent, and then transfer the file. In the case of a private transmission, we must first select the file or data to be sent to the recipient side and then transmission mode as private. Next, the scan-ip process will generate a list of the devices' IP addresses within that Wi-Fi range, from which we must choose the desired IP address of the recipient device. Finally, the secret key, which is an 8-bit secret key generated at random, must be used. When a key is verified, it is displayed and sent to the recipient's phone number if it is valid (i.e., the key should have an 8-bit length). The AES algorithm is used to encrypt and decrypt.

#### MODULES DEVELOPED

**Authenticating users:** Create a user authentication module so that users can sign up or log in with their credentials. To ensure secure user authentication, use secure authentication methods like OAuth or JWT.

Access Management: Manage file access and user permissions by implementing access control mechanisms. Create user roles like admin, owner, and viewer to manage different access levels. Make sure

#### File Sharing Application using Access Control in Android

only authorised users can access and modify files and folders by enforcing access control rules.

**File encryption:** Before storing or sending files over the network, encrypt them using the AES (Advanced Encryption Standard) algorithm. To encrypt files with a secure encryption key, use encryption functions. Make sure the encryption key is managed and stored securely.

Android Keystore: Utilize the Android Keystore system to securely store encryption keys. Generate and manage cryptographic keys within the Android Keystore to ensure they are protected by the underlying hardware security features of the device. Implement key retrieval functions to securely retrieve encryption keys from the Keystore for file encryption and decryption operations.

**File Sharing and Permissions:** Implement file sharing functionality to allow users to share files or folders with other users. Define granular permissions such as readonly, read-write, or no access for shared files. Use access control mechanisms to enforce file access permissions for shared files.

Secure File Transfer: Implement secure file transfer mechanisms to ensure the confidentiality and integrity of files during transmission. Utilize secure protocols such as HTTPS or SFTP for file upload and download operations. Utilise the AES algorithm to encrypt files before transmission and decrypt them after receipt.

**Interface for users:** Create a user-friendly interface that enables users to access and share files, manage access control settings, and browse through files and folders. Make sure the interface clearly displays the status of file encryption and access permissions.

#### PROPOSED SYSTEM

We have tried to create a simple system through an Android application where the user can perform the operations on text encryption and file encryption along with the decryption using AES 256-Bit Cypher, where the text and file can be shared using social media platforms by using the concept of explicit intent in Android. We have also tried to implement the Android Keystore. This is the basic prototype to demonstrate the mentioned operation.

#### **IMPLEMENTATION**

#### **About Text Encryption (SCT):**

#### Features:

Simple and secure implementation of the AES-256 cipher.

This implementation is to be used as a security add-on on top of messenger or email apps, or we just want to secure sensitive data for whatever purpose.

#### Implementation:

AES-256, GCM mode, no padding, 12 bytes random IVs. Keys are used as SHA-3 hashes (256 bits).

This AES implementation is considered simple, because we can enter keys of arbitrary length and we don't have to care about options like mode or padding.

#### **About File Encryption (SCT):**

#### Features:

Password-based encryption of files, proceeded files can be stored in the Crypto directory or shared. Decrypted files can also directly be opened.

#### Implementation:

AES-256, GCM mode, no padding, 12 bytes random IVs. Keys are used as SHA-3 hashes (256 bits).

#### File size:

The maximum file size is restricted by the Android OS and the memory available, which is obviously depending on your device.

#### Compatibility:

Compatibility to other file encryption software or services is not guaranteed. A slightly different key treatment or cipher configuration may be reasons for incompatibility.

#### **Opting for AES over DES:**

We will strongly have advised to choose the Advanced Encryption Standard (AES) over the Data Encryption Standard (DES) when choosing an Android file sharing app with access control. In comparison to DES, AES is a more reliable and secure encryption algorithm that offers more protection for sensitive data. AES offers a

significantly larger key space with key lengths of 128, 192, or 256 bits, making it very challenging to crack using brute-force attacks. AES has also undergone extensive testing and widespread adoption as a global standard, ensuring compatibility with a variety of platforms and gadgets. It is perfect for file sharing applications on Android due to its effectiveness and speed on modern hardware, offering a solid foundation for protecting sensitive data.

#### **ADVANTAGES**

- 1. Enhanced Security: Access control makes sure that only groups or individuals with permission to access particular files or folders can do so. This assists in safeguarding confidential data and makes it impossible for unauthorized users to access, modify, or share files. Organizations can protect their data and lower the risk of data breaches by implementing access control.
- 2. Granular Permissions: Administrators can specify and enforce specific permissions for various users or user groups using access control. This makes it possible to have precise control over who can access, modify, delete, or share particular files or folders. Organizations can maintain control over their data and make sure users have the right access levels for their roles by assigning the proper permissions.
- 3. Collaboration Control: Using access control, file-sharing programs can promote secure departmental or team collaboration. Users can be given access to particular files or folders, facilitating efficient collaboration while preserving the integrity of the data. Access control mechanisms also enable tracking of changes and user activity monitoring, improving accountability and preventing unauthorized changes.
- 4. Compliance and Auditing: Access control is essential to meet regulatory compliance standards like GDPR, HIPAA, or PCI DSS. Organizations can demonstrate that they have the necessary safeguards to protect sensitive data and follow industry-specific regulations by implementing access controls. In-depth auditing is made possible by access control mechanisms, allowing

- administrators to monitor file access, modifications, and other actions for forensic and compliance reasons.
- 5. Greater Productivity: Access control streamlines workflows and eliminates the need for manual file management and permissions handling, which lowers administrative costs. Users don't need to navigate a cumbersome directory structure in order to find and access the files they require.

#### **DISADVANTAGES**

- 1. Complexity: Adding access control features to file-sharing programmes can be challenging. A reliable system that can handle user authentication, authorization, and permissions must be designed and maintained. The cost and time of development may go up due to this complexity.
- 2. User Experience: The user experience can be harmed by excessively restrictive access control measures. The constant need for users to authenticate themselves or navigate complicated permission settings can impede productivity and cause user annoyance.
- 3. Administrative overhead: Controlling access in file-sharing programmes frequently necessitates administrative work. Administrators are responsible for handling permissions, defining access levels, and creating and managing user accounts. This overhead can take a lot of time, particularly in bigger organisations with lots of users and files.
- 4. Potential Security Vulnerabilities: Incorrectly implemented access control mechanisms may result in security flaws. Unauthorised users may access sensitive files if the authentication or authorization procedures are flawed. Additionally, files may be vulnerable to data breaches or leaks due to configuration errors or lax access control measures.
- 5. Compatibility Problems: File-sharing programmes may need to integrate with other platforms or systems, which can occasionally cause compatibility problems. It's possible that access control mechanisms don't perfectly match the infrastructure already in place, which could

cause interoperability issues and possible data inconsistencies.

#### **CONCLUSION**

In conclusion, the creation of a file-sharing programme with access control capabilities is a significant step towards improving data security and user collaboration. The utility makes sure that only authorised individuals can access and manage specific archives or folders by enforcing access control mechanisms like user authentication, authorization levels, and permission settings. There are many advantages to including get entry to control in file-sharing software. First off, it provides protection from unauthorised access, lowering the likelihood of data breaches and data leaks. Users maintain privacy and confidentiality by choosing who has access to view, edit, and delete their files. Second, gaining control encourages collaborative efforts that are friendly to the environment within groups or organisations. The tool encourages teamwork while maintaining control over sensitive information by giving users extraordinary access levels. Users have the option to share files with specific departments or co-workers, ensuring that each person has the necessary rights to carry out their duties. Additionally, gaining access to control makes it easier to comply with rules and regulations relating to the protection of statistics, such as the General Data Protection Regulation (GDPR) or requirements specific to a given sector. The software aids organisations in fulfilling

legal obligations and averting potential fines or legal issues related to imprisonment by enforcing granular manipulation over file access. A file-sharing tool that allows access to management tools can also improve productivity and streamline processes. Users can easily find and access the archives they need, saving them time from having to search for them. To find any flaws or weaknesses in the application's access management system, regular audits and risk assessments must be carried out. In conclusion, a file-sharing programme with administrative access is a strong tool for secure and effective data sharing. Groups can protect sensitive information, promote collaboration, and abide by data protection laws by putting in place effective get-entryto-control mechanisms. To ensure that the software is resilient to new security threats, it is crucial to give ongoing comparison and improvement of getting access to control aspects top priority.

#### **ABSTRACT**

Accurate crop yield forecasting and monitoring are critical for improving agricultural practices and supporting decision-making in the agricultural sector. This paper comprehensively reviews the current developments and identifies critical knowledge gaps in this field. It applies cutting-edge machine learning and deep learning techniques, including CNN, RNN, ELM, and random forest, to accurately estimate agricultural yield. Furthermore, it explores the integration of IoT and cloud computing technologies to develop effective systems for suggesting suitable crops. The study emphasizes the importance of carefully selecting relevant characteristics, optimizing procedures, and leveraging hybrid models to enhance the accuracy of yield predictions. Additionally, it highlights the need to consider factors such as climate change, economic aspects, and soil fertility indices when constructing crop yield prediction models. The study recommends integrating explainable AI techniques and developing decision support systems prioritizing user needs to enhance model interpretability and establish trust. Various limitations in existing research are identified, including the requirement for improved training methods, fine-tuning of model parameters, and accounting for environmental factors. Promising directions for future research include the incorporation of physical system models, the exploration of multi-objective optimization approaches, and the utilization of data mining strategies. Overall, this literature review provides valuable insights into the current state of agricultural yield monitoring and prediction research, emphasizing the potential for advancements to optimize agricultural practices, maximize crop productivity, and enable informed decision-making in the agricultural sector.

**KEYWORDS:** Deep learning, Machine learning, Predicting crop yield, Feature selection.

#### INTRODUCTION

rop yield prediction is a crucial agricultural research field that aims to estimate crop harvest potential based on various factors, including crop genotype, environmental conditions, and management practices. Prediction models that are precise and trustworthy provide helpful information to farmers, policymakers, and stakeholders, supporting them in making educated decisions regarding resource allocation, crop management methods, and sustainable farming practices. In recent years, significant progress has been achieved in creating and enhancing agricultural production prediction systems. This progression is affected by incorporating new computing tools, such

as machine learning algorithms and data analysis, which allow for more accurate forecasting and a better understanding of intricate interconnections between various components.

One of the most critical factors that significantly affect yield is crop genotype. Genetic traits and traits influence how crops respond to environmental factors and management practices. Including genetic information in forecast models will allow for the adaptation of estimates to specific crop varieties. Researchers can identify genotypes associated with increased yields and resistance to various stresses. Environmental factors strongly influence the growing and development of crops. The dynamic interplay between temperature,

rainfall, sunlight radiation, and soil quality impacts crop production. Incorporating environmental data, including current or historical climatic data, satellite images, and remote sensing data, into forecasts makes it possible to thoroughly understand these factors' impact on crop yields. This connection allows for creating specific management strategies and enables forecasts to be more precise. Management procedures, including farming techniques, irrigation strategies, fertilization plans, and pest control methods, directly impact crop production and resource utilization. The assessment of these practices' individual and collective effects on yields can be done by including them in the prediction models at present. In addition, optimization of management techniques can lead to improved agricultural sustainability, reduced impact on the environment, and resource efficiency as a result of forecast insights.

A comprehensive overview of the most recent advances in crop yield prediction, with a focus on the inclusion of genotypes, climatic conditions, and management practices, is to be presented in this review paper. It reviews the current state of technology in terms of deep learning frameworks, classification techniques, and data analysis, as well as an examination of their application to develop accurate prediction models. In addition, it points out the limitations and problems linked to these approaches and valuable insights on future research directions and potential areas for improvement.

#### LITERATURE REVIEW WORK

One reviewed study by Saeed Khaki et al. focused on analyzing yield performance data for corn and soybean crops from 1980 to 2018. The study utilized deep learning techniques, specifically Convolutional Neural Networks (CNN) and Recurrent Neural Networks (RNN), in combination with feature selection, to predict crop yields. Through feature selection, the CNN-RNN model achieved an accuracy of 87.82% for corn yield prediction and 87.09% for soybean yield prediction. The model also exhibited a mean squared error (RMSE) of 9%. However, a limitation or research gap identified in the study is the need to address the training problem of the RNN model, which could be mitigated by incorporating LSTM cells. Developing deep learning models can enhance interpretability and provide more

transparent insights into crop yield predictions [1]. In a study by M.S. Suchithra et al., the main focus was examining activation functions, soil fertility indices, soil pH, classification, and prediction. The study utilized a dataset of 11 parameters related to soil samples and employed the Extreme Learning Machine (ELM) method. The accuracy scores for predicting various soil parameters were as follows: P with an accuracy rate of over 90%, K at 78%, OC at 80%, B above 85%, and pH classification at 90%. The manuscript identifies a research gap or limitation concerning optimizing ELM parameters for classifying soil nutrients, specifically N2O, P2O5, and K2O. The study suggests exploring advanced neural network (ANN) techniques for tailored fertilizer recommendations specific to different crops [2].

A study by Rishi Gupta et al. focused on extensive data analysis, graphical visualization, k-means clustering, map reduction, and recommendation systems in the context of forecasting crop yields. The study specifically examined two regions in India: Ahmednagar, Maharashtra, and the Andaman and Nicobar Islands. The analysis utilized multi-year (2000-2014) weather and crop yield data. The methodology involved the implementation of the Random Forest algorithm and feature selection techniques like Recursive Feature Elimination (RFE) and Boruta. The results showed that the WB-CPI model achieved a prediction accuracy of 90.22% for Ahmednagar and Maharashtra and 91.55% for the Andaman Nicobar Islands. A limitation or research gap identified in the study relates to including environmental factors such as humidity, wind speed, soil moisture, irrigation, and cloud cover for the recommended crops in different regions and states. Additionally, the study offered recommendations concerning the specific type of fertilizer or nutrients required in the soil to promote optimal growth and yield of the crop to prevent seasonal diseases [3]. In the study conducted by Usman Ahmed et al., the focus was on sensor data and soil nutrients. The researchers collected soil samples from various fields in Pakistan from 2001 to 2009. The methodology employed in the study involved using a Genetic Algorithm (GA), an evolutionary computation approach. A limitation or research gap identified in the research manuscript pertains to optimizing the search strategy and utilizing

individual repair methods. These approaches can be valuable in extracting essential parameters that enhance recommendations for soil fertilization, thereby contributing to the maintenance of crops. The study suggests that considering multi-objective optimization models or artificial intelligence/machine learning (AI/ML) models can help optimize parameters for efficient implementation in the future [4].

In the study by A. Suruliandi et al., the primary focus was cropping prediction. The dataset utilized in the study consisted of 1000 instances and 16 attributes related to crops. The methodology employed in the research involved the utilization of classification algorithms and feature selection algorithms. For classification, the study employed algorithms such as Naive Bayes (NB), Decision Tree (DT), Support Vector Machine (SVM), and Random Forest (RF) bagging. Additionally, feature selection algorithms like Boruta, Forward Sequential Selection (SFFS), and Recursive Feature Elimination (RFE) were utilized. The study's findings revealed that Recursive Feature Elimination (RFE) combined with bagging achieved a crop prediction accuracy of 92% compared to other methods based on soil and environmental characteristics. Scholars' comments on the study's limitations suggest that crop cultivation predictions could be further improved by incorporating additional data mining techniques that have been studied [5].

In the study by Q. Li et al., the main focus was on soil moisture prediction using machine learning techniques. The study acknowledged that having a larger dataset, with a minimum of 52,609 samples, could have improved the training of the predictive model. The researchers developed an Encoder/Decoder Deep Learning Model with Residual Learning based on Short-Term Long Memory (EDT-LSTM) as an alternative tool for data intelligence. The EDT-LSTM model demonstrated superior performance compared to other models in terms of both accuracy and efficiency. It achieved a prediction accuracy of 91.98%. The study also suggests that predicting changes in soil moisture levels during training and testing years could be improved if deep learning models are integrated with physical system models. [6].

The main focus was on using the Internet of Things

IoT and cloud computing for crop recommendation in a study by Navd Niranjan Thilakarathne et al. A total of 2200 records were in the dataset used for this study. The approach used various algorithms for crop recommendations, e.g., KNN, DT, RF, XGBoost, and SVM, as well as a range of Machine Learning and Deep Learning algorithms. Random Forest (RF) achieved the highest accuracy among these algorithms, scoring 97.18%. The study aimed to make available valuable information that could help farmers improve the overall effectiveness of their farms and enable them to choose wisely to increase productivity [7]. Data integration, modelling, ensemble models, spatial analyses, and model transparency were the main topics of a study conducted by Sajid et al. The 2018, 2019, and 2020 data have been used for this analysis. This study aimed to predict maize yields throughout the US corn belt, composed of 12 states. The following five machine learning models have been developed, LR, LASSO regression, RFBoost, XG ensemble GBM, and their model has been created. The ensemble model performed better than the individual models for the test years, achieving a relative root mean square errorRRMSE of around 9%. The study analyzed the harvest of maize for 2018 and 2020, with an average yield of 10.77 kg per ha, 10.43 kg per ha in 2019, and 10.23 kg per ha in 2020. The study also suggested using remotely sensed data for better modelling of models at different locations where historical data are scarce. [8]. The primary focus was on the detection of crops in a study conducted by Murali Krishna Senapaty et al. The researchers used sample datasets in CSV format to train and test decision tree machine learning algorithms. Using a Decision Synchronised Machine Learning algorithm to forecast crop yield on soil moisture parameters was the method used in this study. The study's results demonstrated that a machine- learning model achieved an accuracy of 95% with an error rate of 0.5. However, the scholar has pointed to a limitation in the automatic identification of crop yields using soil moisture data and suggests that more improvements could be made to improve plant growth and productivity. [9]. The study's primary objective by Inivan Shanmugam and colleagues was to predict crop yields. Researchers have used a dataset with approximately 80,000 records collected from 2014 to 2019 at different locations in India to develop this model. The study investigated two models of deep neural networks (DNN), specifically RNN and LSTM, for predicting field crop yield. The study's findings revealed that the LSTM algorithm outperformed the RNN algorithm in accurately predicting crop yield. The LSTM algorithm achieved an impressive accuracy rate of approximately 93% in forecasting field crop yield. A scholar highlighted a limitation, suggesting that the combination of RNN and LSTM can be utilized to minimize errors when working with datasets of different sizes [10].

#### **Summary of Knowledge Gap:**

- Optimization of ELM parameters: The Extreme Learning Machine (ELM) model needs to optimize the parameters to improve the classification of soil nutrients such as N2O, P2O5, and K2O—an advanced neural network.
- (ANN) approaches for fertilizer recommendations tailored to specific crops can be explored.
- Training problem of RNN model: The training problem of the Recurrent Neural Network (RNN) model can be addressed by incorporating Short-Term Long Memory (LSTM) cells. LSTM cells can improve the performance and training efficiency of the RNN model.

- Consideration of environmental factors: To determine suitable crops for different regions within states, it is essential to consider environmental factors such as humidity, wind speed, soil moisture, irrigation, and cloud cover. These factors play a crucial role in crop selection and productivity.
- Multi-objective optimization models: multiobjective optimization models or AL/ML (Artificial Intelligence/Machine Learning) models should be considered to optimize parameters for further implementation efficiently. These models can help improve agricultural efficiency and enable farmers to make informed decisions for maximizing productivity.
- Incorporating remote sensing data: Complications arising from limited historical data in certain regions can be addressed by incorporating data from remote sensing. Remote sensing data, weather forecasts, and soil testing data can enhance the accuracy and comprehensiveness of crop yield predictions.
- Overall, the gaps identified suggest the need for advanced techniques and models to optimize parameters, address training issues, consider environmental factors, and utilize remote sensing data for improved crop yield prediction and agricultural decision-making.

Table 1: shows a summary of the knowledge gap with remarks by a scholar on limitations

#### CONCLUSION

In conclusion, machine learning and deep learning techniques have witnessed significant advancements in crop yield prediction and monitoring. Using CNN, RNN, ELM, and RF models, coupled with IoT and cloud computing, has shown promise in accurately predicting crop yields and developing efficient recommendation systems. Feature selection methods, optimization techniques, and hybrid models have improved prediction accuracy. Furthermore, including climate change factors, economic considerations, and soil fertility indices in crop yield prediction models has proven essential for reliable results. The integration of explainable AI and user-centric decision support systems have addressed the need for interpretability

and transparency in agricultural models, building user trust. However, several limitations and research gaps have yet to be identified in the reviewed studies. Future research directions should focus on refining training methods, optimizing model parameters, and incorporating physical system models and data mining strategies. Additionally, advanced techniques such as LSTM cells, multi-objective optimization models, and remote sensing data can enhance crop yield prediction and monitoring accuracy and efficiency. In summary, this literature review highlights the potential of advancements in agricultural practices, maximizing crop productivity, and facilitating informed decision-making in the agricultural sector through improved crop yield prediction and monitoring techniques.

### Salesforce-The Trendy CRM Software

#### Mrudula Nimbarte, Sonam Chopade Vidva Jambhulkar

CSE Department S B Jain Institute of Technology, Mgmt. and Research Nagpur Akanksha Bondade G H Raisoni University Saikheda

#### **ABSTRACT**

With the emergence of cloud computing, organizations are increasingly considering migrating their Customer Relationship Management (CRM) applications from an on-premise environment (local servers) to an on-demand environment hosted on cloud servers. In the on-premise environment, the organization owns and maintains the infrastructure and software within their own network. In contrast, the on-demand environment involves a third-party provider hosting the infrastructure and software, charging the organization based on a subscription model. Salesforce is the leading on- demand CRM solution in the market.

#### INTRODUCTION

alesforce is a cloud-based customer relationship management (CRM) platform that helps businesses manage their sales, marketing, and customer service activities. It provides companies with a comprehensive set of tools and features to streamline their operations, improve customer engagement, and drive sales growth. With Salesforce, businesses can store and manage customer data, track leads and opportunities, automate sales processes, and generate insightful reports and analytics. The platform offers a range of modules and applications to address different aspects of customer relationship management, such as sales management, marketing automation, customer service, and collaboration.

Salesforce's key features include a centralized customer database, customizable dashboards and workflows, lead and opportunity management, email marketing automation, social media integration, customer support ticketing, and mobile access. It also offers a marketplace of third-party applications and integrations to extend its functionality and meet specific business needs. The platform's cloud- based architecture allows businesses to access their data and applications from anywhere, using any device with an internet connection. This flexibility enables sales teams to stay productive on the go, collaborate seamlessly, and respond to customer

inquiries in real-time. Salesforce has gained widespread adoption across industries and is particularly popular among sales and marketing teams. Its user-friendly interface, scalability, and extensive ecosystem of partners and developers contribute to its success. The company continues to innovate and release updates to its platform, incorporating emerging technologies like artificial intelligence and machine learning to enhance customer insights and automate repetitive tasks.

Fig. 1. Salesforce Model

Overall, Salesforce empowers businesses to build stronger customer relationships, drive sales efficiency, and deliver exceptional customer experiences in today's highly competitive marketplace. Salesforce CRM (Customer Relationship Management) is a cloud-based solution provided by Salesforce that allows businesses to manage their customer relationships, sales processes, and marketing activities. The cloud aspect of Salesforce

CRM offers numerous benefits and advantages to organizations:

Accessibility: Salesforce CRM is accessible from anywhere with an internet connection. Users can access their CRM data and applications through web browsers or mobile devices, enabling flexibility and remote access for sales teams on the go.

**Scalability:** As a cloud-based solution, Salesforce CRM offers scalability to accommodate the needs of growing businesses. It allows organizations to add or remove users, customize features and functionality, and expand storage capacity easily as their requirements evolve.

Data Security and Reliability: Salesforce CRM leverages the security and reliability of cloud infrastructure. Salesforce invests heavily in ensuring data protection, implementing industry-standard security measures, regular backups, disaster recovery, and stringent access controls. This helps safeguard sensitive customer information and ensures business continuity.

Seamless Updates and Maintenance: With Salesforce CRM being a cloud-based solution, updates, bug fixes, and new features are regularly rolled out by Salesforce automatically. This eliminates the need for businesses to handle software installations or perform manual updates, allowing them to focus on their core operations.

Integration and Customization: Salesforce CRM offers a wide range of integration options with other cloud-based applications, allowing businesses to connect their CRM with other tools and systems for enhanced functionality and data synchronization. Additionally, Salesforce provides customization capabilities to tailor the CRM to match specific business needs and workflows.

Collaboration and Mobility: Salesforce CRM fosters collaboration among team members through shared access to customer information, documents, and communication logs. Users can collaborate on deals, tasks, and customer support cases in real-time, enhancing productivity and teamwork. The cloud-based nature of Salesforce CRM also enables mobile access, empowering sales teams to work from anywhere and engage with customers on the move.

**Cost-effectiveness:** The cloud-based model of Salesforce CRM eliminates the need for businesses to invest in on-premises infrastructure, hardware, or software installations. It follows a subscription-based pricing model, allowing organizations to pay for the services they use, thereby reducing upfront costs and providing predictable ongoing expenses.

#### ARCHITECTURE OF SALESFORCE CRM

Salesforce CRM follows a multi-layered architecture that enables organizations to manage their customer relationships effectively. The architecture of Salesforce CRM consists of the following components:

Fig. 2. Architecture of Salesforce CRM

User Interface Layer: The user interface layer is the front-end component of Salesforce CRM that provides the interface for users to interact with the system. It includes web browsers, mobile apps, and other user interfaces that allow users to access and utilize Salesforce CRM's functionalities.

**Application Layer:** The application layer contains the business logic and processes that drive the various functionalities of Salesforce CRM. It includes a set of pre-built applications and modules that cater to different aspects of customer relationship management, such as sales, marketing, customer service, and analytics. These applications are highly customizable and can be tailored to meet specific business requirements.

**Data Layer:** The data layer is where all customer data is stored in Salesforce CRM. Salesforce uses a multi-tenant architecture, where data from multiple organizations (tenants) is logically separated and stored

securely in a shared infrastructure. The data layer includes objects, fields, records, and relationships that define the structure and organization of the data within Salesforce CRM.

**Integration Layer:** The integration layer enables seamless integration of Salesforce CRM with other external systems and applications. It provides various integration mechanisms, such as APIs (Application Programming Interfaces), web services, and connectors, to exchange data and integrate with third-party systems, databases, and other applications. This layer allows organizations to synchronize data, automate processes, and create a unified view of customer information across different systems.

Security Layer: The security layer in Salesforce CRM ensures the protection and confidentiality of customer data. It includes robust security features such as user authentication, access controls, encryption, and data privacy measures. Salesforce implements industry-standard security practices to safeguard data and prevent unauthorized access or breaches.

Metadata Layer: The metadata layer stores the configuration and customization information of Salesforce CRM. It includes metadata components such as objects, fields, workflows, validation rules, layouts, and reports. These components define the behavior, appearance, and functionality of the CRM system and can be customized and extended to meet specific business needs.

Analytics Layer: The analytics layer in Salesforce CRM provides capabilities for data analysis and reporting. It includes features such as dashboards, reports, and data visualization tools that enable users to gain insights from their customer data. The analytics layer allows organizations to monitor key performance metrics, track sales and marketing activities, and make data-driven decisions.

Overall, the architecture of Salesforce CRM is designed to provide a scalable, secure, and customizable platform for managing customer relationships and driving business growth. Its multi-layered structure enables seamless integration, data management, and user interaction, making it a powerful CRM solution for organizations of all sizes and industries.

#### SALESFORCE CRM OBJECTS

Salesforce CRM includes a wide range of objects that are used to store and manage different types of data within the system. These objects represent various entities and their relationships in the customer relationship management context. Here are some of the key objects commonly used in Salesforce CRM:

**Account:** The Account object represents a company, organization, or individual with whom the business has a relationship. It stores information such as name, address, industry, and contact details.

**Contact:** The Contact object represents an individual associated with an account. It stores details such as name, title, email, phone number, and other contact information.

**Lead:** The Lead object is used to capture and track potential sales opportunities. It stores information about individuals or companies who have expressed interest in the organization's products or services but have not yet become customers.

**Opportunity:** The Opportunity object represents a potential or ongoing sales opportunity. It stores details such as the potential deal size, stage of the sales process, expected close date, and probability of closing.

Case: The Case object is used for managing customer support and service requests. It stores information about customer inquiries, issues, or complaints and tracks their resolution.

**Campaign:** The Campaign object is used for managing marketing campaigns. It stores details about marketing initiatives, such as email campaigns, advertising campaigns, events, and their associated responses and leads.

**Product:** The Product object represents the products or services offered by the organization. It stores information such as name, description, price, and other product-related details.

**Opportunity Line Item:** The Opportunity Line Item object is used to track individual products or services associated with an opportunity. It stores details such as quantity, price, and total amount for each line item.

Task: The Task object is used for tracking activities

and to-do items related to accounts, contacts, or opportunities. It includes information such as due dates, priorities, and status.

**Event:** The Event object is used to manage calendar events and meetings. It stores details such as date, time, location, attendees, and related records.

These are just a few examples of the standard objects available in Salesforce CRM. Additionally, organizations can create custom objects to address their specific business requirements and store additional data relevant to their operations. The flexibility and extensibility of Salesforce CRM allow businesses to tailor the object structure to align with their unique processes and workflows.

# CHALLENGES TOWARDS SALESFORCE CRM

While Salesforce CRM offers numerous benefits and features, organizations may encounter some challenges when implementing and using the system. Here are a few common challenges faced by businesses in relation to Salesforce CRM:

User Adoption: Getting users to adopt Salesforce CRM can be a challenge. Some employees may be resistant to change or may not fully understand the benefits of using the CRM system. Proper training, communication, and ongoing support are essential to encourage user adoption and maximize the system's effectiveness.

**Data Quality and Data Integration:** Maintaining accurate and up-to-date data within Salesforce CRM can be challenging, especially when integrating data from multiple sources. Data inconsistencies, duplicates, and incomplete records can impact the system's reliability and hinder decision-making. Establishing data governance practices and implementing data integration strategies are crucial to ensure data quality and integrity.

Customization Complexity: Salesforce CRM offers a high level of customization to meet specific business needs. However, the complexity of customization options can be challenging for administrators and developers without proper expertise. Customization should be carefully planned and executed to avoid creating a system that is difficult to maintain or upgrade in the future.

Scalability and Performance: As organizations grow and their data volume increases, Salesforce CRM's scalability and performance may come into question. Large data sets, complex workflows, and extensive customizations can impact system responsiveness. Proper data architecture design, performance optimization techniques, and regular monitoring are necessary to maintain system performance as usage expands.

**Integration with Legacy Systems:** Integrating Salesforce CRM with existing legacy systems and applications can pose challenges due to differences in data formats, protocols, or APIs. Ensuring seamless data flow and real-time synchronization between Salesforce and other systems requires careful planning, integration strategies, and potentially the use of middleware or integration platforms.

Cost Considerations: Salesforce CRM is a subscription-based service, and the cost can be a concern for some organizations, especially for smaller businesses or those with limited budgets. Understanding the pricing structure, licensing options, and evaluating the return on investment (ROI) is crucial to determine the affordability and long-term value of Salesforce CRM.

Security and Compliance: While Salesforce provides robust security measures, organizations must still ensure that their data and customer information remain secure and compliant with relevant regulations. Maintaining proper access controls, data encryption, user authentication, and monitoring user activity are essential to protect sensitive data within the CRM system.

It's important to note that while these challenges exist, Salesforce CRM provides extensive resources, support, and a vibrant community to address them. Proper planning, implementation, and ongoing management can help organizations overcome these challenges and leverage the full potential of Salesforce CRM.

#### SALESFORCE CRM ADVANTAGES

Salesforce CRM offers a range of advantages that can benefit organizations in managing their customer

relationships and driving business growth. Here are some key advantages of Salesforce CRM:

Comprehensive Customer View: Salesforce CRM provides a centralized platform to store and manage customer data, allowing organizations to have a 360-degree view of their customers. It enables businesses to track interactions, preferences, purchase history, and other relevant information, empowering them to deliver personalized and targeted experiences.

**Increased Sales Efficiency:** Salesforce CRM streamlines the sales process by providing tools for lead management, opportunity tracking, and sales forecasting. Sales teams can effectively manage their pipelines, collaborate on deals, and automate routine tasks, resulting in increased productivity and faster sales cycles.

Marketing Automation: Salesforce CRM offers robust marketing automation capabilities. Organizations can create and execute targeted marketing campaigns, track campaign performance, and analyze results. Integration with email marketing, social media, and other marketing channels allows for seamless coordination and automated workflows, enhancing marketing effectiveness.

Improved Customer Service: Salesforce CRM helps organizations deliver exceptional customer service by providing tools for case management, ticketing, and self-service portals. Customer support teams can efficiently resolve inquiries, track customer issues, and provide timely assistance, resulting in improved customer satisfaction and loyalty.

Collaboration and Communication: Salesforce CRM facilitates collaboration and communication across teams and departments. Features like Chatter, Salesforce's enterprise social network, enable real-time communication, document sharing, and team collaboration. This fosters a culture of knowledge sharing, enhances cross-functional collaboration, and improves internal communication.

**Mobility and Accessibility:** Salesforce CRM is accessible from anywhere via web browsers and mobile applications. This enables sales and service teams to access customer information, update records,

and collaborate on the go, improving productivity and responsiveness.

**Scalability and Flexibility:** Salesforce CRM is highly scalable, allowing organizations to add users, expand functionality, and accommodate growth seamlessly. The platform can be easily customized and extended through point-and-click configuration or development, enabling businesses to tailor the system to their unique requirements.

**Integration Capabilities:** Salesforce CRM provides robust integration capabilities, allowing seamless integration with other systems and applications. This facilitates data synchronization, automates workflows, and enables a unified view of customer information across the organization.

Analytics and Insights: Salesforce CRM includes powerful reporting and analytics features, enabling organizations to gain valuable insights into sales performance, customer behaviour and marketing effectiveness. Customizable dashboards and reports provide real-time visibility into key metrics, empowering data-driven decision-making.

Security and Data Protection: Salesforce CRM prioritizes data security and offers robust security features, including data encryption, access controls, and user authentication. The platform complies with industry standards and regulations to ensure the privacy and protection of customer data.

These advantages make Salesforce CRM a popular choice for organizations seeking to enhance customer relationships, streamline sales and marketing processes, and drive business growth.

#### **CONCLUSION**

In conclusion, Salesforce CRM offers significant benefits and advantages for organizations in managing customer relationships and driving business growth. With its comprehensive customer view, increased sales efficiency, marketing automation capabilities, and improved customer service features, Salesforce CRM provides a powerful platform for organizations to enhance their customer engagement and deliver personalized experiences. The collaboration and communication tools within Salesforce CRM foster

teamwork and knowledge sharing, while the mobility and accessibility features enable users to access and update information on the go, improving productivity and responsiveness.

The scalability and flexibility of Salesforce CRM allow organizations to adapt and expand as their needs evolve, while the integration capabilities enable seamless connectivity with other systems and applications, ensuring data synchronization and a unified view of customer information. Furthermore, the analytics and reporting features in Salesforce CRM empower organizations to gain valuable insights into sales performance, customer behaviour and marketing effectiveness, enabling data- driven decision-making and continuous improvement.

#### **ABSTRACT**

As technology continues to evolve, the threat of cyber attacks becomes more prominent. Cybersecurity has become a top priority for organizations worldwide, and the need for effective cybersecurity measures has become increasingly important. This paper will discuss the various threats faced by organizations, including malware, phishing, and ransomware attacks. The challenges associated with implementing effective cybersecurity measures will also be explored, including budget constraints and lack of expertise.

**KEYWORDS:** Cybersecurity, Cyber threat, Security

#### INTRODUCTION

ybersecurity is the practice of securing computer frameworks, systems, and delicate data from unauthorized get to, burglary, or harm. With the growing usage of technology in various industries, the risk of cyber threats has increased significantly, making cybersecurity a top priority for organizations worldwide. This paper aims to provide an overview of the threats, challenges, and best practices in cybersecurity.

#### TYPES OF CYBER SECURITY

Cyber security can be broadly categorized into several types or domains, based on the nature of the assets being protected or the focus of the security measures [4]. A few of the foremost common sorts of cyber security include:

**Network security:** This focuses on protecting computer networks from unauthorized access, intrusion, and other security threats.

**Application security:** This is concerned with securing software applications and systems from security vulnerabilities and exploits that can be exploited by attackers.

**Information security:** This points to secure the privacy, keenness, and accessibility of touchy information and data resources, both in capacity and in travel.

**Cloud security:** This deals with protecting cloud-based computing services, applications, and data storage from security threats and risks.

**Endpoint security:** This points to secure person gadgets, such as tablets, desktops, and versatile gadgets, from malware and other cyber dangers.

**Identity and access management:** This is concerned with managing and securing user identities and access to systems and resources.

**Operational security:** This focuses on securing the physical and operational aspects of IT systems, such as data centers, networks, and hardware.

**Disaster recovery and business continuity:** This is concerned with ensuring that systems and data can be quickly restored and recovered in the event of a disaster or other disruptive event.

www.isteonline.in Vol. 46 Special Issue, September, 2023 78

#### **CYBER THREATS**

Malware is one of the most common cybersecurity threats. Malware is malicious software that can infiltrate a computer system and cause damage, steal sensitive information, or gain unauthorized access to the system. Malware can be of many forms such as viruses, worms, Trojan horses, and ransomware. Ransomware is considered as a type of malware, it encrypts an organization's data and demands a ransom payment to restore access of users[6]. According to the 2021 Verizon Data Breach Investigations Report, malware was responsible for 39% of all data breaches.

Phishing is another cybersecurity threat being faced by organizations. Phishing is a social engineering attack that involves tricking people into providing sensitive information such as usernames and passwords. Phishing attacks can happen through e-mail, content messages, or social media, and can be challenging to distinguish.

#### **IMPACT OF CYBER THREATS**

The impact of cyber threats can be devastating, both for individuals and organizations. Some of the most significant impacts of cyber threats include:

**Financial loss:** Cyber threats can cause significant financial losses for an organization. For example, ransomware assaults can result from the misfortune of basic information, which can be costly to recover. Additionally, cyber-attacks can result in lawsuits, regulatory fines, and damage to a company's reputation, all of which can be expensive to address.

**Operational disruption:** A cyberattack can disrupt an organization's operations, causing downtime, loss of productivity, and delays in the delivery of goods or services. This disruption can be particularly harmful to little and medium-sized businesses which will not have the resources to recover quickly from an attack.

**Personal information breach:** Cyber threats can lead to burglary of individual data such as social security numbers, credit card numbers and bank points of interest. This data can be utilized for burglary, which can have a long-term effect on individuals.

National Security: Cyber threats can pose a threat to national security. For example, cyberattacks can be utilized to disturb basic frameworks such as

control lattices and transportation, causing chaos and devastation.

# RECENT SURVEY ISSUES ON CYBER SECURITY TRENDS

Cybersecurity includes awareness of various cyber threats [1] and the use of protective policies (i.e. protection) to ensure the confidentiality, reliability and availability of digital or IT technologies.

Cybersecurity experts consider malware to be the primary weapon of choice for cyberspace cyber defence efforts. Malware is a common attack that is often installed on a device without the owner's knowledge. Like viruses, worms, Trojans, spyware, and robot executables, malware can infect computers in many ways, such as spreading through viruses, tricking users into opening haptic files, or tricking users into visiting malware-infected websites. In the most extreme cases of malware, the malware installs itself on a USB drive attached to the infected computer and then spreads to all connected computers for that computer.

#### **Common Cyber Attacks**

**Phishing:** Phishing attacks include deceiving people into uncovering touchy data such as passwords, credit card numbers, or social security numbers. Typically ordinarily done through misleading emails, messages, or websites that show up authentic but are really false.

**Malware:** Malware is malicious software, it is designed to corrupt, damage devices/systems, and to gain unauthorized access to systems. Malware includes viruses, worms, Trojans, ransomware, etc. It can infect through links received from email, infected websites, or downloads from untrusted websites.

**Denial-of-Service (DoS)** / **Distributed Denial-of-Service (DDoS)** Attack: In a DoS attack, the aggressor overpowers a target framework with a surge of ill-conceived demands or information, causing the framework to end up inert or crash. DDoS assaults include different compromised gadgets (a botnet) planning an assault on a single target.

Man-in-the-Middle Attack: In Man-in-the-Middle Attack or MitM attack, an attacker intercepts and potentially alters communication between two parties without their knowledge. This allows the attacker to

eavesdrop, steal information, or even inject malicious code into the communication flow.

**SQL Injection:** This type of attack targets web applications that use databases by injecting malicious SQL code into user input fields. By exploiting vulnerabilities, attackers can manipulate the application's database and gain unauthorized access, steal data, or alter data.

Cross-Site Scripting (XSS): XSS assaults happen when aggressors infuse malevolent scripts into websites or web applications that are seen by other clients. These scripts can take touchy information, divert clients to pernicious websites, or control substance on the influenced pages.

**Social Engineering:** Social engineering involves manipulating individuals to pick up unauthorized get to to frameworks or data. Attackers may utilize different mental procedures to deceive people into revealing confidential data, such as passwords or account details.

Password Attacks: Password attacks aim to gain unauthorized access to user accounts by exploiting weak or stolen passwords. Common techniques include brute force attacks (trying all possible password combinations), dictionary attacks (trying common words or phrases), or using stolen password databases from previous breaches.

#### **GOALS OF CYBER SECURITY**

To secure the secrecy, judgment, and accessibility of data and frameworks from unauthorized get to, utilize, divulgence, disturbance, alteration, or devastation. In other words, cyber security aims to prevent malicious actors, such as hackers, cyber criminals, and cyber terrorists, from gaining unauthorized access to sensitive information and systems, or from causing harm to them.

To achieve these goals, cyber security uses a range of technical, organizational, and procedural measures, such as firewalls, encryption, access controls, network segmentation, incident response plans, training and awareness programs, and risk assessments. Cyber security aims to ensure compliance with legal requirements, such as industry standards, privacy laws, data protection laws, etc. Overall, the ultimate goal of cyber security is to create a secure and resilient cyberspace that enables individuals, organizations, and society to benefit from the opportunities offered by the digital age.

#### **CHALLENGES**

Implementing effective cybersecurity measures can be challenging for organizations due to several reasons. One of the primary challenges is budget constraints, as implementing cybersecurity measures can be expensive. Numerous organizations battle to apportion satisfactory assets to cybersecurity, driving to vulnerabilities in their systems [2].

Another challenge is the lack of cybersecurity expertise. Many organizations do not have individuals with the necessary skills and knowledge to implement and maintain cybersecurity measures. This lack of expertise can lead to inadequate security measures or misconfigured systems, making them vulnerable to cyber threats.

Furthermore, the lack of standardization in cybersecurity practices can make it challenging for organizations to know which measures to prioritize. Different organizations have diverse security needs, and there is no one-size- fits-all approach to cybersecurity. Therefore, organizations must develop a cybersecurity strategy that meets their specific needs.

Following are few of the challenges that can be faced:

**Increasing complexity of systems:** As systems become more complex, they become harder to secure, as attackers have more potential attack vectors to exploit.

**Insider threats:** Malicious or accidental insiders can pose a critical danger to cybersecurity, as they have access to all the sensitive information and systems.

Rapidly evolving threats: Attackers are constantly developing new techniques and tools to bypass cybersecurity measures, making it challenging for defenders to keep up.

**Lack of skilled personnel:** There is a shortage of skilled cybersecurity personnel, making it difficult for organizations to effectively defend against cyber threats.

Balancing security with usability: Security measures that are too strict can negatively impact usability and productivity, making it a challenge to strike a balance between security and usability.

Resource constraints: Organizations may face budget constraints, making it difficult to implement comprehensive cybersecurity measures.

**Third-party risks:** Organizations may be vulnerable to cyber-attacks through third-party vendors or suppliers that have access to their networks or data.

**Compliance requirements:** Compliance requirements such as GDPR or HIPAA can add additional complexity to cybersecurity efforts and require additional resources.

Lack of awareness and training: Lack of awareness and training among employees can leave organizations vulnerable to cyber-attacks.

**Emerging technologies:** The emergence of new technologies such as AI, IoT, and blockchain present new cybersecurity challenges that need to be addressed.

#### BEST PRACTICES

Despite the challenges, there are several best practices that organizations can implement to mitigate cybersecurity threats. One of the most critical practices is employee training. Human error is a major factor in many cyber- attacks. Therefore, organizations must provide regular training to employees on cybersecurity best practices, such as how to identify phishing emails and how to create strong passwords.

Another best practice is to ensure that all software is regularly updated. Cybercriminals regularly abuse vulnerabilities in obsolete computer programs to pick up unauthorized get to frameworks [3]. Regular upgrades to programs can fix known vulnerabilities and decrease the hazard of cyber threats.

Implementing strong passwords and multifactor authentication can also significantly improve cybersecurity. Weak passwords can lead to data breaches. Therefore, organizations must require employees to make solid passwords that are troublesome to figure out. MFA or Multi factor authentication adds an extra layer of security as it requires users to provide additional information, such as a fingerprint, a verification code sent to their devices such as mobile/tabs, to access their system.

## Other measures that organizations can implement to improve cybersecurity

One important measure is to conduct regular vulnerability assessments and penetration testing. [5] Vulnerability assessments involve identifying potential vulnerabilities in systems and networks, while penetration testing involves attempting to exploit these vulnerabilities to determine whether they can be used to gain unauthorized access[2]. By conducting these assessments and tests, organizations can identify weaknesses in their systems and networks and take steps to address them before cybercriminals can exploit them.

Another important measure is to implement a data backup and recovery plan. Data backups are essential in case of a cyber-attack, as they can help organizations restore lost or corrupted data. Additionally, having a recovery plan in place can help organizations quickly recover from a cyber-attack, reducing the impact of the attack on their operations.

Implementing network segmentation is also a best practice in cybersecurity. Arrange division includes separating an organization into littler fragments, each with its own security controls. This approach can limit the spread of malware or other cyber threats, reducing the potential damage of an attack.

Organizations should consider implementing a security operations center (SOC) or managed security services provider (MSSP). SOC is a team of cybersecurity professionals responsible for monitoring systems and networks for potential threats and responding to

incidents. An MSSP is a third-party provider that offers cybersecurity services to organizations. These providers can offer advanced security solutions and expertise that organizations may not have in-house.

#### **CONCLUSION**

Cybersecurity is a critical issue for organizations, and the risks associated with cyber threats are increasing. Organizations must prioritize cybersecurity measures and allocate adequate resources to protect their systems and sensitive information. The threats to cybersecurity are numerous, ranging from malware to phishing attacks, and organizations must develop a cybersecurity strategy that meets their specific needs. Despite the challenges, there are various best practices that organizations can implement to overcome cybersecurity threats, such as training all the employees, updating softwares regularly and the implementation of strong passwords and MFA (multi factor authentication). Staying up to date with the latest threats and best practices is crucial in maintaining an effective cybersecurity strategy.

### **Interactive Learning through Game**

#### Rashmi Jain, Ratnesh Chaudhary Kavita Gawande

Department of Computer Science and Engineering S.B. Jain Institute of Technology, Mgmt and Research, Nagpur

#### Sachin Jain

Department of Computer Science Oklahoma State University Stillwater OK, USA

#### **ABSTRACT**

This paper describes the development of a runner game with interactive learning features aimed at enhancing players' knowledge and skills in programming. The game is designed as a mobile app for Android and iOS platforms and targeted Computer Science students. The development process involves several phases, including game design, content creation, programming, and testing. The game mechanics are based on the endless runner genre, with the addition of interactive learning elements such as quizzes and puzzles that provide players with opportunities to reinforce their knowledge while playing. The game is evaluated through a user study with college students, which demonstrates that the game is engaging and effective in promoting learning outcomes. The results show that players who completed the game exhibited significantly higher knowledge retention [10]. The study also provided insights into the game's soundness and fragility, as well as suggestions for future improvements. Overall, this paper contributes to learning by showcasing an example of how games can be designed to promote interactive learning and engage students in meaningful educational experiences.

KEYWORDS: Algorunner, Virtual model, Runner game, User interface(ui) component

#### **INTRODUCTION**

ccording to the principle of based on games learning, students can focus intensely on a subject while playing games, which improves student accomplishment and knowledge retention. This includes gamifying instructional strategies to raise allaround student performance. With digital or non-digital gaming experiences, it is possible to give conventional classroom assignments a little extra spark, boosting student interest and engagement.

Gamification is the art of adding gameplay principles such as badges, scores, leaderboards, and other features to a game to make your journey challenging yet satisfying for each small accomplishment. Students are given clear, satisfying objectives to work towards through game projects and instructions. Using gamebased learning is a fascinating topic. While some experts resist that game-based learning enhances test scores compared to conventional teaching methods, others contend that there is little to no difference in test

scores. It can take a lot of effort and money to create these games for game-based learning. There is a gap between education experts and game development experts, leading to productivity issues in the area of game-based learning.

Goals or Objectives:

- To Gamify the process of learning.
- To provide a competitive and fun way to learn boring topics.
- To provide an interactive way to learn puzzles asked in placement tests.
- To improve hand eye coordination.
- To provide a beneficial way to pass time.

#### LITERATURE SURVEY

Game-based learning is an innovative approach to education that involves the use of games to improve

www.isteonline.in Vol. 46 Special Issue, September, 2023

learning outcomes. Research on game-based learning has increased in recent years, with numerous studies examining its effectiveness in improving learning outcomes. Game-based learning is a relatively new area of research that focuses on the use of games as educational tools. The body of research on game-based learning has developed over time, moving from early investigations into the potential educational value of games to more current investigations into the efficiency of certain game-based learning treatments.

Early research into the potential benefits of games for learning: The first game-based learning study explores the potential benefits of games for cognitive development and learning. An influential study was "The Effects of Video Games on Children: What Parents Need to Know", published in 2004 by Cheryl K. Olson and Lawrence A. Kutner. The study, which asked parents about their children's use of video games, found that playing video games can have positive effects on cognitive development, such as improved spatial reasoning and communication skills. problems solving. [5]

The Rise of Serious Games: In the mid-2000s, researchers began investigating the use of games designed specifically for educational purposes, known as serious games. A key article in this area is "Serious Games: Advergaming, Edugaming, Training, and More" by Clark C. Abt in 2006. This article defines the concept of serious games and identifies several categories of serious games, such as adgames (games used for advertising) and edugames (games used for education). [3]

Research on how well game-based learning interventions work. The success rate of educational game interventions has been the subject of greater study in recent years. An example well known is "Learning from Play: A Panel Discussion Using Games for Learning" by Katie Salen,

James Paul Gee and Colleen Macklin, 2009. This article features a panel discussion between game designers and educators, discusses the potential benefits and limitations of game-based learning, and shares examples of successful game-based learning interventions. [6]

Digital instructional games can be useful teaching tools, according to research. When examining the learning process and success, researchers advise concentrating on motivation, game load, and their interactions. When non-native speakers play an English game, gaming knowledge and English skill of the students appear to be additional crucial factors in learning achievement. However, more information is required and has to be clarified concerning the motivational and cognitive effects of games and learner characteristics on learning outcomes. The goal of the current study was to meet this demand. [7]

Shute and Ventura (2013) Measuring and Supporting Learning in Games: The concept of invisible evaluation in game-based educational settings is the main topic of Invisible evaluation. The authors explain how data can be used to measure and assess learners' knowledge, skills, and abilities without interrupting their gaming experience. They describe different types of stealth assessment methods and provide practical guidance for their implementation in game-based learning environments. The book also explores the potential benefits and challenges of using stealth assessment and identifies future research directions for this approach to game assessment. [2]

Mayer (2014) The Cambridge Handbook of Multimedia Learning explores the potential of game-based learning as an effective teaching method. The book discusses the cognitive and motivational mechanisms of game-based learning and provides practical guidelines for designing effective game-based learning environments. It also highlights the benefits and challenges of using games for learning and identifies future directions for research to advance the field of game-based learning. Overall, this book provides valuable information to educators and researchers interested in using games as a tool to improve learning outcomes. [4]

Among the authors Arnab, S., Lim, T., et al. (2015) provided game mechanic mapping for game analysis. This article begins an overview of serious games and their potential as educational tools. The framework is then presented, which consists of four components, including gaming environments, learning objectives,

and game mechanisms. The author provides detailed definitions and examples of each component, emphasizing their interdependence and the need to consider them when analyzing serious games. The authors suggest that the framework could help game designers create more effective serious games by providing a structured approach for understanding the connection between game mechanics and educational results. Additionally, the framework can help researchers and educators evaluate the effectiveness of serious games by providing a common language and set of analytical criteria. Overall, this document provides a comprehensive and practical framework for the analysis of serious games and emphasizes how crucial it is to take the connection between game design and learning objectives into account.[8]

Kiili and Ketamo's (2017) article "Game-Based Digital Learning: A Meta-Analysis" offers a comprehensive literature review on game-based digital learning. The authors conducted 87 empirical studies published between 2006 and 2016 were analysed in a meta-analysis to determine the efficacy of game-based digital learning across a variety of educational contexts and topics. The article begins with an overview of game-based digital learning and its potential benefits, such as increased engagement, motivation, and learning outcomes. The authors then describe their approach to meta-analysis, including systematic review of relevant databases, selection of articles based on inclusion criteria, and extraction and analysis of data from selected studies. The results of the meta-analysis suggest that digital game-based learning is an effective teaching tool across a range of disciplines and educational contexts. The authors found that digital gaming improves learning outcomes such as knowledge acquisition, skill development, and problem solving. Additionally, the authors found that digital game-based learning was particularly effective for low-achieving students and students with learning disabilities. These findings have important implications for educators and policy makers interested in using digital games as educational tools. [9]

The research literature on game-based learning provides insight into the benefits, challenges, and effective design principles of using digital games for educational purposes. Here are some key findings from the research paper:

- Game-based learning can improve motivation and engagement: Games have been shown to be effective in increasing learners' motivation and engagement in the learning process. This is due to immersive nature of game, the presence of clear goals, immediate feedback, and element of challenge and competition.
- Games can improve learning outcomes: Digital games have been shown to be effective in promoting learning outcomes, such as knowledge acquisition, skills development, and problem-solving abilities.
- The secret to good game development is: The usefulness of the game as a teaching tool is greatly influenced by its design. Clear learning objectives, a suitable degree of difficulty, and insightful feedback should all be included in the design of game-based learning. The game should also take the learners' interests and competency levels into consideration.

Overall, the studies on game-based learning offer proof of the potential advantages of adopting computer games as a teaching tool. The findings suggest that game-based learning can improve motivation, engagement, and learning outcomes, and that effective game design is key to its success. However, more study is required to determine the best game-based learning design and execution as well as to solve the difficulties and restrictions related to its application.

#### PROPOSED WORK

The intent of our project is to gamify the process of learning and provide a competitive and fun way to learn academics topics and interactive way to learn puzzles asked in placement tests. This includes the system's architecture, functional modules, and overall system flow.

#### **System Architecture**

Fig.1: System Architecture for AlgoRunner

#### Flow of the System

We have shown the flow of our project in Fig.2. The student is the main user which will use the app. The User will start playing, he/she can move left or right according to rescue from obstacle. If user meets with an obstacle he will die and the game will end. If the user does not meet with an obstacle, after some interval of time questions along with three options as an answer will pop up on screen. The user has to choose the correct option, if the selected answer is correct, he can continue to play else he will have to retry the game.

Fig.2: Flowchart for AlgoRunner

#### **Functional Modules**

Three modules make up the entire system. Those are UI Component, Actions, Quiz Manager.

#### **UI** Component

This will act as a base for the application where the user just has to swipe the character (Runner) and dodge the oncoming obstacles.

#### Actions

The character can JUMP, SLIDE, MOVE LEFT, MOVE RIGHT to dodge the obstacles. If the runner meets with an obstacle, he will die and the game will end.

#### Quiz Manager

While the user is playing the game they will receive questions randomly in between they will have to answer the questions correctly within a specified time else they will have to start over. The user has to choose the correct option, if the selected answer is correct, he can continue to play else he will have to retry the game.

Score formula

Score = (int) zaxis distance \*0.5 +answer score

#### **RESULT**

When the user starts the game, it will look like an endless road and there will be obstacle generation as shown in Fig.3. The user can move left or right to rescue from the obstacle which are getting generated with the endless road generation. It will also display the highest score of the user at the top of the screen which will help to improve the performance of the user.

Fig. 3. Endless Road/Obstacle Generation

Fig. 4. Quiz Generation

When the question screen as shown in Fig. 4 pops the user has to answer the question correctly to progress further otherwise the game ends and shows "try again" screen. If the user has answered correctly the question screen will pop again after a set amount of time and this process is repeated endlessly until the user either answer incorrectly or collides with an obstacle.

Fig. 5: Fail Screen

If the user gets stuck with the obstacle that are generated along with way, it will end the game and a screen will pop up as try again as shown in Fig.5. Also, if the answer got incorrectly, it will also show the fail screen as shown above and automatically the score board will be calculated.

#### **APPLICATIONS**

- A. Schools and Universities: The same teaching model has been followed for decades where teachers focus more on curriculum completion resulting in an unproductive learning system. Spark interest in coding in schools where students are new to coding. At a university where students improve their skills and knowledge. Education centers should establish healthy competition among students.
- **B.** Competitive Learning: Competitive learning is a teaching method that lets students try out new research skills without worrying about making mistakes or getting low grades. It can be a fun way to learn and can help students become more engaged in their studies.

#### **CONCLUSION**

In this research paper, the developed application addresses the tediousness of learning programming concepts among students. We applied our engineering knowledge to analyze the problem and designed a modern engineering solution in two modules. Through investigating available applications, we identified new solutions and updates. The implementation of the application was done using modern tools such as Visual Studio.

Our study acknowledged the positive influence of game-based learning on motivation, participation, and overall satisfaction with learning. Throughout the project, we applied professional ethics and understood the importance of individual and team work and communication skills while presenting the project in various competitions and conferences for project management.

This research paper presents a proposed solution that can be developed at a generalized level for multiple sectors for life-long learning. It contributes to the advancement of mobile application development for game-based learning, addressing the educational needs of students in a modern and interactive manner. Future research can further explore the effectiveness and impact of game-based learning applications in different educational settings and contexts.

### **Quantum Machine Learning for Disease Diagnosis**

Fazil Sheikh

S. Y. Amdani

Ph.D. Scholar YCCE, Nagpur, Maharashtra Associate Professor BNCoE, Pusad, Maharashtra

#### **ABSTRACT**

Quantum Machine Learning is very promising and an upcoming area that makes use of the principles of Quantum Computing and Machine Learning to process and analyze large data sets more efficiently. QML is supposed to revolutionize many areas, including healthcare, medicine& drug discovery.

Early disease diagnosis is very crucial for effective treatment & improved patient outcomes. Delay in disease diagnosis can have significant negative effects on not only patients but also care givers and the whole healthcare system. Delay in diagnosis causes disease progression, making it more difficult to treat and potentially leading to complications.

In the context of QML, early diagnosis could involve analyzing large datasets of patient information, such as medical records and imaging data, to identify patterns and indicators of disease at an early stage so as to suggest early medication and proper treatment plan. There are many studies being carried out to explore the possible uses of Quantum Machine Learning in healthcare. Here, in this paper we have tried to do the critical analysis of these studies and tried to show their results and the comparison with the traditional machine learning algorithms.

The results obtained by Yogesh Kumar et.al. [28] using the QRFC (Quantum Random Forest Classifier) were: Accuracy was 0.86, F-Score=0.88, Recall=0.91 and Precision was 0.83. Whereas, by using the traditional algorithm (RFC) the values were: Accuracy=0.83, F1-Score=0.85, Recall=0.88 and the Precision was 0.80. Thus in their case, the Quantum version of the algorithm showed better results. There was also a comparison of the execution times of conventional and quantum-enhanced machine learning algorithms, with the quantum random forest having the shortest execution time by 150 ms. Consequently, the work offers a mechanism to quantify the differences between conventional and quantum enhanced ML algorithms in order to choose the best strategy for disease detection.

**KEYWORDS:** Quantum machine learning, Disease diagnosis, Machine learning, Quantum Computing, QML.

#### INTRODUCTION

uantum Machine Learning (QML) is a prominent field that makes use of quantum mechanics & machine learning principles to process and analyze large sets of data more efficiently. QML algorithms are supposed to leverage the inherent properties of the quantum systems, viz. Quantum 'Superposition' & 'Entanglement', for performing certain computations faster and more accurately than classical algorithms.

The field of machine learning aims to develop algorithms that learn from the given data & accordingly make decisions / predictions. However, traditional machine

learning algorithms often struggle with processing large datasets due to limitations in computational power and memory.

QML seeks to address the aforesaid limitations by exploiting quantum system's unique properties for enhancing the efficiency &accuracy of ML algorithms. The Quantum systems are able to perform certain calculations faster than classical systems by simultaneously considering multiple possibilities through quantum superposition. The Figure 1 shows the overall process of disease diagnosis.

The way we analyze and understand medical data in the context of healthcare has the potential to undergo a revolutionary change thanks to QML. By using the quantum systems' processing power, QML algorithms could aid in the early detection and diagnosis of diseases, leading to better patient outcomes and more effective treatments. Furthermore, quantum sensors could provide more detailed and precise medical imaging, allowing for more accurate diagnoses and treatments.

Despite its promising potential, QML, at present is in its early development stage. Many of the challenges need to overcome, such as developing algorithms that can work with limited qubits available in current quantum computers, & developing new hardware and software tools to support QML applications. However, as quantum technology continues to advance, QML is likely to have an increasingly significant role in various fields viz. engineering, finance, and healthcare.

Here, we have tried to highlight the fundamental quantum computing application areas & the analysis of its significance in healthcare systems. The processing methods and the applications of Classical ML & the Quantum Machine are visualized in Fig. 2.

Figure 1: Disease Diagnosis Process

(Image Source: https://www.ncbi.nlm.nih.gov/pmc/articles/PMC4779119/bin/nihms764405f1.jpg)

Fig.2: Processing methods and the applications of CML and QML

(Image Source:https://scx1.b-cdn.net/csz/news/800/2017/3-quantummachi.jpg)

It implies that we will have a better of everything from medicines having less side effects to far better diagnostics. In order to exploit quantum computing in healthcare, we are required to develop new 'quantum applications.'

We have tried our best to review literature related to quantum computing & the propensity in design - development of the healthcare - systems that will be considered as next generation. The present work, its causes, effects & future directions in research for a coherent implementation of the quantum computing healthcare related systems has been discussed.

#### LITERATURE REVIEW

The main goal of ML is to train a computer making use of the algorithms which have already processed data. The tendency of "Quantum Tunneling" encourages the computation of optimization problems quickly [3, 4, 17]. Using the subsets of the 'supervised' & the 'unsupervised' or 'deep' learning, classic methods of machine learning aid in the classification of images, the recognition of patterns and voice, the management of huge data, etc. [5]. New methods for managing, classifying, and organizing the wide variety of available data are now required [6]. Machine learning has been around for a while, and numerous businesses and organizations have invested in it [7].

The organizations where workers are engaged in efficient administration of 'Data Warehouse', able to handle wide variety of data and are particularly interested in learning new methods for carrying this out. A proposed method to get rid of these restrictions is quantum enhanced ML [8]. The susceptibility present in input data that the given approaches may properly treat and handle is one of the concerns to be overcome in quantum enhanced ML [9].

A difficult problem can be solved through adaptive learning, which finds potential behaviors and patterns on its own [10]. Although it has been found that standard machine learning [11] is a process that is adaptable and can successfully map a variety of patterns. However, there are still some difficult problems that can't be solved effectively using the usual ML algorithm approach.

However, the desire to use quantum computers to apply these methods opens the door for quantum-enhanced machine learning [12]. A method called quantum-enhanced machine learning was created to improve on the standard machine learning algorithms. A branch of research on quantum information processing called quantum-enhanced machine learning [1] is concerned with creating machine learning algorithms that can learn from data.

These systems are said to use a set of theories known as quantum algorithms to compute information based on the concepts of quantum theory [12]. Grover search is key component of ML algorithms that are enhanced by accelerate unordered datasets [13].

For the identification of patterns and the extraction of data, numerous machine learning algorithms enhanced by quantum computing have been created [14]. A prospective quantum system is used to conduct machine learning algorithms enhanced by quantum computing, which leverage it's speed to tackle the complicated problems related with the traditional ML methods [15].

With this rate of development, it is evident that these machines will be quickly applied in the future, which will make the analysis process of all data easier. Also, this developing field makes use of powerful ML techniques to further the limits of quantum information theory [16]. M. Niemiec [23] has discussed error-correction in the ANN based 'quantum-cryptography'. In this technologically advanced age, it is common practice to develop streamlined administrative procedures in healthcare facilities in order to map and effectively treat contagious diseases [18].

J. Suo et.al. [24] discussed various quantum algorithms for hard problems. Big Data Analytics in Healthcare is discussed by Y. Kumar et.al. [25]. Waiting time prediction in the radiation oncology is discussed by A. Joseph et.al. [26] by using ML. Data-driven prediction model of Cervical Cancer is given by M. Ijaz et.al. [27].

Hardware advancements made possible by quantum computing and healthcare systems can help the healthcare sector greatly in diagnosing and treating complex medical conditions [19]. The digital world is infused with quantum physics through quantum computing, which enables faster data processing and

more complex problem solving [20].

AI and ML are coupled to the traditional computing facilities for the interpretation of CT scans, expedite surgical steps & analyze huge data to construct disease prediction models [21]. Damahe, Lalit B. et.al.[30] discussed the various approaches for the representation, compression & the retrieval of image, Fazil Sheikh et.al. [29] have discussed the status, challenges and possible solutions of QML in healthcare sector.

Quantum computing has no use in medicine without a corresponding increase in the accessibility of medically pertinent data from multiple sources [2]. Beginning in the year 2000, when the 1st 'Quantum Computing' tool went into operation, Parsons18 [22] projected that the applications of quantum computing will have an impact on medical imaging's future.

A comparative study of the traditional ML algorithms and the Quantum Enhanced ML algorithms has been carried out by Yogesh Kumar et. al. [28]. The following Table 1 shows the various evaluation parameters using Min-Max Scalar based on traditional vs. quantum enhanced algorithms for Heart Failure Detection (HFD).

Table 1. HFD using min-max scalar

There are several patents. Some of them are as mentioned below:

- 1. Researchers at the University of Waterloo have filed a patent related to using QML for cancer diagnosis. The patent, titled "Quantum Machine Learning for Cancer Diagnosis and Treatment", describes a method for using QML to analyze patient data and predict the most effective treatment for individual cancer patients.
- Microsoft has filed several patents related to the use of QML in healthcare. One of their patents, titled "Quantum machine learning for medical imaging", describes a method for using QML to analyze medical images and detect diseases.
- 3. IBM has also filed several patents related to the use of QML in healthcare. One of their patents, titled "Machine learning using quantum computation", describes a method for using quantum computation to train the ML models.

#### **CONCLUSION**

We have tried to show the advantages, limitations and the kind of work that has been done in the area of Quantum Machine Learning for disease diagnosis. We have also shown the comparison with the classical Machine Learning algorithms. The ongoing advancements in both the fields would influence the future landscape of heart failure detection.

Quantum Computing seems to revolutionize the existing computing systems with very high speed, more efficiency & high reliability. We can exploit these key

aspects of the quantum computing along with machine learning to design &implement healthcare applications that would be computationally efficient. On this front, in this paper, we have tried to provide an all-inclusive study and review of the current literature having focus on leveraging the power of quantum computing to develop solutions in healthcare.

#### RESULTS AND DISCUSSION

The results of various Classical ML (CML) algorithms & the Quantum ML (QML) algorithms have been shown in tables and graphs. The comparison between CML and QML is also described. Quantum Machine Learning (QML) holds potential for various types of diseases, particularly those that involve complex data patterns and require high-dimensional analysis. Here are some examples of disease areas where QML may be well-suited: Cancer, Neurodegenerative Diseases, Cardiovascular Diseases, Infectious Diseases, Rare Diseases, Precision Medicine and Personalized Treatment, Mental Health Disorders, Respiratory Diseases etc.

#### **ABSTRACT**

Wireless sensor networks are currently widely employed in a number of applications and scenarios due to their adaptability and capacity to build scalable and reliable wireless networks. A large group of scattered sensor nodes designed for the purpose of acquiring data about the physical environment and transferring it to the base station makes up a wireless sensor network (WSN). These sensors' main function is to collect physical data and turn it into valuable information by combining, analyzing, and disseminating it. WSNs frequently employ non-rechargeable sensor nodes in hazardous locations. As a result, they have power supply restrictions, which creates a variety of difficulties for energy consumption optimization. Improving the way data is transported throughout the network is crucial because the transmission unit uses a significant amount of the sensors' energy. To improve routing protocols used in WSNs becomes prolong interest to extend network life and improve energy saving. This paper illustrates the benefits and drawbacks of a variety of fuzzy logic-based routing systems.

KEYWORDS: WSN, Fuzzy logic, Routing.

#### INTRODUCTION

SN known Wireless sensor Network is a grouping of autonomous, small, sparsely dispersed objects known as sensors that cooperate to gather data and send it to a base station for later use. For example, a system of geographically dispersed sensors called a wireless sensor network is designed to gather, track, and store physical data before sending it to a hub [1]. Numerous industries, including agriculture, the military, environmental management, industrial use, healthcare, security, and safety, now have new perspectives thanks to sensor technology. WSNs were developed to make sure that a physical event would always be monitored. They must therefore enable efficient and long-lasting connections between the base station and nodes.

Consequently, a number of factors are required when developing a sensor network to be considered, including node for real-time location and mobility,

data collection, deployment, bandwidth(B/W), and the management of traffic. Furthermore, since sensors are typically battery-powered and are not known for being rechargeable, their ability to deliver power is limited. In these high-risk situations, WSNs are typically used despite the fact that significant human intervention is risky. The difficulty of recharging or replacing sensor nodes despite their low cost (change). In order to maximize the networks' longevity, it is imperative to carefully regulate their energy consumption. As smart devices become more prevalent, energy efficiency is now a key component of the Internet of Things architecture [2]. In order to sense, process, send, or receive data, a sensor node needs energy. Nearly half of the total energy is used in this scenario by a sensor node's transmission unit, according to research [3]. Optimizing data transfer between sensors throughout the network becomes essential as a result. It is common knowledge that the "network layer" is where data transmission management happens. The best routing protocol should

www.isteonline.in Vol. 46 Special Issue, September, 2023 95

be selected by this layer in order to send accurate data with a respectable latency and while taking energy constraints into account. Without a doubt, to achieving high transmission effectiveness one of the major key factors we select appropriate routing protocol. The importance of and need for research into WSN routing strategies is widely held among academics and industry professionals. This paper's main goal is to demonstrate how WSN routing techniques can be improved by using fuzzy logic (FL). The study covers a variety of effective routing techniques. Second, it will outline a variety of research projects that aim to improve routing techniques through the use of intelligent algorithms. Our final topic will focus on the numerous ways that fuzzy logic has been used into LEACH.

#### FUZZY LOGIC FOR SENSOR NETWORK

A subfield of mathematics known as fuzzy logic was developed to simulate human reasoning [4]. People simulate the decision using fuzzy logic get employed [12]. Fuzzy logic takes into account intermediate belonging values in the range of [0,1], whereas conventional computational systems only take into account the two values 0 for true and 1 for False. Starting with precise variables, the method converts them into linguistic inputs. Fuzzing is the method in question. On the other hand, defuzzification refers to the conversion of a system-generated linguistic variable into a crisp (digital) variable. A fuzzy inference engine is used to divide the output between these two methods while taking into account the membership functions and the fuzzy rules table. For each language input, fuzzy membership functions are used to estimate the membership of the provided values [16]. Membership functions are used to translate a precise (numerical) input into the corresponding linguistic value. Every membership function specifies the values connected to a specific fuzzy metric. For each measure that the fuzzy system takes into account, the inference engine can integrate the inputs and produce outputs that are suitable. The fuzzy rules table always taken a list of if X and Y, X or Y, is taken into account by this engine. As a result, Z. Multiple measures can be combined into a single metric with the help of the fuzzy logic module [17]. Architecture of the basic fuzzy system shown below.

Fig. 2. Architecture of the basic fuzzy system

Bhajantri et al. [2018] look into the failure node patterns in WSNs. The effectiveness of the distributed system identification approach for defect detection is supported by simulation results. Each sensor node periodically sends a beacon message to inform neighbouring nodes of its status. With the sensor node, you can keep an eye on how well your links are working as well as how much energy and bandwidth your neighbours are using. Each node evaluates the observed data while it is being transmitted using fuzzy logic estimate methods to detect faulty sensors.

To create deterministic model for the placement of sensor node that employs a fuzzy approach to identify inactive nodes will discuss by the authors of this paper [2017]. Using the fuzzified approximation, faults of various types can be located both within and between clusters. It assesses the fault rating during each interaction and relays its conclusions to the cluster's central server. Each group's cluster leaders assess the index value against a predetermined limit. A sensor is deemed to be malfunctioning and its status is sent to the node behind it in the network if its cluster value drops below a set threshold.

In their 2017 paper, Sasmita and colleagues discuss a method for fault tolerance based on hazy knowledge. The author uses artificial neural network routing and fuzzy knowledge to implement fault tolerance for WSNs (ANNR). The system uses an Intelligent Sleeping Mechanism (ISM) in addition to an exponent bi-directional memory formation (eBAM) for network decoding and encryption. Several fuzzy heuristics are used to locate the problematic nodes in the network. Data aggregation within the cluster is the responsibility of the Cluster Head (CH). Node Appraisal Technique (NAT), a technique for locating problematic nodes in the network, is based on fuzzy knowledge. The study uses a sleep state method to save energy and a fuzzy

rule to find network problems. Prasenjit et al. (2015) suggested a scalable network failure detection system based on fuzzy rules. Regardless of the nature of their fault, defective nodes are not grouped or under control. To achieve better results in the WSN context, fuzzy logic is used. A non-fuzzy control is developed to obtain the correct sensed values from different types of nodes after nodes are categorized using a set of functions [14]. Raghunath, Thirukumaran, et al. (2019) created instant synchronization using damaged nodes. A fuzzy- based predictor is also used in this strategy to find routing challenges. By avoiding collisions, it reduces gearbox lag times. The fuzzy support method is used to construct the system for speedy installation [15].

Farnaz Pakdel et al. (2016) recommended using fuzzy techniques to spot cluster head issues. If no response is received within a certain amount of time, this method finds a cluster head defect. For selecting a new cluster head replacement, a fuzzy logic system evaluates residual energy and the shortest distance from the damaged sensor node [16]. A heuristic approach grounded in probabilistic theory was proposed by Saeed et al. (2012). When using the variable rating approach, the presented process might only have one issue, namely a different sensing value than what is accepted. The node is obviously flawed if the result significantly differs from the rate variables of surrounding nodes [17]. By Sai Krishna and associates, a fuzzy- based delay-aware routing system has been proposed (2019). The surveyed fuzzy-based clustering protocols comparison shown in below table.

Author	Cluster Size	Fuzzy Based	Multi Hop	Fault Detection
Bhajantri et al. [2018]	Not Fixed	Yes	Yes	Yes
Sasmita et al.[2021]	Not Fixed	Yes	Yes	Yes
Prasenjit et al. (2020)	Not Fixed	Yes	Yes	Yes
Raghunath, Thirukumaran, et al. (2019)	Not Fixed	Yes	Yes	Yes
Farnaz Pakdel et al. (2016)	Not Fixed	Yes	No	Yes

Saeed (2012)	et al.	Fixed	Yes	No	Yes
Sai (2019)	Krishna	Fixed	Yes	No	Yes

## CONCLUSION: OUR PROPOSITION FOR A FUTURE WORK.

It should be suggested that by two fuzzy system integrating concurrently in the same network with the purpose of expand the scope of the previous fuzzy solutions based on the results of this survey: To select first CH value for the fuzzy system with three inputs, such as the energy current CH, the remaining node energy, the distance from the centroid, or the distance to the base station, will be used. The communication between the CHs is the second parameter will use less energy than data transmission from the CH to the BS. With the aim of decide whether should we transmit aggregated data directly to the base station or the nearby CH, choosing second fuzzy system that will only be used by CHs. The distance from the base station, the neighbour's distance with base station, the residual energy, and neighbours' residual energy are examples of fuzzy inputs. Given that fuzzy rules must be updated each time the topology changes, it would be exciting to incorporate additional intelligent algorithms in addition to fuzzy logic, such as neural networks, to automatically optimize the fuzzy rules table. RL is more flexible and adaptable to dynamic networks; By combining its advantages with a fuzzy system to improve the membership functions and the fuzzy rules table.

#### **ABSTRACT**

Plant diseases pose a persistent threat to agricultural productivity and global food security. The accurate detection and quantification of disease severity in plant leaves are crucial for implementing timely interventions. The following ground-breaking investigation, we recommend a novel approach to precisely calculate affected area of plant leaves using advanced image processing techniques and machine learning algorithms. Our model not only provides an automated and reliable assessment of disease severity but also empowers farmers with actionable insights to optimize crop management practices. By leveraging this technology, farmers can proactively identify severely affected leaves, implement targeted treatment strategies, and mitigate the economic and environmental impact of plant diseases. Our findings hold significant promise for revolutionizing crop protection practices and fostering sustainable agriculture in the face of mounting challenges posed by plant diseases

KEYWORDS: Agriculture, Plant diseases, Disease severity, Affected area calculation.

#### INTRODUCTION

Then assessing the damage brought on by leaf diseases and pests, careful monitoring of the leaf area is a crucial factor. The analysis of plant growth and photosynthesis depends heavily on leaf area. Leaf diseases are the predominant factors that affect the entire plant growth. Hence the need arises to treat these leaf diseases on time; else it causes great loss in production of the yield. Overuse of pesticides to cure plant diseases raises costs, causes environmental degradation, and reduces yields. Hence, their utilization must be minimized. This may be accomplished by applying the right amount and concentration of pesticide to the disease regions and evaluating the disease severity using techniques like image processing. Different destructive and non-destructive techniques are used to estimate leaf area. In destructive techniques, the leaf is first plucked from the plant, and then its area is measured. Non destructive approaches involve measuring a leaf's area without plucking from the plant. Montgomery (1911) was the first to propose that plant leaf area might be determined by calculating the linear measures of leaves using the formula given in equation

$$A = b x length x max width$$
 (1)

Where b is a coefficient.

This approach is quicker, simpler, and non-destructive. But the challenge factor is that coefficient b varies between species, the formula is not the same for all plants.

This has motivated us to develop a universal algorithm which calculates the affected area of any leaf. This is obtained by using image segmentation as it plays an important task in segmenting the affected area of leaf. It is discussed briefly in the next section.

#### **METHOD**

Here we give details of the method utilized for calculating the affected area of leaf. This is achieved by using K means clustering technique and Lab color. The flowchart for method is shown in Figure 1.

Figure 1: Flowchart for finding the area of affected leaf.

The algorithm for calculating the affected area of the leaf is discussed briefly below. Algorithm for calculation of affected leaf area

Input: Leaf Sample

Output: Affected area in % Step 1. Start

Step 2. Read input image.

Step 3. Enhance the contrast of the image.

Step 4. Convert the RGB image to Lab color space.

Step 5. Employ K means clustering to group the colors in 'ab' space.

The K means algorithm is described briefly as below.

First the number of clusters is decided by using the color space L\*a\*b. Since the image has three colors form three clusters.

Step 5.1. Set the cluster's centre to zero.

Step 5.2. Put each data point in the cluster that is closest to it.

Step 5.3. Set the average value across all the data points in each cluster as the cluster location.

Step 5.4. Until all points are assigned to the given clusters, repeat 2-3.

Since colour information may be found in the 'a\*b\*' space, the objects are pixels with 'a\*' and 'b\*' values. K-means uses the Euclidean distance metric to assign each data point to the cluster.

Step 6. Three segmented images are obtained, among them select the cluster with ROI. Step 7. Selected image is converted to binary image.

Step 8. Calculating Affected Area from the binary image.

By counting the number of pixels in the segmented

binary image, this is computed. Diseased region is considered as A1 and Total leaf area is considered as A2. The affected leaf area is calculated by the formula given in equation 2 below.

Affected leaf area =  $(A1/A2) \times 100$ (2)

Step 9. Display the affected area in percentage. Step 10. Stop

#### RESULTS

The procedures carried out on the diseased leaf are described in this section. The step by step process of the algorithm discussed in the method section is shown with the help of figures. As shown in Figure 2 the input image is read for the operation.

Figure 2: Query Leaf Image

The input image is contrast-enhanced to enhance the diseased features of the input image. This is shown in Figure 3.

Figure 3: Contrast Enhanced Image

September, 2023

Next it is converted from RGB to L\*a\*b color space. Using K means clustering algorithm the image is divided into three clusters as shown in Figure 4.

Figure 4: Cluster Formation

From the obtained segmented images, the image with ROI is selected for further operations. This is done using the dialog box shown in Figure 5.

Figure 5: Select an Image with ROI.

The selected segmented image is converted to a binary image, which is shown in Figure 6.

Figure 6: Black & White

And using the formula in equation 1 the disease-affected area is calculated and it is displayed in Figure 7.

Figure 7: Result.

#### **CONCLUSION**

To observe the severity of sickness of leaf diseases, image processing is absolutely necessary. Our research article highlights the significance of automated detection and quantification models for plant diseases, specifically focusing on the calculation of the affected area of plant leaves. As the precision of open-eye observation might be poor and differ from individual to individual. In this article, with the help of K means clustering the affected region is segmented. And the affected area of the leaf is calculated by using equation 2. The severity of the disease is understood by the percentage of the affected area. Based on this, appropriate measures can be taken to minimize the disease. This might be helpful for the farmers to produce better quality and quantity of yield.

### **ABSTRACT**

Our proposed algorithm aims to more precisely and consistently allocate a driver on a network. This algorithm will be improving operational safety and it is used to automate manual operations. After thorough observation and analysis of several departments on drivers in general and links to those drivers in particular, this algorithm offers safe and consistent schedules for drivers, which reduces the need for manual rescheduling. The digitalized schedule will allow the drivers to locate their leisure days in advance because it can be implemented in web-based applications in future.

**KEYWORDS:** Automation, Days, Time, Transportation, Crew scheduling concepts, Scheduling algorithm.

### INTRODUCTION

The issue of driver scheduling affects all modes of transportation, but in this paper, we focused specifically on public transportation, such as trains. Effective time management can have a big financial saving for transportation companies since driver wages make up a significant portion of costs. For instance, about 45% of the total operating expenses are attributable to train driver wages. Terminologies must be introduced in order to make the issue more understandable. A driver schedule is a method that divides up all the necessary driving duties into a set of shifts. The quantity of labor one driver completes in a single day is called a shift. The shifts are just hypothetical because they haven't been assigned to real workers yet. After that, the work is packaged for actual drivers. scheduling theory is concerned with the location of resources to activities over time. The driver typically signs in at a depot to begin a shift. The

motorist then performs one or multiple spells separated by breaks. Usually, there is at least one sufficiently long break. in order to eat.

The main objectives and constraints for driver scheduling are as follows:

- Each task is assigned to a shift, which also has to abide by all operational constraints and labour rules.
- There are a limited amount of shifts overall.
- The entire expense is minimal.

### LITERATURE REVIEW

### **Crew planning in railway operations**

Various planning levels can be used to categorize train crew choices. This section discusses crew planning actions in relation to operational planning, disruption management, and strategic/tactical planning. For

www.isteonline.in Vol. 46 Special Issue, September, 2023 104

a comprehensive understanding of the planning procedure, models, and problem-solving methods used in railroad operations, we recommend the following book. We also define the technical words used in crew scheduling and go through the distinct characteristics of the various kinds of railway transit.

### Strategic and tactical planning in Crew management

Crew planning considers the availability and longterm capabilities of personnel members with a time horizon longer than a year, as well as the location and capacity of crew depot. Realizing a balanced crew composition in terms of experience and age, as well as making future plans for the requirement for diverse crew types, is crucial for reliable long-term operations. This involves choosing to hire, train, or transfer a crew between depots. Decisions about the locations of the crew depots, including whether to open or close them, are also crucial at this point.

### Scheduling of crew in operational planning

Crew planning is the process of creating work plans for crew members in order to adhere to a predetermined schedule. It demonstrates the standard operational planning process for rail transit. The lines, their origin/destination stations, and their pauses at the start of the operation are all determined by the line planning issue. Train types and frequency on each route are set in order to satisfy all travel requirements while optimizing service or reducing operational expenses. Then, for each station and track segment, the arrival and departure timings of each train are computed, taking into consideration all applicable safety constraints. After the timetable for each route is published, trains must be assigned to platforms.

### A self-Adapting algorithm for Driver Scheduling

The main advantages of employing metaheuristics are a relatively efficient way to search through extremely large solutions. Regardless of the type of problem being solved, each class of meta-heuristics has a methodical and consistent approach that always returns a solution. Strategic structure GAs, or genetic algorithms, are a significant class of meta-heuristics that have been extensively used in driver scheduling algorithms.

### THE S-TRAIN NETWORK

DSB S-tog A/S, a part of the Danish State Railways, serves Greater Copenhagen, the largest train in the Danish firm, on the S-train network. It displays the network of S-trains. There are 85 stations over its 170 kilometres of twin tracks. Every network section is serviced by a minimum of two railway lines that operate three trains per hour, cyclically, in each direction. There are two types of lines: the main line, which runs from around five in the morning until one in the morning the following day, and the supplementary line, which runs all day long. around 6 am to 7 pm. The principal line, such as a line connecting networks, is designated by a colour and a capital letter.

The only two rail routes that do not pass through Copenhagen H are F and F+ (Copenhagen Central Station). The network segment in issue is known as a circular rail segment. The fingers are the last components of the network. The obstacle separating Copenhagen H from Svanemllen station in North Copenhagen is the network. Here is where the network is busiest. Considering each train separately.

A train ride between two terminal stations is referred to as a train task in a timetable. Copenhagen Central Station, KBH, and Farum Station for Lines H and H+ are just a few examples of termini on S-tog train lines. Another train task (w) refers to the responsibility of a train driver that comes after the previous train task.

Relief terminal stations, or locations where a driver can give over control of a train to another driver and take a break or check out, include check-in depots and crew depots. In a non-stop timetable, the conductor designated to operate the first train from a non-relief terminal station likewise conducts the train that arrives at the station, line B.

On a workday, up to 19 drivers may be placed in reserve, while on a weekend day, up to 12 drivers may be placed in reserve. A few reserve drivers are stationed at the Hilliard and Kage check-in depots, but the bulk are in Copenhagen H. The majority of the backup drivers are at work. The majority of reserve drivers work the whole shift, however a small percentage work for a portion of the day before receiving training assignments.

Fig. 1. S-Train Network

### **DISCUSSION**

### Link scheduling algorithm:

Every Algorithm is a set of rules, instructions, and conditions to solve a problem in an efficient manner. In this automated driver Link data scheduler, we are designing a link scheduling algorithm to make the process of link scheduling much easier and faster. This link scheduling algorithm can schedule the drivers on their fixed link automatically according to the certain condition, times, and availability of a driver. Right now, the process of scheduling drivers on their allocated link is manual and it is a very hectic process it wastes a lot of time and resources. That is why we are creating an automated driver link scheduling algorithm to make the driver scheduling process much easier.

The algorithm should follow certain conditions.

• Number of Drivers for a particular link

The number of links and their number of drivers is fixed.

Time

Each link has its own traveling time, so according to that time, the link scheduling algorithm should have to decide the driver's duty and the driver's rest time.

Rest time

The drivers will get a fixed time duration for rest in a week.

Rescheduling

The algorithm should reschedule the driver to the link again based on the availability of the driver.

• Problems in the scheduling algorithm

In real life, there could be certain problems arise because of weather conditions, link maintenance issues, loco maintenance issues, driver problems, and other unplanned events. These can create an error or abnormal termination in the working of the algorithm. When such unpredictable errors occur, the algorithm recovery procedure will update the scheduled drivers again according to the availability of drivers of that particular link.

Fig. 2. Flow chart of Link Scheduling

### **IMPLEMENTATION**

The Automated driver data link scheduling algorithm will works in many stages. The working Stages of the system are given below:-

 Data Input: The system will be updated with information regarding the driver's availability, working hours, and rest times. Both the drivers themselves and the transportation company's scheduling system can offer this data.

- Check for Availability: The scheduler will initially check to see whether any drivers are available for the next shifts. A list of available drivers will contain the drivers who can perform the shift.
- Working Hour Check: The scheduler will next ascertain how many working hours each driver has racked up over the course of the preceding day or week, depending on the policies of the transportation company. If a driver has used up their permitted number of hours, they will be taken out of the pool of available drivers. The scheduler will also take a look at each driver's rest time. The transportation company's rest time policy will determine the minimum length of downtime required before a driver can start a new shift. Unrested drivers won't be included in the pool of available drivers.
- Shift Allocation: Based on the pool of drivers that are now available, the scheduler will assign drivers to the upcoming shifts. The allocation will be determined by a number of factors, such as the driver's preferences, seniority, and credentials.
- Shift Reassignment: In the event of any unanticipated circumstances, such as a driver reporting sick or an emergency, the scheduler will reassign drivers to the impacted shifts. The shift will be reassigned in accordance with priority and other drivers' availabilities. The system will notify the drivers of their future shifts by email, SMS, or a mobile application after they are assigned to their shifts.
- The system will generate daily, weekly, and monthly data on driver scheduling. The reports will provide details on each driver's shift and hour totals as well as the efficiency of the scheduling system. To improve scheduling efficiency, reduce expenses, and improve driver satisfaction, the scheduler will gradually improve its algorithms.

### **ADVANTAGES**

 The railway department benefits greatly from the Automated Driver Link Data Scheduler technology.
 The fact that this system replaces the current manual

- driver scheduling method with an automated digital system is one of its most important features.
- Drivers must be manually scheduled on their assigned link, which takes a lot of time and work. The automated driver scheduling system, however, can do the same duty considerably more quickly and effectively. The railway department may concentrate on other important activities by employing the system to ease the burden of human scheduling.
- The Automated Driver Link Data Scheduler technology also has the benefit of letting drivers see their impending tasks in advance. Drivers will be aware of their upcoming responsibilities as a result, allowing them to plan accordingly. Drivers can better arrange their professional and personal lives if they are aware of their future responsibilities in advance.
- In case of an emergency, the admin can designate a substitute for that driver. This means that the admin may assign another driver to that duty if a driver is unable to complete their tasks due to illness or another circumstance. This guarantees that the train services won't be hampered by a lack of drivers.
- All under-government officials can also utilise this system to keep track of the data for their current and upcoming officials. This indicates that the system may keep and access all data pertaining to the drivers, including their personal data, training records, and employment history. This enables the railway department to monitor all driver information and make sure that they are appropriately educated and equipped to perform their jobs.
- The Automated Driver Link Data Scheduler system benefits the railway department in several ways overall. It eliminates the tedious manual scheduling process for drivers and replaces it with an automated digital system. Additionally, it enables drivers to view their impending tasks in advance, which might assist them in planning their personal and professional lives.
- In the event of an emergency, the admin can designate a replacement driver, preventing a disruption in the train services owing to a lack of

drivers. Finally, all under-government officials can utilize this system to keep track of their past and future officials' information, enabling the railway department to monitor all driver information and make sure that all drivers are suitably educated and certified for their jobs.

### **FUTURE SCOPE**

The automated driver link data scheduler is a software application that is used to schedule the link of train drivers automatically. It uses various algorithms and data analytics to process real-time data and determine the best schedule for train drivers. The system is beneficial for transportation companies as it helps to optimize driver scheduling and reduce costs associated with manual scheduling. As technology evolves, the future scope of the automated driver link data scheduler is promising.

Artificial Intelligence (AI) and Machine Learning (ML) integration: The integration of AI and ML technologies can improve the efficiency of the automated driver link data scheduler. AI can be used to predict potential issues and suggest optimal schedules based on historical data. ML algorithms can analyze real-time data and make adjustments to the schedule as needed. This will improve the accuracy of the scheduler and reduce the need for manual intervention.

Real-time monitoring of driver fatigue: One of the biggest challenges in driver scheduling is driver fatigue. Future versions of the automated driver link data scheduler could integrate real-time monitoring of driver fatigue using sensors and wearables. This data can be used to adjust schedules and ensure that drivers are adequately rested to prevent accidents.

Integration with IoT-enabled devices: IoT-enabled devices such as smart sensors, cameras, and other monitoring devices can be integrated with the automated driver link data scheduler. This will provide more accurate data and enable the system to make real-time adjustments to the schedule based on the data collected.

**Predictive maintenance of trains:** The automated driver link data scheduler can be used to predict maintenance issues with the trains. This can be done using AI and ML algorithms to analyze data collected

from sensors installed on the train. The system can then schedule maintenance activities during periods when the train is not scheduled for use, reducing downtime and minimizing the impact on the transportation network.

**Integration with blockchain technology:** The automated driver link data scheduler can be integrated with blockchain technology to improve data security and transparency. This will ensure that data is tamper-proof and can be accessed by authorized personnel only. This will improve the overall efficiency of the transportation network and increase trust between stakeholders.

Augmented Reality (AR) and Virtual Reality (VR) integration: The integration of AR and VR technologies can help train drivers to prepare for their scheduled trips. AR can be used to provide drivers with real-time information about the train's location, speed, and other relevant parameters. VR can be used to provide drivers with simulated training scenarios, improving their skills and reducing the risk of accidents.

In conclusion, the future scope of the automated driver link data scheduler is promising. With the integration of advanced technologies such as AI, ML, IoT, blockchain, AR, and VR, the system can be further improved to optimize driver scheduling, reduce costs, and improve the overall efficiency of the transportation network. The system is highly scalable and customizable, making it a valuable asset for any transportation company. As technology continues to evolve, the automated driver link data scheduler will continue to be an essential tool for optimizing driver scheduling in the transportation industry.

### **CONCLUSIONS**

Issue and a plan for using the Branch & Price algorithm to fix it A small number of drivers are used in the construction of the problem, and the recovery period is set at a time that is limited by the drivers' initial commitments. Additional drivers are added to the problem or the recovery period is prolonged if the initial problem size is too large to find a workable recovery solution. Data from the Danish passenger railway operator DSB S-tog A/S is used to test the solution method. In test scenarios, a train line and all tasks connected to it are suspended for the duration of the recovery period. The best integer solutions are found in

5 seconds for test instances with recovery times of 3 to 5 hours.

An algorithm will have clearly specified, explicit phases in its growth. The steps will be detailed enough to make clear what has to be done at each stage, All stages in an algorithm must be feasible (effectively computable), receive a well-defined set of inputs, and provide some sort of result as an output. An algorithm's exact sequence of operations must also be concretely described.

### **ABSTRACT**

Speech emotion recognition (SER) is a significant area of research dedicated to identifying and interpreting human emotions based on voice signals. With the rapid advancements in machine learning (ML) techniques, SER has gained substantial attention due to its potential applications in diverse fields such as healthcare, entertainment, and human-computer interaction. This abstract provides a concise overview of research work focused on speech emotion recognition using ML algorithms. The main objective of this study is to create an accurate and efficient system for emotion recognition from speech signals. The proposed approach utilizes a combination of feature extraction techniques and ML models to extract relevant information from the speech data and classify it into distinct emotion categories. The key features extracted from the speech signals include pitch, intensity, Melfrequency cepstral coefficients (MFCCs), and spectral features. Proposed work worked on accuracy and confusion matrix and overall accuracy achieved by this model is 85.7%, and matric value are in diagonal fashion which indicate good performance for classifier.

**KEYWORDS:** Speech emotion recognition (SER), Machine learning (ML), Support vector machines (SVM), Feature extraction.

### INTRODUCTION

peech emotion recognition (SER) is an expanding field focused on comprehending and interpreting human emotions via voice signals. Emotions play a crucial role in human communication and have a significant impact on various aspects of our lives, including social interactions, mental health, and decision-making processes. Traditional methods of emotion recognition primarily relied on subjective assessments or self-reporting, which are subjective and prone to biases. The emergence of machine learning (ML) techniques has opened up new possibilities for automatic and objective emotion recognition from speech data. ML algorithms can learn patterns and relationships from large amounts of data, enabling the development of robust and accurate emotion recognition systems. This project builds upon the advancements in ML and focuses on developing a

system that can effectively recognize and classify emotions from speech signals. The project aims to address several challenges associated with speech emotion recognition. These challenges include feature extraction from speech signals, selection of appropriate ML algorithms, handling of diverse and imbalanced datasets, and achieving high accuracy and efficiency in emotion classification. By addressing these challenges, the project seeks to contribute to the advancement of SER technology and its practical applications in various domains. The project also takes into account the potential real-world applications of speech emotion recognition. Emotion-aware virtual assistants can adapt their responses based on the user's emotional state, providing more personalized and empathetic interactions. Mental health monitoring systems can utilize speech emotion recognition to assess individuals' emotional well-being and provide timely interventions

www.isteonline.in Vol. 46 Special Issue, September, 2023 110

when necessary. Interactive entertainment platforms can enhance user experience by incorporating emotion recognition to create more immersive and engaging content.

### LITERATURE SURVEY

- "Emotion Recognition in Speech Using Neural Networks" by Kim et al. (2013): In this study, the authors investigate the application of deep neural networks, specifically deep belief networks, for speech emotion recognition. They obtained competitive outcomes on standard datasets, emphasizing the effectiveness of deep learning techniques.
- "Speech Emotion Recognition Using Support Vector Machines" by Schuller et al. (2003): In this research, the authors explore the use of support vector machines (SVM) in speech emotion recognition. They evaluate various feature sets, such as prosodic and spectral features, and demonstrate the effectiveness of SVM in classifying emotions.
- "A Survey of Speech Emotion Recognition: Features, Classifiers, and Databases" by El Ayadi et al. (2011): This comprehensive survey provides an overview of feature extraction techniques, classification algorithms, and available emotion databases for speech emotion recognition. It serves as a valuable reference for researchers entering the field.
- "Deep Convolutional Neural Networks for Speech Emotion Recognition" by Satt et al. (2017): In this study, the authors investigate the application of convolutional neural networks (CNN) in speech emotion recognition. They introduce a deep CNN architecture that learns distinctive features directly from spectrograms, resulting in promising outcomes on widely recognized datasets.
- "Speech Emotion Recognition Using Recurrent Neural Networks with Local Attention" by Zadeh et al. (2018): In this research, the authors present a novel approach to speech emotion recognition using a recurrent neural network (RNN) model with a local attention mechanism. They showcase the effectiveness of their proposed method on various emotion recognition tasks and emphasize the

- significance of attention mechanisms in capturing pertinent information.
- "Speech Emotion Recognition using Transfer Learning from Raw Waveforms" by Eyben et al. (2016): In this research, the authors delve into the implementation of transfer learning techniques in speech emotion recognition. They put forward a transfer learning framework that takes advantage of pre-trained models on extensive audio datasets, effectively adapting them for the purpose of emotion recognition tasks.
- "Speech Emotion Recognition Using Hidden Markov Models" by Deng and Wu (2013): In this study, the authors explore the application of Hidden Markov Models (HMMs) in speech emotion recognition. They present an HMM-based framework that effectively models the temporal dynamics of speech features, leading to competitive results in emotion classification tasks.
- "Joint Speech Emotion and Speaker Recognition Using Deep Neural Networks" by Han et al. (2014): This work addresses the challenge of simultaneous speech emotion and speaker recognition. The authors propose a joint deep neural network (DNN) architecture that learns representations for both tasks and demonstrates improved performance compared to separate models.
- "Adversarial Training for Speech Emotion Recognition" by Xing et al. (2018): This study introduces adversarial training techniques to enhance speech emotion recognition. The authors propose a generative adversarial network (GAN) framework that improves the discriminative capabilities of the emotion recognition model by generating more realistic speech samples.
- "Speech Emotion Recognition using Attention-based Convolutional Recurrent Neural Networks" by Zhang et al. (2019): In this study, the authors aim to harness the benefits of both convolutional neural networks (CNNs) and recurrent neural networks (RNNs) in speech emotion recognition. They introduce an attention-based CNN-RNN model that effectively captures both local and global dependencies present in speech signals. By

- doing so, the proposed model achieves state-of-theart performance on emotion recognition tasks.
- "Efficient Speech Emotion Recognition using Transfer Learning and Autoencoders" by Ramakrishnan et al. (2020): This study explores the use of transfer learning and autoencoders to improve the efficiency of speech emotion recognition systems. The authors propose a framework that leverages pre-trained models and applies autoencoders for feature compression, achieving comparable performance with reduced computational complexity.

These are just a few examples of the proposed works in speech emotion recognition. The field is continuously evolving, with researchers introducing innovative techniques, exploring different algorithms, and leveraging advancements in deep learning and multimodal approaches.

These studies showcase a wide array of approaches and techniques utilized in speech emotion recognition, encompassing traditional models such as HMMs, as well as more advanced deep learning architectures and transfer learning methods. Each of these works contributes to the continuous endeavor to enhance the accuracy, efficiency, and resilience of speech emotion recognition systems.

### PURPOSE OF STUDY

This study aims to develop a robust system for speech emotion recognition using machine learning techniques. By addressing the limitations of traditional methods, the study seeks to provide an automated and objective approach to accurately classify emotions from speech signals. The primary objective is to contribute to the advancement of speech emotion recognition technology and its practical applications. The study's overarching goal is to enhance human-computer interaction, enable emotion-aware virtual assistants, support mental health monitoring systems, and improve user experiences in interactive entertainment platforms. The findings of this study can have implications in various fields, including healthcare, entertainment, customer service, and human-computer interaction, where understanding and responding to human emotions are crucial factors. The study aims to contribute to the existing knowledge

in the field of speech emotion recognition and provide valuable insights for further research and development in this area. In summary, the purpose of studying speech emotion recognition is to deepen our understanding of human emotions, develop objective and automated emotion recognition systems, advance machine learning techniques, enable personalized technology interactions, and facilitate mental health monitoring and intervention. These purposes collectively contribute to enhancing various aspects of human life, communication, and well-being, Figure 1 describe the same.

### **Objectives:**

- To develop an automated system for accurate speech emotion recognition using machine learning.
- Compare and evaluate different machine learning algorithms for emotion classification.
- Address challenges related to dataset characteristics to enhance the system's robustness.
- Provide insights and recommendations for improving the system's performance and enabling practical applications.

Figure 1: General Block diagram of the proposed system

### **METHODOLOGY**

- Data Collection: Collect the necessary audio datasets for emotion classification, such as RAVDESS, CREMA, TESS, and SAVEE. Ensure that the datasets are properly downloaded and stored in the specified directories.
- Data Preprocessing and Exploration: Import the required libraries, including pandas, numpy, os, librosa, matplotlib, and pydub. Load the audio files from each dataset and extract relevant information

such as file paths, gender, and emotion labels. Combine the data from all datasets into a single dataframe using the concatenation technique. Visualize the distribution of emotions and genders using bar plots to gain insights into the dataset

- Support Vector Machines (SVM): SVM is a widely used algorithm for classification tasks, including SER. It can effectively separate data points in highdimensional feature spaces and handle non-linear relationships.
- Data Preparation: Filter the dataset to include only female samples as specified in the problem statement. Drop the 'sex' column from the dataframe since it is no longer needed. Preprocess the audio files by applying trimming, padding, and feature extraction techniques (e.g., ZCR, RMS, MFCCs) using librosa and pydub libraries. Encode the emotion labels into numerical values suitable for classification using a predefined emotion dictionary.
- Data Splitting: To divide the preprocessed data into training, validation, and testing sets, the train\_test\_split function from the sklearn library can be utilized. This function enables the specification of desired proportions for the splits. For example, one can assign 85% of the data to training, 15% to testing, and 30% of the remaining data to validation.
- Model Building: Import the necessary libraries for building the emotion classification model, including keras and sklearn. Define the model architecture using the Sequential API from Keras. Add LSTM layers to the model for sequence modeling and a dense layer with softmax activation for multiclass classification. Compile the model with an appropriate loss function, optimizer, and evaluation metric.
- Model Training and Evaluation: To train the model on the training data, the fit function can be employed, specifying the desired number of epochs and batch size. It is important to monitor the model's training progress by plotting the loss and accuracy curves for both the training and validation sets. This provides insights into how the model is learning over time. Following the training

- process, it is crucial to evaluate the trained model's performance on the testing set using metrics such as accuracy. This assessment helps gauge how well the model generalizes to unseen data.
- Model Performance Analysis: To analyze the model's predictions compared to the ground truth, a confusion matrix can be generated using the predicted labels from the model and the true labels from the testing set. Visualizing the confusion matrix using a heat-map provides a clear representation of the model's performance.
- Model Improvement and Iteration: Analyze the model's performance and identify areas for improvement based on the evaluation metrics and confusion matrix. Experiment with different hyper parameters, such as learning rate, number of LSTM units, and batch size, to optimize the model's performance. Consider adding additional layers or modifying the model architecture to enhance its capacity to capture emotion-related features.
- Deployment and Application: Save the trained model for future use and deployment in a production environment or application. Integrate the model into an application or system that can perform realtime emotion classification on new audio inputs.

Figure 2a shows the block diagram of proposed system and figure 2b shows the Flow of proposed system.

Figure 2a: Block diagram of proposed system

Figure 2b: Flow of proposed system

### **TESTING, RESULTS & DISCUSSION**

### **Testing**

from sklearn.model selection import train test split from tensorflow.keras.utils import to categorical

# Splitting the data into training and testing sets

X train, X to split, y train, y to split = train test split(X, y, test size=0.15, random state=1) X val, X test, y val, y test = train test split(X to split, y to split, test size=0.3, random state=1)

# Convert class labels to one-hot encoded format num classes = 6

y train class = to categorical(y train, num classes) y val class = to categorical(y val, num classes)

# Hyperparameter tuning and optimizer selection

# Experiment with various optimizers for better results

# For simplicity, we'll use RMSProp with default learning rate and decay optimizer = 'RMSProp'

# Training the model for 100 epochs epochs = 100

model.fit(X train, y train class, validation data=(X val, y val class), epochs=epochs) # Evaluate the model on the test set

loss, categorical accuracy = model.evaluate(X test, y test) print(f"Loss: {loss}, Categorical Accuracy: {categorical accuracy}")

# Plotting the train and test accuracy for better understanding of the training process plot accuracy(history)

Note: The code assumes that you have defined and compiled the model before training it. Also, the plot accuracy function is a custom function that you need to define to plot the accuracy, as shown in Figure 3 about the same.

Figure 3: Training and testing

### **RESULTS AND DISCUSSIONS**

This level of accuracy (figure 4) suggests that the model has learned patterns and features in the audio data that are indicative of different emotions. It shows the effectiveness of the chosen approach, including the pre-processing techniques and the LSTM-based model architecture.

However, it's important to consider certain aspects when

Special Issue,

interpreting the accuracy. First, the accuracy achieved on the validation set may not necessarily generalize to unseen data, so further evaluation on an independent test set is recommended.

Figure 4: Accuracy

Second, the accuracy might vary depending on the distribution and quality of the dataset, as well as the complexity and variability of the emotions being classified. Overall, achieving 85% accuracy on emotion classification in audio data is a promising result. It suggests that the developed model has the potential to be useful in practical applications such as emotion recognition systems, speech analysis, or human computer interaction. Further refinements and evaluations can be performed to improve the model's performance and robustness.

Figure 5: Confusion Matrix

The above confusion (Figure 5) matrix shows the relation between the true label and the predicted label. The colors and numbers show how each label is related to each other.

### **ADVANTAGES**

- Non-Invasive: Speech emotion recognition is a non-invasive technique that can analyze emotions based on acoustic features of speech signals. It doesn't require any physical contact or invasive methods, making it convenient and comfortable for users.
- 2. Real-Time Emotion Monitoring: Speech emotion recognition can provide real-time emotion monitoring by analyzing speech signals as they are being spoken. This capability is valuable in applications such as call centers, virtual assistants, or mental health monitoring systems, where immediate emotion detection and response are important.
- 3. Wide Applicability: Speech emotion recognition can be applied across various domains and industries. It has applications in customer service, human-computer interaction, psychological research, entertainment, voice assistants, and more. It can enhance user experiences, improve communication, and enable personalized interactions.
- 4. Objective Measurement: Emotions can be subjective and challenging to measure accurately. Speech emotion recognition provides an objective and quantitative measure of emotions by analyzing acoustic features in speech signals. This objective measurement can be valuable in research, clinical settings, or any context where reliable emotion assessment is needed.
- 5. Automated Processing: With advancements in machine learning and signal processing techniques, speech emotion recognition can be automated and performed at scale. Large volumes of speech data can be processed efficiently, enabling the analysis of emotions in a timely and cost-effective manner.
- Multi-Modal Integration: Integrating multiple modalities, such as facial expressions, body gestures, or physiological signals, with speech

emotion recognition can significantly enhance emotion recognition accuracy. This multi-modal approach provides a more comprehensive and robust understanding of emotions by leveraging information from different sources.

### APPLICATIONS

- 1. Education and E-Learning: Speech emotion recognition can be used in educational settings and e-learning platforms to assess students' engagement, attention, and emotional states during online courses or virtual classrooms. It can provide feedback to instructors and help personalize the learning experience based on students' emotional responses.
- Human-Computer Interaction: Speech emotion recognition can enhance human-computer interaction by enabling computers and machines to understand and respond to human emotions. Emotionaware systems can adapt their responses, such as virtual assistants providing empathetic and personalized responses based on the user's emotional state.
- 3. Call Center Analysis: Speech emotion recognition can be used in call centers to analyze customer-agent interactions. It can automatically detect customer emotions, such as frustration or satisfaction, during phone conversations. This information can help improve customer service, identify training needs, and enhance overall customer experience.
- 4. Mental Health Monitoring: Speech emotion recognition can be used as a non-invasive tool for monitoring mental health conditions. By analyzing changes in speech patterns and detecting emotional cues, it can assist in diagnosing and monitoring conditions such as depression, anxiety, or bipolar disorder
- Market Research and Advertising: SER can be employed in market research to analyze consumers' emotional responses to products, services, or advertisements. It helps businesses understand consumer preferences, optimize marketing strategies, and develop emotionally appealing content.

- 6. Entertainment and Gaming: SER can enhance user experiences in entertainment and gaming industries. It can be utilized to personalize game interactions, adapt game difficulty based on user emotions, and create immersive virtual reality experiences.
- 7. Psychological Research: SER plays a significant role in psychological research, enabling researchers to study emotional expressions, social interactions, and affective states. It helps in understanding human behavior, emotion dynamics, and psychological disorders.
- 8. Sentiment Analysis: SER can be integrated with sentiment analysis to analyze social media content, customer reviews, and public opinions. This combination provides a more comprehensive understanding of individuals' emotions and sentiments expressed in textual and audio data.
- 9. Biometric Security: SER can be utilized as a biometric modality for user authentication and security systems. By analyzing speech patterns and emotional cues, it can help in verifying users' identities and detecting impostors.

#### CONCLUSION

September, 2023

Our project successfully accomplishes the main objective of utilizing recurrent neural networks with long short-term memory (LSTM) for identifying emotions in individuals. To achieve this, we work with a dataset comprising 1440 files that encompass various emotions such as calm, happy, sad, fear, disgust, surprise, and neutral. The LSTM machine learning model is employed for testing the system. As machine learning models typically operate with numeric inputs, we convert our data into arrays prior to feature extraction. In this model, we utilize Melfrequency cepstral coefficients (MFCC) as the feature, which is extracted using the librosa package. These extracted values serve as inputs to the developed LSTM model, which utilizes these features to predict the final emotion. The overall accuracy achieved by this model is 85.7%. To further enhance the model's accuracy, we can consider removing random silences from the audio clips and augmenting the data volume by acquiring additional annotated audio clips. These steps have the potential to improve the model's performance.

# Creation of Harvest Productivity Projection Method (HPPM) using Machine Learning Framework through Combating Infection and Generating Knowledge

Snehal A. Lohi Chinmay Bhatt

Department of Computer Science and Engineering RKDF Institute of Science and Technology Sarvepalli Radhakrishnan University Bhopal

### **ABSTRACT**

The identification of crop diseases has become crucial to smart farming methods. Researchers have presented a variety of intrusive and non-intrusive models to carry out this task. Intrusive models are only appropriate for use in therapeutic settings because of their greater deployment costs, increased complexity, and potential for contamination of underlying crops. It is noted that most of these models for non-intrusive approaches perform better on datasets particular to the application and cannot be scaled to bigger datasets. The suggested model uses an adaptive thresholding technique that is initially crop-specific, which helps with effective segmentation for various crop varieties. The chosen feature sets are categorised using an ensemble classification model that integrates classifiers from Nave Bayes (NB), Decision Tree (DT), Linear Regression (LR), Support Vector Machines (SVM), and Multilayer Perceptron (MLP). These classifiers were chosen based on how accurately they performed with various crop varieties. SVM & LR performed better for crops of soy and squash, MLP & LR performed better for crops of potatoes and peppers, while NB performed better for crops of apples and raspberries. The suggested model can achieve an accuracy of 99.5% across several datasets thanks to a combination of these adaptive classifiers, which makes it extremely helpful for a range of classification applications.

**KEYWORDS:** Crop productivity projection, Machine learning, Combating infection.

### **INTRODUCTION**

he multi-domain problem of disease detection using crop imaging includes dataset-based classification and various other procedures. These models must be modified according to their applicability and validated for various datasets. A typical machine learning-based harvest productivity projection model, where various pre-processing, segmentation, feature representation, and classification process can be seen. To improve classification performance, the model first gathers information on productivity.

This discussion led to the conclusion that the majority of these models perform better with correct knowledge and in-depth analysis. In section 4, the proposed model was assessed using various datasets, and its performance was compared to several cutting-edge techniques. Based on this analysis, it was shown that the proposed model performed better than standard models in terms of accuracy, precision, and recall. The paper continues by making a few observations about the suggested model that are relevant to the setting and generating knowledge.

### LITERATURE REVIEW

Different models have been put out by researchers to identify the many forms of crop diseases. These models employ cutting-edge categorization methods, which help to enhance accuracy & precision performance for various illness kinds. For instance, research in [5,

www.isteonline.in Vol. 46 Special Issue, September, 2023

6] suggests using the Leaf Wetness Sensor (LWS) and Unified MatrixBased Convolutional Neural Network (UMB CNN) to enhance classification performance for wheat and rice crops. However, because to the high crop specificity of these models, their scalability is constrained. The EfficientNetV2 Model, which exhibits higher accuracy and lower complexity than previous models for various illness kinds, is suggested by work in [7] as a way to enhance this performance. The model employs feature variance maximisation to achieve performance optimisation for various illness kinds. These models detect several feature sets using black box techniques, which helps to enhance the performance of their real-time categorization. However, the size of the training and validation datasets directly affects performance, limiting their potential to scale. These methods divide the input images into segments to make diseased areas more visible before using various classification models to attain higher classification levels. However, the lack of feature selection methods in these models limits their ability to be deployed in real-time.

Researchers have suggested the use of the Genetic Algorithm with Decision Tree (GADT) [14], Graph Theory (GT) [15], the combination of InceptionNet with ResNet V2 [16], and the use of indices like the Normalised Powdery Mildew Index (NPMI), Ratio Powdery Mildew Index (RPMI). These models advocate the use of specialised CNN layers that aid in feature augmentation and improve accuracy, precision, and recall metrics when applied to real-time crop image sets.

The aforementioned models are expanded by the research in [22, 23, 24], which suggests the usage of MobileNet Models based on CNN, Restructured Deep Residual Dense Network (RRDN), and Faster Recurrent CNN (FRCNN), which aid in improving scalability performance under various image sets. With the help of these models, crop images' feature extraction capacities are enhanced. Additionally, window-based classification is applied to these characteristics for more accurate disease identification in various harvest kinds.

### **Creation of a Harvest Productivity Projection Method Using Machine Learning**

The literature review reveals that current models for

recognising the presence of illnesses in plants can perform better with specific to the application datasets but are unable to expanded for bigger sets. The classifiers used to categorise identified feature sets include Naive Bayes (NB), Multilayer Perceptron (MLP), Support Vector Machines (SVM), Decision Tree (DT), and Linear Regression (LR), and they are chosen based on how well they perform on various datasets. This flow has been broken up into several smaller modules to streamline the design.

Fig. 1. Flow of HPPM

### Crop-specific categorization and extraction of features layer design

o The suggested effort has the ability to categorise diseases in crops like soy, squash, potatoes, peppers, apples, and raspberries. The approach first uses a crop- specific thresholding model to analyse various crops, helping to segment these images. The procedure utilised for soyabean, potato, and squash crops is as follows:

- o Take the R, G, and B components out of the photos.
- o If, Img(r, c, G) = 0 then output this pixel
- o If, Img(r, c, R) > Img(r, c, B) crop these pixels
- o Else discard the pixel

Brown-colored elements from the supplied image are retrieved, aiding in the segmentation of the crops soyabean, potato, and squash. We do this pepper:

- o Take the R, G, and B constituents out of the photos.
- o If Img(r, c, G) > Img(r, c, R) and Img(r, c, G) > Img(r, c, B), then output this pixel.
- o Else discard the pixel.

This is followed by segmentation for Apple & Raspberry crops, which is done via the following process,

- Extract R, G & B components from the images
- o If Img(r, c, R) > Img(r, c, G) and Img(r, c, R) > Img(r, c, B), then output this pixel
- o Else discard the pixel

Equation 2

$$E_i = P\left\{ \bigcup_{j=1}^R \bigcup_{l=1}^C Canny[|Img(j,l) = 1|] \right\}$$
 (2)

Where, denotes the edge identification model used to extract image edges, and indicates the edge probability. The final feature vectors are created by combining these features, which are then obtained for each grey level within and. In addition to these features, texture features are also extracted. These features are energy (E), entropy (EN), dissimilarity (D), contrast (Cont.), differential variance (DV), homogeneity (H), and correlation (Corr).

$$E = \sum_{i=1}^{R} \sum_{j=1}^{C} Img(i,j)^{2}$$
(3)

$$EN = -\sum_{i=1}^{R} \sum_{j=1}^{C} Img(i,j)^{1} * \log(Img(i,j))$$
 (4)

$$D = \sum_{i=1}^{R} \sum_{j=1}^{C} Img(i-j)^{1}$$
(5)

$$Cont = \sum_{i=1}^{R} \sum_{j=1}^{C} Img(i-j)^{2}$$
 (6)

$$DV = \sqrt{\frac{\sum_{i=1}^{R} \left( \sum_{j=1}^{C} Img(i-j) - \sum_{i=1}^{R} \sum_{j=1}^{C} Img(i-j) - \sum_{i=1}^{C} \frac{\sum_{j=1}^{R} Img(i-j)}{R*C} \right)^{2}}{R*C - 1}}$$
(7)

$$H = \sum_{i=1}^{R} \sum_{j=1}^{C} \frac{Img(i,j)^{1}}{1 + (i-j)}$$
(8)

$$Corr = \sum_{i=1}^{R} \sum_{j=1}^{C} Img(i,j)^{1} * \left[ \frac{(i-DV) * (j-DV)}{DV} \right]$$
(9)

Based on these evaluations, different features are extracted for each of the crop types. Thereby improving classification performance. Design of MGA is discussed in the next section of this text.

### Design of Genetic Algorithm Model for identification of Variant features

After extraction of features, a Genetic Algorithm Model is deployed which assists in increasing feature variance for efficient classification performance. This is done via the following process,

- Initialize Genetic Algorithm parameters,
- o Number of iterations  $(N_i)$
- o Number of solutions  $(N_s)$
- o Total number of features extracted  $(N_c)$
- o Learning rate of the model  $(L_{\cdot})$
- Mark all the solutions as 'to be transformed'
- Perform the following for each iteration in 1 to  $N_{r}$ ,
- o Perform the following for each solution in 1 to  $N_{\odot}$
- Check if the solution is marked as 'not to be transformed', then skip it and go to the next solution sets
- ☐ Else, transform this solution via the following process,
- Identify a stochastic number for feature selection via equation 10,

$$Sel_f = STOCH(L_r * N_f, N_f)$$
(10)

Where,  $Sel_f$  & STOCH, represents selected feature numbers, and a stochastic Markovian process, for generation of sequences between the given ranges.

 Based on the value of Sel<sub>f</sub>, identify stochastic but unique features from the set of input features, and evaluate solution fitness via equation 11 as follows,

$$f_i = \sqrt{\sum_{j=1}^{Sel_f} \left( FV_i - \sum_{l=1}^{Sel_f} \frac{FV_l}{Sel_f} \right)^2} \frac{1}{Sel_f + 1}$$

$$(11)$$

 Repeat this process for all solutions, and evaluate an iteration fitness threshold via equation 12 as follows,

$$f_{th} = \frac{1}{N_s} \sum_{i=1}^{N_s} f_i * L_r \tag{12}$$

- o At the end of each iteration, mark solutions with  $f_i < f_{th}$  'to be transformed', while mark others as 'not to be transformed'
- Continue this process for all iterations

At the end of the final iteration, identify solution with maximum fitness, and use its features for classification process. These features have higher variance, which improves performance of the ensemble classification process. Design of the ensemble classifier is discussed in the next section of this text.

### Design of the Ensemble Classification Model for identification of diseases

These are formulated in T-1:

Classifier	Parameter	Value
NB	Previous likelihood for every category	Equation 11 is used to evaluate the characteristic variability of all the classes
NB	Smoothing Factor	Equation 11 is used to evaluate the characteristic variability of all the classes

SVM	Regularization coefficient	1
SVM	Kernel	Sigmoid
SVM	Gamma	variability of all the classes in inverse
SVM	Shrinking Heuristics	Enabled
SVM	Estimation of probability	Enabled
SVM	Error tolerance	0.01%
SVM	Number of iterations	-1 (No limit)
MLP	Size of hidden layers	3 (Because of 3 different feature sets)
MLP	Activation Function	Leaky Rectilinear Unit (LReLU)
MLP	Solver	Stochastic Gradient Descent
MLP	Learning Rate	$L_r$
MLP	Iterations	-1 (No limit)
MLP	Error Tolerance	0.01%
MLP	No Change Epochs	$N_i$
LR	Data Normalization	Enabled
LR	Number of Tasks	$N_S * N_i$
DT	Criterion for convergence	Entropy Maximization
DT	Maximum Depth	$N_S * N_i$
DT	Maximum Features	$Sel_f$

### T-1. Particular parameters

$$c_{out} = NB_{acc} * NB_c + SVC_{acc} * SVC_c + DT_{acc} * DT_c + MLP_{acc} * MLP_c + LR_{acc} * LR_c$$
 (13)

Where,  $C_c$  represents output class for classifier C, while  $C_{acc}$  represents test accuracy for the classifier, which is pre-evaluated for the entire image dataset with selected features. Based on this output class, metrics including accuracy, precision, recall, and area under the curve (AUC) were evaluated, and compared with various state-of-the-art models. This evaluation & comparison is discussed in the next section of this text.

### RESULTS AND COMPARATIVE ANALYSIS

To categorise agricultural diseases, the suggested CDMBFREC model combines a variety of optimisation approaches. The following sources were used to compile the images for these crops:

A total of 15000 images were collected from these datasets, and these images were segregated into 60:20:20 ratio for training the model, testing the model and validating the model respectively. Equation 14 as follows,

$$A = \frac{N_C}{N_T} * 100$$

Where,  $N_c$  represents total number of correctly classified crop images, while  $N_T$  represents number of images present in the datasets

NT	A (%) U- C	A (%) SC	A (%) GD	A (%) CB

3000	9.67	10.94	9.25	7.57

T-6. Average delay (D) of different classification models for detection of crop diseases.

These segmented images are reduced of redundant features using a genetic algorithm model. Based on this assessment, it can be seen that the proposed model, when compared to various state-of-the-art models, has the attributes of offering greater precision, more effectively accuracy, greater recall, and faster performance, making it useful for a wide range of actual time harvest disease identification and application scenarios.

### **CONCLUSION**

In order to enhance the performance of its representation, the proposed model combines a genetic algorithm approach helps to increase the feature variance for various crop varieties. Its classification performance is increased by combining a number of high-efficiency classification models to classify the chosen features. Additionally, it was noted that, for various picture types, the suggested model outperformed UMB CNN [5], SPED CCNN [12], and GAN DATF [18] by 4.9%, 15.5%, and 1.4%, respectively, in terms of precision. Similar improvements were noted for many disease categories. This performance was also assessed by means of recall & fMeasure values. The model incorporates the use of Genetic Algorithms (GA) for choosing features, which enables it to more effectively eliminate redundant characteristics. In future, researchers can extend this model via integration of multiple bioinspired techniques including Particle Swarm Optimization (PSO), Bacterial Foraging Optimization (BFO), etc. Researchers can also integrate deep learning models for improving its accuracy for larger number of disease types. Moreover, the model must be validated for other crop types, and its classification performance must be optimized for yield prediction via integration of different crop specific segmentation, feature extraction & prediction methods.

This will improve its scalability under different crop & disease types.

Pune

### **ABSTRACT**

Agriculture holds immense importance in India due to its multifaceted impact on the country's economy, food security, rural development, and export potential. With a significant portion of the population engaged in agriculture, it serves as a primary source of livelihood for millions, ensuring food security for the nation's vast population. Artificial intelligence (AI) has the potential to revolutionize agricultural production and enhance efficiency, sustainability, and productivity in several ways. This research paper explores the transformative impact of AI-powered innovations in agriculture, specifically focusing on how artificial intelligence technologies are revolutionizing farming practices and optimizing crop yields. The study investigates the various applications of AI in agriculture, including crop monitoring, pest management, irrigation systems, and predictive analytics. By examining the benefits and challenges associated with AI adoption in the agricultural sector, this research aims to provide insights into the potential of AI-powered solutions to enhance productivity, sustainability, and profitability in farming.

**KEYWORDS:** AI-Powered innovations, Agriculture, Farming practices, Yield optimization, Crop monitoring, Pest management, Irrigation systems, Predictive analytics

### **INTRODUCTION**

griculture plays a vital role in feeding the growing global population and ensuring food security. However, the agricultural sector faces numerous challenges, including unpredictable weather patterns, limited resources, labor shortages, and the need for sustainable farming practices. In recent years, the emergence of artificial intelligence (AI) has opened up new possibilities for transforming traditional farming practices and optimizing crop yields [1]. AI technologies, such as machine learning, data analytics, and robotics, offer immense potential to revolutionize the agricultural sector and address these challenges effectively.AI-powered innovations in agriculture, focusing on transforming farming practices and optimizing crop yields, holds significant significance. With the global population steadily increasing, there is a pressing need to enhance agricultural productivity and ensure food security. AI technologies offer immense

potential to revolutionize traditional farming methods and address challenges faced by the agricultural sector [10]. By leveraging AI, farmers can achieve enhanced efficiency through precision agriculture, making data-driven decisions on irrigation, fertilization, and pest management. This leads to optimized resource utilization, reduced waste, and improved productivity. Moreover, AI enables the implementation of sustainable farming practices by analyzing data on soil health, weather patterns, and crop performance, which helps in minimizing the use of pesticides, fertilizers, and water. Additionally, AI algorithms can process large volumes of data to predict optimal planting times, disease outbreaks, and yield estimates, enabling farmers to make informed decisions for maximizing crop yields and profitability. By optimizing farming practices and minimizing losses, AI contributes to meeting the increasing global food demand sustainably. Overall, this research has the potential to transform agriculture,

www.isteonline.in Vol. 46 Special Issue, September, 2023 126

promote sustainability, and ensure food security for the growing population.

### **Objectives**

- To explore the transformative impact of AI in agriculture
- To investigate specific areas where AI is being applied in agriculture
- To assess the benefits and challenges associated with the adoption of AI in the agricultural sector.
- To provide valuable insights for stakeholders in the agricultural industry
- To contribute to the understanding and advancement of AI-powered innovations in agriculture

### LITERATURE REVIEW

The literature review highlights the transformative impact of AI-powered innovations in agriculture, showcasing the potential to revolutionize farming practices and optimize crop yields. Precision agriculture, crop monitoring, autonomous equipment, predictive analytics, and yield optimization are key areas where AI is making significant contributions. However, it is essential to address challenges and considerations for successful implementation. Overall, the existing research demonstrates the value of AI in enhancing productivity, sustainability, and profitability in agricultural practices, paving the way for a more efficient and technologically advanced farming industry.

### The Role of Technology in Agriculture

Technology plays a vital role in modern agriculture, transforming traditional farming practices innovative. efficient. and sustainable systems. Advancements in precision agriculture, management systems, automation, IoT, data analytics, AI, and biotechnology have revolutionized the way farmers manage their crops and livestock [2]. Precision agriculture techniques enable targeted resource application based on real-time data, optimizing inputs while minimizing waste. Automation and robotics streamline labor-intensive tasks, improving productivity and reducing costs. IoT devices and sensors collect valuable data for informed decision-making, while data analytics and AI enable predictive modeling and optimal farm management strategies. Biotechnology has contributed to the development of genetically modified crops with enhanced traits, improving yields and resilience. Furthermore, digital platforms and mobile applications provide farmers with access to agricultural information, market data, and training resources, empowering them with knowledge and improving their overall productivity [13]. Technology has become an indispensable tool in agriculture, promoting sustainability, resource efficiency, and increased food production to meet the growing global demand.

### Overview of Artificial Intelligence in Agriculture

Artificial Intelligence (AI) has emerged as a transformative technology in the field of agriculture, revolutionizing the way farming operations are conducted. AI systems and algorithms analyze vast amounts of data collected from various sources, including sensors, drones, satellites, and farm machinery, to provide valuable insights and support decision-making processes [18]. AI in agriculture encompasses a wide range of applications, such as crop monitoring, disease detection, yield prediction, soil analysis, and autonomous farming. Machine learning algorithms enable the identification of patterns, trends, and anomalies in data, facilitating accurate predictions and optimized resource management. AI-powered technologies also enable the integration of robotics, enabling tasks such as automated harvesting, precision spraying, and weed control. By harnessing the power of AI, farmers can enhance efficiency, reduce resource waste, optimize crop production, and make informed decisions for sustainable and profitable farming practices.[8]

### AI Applications in Crop Monitoring and Management

AI applications in crop monitoring and management have transformed traditional agricultural practices by providing accurate and real-time insights into crop health, growth, and yield potential. Here are some key AI applications in crop monitoring and management:

 Disease and Pest Detection: AI algorithms can analyze images captured by drones, satellites, or sensors to detect signs of crop diseases, pests, or nutrient deficiencies. By identifying early warning signs, farmers can take timely action to mitigate risks and minimize crop losses.

- Yield Prediction: AI models can leverage historical and real-time data, including weather conditions, soil characteristics, and crop growth patterns, to predict crop yields. This information helps farmers optimize their production strategies, plan logistics, and make informed marketing decisions.[5]
- Weed Detection and Management: AI-powered systems can differentiate between crop plants and weeds, enabling targeted weed management. By precisely identifying and targeting weeds, farmers can minimize herbicide use, reduce environmental impact, and optimize resource allocation [8].
- Irrigation Optimization: AI algorithms, coupled with sensor data and weather forecasts, can determine optimal irrigation schedules and water application rates based on crop water requirements. This helps farmers conserve water, minimize water stress on crops, and improve overall water use efficiency.[4]
- Nutrient Management: AI models can analyze soil data, plant characteristics, and historical yield information to optimize nutrient application rates. By tailoring nutrient management strategies to specific crop needs, farmers can maximize yields while minimizing environmental impacts.[6]
- Crop Disease Forecasting: By integrating AI with disease models and weather data, predictive models can forecast the risk of disease outbreaks. This allows farmers to implement preventative measures, adjust management practices, and apply targeted treatments, reducing the spread and impact of diseases.[5]
- Harvesting Optimization: AI-powered technologies can analyze crop maturity indicators, such as color and texture, to optimize harvest timing. This helps ensure optimal crop quality, minimize losses due to over-ripening or under-ripening, and streamline harvesting operations.
- Autonomous Farming: AI-driven robotics and autonomous systems enable tasks such as planting,

seeding, and harvesting to be performed with precision and efficiency. These technologies reduce labor requirements, increase operational speed, and improve overall farm productivity [10].

The integration of AI applications in crop monitoring and management empowers farmers with accurate and actionable insights, allowing them to optimize production practices, increase resource efficiency, and enhance overall crop health and productivity.

### AI for Pest Detection and Management

AI for pest detection and management has emerged as a powerful tool in agriculture, helping farmers identify, monitor, and control pests more effectively. By leveraging advanced algorithms and machine learning techniques, AI systems can analyze data from various sources to detect pests, predict infestations, and recommend appropriate management strategies. Here are some key aspects of AI for pest detection and management:

- Pest Identification: AI algorithms can analyze images of crops, leaves, or pests captured by cameras, drones, or sensors to identify and classify different pest species accurately. This enables farmers to quickly identify specific pests and implement targeted control measures.[7]
- Early Pest Detection: AI models can continuously monitor crops by analyzing images or sensor data for early signs of pest presence, including visual cues, damage patterns, or behavioral changes. Early detection allows for timely intervention, preventing further spread and minimizing crop damage.
- Disease and Pest Risk Assessment: By integrating
  pest data with other environmental factors such
  as weather conditions, crop growth stage, and
  historical pest occurrences, AI models can assess
  the risk of pest outbreaks. This information helps
  farmers proactively implement preventive measures
  and allocate resources efficiently [9].
- Decision Support Systems: AI-powered decision support systems can provide personalized recommendations for pest management based on specific crop conditions and pest dynamics. These systems consider multiple factors such as

pest life cycles, weather patterns, crop varieties, and pesticide efficacy, assisting farmers in making informed decisions.[8]

- Precision Pest Control: AI systems facilitate precision pest control by enabling targeted application of pesticides or biological control agents. By analyzing pest distribution patterns and utilizing real-time data, AI models can optimize pesticide dosages, minimize chemical usage, and reduce environmental impacts [17].
- Data Integration and Analytics: AI algorithms can integrate and analyze vast amounts of data from multiple sources, including weather data, pest monitoring traps, and historical records. This allows for the identification of correlations, patterns, and trends in pest populations, supporting effective pest management strategies.
- Real-Time Monitoring and Alerts: AI-driven systems can provide real-time monitoring of pest populations, sending alerts to farmers when pest thresholds are exceeded. This timely information enables proactive responses and the implementation of appropriate pest control measures.[9]
- Continuous Learning and Improvement: AI models can continuously learn and adapt based on feedback and new data. By incorporating new information, AI systems can improve pest detection accuracy, refine prediction models, and enhance pest management recommendations over time.

The application of AI for pest detection and management empowers farmers to respond swiftly and effectively to pest challenges [17]. By enabling early detection, precise control measures, and data-driven decision-making, AI technologies contribute to sustainable pest management practices, reducing pesticide usage, minimizing crop losses, and promoting healthier agricultural ecosystems.

### **AI-Enabled Irrigation Systems**

AI-enabled irrigation systems leverage advanced technologies and algorithms to optimize water usage in agriculture. These systems utilize real-time data, including weather conditions, soil moisture levels, crop water requirements, and evapotranspiration rates, to make intelligent irrigation decisions. Here are key

aspects of AI-enabled irrigation systems:

- Data Collection and Monitoring: Sensors and IoT devices are deployed to collect data on soil moisture, weather conditions, and plant health. These devices provide continuous monitoring and transmit data to the AI system.[10]
- Data Analysis and Decision-Making: AI algorithms analyze the collected data to determine the optimal irrigation schedule, duration, and volume. These algorithms take into account factors such as crop type, growth stage, soil type, and weather forecasts [13].
- Evapotranspiration Modeling: ΑI systems incorporate evapotranspiration models to estimate the amount of water lost through plant transpiration and soil evaporation. This helps determine crop water requirements and adjust irrigation accordingly.
- Predictive Analytics: AI-enabled irrigation systems use historical and real-time data to predict future water needs based on crop growth patterns, weather trends, and other relevant factors. These predictions facilitate proactive irrigation management [14].
- Smart Irrigation Control: AI systems control irrigation systems, adjusting water flow and timing based on real-time data and predictive analytics [16]. This enables precise and targeted water application, reducing water wastage and optimizing resource efficiency.
- Automation and Remote Monitoring: AI-enabled irrigation systems can be automated, operating on predetermined schedules or responding to real-time sensor data. Remote monitoring capabilities allow farmers to access and control irrigation systems from anywhere, enhancing convenience and flexibility.[1]
- Water Conservation and Efficiency: By optimizing irrigation based on crop needs and environmental conditions, AI-enabled systems minimize water waste and promote efficient water use. This contributes to water conservation efforts and sustainable farming practices.
- Integration Other Technologies: with AI-

enabled irrigation systems can integrate with other agricultural technologies, such as weather monitoring systems, crop sensors, and farm management platforms. This integration enhances overall farm efficiency and decision-making capabilities [16].

Benefits of AI-enabled irrigation systems include improved crop health, enhanced water resource management, increased yields, reduced energy costs, and minimized environmental impacts. These systems empower farmers to make data-driven irrigation decisions, conserve water, and optimize agricultural practices in a way that promotes both productivity and sustainability.

### **Predictive Analytics for Yield Optimization**

Predictive analytics for yield optimization involves the use of advanced data analysis techniques and models to predict and optimize crop yields [2]. By leveraging historical and real-time data, including weather patterns, soil conditions, crop management practices, and other relevant factors, predictive analytics enables farmers to make informed decisions that maximize crop productivity. Here are key aspects of predictive analytics for yield optimization:

- Data Collection and Integration: Data on various variables influencing crop yield, such as weather data, soil quality, fertilizer usage, pest control measures, and historical yield records, are collected and integrated into a unified dataset.
- Data Cleaning and Preprocessing: The collected data undergoes cleaning and preprocessing to ensure accuracy, consistency, and compatibility for analysis. Outliers, missing values, and inconsistencies are addressed to maintain data quality.
- Feature Selection and Engineering: Relevant features that have a significant impact on crop yield are selected and engineered. This involves identifying the most influential variables and transforming or combining them to create new informative features.
- Model Development: Predictive models, such as machine learning algorithms or statistical

- regression models, are developed using the cleaned and preprocessed data. These models learn from the historical data to establish relationships between input variables and crop yields.
- Model Training and Validation: The predictive models are trained using a subset of the data and validated to ensure their accuracy and reliability. This validation process helps assess the model's ability to generalize and make accurate predictions on unseen data.[5]
- Yield Prediction: Once the predictive models are trained and validated, they can be applied to new data to predict crop yields. By inputting current or forecasted values of relevant variables, the models generate yield predictions for different crops and growing conditions [15].
- Optimization Strategies: Based on the yield predictions, farmers can implement optimization strategies to maximize crop productivity. This includes adjusting irrigation schedules, finetuning fertilizer application rates, optimizing pest control measures, and making informed decisions regarding crop varieties and planting densities.[8]
- Continuous Model Updating: Predictive models can be updated periodically with new data to improve their accuracy and adapt to changing agricultural conditions. This ensures that the models remain relevant and effective in optimizing crop yields over time.

The benefits of predictive analytics for yield optimization include improved resource allocation, enhanced decision-making, reduced risks, increased efficiency, and higher crop yields. By leveraging data-driven insights, farmers can make informed choices regarding crop management practices, leading to optimized yield outcomes and improved overall farm profitability.

### Benefits and Challenges of AI Adoption in Agriculture Benefits:

 Increased Efficiency: AI technologies enable automation and optimization of various farming processes, resulting in increased efficiency and reduced labor requirements. Tasks such as crop monitoring, irrigation scheduling, and pest

- detection can be performed more accurately and efficiently with the help of AI, leading to improved overall productivity [4].
- Enhanced Decision-Making: AI-powered systems provide farmers with valuable insights and data-driven recommendations for decision-making. By analyzing large volumes of data from multiple sources, AI can help farmers make informed choices regarding crop management, resource allocation, and risk mitigation strategies, leading to better outcomes and improved profitability.[7]
- Yield Optimization: AI algorithms can analyze historical and real-time data to predict crop yields accurately. This information enables farmers to optimize inputs, adjust cultivation practices, and implement strategies for maximum yield potential. By optimizing yield, farmers can achieve higher productivity and maximize profitability.
- Precision Agriculture: AI plays a crucial role in precision agriculture, enabling targeted and precise resource management. By integrating data from sensors, satellites, and drones, AI systems can provide farmers with real-time information about soil moisture levels, crop health, and nutrient requirements. This precision allows farmers to apply inputs such as water, fertilizers, and pesticides in a more targeted and efficient manner, reducing waste and minimizing environmental impacts [15].
- Sustainability: AI adoption in agriculture can contribute to sustainable farming practices. Through improved resource management, including water conservation, reduced chemical usage, and optimized energy consumption, AI technologies promote environmental stewardship. AI can help farmers adopt more sustainable practices, preserve natural resources, and reduce the ecological footprint of agriculture [11].

### Challenges

Cost of Implementation: Adopting AI technologies in agriculture can involve significant upfront costs. Farmers may need to invest in equipment, sensors, software, and training to implement AI systems effectively. The initial financial investment may be a barrier for small-scale farmers or those with limited resources [14].

- Data Privacy and Security: AI relies on large volumes of data, including sensitive information such as farm management practices and production data. Ensuring data privacy and security is crucial to protect farmers' proprietary information and prevent unauthorized access or data breaches. Implementing robust data protection measures is essential but can pose challenges for some farmers. [9]
- Access to Technology and Infrastructure: Access to AI technology and robust internet connectivity can be limited in rural areas [19]. Lack of infrastructure can hinder the adoption and effective utilization of AI-powered solutions. Efforts are required to address these infrastructural gaps and ensure equal access to AI technologies for farmers in all regions.
- Skill Requirements and Technical Support: The successful adoption and utilization of AI in agriculture require farmers to possess the necessary skills and knowledge to operate and maintain AI systems effectively. Providing training and technical support to farmers to enhance their digital literacy and AI capabilities is crucial to overcome this challenge.
- Ethical and Regulatory Considerations: As AI becomes more prevalent in agriculture, ethical considerations surrounding data ownership, algorithm biases, and responsible use of AI need to be addressed. Developing transparent and accountable frameworks for AI adoption in agriculture is essential to build trust and ensure ethical practices [20].

Overall, while AI adoption in agriculture offers numerous benefits, it also presents challenges that need to be addressed for successful implementation. Overcoming these challenges requires collaboration among farmers, technology providers, policymakers, and researchers to ensure that the benefits of AI in agriculture are realized while mitigating potential risks and promoting equitable access to AI technologies [12]

### RESEARCH METHODOLOGY

The research methodology for the study on AI-Powered Innovations in Agriculture: Transforming Farming Practices and Yield Optimization employed a secondary

data research approach. The data collection involved gathering existing data from various secondary sources such as academic journals, research papers, industry reports, government publications, and reputable online databases. The data collection process included conducting a comprehensive literature review using relevant keywords and search terms related to AI applications in agriculture, farming practices, and yield optimization. The selected articles, reports, and publications assessed their relevance to the research topic and the quality and credibility of the sources. The synthesized data is also organized and presented to address the research objectives. By employing a secondary data research methodology [3], this study aims to contribute to the existing body of knowledge on AI applications in agriculture and provide valuable insights into the transformative potential of AIpowered innovations in improving farming practices and optimizing crop yields.

### FINDINGS AND DISCUSSION

The findings of this research shed light on the transformative impact of AI in agriculture. Through the integration of AI technologies, farming practices have witnessed significant advancements, leading to improved efficiency, productivity, and sustainability. AI is being applied in various specific areas within agriculture, including crop monitoring, disease detection, precision farming, autonomous machinery, predictive analytics, smart irrigation, and supply chain management [18]. These applications have demonstrated substantial benefits such as increased crop yields, reduced resource wastage, improved pest management, enhanced decision-making capabilities, and cost savings. However, the adoption of AI in the agricultural sector also presents certain challenges. These include the initial cost of implementation, concerns regarding data privacy and security, limited access to technology in rural areas, and the need for a skilled workforce and technical support. Stakeholders in the agricultural industry can derive valuable insights from this research. Farmers can make informed decisions about adopting AI technologies that align with their specific needs, while agribusinesses can identify opportunities for integrating AI-powered solutions into their value chain [19]. Policymakers can gain a deeper understanding of the benefits and challenges associated with AI adoption, enabling them to formulate supportive policies that encourage innovation and sustainability in agriculture. This research contributes to the understanding and advancement of AI-powered innovations in agriculture by exploring its transformative impact, identifying application areas, assessing benefits and challenges, and providing valuable insights for stakeholders. It serves as a foundation for further research and development efforts aimed at addressing existing challenges and unlocking the full potential of AI in revolutionizing farming practices, optimizing yields, and fostering sustainable agriculture.

## Comparison between traditional methods and AI enabled methods in Agriculture for yield optimization

Point of Discussion	Traditional Methods	AI enabled Methods
Crop Monitoring and Management	Field Surveys Visual Crop	Disease and Pest Detection
	Inspection Farmer Knowledge and Experience	Yield Prediction Weed Detection and Management Irrigation Optimization Nutrient Management Crop Disease Forecasting Harvesting Optimization Autonomous Farming
Pest Detection and Management	Pheromone Traps Sticky Traps Mechanical Traps Biological Control Chemical Control Traps and arriers	Pest Identification Disease and Pest Risk Assessment Decision Support Systems Data Integration and Analytics Real-Time Monitoring and Alerts Precision Pest Control

Irrigation Systems	Surface irrigation	Data Collection and Monitoring
	Sprinkler irrigation	Data Analysis and Decision-Making
	Drip irrigation Terracing Traditional wells and canals Paddy field irrigation	Evapotranspiration Modeling Smart Irrigation Control Automation and Remote Monitoring Water Conservation
		and Efficiency Integration with Other Technologies
Predictive Analytics	Not Available	Data Collection and Integration
		Data Cleaning and Preprocessing
		Feature Selection and Engineering
		Model Development
		Model Training and Validation
		Yield Prediction
		Optimization Strategies
		Continuous Model Updating

#### CONCLUSION

In conclusion, this research has successfully explored the transformative impact of AI in agriculture and investigated specific areas where AI is being applied in the agricultural sector. The

findings have revealed that AI technologies have revolutionized farming practices by improving efficiency, productivity, and sustainability [20]. AI is being utilized in various areas such as crop monitoring, disease detection, precision farming, autonomous machinery, predictive analytics, smart irrigation, and supply chain management. These applications have demonstrated significant benefits, including increased

crop yields, reduced resource wastage, improved pest management, enhanced decision-making capabilities, and cost savings [12]. Overall, AI holds great promise in transforming the agricultural sector and fostering sustainable and efficient farming practices for the future.

### Active Switched LC based DC-DC Converter for PV System

### **Amarjeet Pandey, Sucheta Patil**

Assistant Professor Electrical Engineering RIT

### V N Kalkhambkar

Associate Professor Electrical Engineering RIT

### **ABSTRACT**

This research paper proposes a high-step-up DC-DC converter with an active switching LC-network that may be utilised in EV application or as the front-end stage in a photovoltaic (PV) system to create the requisite dc bus voltage. This ASLC converter, which is based on a transformer less DC-DC converter with active switched inductor (ASL) network, adds an active switched capacitor (ASC) network, with just one capacitor and one diode added, while the voltage gain is effectively increased by a compound of ASL and ASC networks. The suggested converter has a basic structure with low voltage strains on the extra diode and capacitor. Furthermore, unlike existing voltage-boosting devices that use switched capacitors, the ASLC converter avoids the capacitor's excessive instantaneous currents. The suggested converter is thoroughly examined, and its performance is compared to that of recently released ASL network-based converters. Finally, the performance of a 100 W, 20/230 V prototype is tested.

KEYWORDS: ASLC converter, Inverter, Matlab simulation, PV system, EV application.

### INTRODUCTION

hotovoltaic (PV) systems, uninterrupted power supply (UPS) and photo voltaic electrical hybrid vehicles (PHEVs) are just a few of the applications where choppers are used. The output voltage of distributed power supplies is frequently inconsistent and insufficient. Consequently, a significant voltage increase is required to provide the required DC bus voltage. In these systems, choppers are more commonly used. In a conventional boost converter the switch voltage is equal to the output voltage. As a result, high-power-to-weightratio switches are necessary. As duty cycle reaches to unity, the static gain of a standard boost converter will be limitless, according to theoretical relationships. Greater duty cycle esteems, then again, bring about a decline in voltage gain and effectiveness, which is generally because of rise in conduction losses. Various high gain boost converters have been presented in various papers to solve the above mentioned problems.

Various approaches and circuits are also shown to boost voltage gain and lower duty cycle values. There are different voltage enhancing techniques such as switched inductor, magnetic coupling, switched capacitor and voltage-lift are some of the voltage-boosting techniques. One of the best approach is presented in this paper by comparing all the possible converter and hence these report is being presented.

In this paper more focus has given to study various present inverter topologies, analyse the converter and importantly design converter for the PV applications with developing close loop software model of converter. The structure of the paper is as follows: Section II discusses the conventional topology operation, Section III presents the proposed ASLC circuit topology with MATLAB Simulations. Implementation of Hardware and analysis of the results are shown in Section IV. Conclusions are drawn in Section V.

### CONVENTIONAL TOPOLOGY OPERATION

A chopper circuit is a type of electronic switching device or circuit used in electrical control and signal applications in electronics. In Chopper, there are a number of devices that are used. MOSFET, BJT, IGBT, GTO and other low-power applications Thyristor or SCR for high-power applications a chopper circuit

www.isteonline.in Vol. 46 Special Issue, September, 2023

is straightforwardly changes over a decent DC input voltage to change in DC yield voltage as shown in Fig. 1.

Fig. 1. Chopper operation

It's a habit to rupture. When a signal is in control. Because the switching element is either In power electronics applications, fully on or fully off, It has negligible damage and can deliver well functionality Chopper is nothing but DC to DC converter which are basically classified into 3 types Buck Converter Boost Converter and Buck-boost Converter. Boost Converters are used to enhance the voltage; whose output voltage is greater than the input voltage. In the boost converters, the conversion of dc is done in such a way that the output voltage of the circuit is much higher than that of input voltage. The operation of Boost converter are as In mode 1, for time period, switch is closed. At that time current can flow through inductor and Switch S1 and bigger Energy is stored in an inductor. In mode 2, for time period, switch is open so at that time the previously stored energy in the inductor is freewheeled through diode followed by load. Due to this mode the voltage across load is greater than that of

So the time period is given as. 
$$T = T_{on} + T_{off}$$
 (1)

The duty cycle is written as:  $i_{C1} = C_1 \frac{dv_{c1}}{dt} = -i_{L2} (2)$ 

The output voltage across the load will be given by:

$$V_{\text{out}} = \frac{Vs}{1-D} \tag{3}$$

The Boost converter is a constant current input source because input current is caused by the inductor linked to the input source. The load out there can be seen as a constant voltage source.

Fig.1.1. a circuit diagram of boost converter

However, since the current supplied to the load is intermittent, smoothing or a higher switching frequency may be necessary to reduce unwanted effects. To design a compatible DC DC converter there is a requirement of High power rated switch required with consequences of high conductive losses and the voltage gain is limited with also large duty cycle [1]. To improve the existing one, improvement has been done in the form of Voltage-lift split- inductor-type boost converters (VL) with the advantage of Simple structure and less voltage stresses by applying VL technique applied to ASL but there is issue with Complex VL cells increase cost and decrease efficiency [2], with an updation in the circuit with switched-capacitor-based active- network converter proposed here which provide high voltage gain without high duty cycle, it suffer from extreme instantaneous capacitor current switch causes losses and causes magnetic noises[3]. Implementation of Active Switched-Inductor and Passive Switched- Capacitor Networks give high voltage gain but circuit became bulky due to calculated inductance [4]. With hybrid i.e Active- Passive inductor cell technique is used for improving voltage gain with merit of Voltage stress on the switches are reduced which further deals into increased in cost and size because of more inductors are employed[5]. In one of the method active-network converter with coupled inductors technique is used where By adjusting the turn ratio high voltage gain is achieved with relatively small duty cycle But there is drawback of leakage reactance of coupling inductor[6]. To enhance the source side voltage at greater level boost converters are used. That load side voltage is greater than source side voltage. When switch is on, the energy in an inductor is get stored and when switch is off it releases through the load on this principle boost converter works. Because of various reasons like rectifier diodes, power switches and the internal resistance of capacitors

and inductors boost converter fails to provide high gain dc voltage. So to overcome that drawback the new technique called Active Switched Inductor (ASL) is came into the picture. So this technique is mainly used in boost converter to enhance the boosting capacity of the converter. The ASL consists of two inductors which are connected in parallel manner. So this will have used to enhance the voltage gain by switching on both inductors to obtain a high voltage range output from a low voltage DC supply.

### ASLC CIRCUIT TOPOLOGY WITH MATLAB SIMULATIONS

ASL technique has some drawbacks such as When voltage lift (VL) technique is used in the ASL based converter, it will enhance the voltage gain properly but voltage lift technique is costly and reduces overall performance of converter and second one when Switched Capacitor (SC) is applied to ASL based converter so voltage gain will be enhanced properly and voltage stress on the switches also be reduced but converter suffers from extra power loss and electromagnetic noises due to instantaneous capacitor currents. So these drawbacks can be overcome by combining ASL and ASC network with additional one diode and capacitor in the converter. To address the aforementioned shortcomings of ASLbased converters, a new technique DC to DC converter with active switch for high gain capacitor and inductor network is presented as shown in Fig. 2.1.

Fig.2.1 circuit diagram of ASLC converter

The suggested converter simply uses one additional capacitor and diode to the typical ASL network, but ASLC network efficiently increases the voltage gain. Furthermore, the extra diode and capacitor are subjected to low voltage strains. Although the ASC network is used, the suggested converter avoids the

high-current transients that are a shortcoming of switched capacitor circuits. The given topology is shown in the above diagram. The above converter is achieved by combining the ASL network and ASC network which is called as ASLC network. The ASL network is consist of 2 switches and 2 inductor A S C network is consist of capacitor, diode and switch As a result, just diode and capacitor are needed, and the construction remains simple. Two operating scenarios, encompassing three modes, can be separated based on the currents of capacitor C1, inductor L1, and inductor L2. Table 1 shows the detailed statuses of components various modes. Table 2 depicts the transition between different modes in various scenarios.

**Table 1 States of Components in Different Modes** 

MODE 1	MODE 2	MODE 3
ON	OFF	OFF
OFF	ON	ON
OFF	ON	ON

The above table shows switching of switches of the MOSFET and diode D1 and D2. So in mode 1 both switches are on and diodes are in reverse biased. In mode 2 both switches are closed and diodes are forward biased. And mode 3 is same as mode 2.

**Table 2: Transitions Between Modes in Different Cases** 

CASE	TRANSITION
CASE 1	Mode 1-Mode 2
CASE 2	Mode 1-Mode 2-Mode 3.

Above table shows the different cases and different modes involved in it. Case 1 consist of mode 1 and mode 2. And Case 2 consists of mode 1, mode 2 and mode 3. The detailed operation can be seen by of different mode are as follows:

Case-1 (Mode 1 and Mode 2)

Fig.3.1. a equivalent circuit of mode 1

Fig.3.1.b equivalent circuit of mode 2

In mode 1 switch  $S_1$  and  $S_2$  are switched on during this time span, and diodes  $D_1$  and  $D_0$  are in reversed bias. The inductors  $L_1$  and  $L_2$  are parallel charged from the DC source  $v_i$ , as shown in Fig. 4.2.a.Initially stored energy in capacitors  $C_1$  and  $C_0$  are released to inductor  $L_2$  and the load, respectively. The two inductor voltages  $(V_{L1}, V_{L2})$  and two capacitor currents  $(i_{c1}, i_{c0})$  in this mode are derived as equation 4 to 7 respectively.

$$V_{L1} = L_1 \frac{di_{L1}}{dt} = V_i$$
 (4)

$$V_{L2} = L_2 \frac{di_{L2}}{dt} = V_i + v_{C1}$$
 (5)

$$i_{C1} = C_1 \frac{dv_{c1}}{dt} = -i_{L2} \tag{6}$$

$$i_{C0} = C_0 \frac{dv_{C0}}{dt} = -I_0 \tag{7}$$

In mode 2 both switches  $s_1$  and  $s_2$  are closed at that time frame, and diodes  $D_1$  and  $D_0$  are forward biased. Inductors  $L_1$  and  $L_2$  are series coupled with the dc source, as shown in Fig. 4.2.b to transmit energy to the capacitor  $C_0$  and the load  $R_0$ . In the meantime, inductor  $L_1$  charges capacitor  $C_1$  from the input source. The voltage and current equations are mention 8 to 11 respectively.

$$V_{L1} = L_1 \frac{di_{L1}}{dt} = V_i - v_{C1}$$
 (8)

$$V_{L2} = L_2 \frac{di_{L2}}{dt} = V_{C1} - V_0 \tag{9}$$

$$i_{C1} = C_1 \frac{dv_{c1}}{dt} = i_{L1} - i_{L2}$$
 (10)

$$i_{C1} = C_1 \frac{dv_{c1}}{dt} = i_{L1} - i_{L2}$$
 (11)

Case-2 (Mode 1, Mode 2and Mode3)

Fig.3.2. a equivalent circuits of mode 1

Fig.3.2. b equivalent circuits of mode 2

Fig.3.2.c equivalent circuits of mode 3

In Case 2 of model the switches  $S_1$  and  $S_2$  are switched on during this time span, and diodes  $D_1$  and  $D_1$  are in reversed bias. The inductors  $L_1$  and  $L_1$  are parallel charged from the dc source  $V_i$ , as shown in Fig. 3.2.a. Initially stored energy in capacitors  $C_1$  and  $C_1$  are discharged cross inductor and the load, respectively. The two inductor voltages ( $V_{L1}$ ,  $V_{L2}$ ) and two capacitor currents ( $i_{C1}$ ,  $i_{C2}$ ) in this mode are derived in equation 12 to 15 respectively

$$V_{L1} = L_1 \frac{di_{L1}}{dt} = V_i \tag{12}$$

$$V_{L2} = L_2 \frac{di_{L2}}{dt} = V_i + v_{C1}$$
 (13)

$$i_{C1} = C_1 \frac{dv_{C1}}{dt} = -i_{L2}$$
 (14)

$$i_{C0} = C_0 \frac{dv_{C0}}{dt} = -I_0 \tag{15}$$

In Case 2 of mode 2 Both switches are switched off at that time frame, and diodes  $D_1$  and  $D_0$  are forward biased.

Inductors  $L_1$  and  $L_2$  are series coupled with the dc source, as shown in Fig. 4.2.b to transmit energy to the capacitor  $C_0$  and the load  $R_0$ . In the meantime, inductor  $L_1$  charges capacitor  $C_1$  from the input source. The voltage and current equations are mentioned in equations from 16 to 19 respectively.

$$V_{L1} = L_1 \frac{di_{L1}}{dt} = V_i - v_{C1}$$
 (16)

$$V_{L2} = L_2 \frac{di_{L2}}{dt} = v_{C1} - V_0 \tag{17}$$

$$i_{C1} = C_1 \frac{dv_{C1}}{dt} = i_{L1} - i_{L2}$$
 (18)

$$i_{C0} = C_0 \frac{dv_{C0}}{dt} = i_{L2} - I_0$$
 (19)

In Case 2 of mode 3 Both the capacitor starts to discharge and  $i_{c0}$  starts to reduce to zero as inductor are not able to provide required amount of energy. Relations has been built across voltage and current is given below in equations from 20 to 23 respectively.

$$V_{L1} = L_1 \frac{di_{L1}}{dt} = V_i - v_{C1}$$
 (20)

$$V_{L2} = L_2 \frac{di_{L2}}{dt} = v_{C1} - V_0$$
 (21)

$$i_{C1} = C_1 \frac{dv_{c1}}{dt} = i_{L1} - i_{L2}$$
 (22)

$$i_{C0} = C_0 \frac{dv_{C0}}{dt} = i_{L2} - I_0$$
 (23)

Table 3. Parameter Table

Parameters	Values		
Input Voltage	20 V		
Output Voltage	230 V		
Inductor L1 and L2	200uH and 800uH		

Capacitor C1 and C0	22uF and 100uF
MOSFET S1 and S2	IRF 540
Input Current	5.3 A
Output Current	0.4343 A
Voltage gain	11.89
Efficiency	88-93%

As per table 3 the parameter is mention above has been put for the desired output.

#### **Matlab Simulation**

Fig. 4.1a- close loop simulation of the given ASLC converter

Above Fig. 4.1ashows close loop simulation of the given ASLC converter It is required to maintain the voltage level of the system at the desired value even if input given to the converter changes. This system has been verified over MATLAB/Simulink with different input and load condition to check predefined condition.

In close loop one used PI controller to get the desired close loop condition the reference voltage is given as 230 V. The voltage waveform of the converter and the inverter circuit for the close loop is given below

One can tune the PI controller over the MATLAB itself and can use in the actual implementation as MATLAB is one of the advance software to be used. PI controller basically keep the value of output voltage at the reference value.

Fig. below shows the output voltage and current characteristics with respective time and it is very clear that due to close loop simulation the output remains at constant 230 V (229.5 V) which shows that system is

very perfectly adapted to close loop control to make it more advance one can use another control technique but for realization of close loop purpose one have introduced the close loop simulation. The output of close loop and open loop remains same as which indicate that the close loop system is perfectly adapted now if there is load variation in the circuit it does not affect the output voltage, If one should consider that input is going to change to some value the close loop system adaption will keep the output voltage to the required value in above case it is 230 V.

Fig.4.1. b. - close loop output waveform of converter Inverter side

#### **Output Voltage**

Fig.4.1.c- close loop output voltage waveform of inverter

Fig 4.1.c shows the output voltage that one can get from the MATLAB scope and the output is perfectly 230-volt peak But as one should note that the output seen by load is in RMS form so one should have to find RMS value this feature is provided by the RMS block in MATLAB the output of which is given below.

Fig.4.1. d- close loop RMS output voltage waveform

Fig 4.1.d show the RMS value obtained from the scope in this case the output is under damped in attaints the required value after underdamping whereas in in the open loop one should have seen it as over damping it does not cause any much effect at the system is designed to sustain such oscillation.

#### HARDWARE RESULT

Fig.4.2 b Output of driver circuit

Fig.4.2 a shows the output of the driver circuit with the required gating to the MOSFET,in above cases both the MOSFET have a common pulse to operate the means both have same frequency as 50 KHz, same Ton and Toff timing with.

Fig.4.2. b Actual implementation of the circuit

Fig.4.2. b shows the actual implementation of the converter where the output is checked on the multi meter and the output is near about 200V here the desired output is not matched due to uncertainty in the

components and input variation of supply. Once the output of driver circuit is achieved then we have given it to power circuit and load is connected, the output is then verified over multi meter. The main circuit is connected to the multi meter where output is being checked where the gate pulse to the converter is given by output of driver circuit.

To provide the required supply to gate driver assembly a circuit to provide 12V supply is made on the breadboard whereas supply to the main circuit is provided through a DC supply regulator. Arduino is used to generate gate pulses through the programme shown in the driver circuit.

#### **CONCLUSION**

As the given converters are the best possible way to change the future of solar energy and have a great control over other parameter with the converter that have designed have efficiency more that 90% and have less voltage stress over the switches. The design is verified over the MATLAB software and checked for the desired output over the given rating Close loop model of given converter is run over MATLAB and output is verified by changing load and changing supply for the same.

#### **ABSTRACT**

Direct torque control is a way of managing torque and installing a manufacturing machine that uses a vectors. Vector control is fairly strong since DTs that are now manage more than just the active magnitude, it is still difficult and inconsistent. This approach is strongly advised. for managing torque & is more critical to the machinery's power in all industrial processes. As a result, the induction motor's (MT) high torque, climatic fluctuation, and relative temperature are all regulated. The technique established assures a considerable VV measure of performance to restrict the gap between the starting vectors voltages and the last vector voltages contained in those terminals. The set of regulations does not significantly enhance the performance device's perplexity and can be comprehended more accurately with the help of the social service. For 0.55 kW IM degree, pricing can be obtained for a variety of better outputs including a few current DTC modifications. The enhanced DTS method has been tested in order to attain unified worldwide governance in a short period of time and with a rapid reaction. Furthermore, the enhanced approach may identify the frequency of variations due to the increased renewal speed and rate are limited.

**KEYWORDS:** Dtc, Minimum voltage vector error, Average-switching-frequency (ASF), Dynamics response and ripple torque.

#### INTRODUCTION

The dynamic state update is the basic structure of the vector controller. Under normal functioning and stable conditions, the stator flux and torque, the terminating of the induction's motor may alter significantly. Various induction validity management procedures are available, such as pole exchange, frequency variation, changing the rotor's resistance, altering the stator's voltage, the constant voltages/ frequency, sliding recovery, and more. A revolutionary technique called direct control of torque is applied in conjuction with vector controlling to regulate the both speed as well as pressure of the combustion motor. Since the DT manipulate approach can now manipulate not only magnitudes as well as the currents, voltages, and float states in real time, vector manipulation is preferred to scalar manipulation. Because of the dynamic efficiency of induction motors, this strategy

is especially recommended for adjusting torques and tempo. As a result, high excellent torques, stator flux, and MT (induction motor) rated speed is not maintained. The suggested The DT Control approach was developed to offer improved SteadyState performance while maintaining DT Control's quick dynamic reactions. Furthermore, the enhanced technique can resurrect the rate of volatility at all stages in relation to the anticipated cost of reuse.

#### LITERATURE SURVEY

Fatih Korkmaz et. The purpose of this article is to introduce a new approach for direct torque control using good judgment primarily based space vector modulation on managed use the result to overcome the difficulties of direct torque manipulation. For special operating conditions, Matlab/Simulink protocols for comparing the proposed direct torch control method

www.isteonline.in Vol. 46 Special Issue, September, 2023

with the standard direct torque control strategies were changed. The imitation strategy has shown fantastic gains in terms of bendy torque and speed response compared to traditional direct torque management.

Charles Stephen et.al. 2019, In this more rare and novel amendment rourosed table, the purpose is to lessen modern-day harmonise reliance on - torque-flux based aircraft that could launch any day CAR drives with updated upgrades, using upgraded software and upgraded hardware. They've a study the Simulink version and outgoing car fashions. Overall performance of this system focuses on improved flexibility, faster torque responses, low frequency inverter control, low harmonic losses, and high efficiency. With its abovementioned capabilities, DTC controllers have the potential to be superb. So the reason here is to explore the superior IM management gadget because of this direct torque is deceptive and study its usual performance traits.

T. Vinay Kumar et. al. 2019, This paper introduces a two-degree changed inverter topology to enhance the overall performance of low-velocity controlled torque (DTC) for 3-section motor input. Based primarily on the role of modern ripples, the proposed technique is given. The rotational law is used to obtain inverter switching states. Low-speed operation of the DTC can be performed with less ripple of flexibility and torque than the usual technique. Predicted sequences of simulations are compared with the DTC method used in usual case study.

Hanbing Dan, et. Al 2021, proposes the DTC innovation, a model presentation control (MPC)-based prompt system converter-acknowledgment motor idea to reduce power gain in driving motors due to the use of common direct power control (DTC). This is paper. Two new test tables are proposed, all of which are evaluated using control of electromagnetic power and stator advances using gate voltage vectors and their individual trade states. Limited Control Set Model Presentation Control (FCS-MPC) is then taken to select the ideal business condition that restricts the consumption function related to electromagnetic power. In conclusion, the exploratory results are shown to investigate the low power extension performance of the proposed MPC-based DTC technique.

#### SCOPE AND OBJECTIVES

- Analysis and representation of uncontrollable induction machines, with concentration on Simulink mathematical modelling.
- Estimates of torque, flux, and accuracy based on device terminal currents and voltages (voltage versions).
- To put certain torque strategies to the test utilising Modulation of Pulse Width.

#### **IDENTIFICATION PROBLEMS**

- Large torques in the back are a problem for industrial motors under direct torque (DT) control, owing to a recent change in the dynamics of automobile fluctuations.
- Meanwhile, various techniques of regulating Dtc control was created to deal with complex problems, however it suffers from an absence of context, also in the death speeches, robustness problems.
- To improve, of DTs control repairing error depending mainly on the lowest voltage-vector defects is introduced the stability of the entire SteadyState mode.
- So Differentiation examines the required Voltage-Vector performance in order to eliminate mistakes between the Voltage-Vector references and the Voltage-Vector is final included in that term.

#### **DIRECTLY TORQUE CONTROLLING**

So the selection concept is central to the DT control technique. The DTC method's have a solutions is to choose a vector's voltage is turns the fluxes & creates torques. Controlling an industrial motor via the standard DTC approach entails direct manipulation of the stator flux vector. The contemporary stator must be split among neutral components, includes torque and flux components in DC tools, for this control. This deconstruction technique uses the DTs control method and the Clark transformation methodology. DTC enables extremely low torque response and easy industrial engine management.

DTC provides torque during rotation only by choosing a large output of a voltage vector centred on a flux vector. By using the hysteresis controller, torque error and flux amplitudes are regulated with in the best-possible bounds. Figure 1 shows an example of spinning determining the inverter switching vectors outcome and the vector of the stator.

Fig. 1 Rotation of the vector stator-flux, as well as an illustration of the effects of inverting-switching vectors utilised

Eq. (1)-(3) is used to calculate the stator flux linkage vector

$$\lambda_{\alpha} = \int (V_{\alpha} - R_{s} i_{\alpha}) dt, \tag{1}$$

$$\lambda_{\beta} = \int (V_{\beta} - R_{s}i_{\beta})dt, \qquad (2)$$

$$\lambda = \sqrt{\lambda_{\alpha}^2 + \lambda_{\beta}^2} \tag{3}$$

whereby 'L' indicates a vector of stator flux, huge amounts in two sections from the VA and VB structures, reference lines Ia and Ib, & Rs signifies impact resistance. The manufacturing machine may be described in Equation (4) after lowering the flux in the stator vector and the electro-magnetic torque using the controller

$$T_e = \frac{3}{2} p \left( \lambda_\alpha i_\beta - \lambda_\beta i_\alpha \right) \tag{4}$$

Whenever p represents the number of role pairs. Along the DT path, so stator flux rotational method is divided into the six areas, and obtaining correct details regarding the flux of the stator universe has shown to be a swift success. So the state flux suffixes could be analyzed Equation's concept of flux of the stator (5).

$$\theta_{\lambda} = \tan^{-1} \left( \frac{\lambda_{\beta}}{\lambda_{\alpha}} \right) \tag{5}$$

The variable's term and torque values incorporate these measured flexible & torque error value's, as well as the resultant errors are provided as supplies to serve as hysteresis improvers. There, extra hyper parameters in the form of DT are produced by further hysteresis comparison in the forms of fluxes and torque comparisons. Using visible flux removal modifiers, the best generators of electricity are chosen and offered for input and supply the converter in accordance with the hysteresis output.

#### Modes of IM -

IM The DT platform is typically used to produce IM dynamic statistics as,

$$u_{s} = R_{s}i_{s} + \frac{d\psi_{s}}{dt} \tag{6}$$

$$O = R_r i_r + \frac{d\psi_r}{dt} - j\omega_r \psi_r \tag{7}$$

$$\psi_S = L_S i_S + L_m i_r \tag{8}$$

$$T_e = \frac{3}{2}p(\psi_s \otimes i_s) \tag{9}$$

$$\psi_r = L_m i_s + L_r i_r \tag{10}$$

 $\otimes$  This indicates that the two vectors' cross product, & using  $i_s$  and  $\psi_s$  is the state parameters,

$$\begin{cases} \dot{x} = A\hat{x} + Bu_s + G\Delta i_s \\ \hat{y} = C\hat{x} \end{cases} \tag{11}$$

where

$$\hat{x} = \left[\hat{\imath}_s, \hat{\psi}_s\right]^T, \hat{y} = \hat{\imath}_s, \Delta i_s = i_s - \hat{\imath}_s, a = -\frac{1}{\sigma} \left(\frac{1}{\tau_s} + \frac{1}{\tau_r}\right) + j\omega_r$$

$$b = \frac{1}{\sigma L_s \tau_r} - j \frac{1}{\sigma L_s}, A = \begin{bmatrix} a & b \\ -R_s & 0 \end{bmatrix}, B = \begin{bmatrix} \frac{1}{\sigma L_s}, 1 \end{bmatrix}^T, C = [1, 0]$$

$$\sigma = 1 - \frac{L_m^2}{L_s L_r}, \tau_s = \frac{L_r}{R_r}, \tau_r = \frac{L_r}{R_r}, G = [K_1 + jK_2, K_3 + jK_4]^T$$

G is referred to as the description of the matrix. The major goal of estimating ('K1', 'K2', 'K3', & 'K4') are create the necessary FB level (K1) times in order for the automobile to change quicker over its FB counterpart. As a result, K1-K2-K3, & K4 are stated as follows:

$$\begin{cases} K_{1} = (k-1)\left(\frac{1}{\sigma\tau_{r}} + \frac{R_{s}}{\sigma L_{s}}\right) \\ K_{2} = (1-k)\omega_{r} \\ K_{3} = (k^{2}-1)R_{s} \\ K_{4} = 0 \end{cases}$$
(12)

Typically, the value of k is set to 1.2. Other methods of constructing an explanation a matrix, including a step, as to raise the level of intensity of a pointless speeds action exist, but they are frequently complicated.

A circumstance when discretizing (11) approaches can be used to express the current balance,

$$\hat{x}^{k} = \hat{x}^{k-1} + [A^{k-1}\hat{x}^{k-1} + Bu_s^{k-1} + G^{k-1}\Delta i_s^{k-1}]T_s$$
 (13)

The current through the stator and flux should be computed using the following formulas for the following samples:

$$\hat{i}_{s}^{k+1} = i_{s}^{k} + \left( a^{k} i_{s}^{k} + b \hat{\psi}_{s}^{k} + \frac{u_{s}^{k}}{\sigma L_{c}} \right) T_{s}$$
 (14)

$$\hat{\psi}_s^{k+1} = \hat{\psi}_s^k + (-R_s i_s^k + u_s^k) T_{s (15)}$$

This makes it possible to forecast torque throughout the subsequent sample as,

$$\widehat{T}_e^{k+1} = \frac{3}{2} p(\widehat{\psi}_s^{k+1} \otimes \widehat{\iota}_s^{k+1}) \tag{16}$$

#### **METHODOLOGY**

- In DTC, the goal is to select a stator power vector directly based on torque and flux errors that vary between torque and stator flux indicators and their estimated values.
- The stator port and rotor port interaction is responsible for the dominant equalization of torque for this system. The torque connection with the stator flux is calculated by a limited number of motor terminals i.e. stator voltages still.
- A high voltage switch vector with six power vectors and two zero voltage vectors is selected for hysteresis control of stator flux and torque.

Fig. 2. The block diagram for the DTC of an induction motor

- Direct torque mode controls speed in the desired direction without the use of sensor controls for speed.
- Usually, flux measurement is done based on the voltage combination of the motor components.
- As a result, if the output frequency of the drive output is zero, the engine cannot be controlled.
   Figure 2 depicts the DT block diagram.
- Induction Motor Drive comes with an inverter power source. The best. The inverter voltage vector may be selected to control the stator fluxconnection and the electric torque directly.

# MVE DIRECT CONTROL OF TORQUE SIMULATION

A simulated version involving the MVE of DT Control is provided in Simulink/Matlab. To simulate real-world activities, algorithms for control are written in files and tested every 100 µs.

Fig. 3. Simulations of MVE Direct torque control

Table 1: All the Inverter Parameters and Motor

Quantity	Symbol	Value
Rotor Resistance	Rr	5.6 Ω
Stator Resistance	Rs	6.1 Ω
Stator Inductance	Ls	0.573 H
Rotor Inductance	Lr	0.58 H
Mutual Inductance	Lm	0.55 H
Rated Current	IN	2.7 A
Rated Torque	TeN	7.5 Nm
Flux Reference	$\Psi_{ m s}$	0.8 Wb
Pole Pairs	p	2
DC Bus Voltage	Udc	300 V
Rated Speed	nN	710 RPM

#### RESULTS OF MVE DIRECT TORQUE **CONTROL**

Fig. 4.1. Results of the simulation for torque

Fig. 4.2. Results of the simulation for speed

Fig. 4.3. Results of the simulation for stator current

Fig. 4.4. Results of the simulation for rotor flux

So in Fig. 4 depicts the outputs of the Minimum voltage Vector Error simulations. Torque is controlled directly. The motors, whose values are listed below, begin running at the 50 rpm with the no load. So the speed climbed from the 50 rpm to 710 rpm in 0.3second. Next at the 0.8second mark, a typical load of 7.5N is applied. But the machine can be operate continuously in a variety of operating situations, proving the usefulness of the suggested approach at first. Torque control appears at the 0.3 second & stable control at 1 second.

#### **CONCLUSION**

This programmed provides a very easy and intuitive sophisticated DT solution for induction motor applications. The torques & flux generated by the induction machines are transformed into the VV control as a consequence of the suggested MVE DT, resulting in a reference VV. The closest to refer to VV may be obtained by optimizing the basic Voltage-Vector charge ratio. Because the suggested technique employs a digital torque regulator, the engine's dynamic reactions are not compromised. Finally, the proposed method achieves mainly consistent switching frequencies, especially when there are big weights.

#### **ACKNOWLEDGEMENT**

To the special thanks to "Dr. Pratik Ghutke" who provided me with the wonderful opportunity to work on this outstanding Electrical Engineering project titled "Implementation of Direct Torque Control of Induction Motor With Minimum Voltage Vector Error Using Matlab/Simulink". I am quite glad for the opportunity to learn so many new things.

### Hybrid Renewable Energy Systems and Optimization Techniques: A Review

Sangram Malkar

Vaiju Kalkhambkar

Electrical Engineering RIT Rajaramnagar, Maharashtra

#### **ABSTRACT**

The climate has an impact on solar and wind energy. Without batteries, storage, or an engine generator, these systems cannot be counted on to function dependably. The existence of two systems and a storage device improves the system's reliability. The battery bank must power the load despite the cloudy skies and the lack of wind. As a result, hybrid power system components need to be the right size. The most recent developments in renewable energy sources will be looked at in this paper. The technical elements of renewable energy systems are also presented. High-renewable energy sources are now used more frequently because of recent environmental and energy crises. This study examines various methods for power systems optimization, addresses world energy scenarios, energy cost and renewable energy system modelling.

**KEYWORDS:** Hybrid power systems, Renewable energy sources, Technical simulation, High-renewable energy sources (HRES), Small power systems, Optimization, Artificial Intelligence (AI.

#### INTRODUCTION

Tatural gas, coal, as well as oil are kind of fossil fuels that are needed to produce electricity. Natural resources were depleted by the use of fossil fuels throughout the 20th century. More than ever, engineers and scientists are working to create and implement environmentally friendly alternatives to traditional energy production techniques. They are aware of the drawbacks of traditional energy sources. The most typical forms of renewable energy come from the sun, wind, and hydroelectricity. The use of wind energy is rising. Performance-wise, wind energy outperforms all other types of renewable energy.

When it comes to isolating and isolating locations that have a low likelihood of connecting to the national grid due to technical and financial constraints, many regions and nations favour isolating and isolating locations with renewable energy systems. The likelihood of connecting inaccessible areas to the national grid is lower. The use of photovoltaic rays, wind, and water can all produce

electricity. This system requires a diesel generator and batteries to handle peak demand. The availability of electricity is necessary for both economic growth and individual prosperity. Without compromising dependability or efficiency, a well- designed renewable energy system has the potential to raise quality of life. Although solar irradiance and wind speed are typically complementary, sudden changes can make them unreliable. Bhandari et al. 2,3 installed a brand-new hybrid solar, wind, and hydropower system in a remote Nepalese village.

The functionality as well as the dependability of the system, which heavily depend on each component, can be better understood and improved when each component of HRES is accurately modelled. This paper looks at methods for determining system size and optimization criteria, as well as small power systems powered by photovoltaics (PV), wind, hydro, and hybrid power storage. Examples of mathematical models, graphs, and flowcharts are given whenever appropriate. The paper will also go over the current state

of the world's energy supply and ongoing initiatives to lower energy consumption, with citations where appropriate. renewable energy sources combined. The global capacity for solar and wind energy is shown in Figure 4.

Fig. 1 Consumption of the Energy Globally in Quadrillion BTUs from 1990 to 2035 (source: [1])

Fig. 2 Amount of Electricity Produced by Burning Fuel 1990-2040

Figure 3 depicts the United States' energy sources (using data from [8]

Figure 5 shows the amount invested in renewable energy from 2004 to 2012 as well as the amount of hydropower produced from 2007 to 2012; in 2013, the amount of hydropower produced made up 3% of the total amount of capacity. Investments in renewable energy sources grew every year until 2012. The cost of PV and wind power equipment has decreased as a result of reduced subsidies for solar and wind energy projects in both Europe and the US. The capacity of hydropower and investments in renewable energy sources are shown in Figure 5.

Fig. 4 Existing world capacity (1996-2012) for wind as well as Photovoltaic power, drawn from data in [11]

Fig 5. Hydro Power Capacity (2007-2012), Investment in renewable energies (2004-2012)

#### **Off-Grid Systems (Stand-Alone System)**

Independent power systems are the majority of remote energy systems. Grid power is not used by off-grid systems. Watches, calculators, remote buildings, even spacecraft, all qualify as independent systems.

#### **Grid Tied Systems**

The public electrical grid is the largest independent grid, and is directly linked to the vast majority of transmission networks. A grid-interactive inverter must change DC to AC before it can supply power to the grid.

#### **Hybrid Power Systems**

Electricity can be generated by a variety of generators, including those powered by fossil fuels, solar cells, wind turbines, and micro hydropower. These systems are capable of managing not only a single home, but also a town or an island. Many remote areas could benefit from hybrid power systems, particularly in developing countries where connecting to the national grid is costly and dangerous.

#### **Photovoltaic System**

\$6.13/W.

Solar photovoltaic ranks third among renewable energy sources in terms of installed capacity, trailing only wind and hydropower.

Solar energy can be collected using photovoltaic panels that have been installed. The California Valley Solar Ranch and the Agua Caliente Solar Project are the two biggest solar power facilities in the world. There are places in the United Stateson this list. Every plant produces more than 250 megawatts [13,14]. Solar panels only generate 1% of the world's electricity because of their high cost.

Battery banks will be needed as long as energy cannot be continuously produced. In 2011, commercial applications above 100 kW had a median reported cost of \$4.87/W, while residential and small business applications up to 10 kW had a median reported cost of

Figure 7 depicts the price of solar power systems in the United States over time [15]

Photovoltaic (PV) solar energy systems are the most cost-effective option for rural communities to satisfy their energy demands. It has been determined whether or not hybrid photovoltaic (PV) power generation systems are commercially viable. These studies showed

that the approach works well in settings with fewer than 100 people. [16] Research on the ratio of solar hybrid systems to diesel generator-powered systems was done in 2017 by Muselli et al. The battery's theoretical storage capacity was taken into account during both the backup generator's starting and stopping procedures. El-Hefnawi Shrestha and Goel [19] gave an example of how to determine the ideal battery size and capacity for a specific load. The hybrid PV system's storage needs, including the size of the PV array, were determined using FORTRAN and math in [18]. Statistics were used to quantify the burden and sense of isolation while taking into account the pre-operational stage of the diesel generator.

To calculate the LPSP of a combined solar and battery system, Abouzahr and Ramakumar developed a closed-form method. Iterative improvement allows for the fine- tuning of individual components of a hybrid PV system. [20]. The tilt, azimuth angle, separation from the power line, and cost of electricity all have an impact on this composition. The responsiveness of the power supply to changing load conditions is what determines how effective a hybrid photovoltaic system is. Egido and Lorenzo conducted significant study utilising the load loss probability (LOLP) approach to evaluate the PV array and battery capacity. A grid-connected PV system's battery bank's energy-storage capacity was studied by [22].

#### **Wind System**

Wind energy has been used by people since the beginning of time. In the past, grain mills, water pumps, and vessels were all powered by wind energy. Professor James Blyth of Anderson's College in Glasgow constructed the first electric windmill in July 1887. Charles Brush made history when he was the first person in the United States to produce electricity in the dead of winter using a wind-powered device. A hybrid wind energy system needs to have year-round wind energy potential in order to be economically viable. Wind turbines of various shapes, sizes, and arrangements are currently used to capture wind energy. It has the fastest rate of growth of any renewable energy source. Unlike solar energy, it can generate electricity at night and on overcast days. Wind farms produce 35,000 megawatts of electricity in Europe. One of the drawbacks of wind turbines is that they

cannot produce electricity when there is no wind. The addition of additional power sources is necessary due to the demand. Storage devices are required for solar and wind energy because they need to be able to store excess energy for later use. On the other hand, rooftop solar and wind energy systems may continuously generate power. The Rayleigh wind speed distribution was used by Feijoo et al. [24] in their Monte Carlo simulation of the effects of wind farms. Regression analysis and artificial neural network models were combined by [25] to estimate wind turbine power curves. Using long-term wind speed data, Salameh and Safari (1996) examined the capacity factor and windmill parameters. When deciding which wind turbine would be most effective at a given area, the capacity factor must be taken into account. "The capacity factor of hybrid wind energy systems is very important. The wind turbine with the greatest average capacity factor should be used as much as possible. Boccard [27], comparing the capacity factors based on estimates to those based on actual data. In order to optimize an algorithm for the annual wind fraction [28,29] gathered data on the hourly wind speed at five different locations over the course of eight years. The algorithm's precision increased as a result of this. The annual wind percentage was estimated by the algorithm. Inputs include power, the battery, a monthly Weibull wind speed distribution, and model parameters. For the purpose of evaluating LPSPs in self-sufficient wind energy systems with energy storage, Abouzahr and Ramakumar came up with a closed-form solution [30]. A simulation technique was created by Karki and Billinton [31] to determine the ideal proportion of wind energy in an existing power system. To arrive at this conclusion, probability indices were calculated utilizing their method. Dependability and cost effectiveness were taken into account. Monte Carlo simulation was used to develop the method.

#### **Hydro System**

The predecessors of turbines, water wheels, have the capacity to transform hydraulic energy into mechanical energy. Then, electrical energy can be created from this mechanical energy. The hydropower turbine was created in the 18th century by Bernard Forest de Bélidor, a French employee of Architecture Hydraulique. The engineer known as Bélidor was Bernard Forest de

Bélidor, a specialist in military hydraulics. Brush arc light dynamos that were driven by water turbines lit up Grand Rapids' theatres and stores. A turbine-coupled brush dynamo supplied the first light at Niagara Falls in the year 1881. Direct current was used to power them both. The first 12.5 kW hydroelectric plant in history was built in the Wisconsinn city of Appleton in 1882. Over the past four decades, the amount of electricity produced by hydroelectric sources has increased by 3% every year. 16% of the electricity produced worldwide in 2011 came from the 160 different countries that produced hydroelectricity. Hydropower is the main means by which Venezuela, Bhutan, Ethiopia, Paraguay, Norway, and Paraguay produce electricity [33]. The seasonal cycle of hydropower is slower but more reliable than that of solar and wind power. The water levels in rivers and streams vary a little bit throughout the year as a result of seasonal changes. As a result, energy storage is not necessary. It generated 16% of the world's electricity in 2010, making it the "most popular" renewable energy source at the time [34].

#### **Hybrid Renewable Energy System (HRES)**

The Papago Indian hamlet in Schuchuli, Arizona, created the first hybrid power system for a hamlet on December 16, 1978, by combining a diesel generator and photovoltaic panels. When the city finally was hooked up to the electric grid in 1983, the residents relied on the system's electricity to run their lights, water pumps, freezers, washing machines, and sewing machines..HRES currently uses a variety of renewable energy sources. To provide electricity to users in remote locations, energy storage devices, micro hydropower (MHP), solar energy, and small wind power sources are frequently used. Alternative energy sources have distinct manufacturing characteristics. Seasonal differences in river flow, the fact that the sun is stronger during the day than at night, and seasonal differences in wind velocity are all examples. As a result, hybrid system configurations frequently use them.

#### The HRES provides the following benefits

• Depending on the available resources in the area, it might be possible to integrate several renewable energy sources into a single system. Hybrid systems emit no emissions because they use renewable

energy. These systems include, among others, hydropower, solar power, and wind power.

- Modular photovoltaic and wind energy systems are simple to install and do not typically require home design.
- Because the fuel used by HRES energy is unlimited, abundant, and uncontrollable, it cannot be priced.
   For off-grid applications, the use of more portable hybrid energy systems is ideal.

It is anticipated that commercial wind and photovoltaic energy systems will produce electricity sporadically. Combining photovoltaic and wind energy can lower diesel consumption and boost the battery bank's capacity if a conventional generator is used as a backup. Depending on the available solar and wind resources, a hybrid solar photovoltaic and wind power system may be the most efficient option. A number of factors, including but not limited to environmental conditions, the number of photovoltaic panels, the size of the wind generator, the number of batteries in the storage device, and the distance between the generation site and the power plant, can affect the initial investment, ongoing maintenance, and daily operation of a hybrid system. Another important factor to take into account is the distance between the power plant and the generation site.

Nehrir et al. [36] assessed the performance of a fully autonomous hybrid PV/wind system using MATLAB/Simulink.

[37] describes how to calculate and integrate the individual unit quantities of hybrid wind, solar, and tidal energy systems. Notton et al. introduced a LOLP-based model for evaluating hybrid PV systems in [38]. Photovoltaic energy, according to the researchers, can provide 75% of the energy required for optimal performance. Wind turbines, solar panels, and diesel generators were the components of a hybrid energy system studied by Elhadidy and Shahid [39]. As the number of wind turbines, PV array size, and HRES battery capacity were varied, the system's performance was evaluated. Chedid et al. employed AHP to quantify hybrid system design characteristics that produced confusion, with the goal of assisting policymakers in figuring out the variables of grid-connected hybrid PV-

wind generation systems. As a result, creating hybrid system plans was made easier. They looked into social, technological, political, and economic issues.

Here is the block diagram for the MHP-PV-WG hybrid standalone system.

Fig. 8 A typical hybrid micro-hydroelectric, photovoltaic, and wind system is shown

The PV and WG power sources will be connected with the help of a hybrid charge controller. It's possible that the battery bank will need more power to recharge given its current load. Battery power is used to run the load if the power generated by the hybrid system is inadequate. The DC/AC inverter converts direct current to alternating current to satisfy the needs of the consumer load. Parallel connections are required for the battery bank's input terminals, DC/AC converter, and battery chargers. The power structure is evenly distributed. For a hybrid system to reliably deliver energy to customers regardless of environmental conditions, careful planning and development are necessary. Because even slight changes in wind and solar irradiance can affect how much energy is produced. Planning also helps the system save money on costs.

#### **Future of Hybrid Renewable Energy Systems**

There are one billion people who lack access to energy. To emphasise the significance of energy concerns for the post-2015 development agenda and the environment, the United Nations General Assembly launched the Decade of Sustainable Energy for All in 2014. This decade runs from 2015 to 2030 [41]. Distributed hybrid systems make use of local energy generation. Distribution systems eliminate the losses involved in the transmission and distribution of energy. To lower electricity costs while maintaining the network's functionality, pinpoint

the location of photovoltaic and wind energy systems as well as their connections to the utility grid. In a number of countries, renewable energy sources provide a considerable amount of the required energy. The cost of developing and manufacturing wind and solar energy technologies has decreased, making them a viable alternative to conventional energy sources. The price of a hybrid system and how dependable its power output is in a variety of environmental circumstances are its two most crucial features. Most authors tried to make these better.

#### **Mathematical Modeling**

Hybrid systems are powered by batteries, micro turbines, and diesel generators. Hydro turbines, wind turbines, photovoltaic systems, and fuel cells are the elements that make up hybrid power systems. This element is used in the propulsion systems of hybrid vehicles. In order to acquire accurate readings of the system's components, it is important to simulate the system under different global weather, insolation, and wind speed circumstances. The coordinated efforts of an HRES's constituent parts and subsystems result in its optimization. The kind of load, location, and grid connection must all be considered when designing hybrid systems. The majority of distributed hybrid systems are used to power homes and communal buildings. Examples include lighting, radios, televisions, and various home appliances. Clean, renewable energy is the sole kind of energy HRES utilises. The High Renewable Energy Standard gives preference to using renewable energy while also considering things like cost, reliability, and durability. Modelling a hybrid system's component parts is the first step in enhancing its performance. By combining small hydro-solar and wind power systems with mathematical modelling, Bhandari et al. [42] produced a simulation of HRES. Understanding, problem-solving, and decision-making are all aided by modelling. The complexity of the design has no bearing on how accurately the model predicts performance. The balance between complexity and simplicity should be maintained in reality models. Both deterministic and probabilistic modelling strategies can be used to analyze component performance. Modelling of solar, wind, diesel, and batteries.

#### **PV Array Modeling**

The model of a single diode circuit depicted in Figure 10 [44–46] is typically used to calculate the potential energy output of photovoltaic (PV) cells. A PV cell is represented by the ideal single-diode model (ISDM), which consists of a single diode and no shunt resistance.

It is possible to simulate the output current of a single-diode PV cell using Equations 1, 2, and 3. Shunt resistance, represented by the symbol , is necessary for these equations. In the industrial setting, PV cells with two diodes are typically used. In [47], Salam et al. presented a two-diode PV cell model.

$$I = I_{ph} - I_0 \left( \exp\left(\frac{V + R_S I}{A}\right) - 1 \right) - \frac{V + R_S I}{R_{sh}}$$
 (1)

$$I = I_{ph} - I_0 \left( \exp \left( \frac{qV}{kT} \right) - 1 \right)$$
(2)

Figure 10 shows a single-diode PV cell model

$$A = \frac{N_S n k T_c}{q} \tag{3}$$

The amount of continuous and diffuse solar energy captured by a photovoltaic system varies depending on the time of year and the sun's angle. Equation 4 is used to determine solar cell radiation.

$$I_T = I_b R_b + I_d R_d + (I_b + I_d) R_r \tag{4}$$

where  $R_d$  represents the tilt diffuse factor,  $R_r$  represents the tilt factor for reflected solar radiations,  $I_b$  represents normal radiations,  $I_d$  represents diffuse solar radiation, etc.

The hourly power output of a PV system  $P_{sj}$  with a surface area of  $A_{pv}$  under conditions where  $I_{ij}$  (kW) of total solar radiation is incident on the PV surface on an average day of the month is described by equation 5 [49].

$$P_{sj} = I_{Tj} \eta A_{PV} \tag{5}$$

The system's efficiency  $\eta$  is represented by the number 6[50]

$$\eta = \eta_m \eta_{pc} P_f \tag{6}$$

The efficiency of the module  $\eta_m$  as defined by equation 7 [51].

$$\eta_m = \eta_r [1 - \beta (T_c - T_r)] \tag{7}$$

Module reference efficiency, power conditioning efficiency, array efficiency, reference temperature, monthly average cell temperature, power factor, and array efficiency are all computed in Equation 8.

$$T_c = T_a + \frac{\alpha \tau}{U_L} I_T \tag{8}$$

where,

$$\frac{U_L}{\alpha \tau} = \frac{I_{T,NOCT}}{\left(NOCT - T_{a,NOCT}\right)}$$

 $T_a$  is instantaneous ambient temperature, NOCT is normal operating cell temperature,  $I_{T,NOCT} = 800 \text{W/m}^2$  for a wind speed of 1 m/s. Solar insolation and module temperature have a significant effect on PV module performance. A model provided by Zhou [52] in its abridged form is outlined below.

$$v_{oc} = \frac{V_{oc}}{nkT/q}$$

$$P_{max} = \frac{\frac{V_{oc}}{nkT/q} - \ln\left(\frac{V_{oc}}{nkT/q} + 0.72\right)}{1 + \frac{V_{oc}}{nkT/q}} \cdot \left(1 - \frac{R_s}{V_{oc}/I_{sc}}\right)$$

$$\frac{V_{oco}}{1 + \beta \ln\frac{G_s}{s}} \cdot \left(\frac{T_o}{T}\right)^{\gamma} \cdot I_{sco} \left(\frac{G}{G_o}\right)^{\alpha}$$
(10)

where n is the ideality factor (1 < n), T is the temperature of the PV module, and it is this factor that is responsible for all the non-linear effects on which the photocurrent relies. T is a dimensionless coefficient connected to PV module technology, and it is this factor that takes into account all the non-linear temperature voltage effects represents the open-circuit voltage adjusted for temperature.

$$V_t = nkT/q \tag{11}$$

Equation 11 provides an illustration of the power restrictions of PV modules. Photovoltaic modules can produce more voltage and current by being connected in parallel or series. Equation 12 depicts the maximum power output of the photovoltaic array.

$$P_{\text{array}} = N_s \times N_p \times P_M \tag{12}$$

where  $N_s$ ,  $N_p$  and  $P_M$  stand for the no. of photovoltaic modules that have been connected in series, the no. of photovoltaic modules that have been connected in parallel respectively.

#### Wind Turbine Modeling

The quantity of power generated by a wind turbine depends on two factors: the wind speed at the hub height of the turbine and the rotational speed of the turbine. Determine the wind velocity at the hub height using the 13th equation of the power law.

$$V_z = V_i \left[ \frac{Z}{Z_i} \right]^x \tag{13}$$

 $V_z$  An exponent for a power law, denoted by Vz, where Vz is the wind speed at the hub and VZ, Vz is the wind speed at the reference heights Z and Zi, relies on the surface features and atmospheric stability of the layer across which x is valid [54]. The mechanical power of wind turbines may be calculated using Equation 14.

$$P_{\text{mech}} = \frac{1}{2} \rho A C_p V^3 \tag{14}$$

where  $\rho$  is the air density  $\binom{\text{kg}}{\text{m}^3}$  is the swept area of the rotor blades (m²) V is the velocity of wind (m/sec)  $C_p$  is the power coefficient of the wind turbine.

Betz's coefficient, or the power coefficient  $C_p$ , has a maximum theoretical value of 0.593 [55]. Which is often stated as a function of the ratio of the rotor's tip speed to the wind speed  $(\lambda)$ , provided by equation 15.

$$\lambda = \frac{\omega R}{v} \tag{15}$$

Fig. 11 Wind turbine power characteristics

Figure 11 depicts the electricity generated by wind turbines in steady winds. The "cut-in speed" of a wind turbine is the wind velocity at which it begins to spin and produce power. An abrupt braking mechanism stops

155

the rotor's spin, protecting it from damage. At the wind speed at which the cut- out wind speed is achieved, the rotor will be damaged due to the forces produced by the turbine. This wind is what's causing the issue. The rated output speed is determined by the wind speed at which the greatest power is generated. Between the minimum and maximum speeds is this speed. The wind turbine blades and the electrical generator blades combine to produce electricity from their respective sources of mechanical energy. Equation 16 can be used to calculate  $P_{\rm wind}$  (kW/m²), the power output of a wind turbine generator.

$$P_{\text{Wind}} = \begin{cases} P_R \cdot \frac{v - v_c}{v_R - v_c} & \text{for } (v_c \le v \le v_R) \\ P_R & \text{for } (v_R \le v \le v_F) \\ 0 & \text{for } (v < v_c \text{ or } v > v_F) \end{cases}$$
(16)

 $P_R$  stands for rated electrical power, while  $v_C$ ,  $v_R$ , and  $v_F$  stand for cut-in, rated, and, respectively, cut- off wind speeds. The effectiveness of wind turbines is impacted by their placement height. Use equation 17 to calculate the power generated by a wind farm.

$$P = P_{\text{Wind}} A_{\text{Wind}} \eta \tag{17}$$

where,  $A_{wind}$  is the total area swept by the wind turbine, is the generator and converter efficiency ( $\eta$ ) [56].

#### **Engine Generator Modeling**

A conventional generator should be used if a renewable energy system that also has a battery bank is unable to meet load demands. A prime mover, synchronous generator, speed-governed engine, and automated voltage regulator make up a generator set [57].

The engine generator's rated capacity must be established prior to installation; please refer to the guidelines below. [38]

- 1. When the generator is connected directly to the load, the engine's rated capacity must be equal to or higher than the maximum load.
- 2. The engine generator's current output should not exceed  $C_{Ah}/5$ A, when used as a battery charger, where  $C_{Ah}$  is the battery's ampere-hour capacity. According to ElHefnawi [18], running a generator at 70-90% of full load saves money.

#### Modeling of Battery Bank and Its Performance

When autonomy is active, load demand can be satisfied by battery banks even if HRES energy is insufficient or unavailable. The next two days must be used to achieve autonomy. A variety of factors, including the maximum depth of discharge, temperature correction, rated battery capacity, and expected battery life, influence the overall battery size. Consideration should also be given to the battery's capacity and expected lifetime. Equation 18 may be used to determine the ampere-hour capacity of a battery. [58]

$$B_{rc} = \frac{E_c D_s}{DOD_{\text{max}} \eta_t}$$
 (18)

where  $E_cD_s$  is the amp-hour (Ah) current load, is the temperature correction factor, and **DOI** is the maximum depth of discharge of the battery (80% for deep cycle batteries). If the total production of HRES is more than the demand, the battery bank is charging; otherwise, it is draining. Calculate the charge of the battery bank at time t using equation 19. [59]

$$E_g(t) = E_g(t-1)(1-\sigma) + \left(\frac{E_{GA}(t) - E_L(t)}{\eta_{inv}}\right)\eta_{bat}$$
(19)

where E and  $E_E(t)$  are the quantities of energy being charged into the battery bank at time t, and (t-1) is the total energy generated by renewable energy sources after energy loss in the controller, E is the load demand at time t, and are the inverter and battery bank charge efficiency, and s is the self-discharge rate, which is a function of the accumulated charge and the battery's health. The constraints of Equation 20 limit the amount of battery bank charge that is possible.

$$E_{B_{\min}} \le E_B(t) \le E_{B_{\max}}$$
 (20)

where  $E_{\text{Bmax}}$  and  $E_{\text{Bmin}}$  are the maximum and minimum charge quantity of battery bank.

For HRES, state of charge (SOC), floating charge voltage, depth of discharge (DOD), maintenance needs, and battery lifespan are the most crucial battery properties. Each of these elements has to be taken into account while optimising the HRES. However, due to the complexity of the matter, the optimisation process in reference [60]took into account SOC and floating charge voltage. Time, current, state-of-charge (SOC) at time (t), and state-of-charge (SOC) at time (t-1) must

all be known in advance for charging and draining the battery.

#### **HRES Optimization Methods**

Optimising the size of a battery bank, photovoltaic (PV) array, wind turbine, hydro production capacity, or any other kind of power generation system is achievable using load and loss of power supply probability (LPSP) as the key inputs. When talking about HRES, which can operate either grid-integrated or grid-independently, these factors are of the utmost importance. These aspects will be optimized through HRES. The system must be affordable and capable of producing high output power, LPSP, and LOLP. The hybrid PV/wind energy system was improved using the probabilistic, linear, iterative, artificial intelligence (AI), dynamic, and multi-objective optimization techniques.

#### **Graphical Construction**

One approach to the multiple design variable problem is to visualize the ways in which the design variables change. The same graph is used to graphically depict each constraint function. After the contours of the objective function have been drawn, the feasible region can be visually inspected to determine the optimal point on the graph. It is possible to do this by drawing contours. In order to determine the ideal size, Markvart et al. superimposed lengthy time series of climate cycles with low daily solar radiation. They were able to draw their conclusion thanks to this. They came to the conclusion as a result. They came up with the best ratios by using calculations. This determined the ideal size. The first theoretical analyses of a combined solar and wind energy system were provided by Ai and his colleagues in 1959. Keeping the capacity of the wind generator constant, we calculated the hourly performance of a hybrid photovoltaic-wind energy system. By contrasting photovoltaic arrays and battery banks, the annual levelized operating cost of photovoltaic arrays was determined.

#### **Probabilistic Approach**

The probability approach, as opposed to giving precise values, acknowledges the randomness of the data and uses a statistical instrument to describe the variable states. Hybrid photovoltaic and wind energy systems may have their power production estimated in a variety

of ways, including hourly power, monthly power, the smallest quantity of PV power, and the smallest amount of wind power. The efficiency and low cost of this method make it ideal for gathering load and environmental data.

#### **Hourly Average Generation Capacity Method**

Using hourly averages of wind, solar radiation, and electricity demand, this method optimises system size. This estimate is based on the monthly averages of wind and solar energy production over a whole year. The following equations describe the dimensions of the wind and photovoltaic components [63]. The objective function that must be minimised is defined in Equation 21.

$$F_c = C_c + C_m \tag{21}$$

where represents the cost of capital investments and represents the annual cost of maintenance. The difference between the power generated and the power demanded should be as small as possible to maintain system balance.

$$\Delta P = P_{gen} - P_{dem} \tag{22}$$

#### Most Unfavorable Month Method

The approach calculates the optimal size of solar and wind generators based on the wettest month of the year. According to the most current information, there are some months when wind and radiation conditions are less than optimal. [92,93] Equation 23 determines the size for a given PV or wind component.

$$A_i = \max\left(\frac{E_{Load,m}}{E_{i,m}}\right) \tag{23}$$

where m=1 represents the month of the year, The system's monthly energy output, expressed as a function of land area, is represented by the variables and . The amount of energy that generators (like wind and solar power) supply to the load is represented by equations 24-25.

$$\sum E_i A_i = E_{\text{Load}} \tag{24}$$

$$E_i \times A_i = f_i \times E_{Load} \tag{25}$$

where  $f_i$  is the percentage of load supplied by the generator i.

#### **Deterministic Approach**

Deterministic techniques, in contrast to probabilistic ones, always provide a unique solution for a given set of parameters since each set of variable states is produced uniquely by the model's parameters and the previous values of these variables. Bhandari and Stadler determined the cost and size of a PV system for Nepal. [70].

#### Iterative Approach

An optimisation issue may be solved using an iterative technique by developing a set of ever- improving approximation solutions until a termination criterion is reached. It is usually implemented by a computer. With an increasing number of optimisation variables, the calculation time for this approach climbs exponentially. Using this strategy, Li et al. [74] tuned PV-wind-battery HRES to lower total system costs.

#### **Artificial Intelligence**

The analysis and creation of intelligent computer hardware and software is the main focus of AI research and development. Artificial intelligence (AI) was first defined by researchers Russell and Norvig in a 1994 publication as 'the study and design of intelligent agents." This indicates that a smart agent is one that actively seeks to achieve its goals. The fields of ANN, FL, GA, and hybrid systems that combine two or more of these all fall under the heading of 'artificial intelligence" (AI). Both the performance and other aspects of the system are improved by intelligent technologies. Unlike more traditional techniques [95].

#### **Optimization with Genetic Algorithm**

Computers can use GA to solve search and optimization issues with accuracy or approximation. In the field, general-purpose search heuristics are referred to as GA. Problem-solving genetic algorithms employ evolutionary biologyideas. Examples include recombination, inheritance, selection, and mutation.

#### A typical GA must include the following items

- a. problem domain genetic model
- b. a problem domain evaluation function

Genetic algorithms (GA) may be useful when conventional hill climbing algorithms fail in difficult

fitness environments. Figure 12 depicts the process flow for using GA to optimise HRES.Xu et al.[80] utilised a genetic algorithm and an elitist technique to find out how big of a hybrid PV/Wind power plant would be best for a year's worth of consumption (8760 hours). With LPSP being at a premium, saving money was a top priority.

#### Software based Approach

Hrayshat [91] used HOMER to conduct a technoeconomic analysis of the components of a hybrid PVdiesel-battery system for a rural Jordanian home and came up with the system's optimal design. This change was driven by a desire to improve energy efficiency. Information on solar insolation, electricity demand, hybrid generator technical details, costs, caps, and controls is provided to HOMER. It is also possible to learn more about the dispatching plan.

The most efficient hybrid PV-diesel-battery system for a rural Jordanian house was designed by Hrayshat [91], who utilised HOMER to undertake a techno-economic study of the system's components. Maximising energy efficiency was the motivation behind this move..

#### **Optimal Design Criteria for HRES**

The goal of the HRES system sizing procedure is to determine the optimal combination of generator sizes (renewable and conventional) and storage capacity for meeting the anticipated demand load with the lowest tolerated degree of security. To create the best HRES, researchers used a variety of economic, reliability, capacity, and other design criteria.

#### **Cost of the Energy**

Battery banks are typically replaced every five years, giving a hybrid system an average lifespan of 20 years. Several factors influence energy pricing, including initial and ongoing costs, annual energy production, the likelihood that equipment prices will fall as output increases, and others. Equation 26 depicts a simple relationship for cost estimation.

$$C_E = C_{Cap} \times \frac{R}{E_{Tot}} + C_{O\&M}$$
 (26)

where  $E_{\textit{Tot}}$  is the total amount of energy produced,  $C_{\textit{O&M}}$  is the annual cost of operation and maintenance, R is the

annual discount rate for capital costs, and  $C_{\rm E}$  is the cost of energy.  $C_{\rm Cap}$  is the investment cost of the HRES generator and storage system. Numerous researchers consider the price of electricity when evaluating the LOLP HRES configuration. The price per kilowatt-hour is an important HRES metric. The price per kilowatt-hour is shown in equation 27.

$$Cost /kWh(\$) = \frac{C_{Total}}{E_{Total}(kWh)}$$
 (27)

where kWh is the used measurement unit and  $E_{\textit{Total}}$  denotes the annual electricity production priced in  $C_{\textit{Total}}$ .

#### Loss of Power Supply Probability (LPSP)

When deciding on the ideal number of batteries, solar panels, wind turbines, and other renewable generators, this method takes the security of the power supply into account. When the needs of the load aren't satisfied, a hybrid system's reliability is compromised".

LPSPs are used to calculate the normal and long-term power loss of a power system. When the LPSP is equal to one, the load is never dissatisfied, and when it is equal to zero, the load is never satisfied.

#### The LPSP technique is divided into two steps

- a. After the HRES generates more power, the cycle continues until the battery is fully charged, at which time a new SOC is determined. Any excess energy is not consumed once the battery has been fully charged.
- b. In the event that the HRES fails to provide enough power, the SOC is recalculated until either the hardware disconnects from the load or the battery bank hits its minimum capacity.

The LPSP can be calculated in terms of battery SOC using equation 28.

$$LPSP = \Pr \left\{ E_B(t) \le E_{B_{\min}}; \text{ for } i \le T \right\}$$
(28)

i.e., the energy stored in the battery at any given time t is a guarantee that the state of charge at that time is less than or equal to the bare minimum of the provided energy in battery  $E_{Bmin}$ .  $E_{B}(t)$ .

#### Loss of Load Probability

LOL refers to the HRES's inability to meet daily peak demand. When the system's demand exceeds its generating capacity, a LOL occurs [98]. Days per year, hours per day, and percentage of time are all ways to measure the frequency and duration of power outages (loss of power, or LOLP). Calabrese was the first to propose the LOLP plan [99]. The LOLP is calculated using equations 28 through 29. [17]

$$LOLP = \frac{\sum_{t=1}^{n} \text{ hours } (I_{\text{supply}} < I_{\text{needed }}(t))}{n}$$
(29)

Where,

$$I_{\text{needed}}\left(t\right) = \frac{L(t) - P_{W}\left(t\right) - P_{pV}\left(t\right)}{V_{L}} \eta \left(I_{\text{battery}}\left(t\right)\right)$$

$$I_{\rm needed}\left(t\right) = \min\!\left(I_{\rm max} = \frac{0.2SOC}{\Delta t}, \frac{SOC(t)\sigma - SOC_{\rm min}}{\Delta t}\right)$$

And  $I_{needed}$  (t) is the current required for the load at hour t,  $I_{supply}$  (t) is the current supplied by HRES at hour t, n is number of samples.  $V_L$  is the nominal voltage needed by the system, L(t) is the electrical load requirements at hour t,  $P_w(t)$  is the power generated by the wind turbine at hour t, and  $P_{pv}$  (t) is the power generated by PV modules at hour When LOLP is low, system costs are high, and vice versa.

#### CONCLUSIONS

Since hydroelectric renewable energy sources (HRES) are becoming more economically viable, more people are turning to them to provide power to rural regions. The vast majority of the one billion people without access to electricity who live in developing nations should benefit from this initiative. Compared to photovoltaic and wind systems, HRES is able to collect more energy, improving the supply security of these technologies. The structure of the global energy market includes a section that emphasizes renewable energy sources. The experiment proves the accuracy of the battery bank and generator mathematical model. There has been a lot of study devoted to the potential benefits of hybrid power systems that combine renewable energy sources. This article discusses design suggestions as well as the benefits of optimization strategies.

This paper provides a thorough summary and analysis

of years of research on the enhancement of HRES. They could be connected to an existing grid or not. A scope diagram is included in the article to aid readers in understanding the content. The two tables on optimization approaches and HRES optimization based on key criteria will be helpful to academic researchers and members of the research community.

### Development of an IoT based Real-Time Monitoring and Automatic Water Level Control System with Alert Notification through IFTTT

Afsar Khan, Pankaj B. Thote

Arpita Fusey, Priya Keshkar

Electrical Engineering Department
S. B. Jain Institute of Technology, Management & Research
Nagpur

#### **ABSTRACT**

Waste of water monitoring and controlling is an essential service that many utilizes and perform for their industrial and larger commercial applications. The Internet of Things (IoT) could prove to be one of the most important methods for developing more utility, proper system and for making consumptions of water resources more efficient. Liquid monitoring through cloud is effective and it provides an feasible solution for remote monitoring. In this work, the new approach for monitoring and controlling the water level with the help of various cloud service. Wastage of water is very important for the part of focus so, the conservation of water resources is very essential. The water level inside the tank can potentially be determined by this project and the display will show it appropriately. NodeMCU module work on the WI-FI which is use for automatically operation of system. This is close loop control system. IFTTT (If This Then That) web service has been used for sending SMS on mobile.

**KEYWORDS:** Water monitoring, Water controlling, NodeMCU module, IFTTT service, Thing speak platform.

#### INTRODUCTION

oday, the world is facing the environmental problems and challenges. One of the main issues of the current situation is the lack of drinking water. Clean drinking water and water used for utility purpose is very significant to sustain life and it plays a major role in well-being of human society. In a civilized society, overflowing of water is very concernful matter which leads to precious water wastage and energy losses. This issue can be resolved by just monitoring and controlling the water level with some kind of alertness such as notification on mobile or any android application which can make aware the user about the water level. To overcome the problem of the wastage of water, the monitoring and analysis of roof top tank water level at house hold or any type of buildings with alert notification and demonstrated in the project.

In this project, the aim is to monitor the liquid level using IoT technology specifically by utilizing the

NodeMCU and an ultrasonic sensor. The NodeMCU is chosen as it integrates an ESP8266 Wi-Fi module making it cost-effective, compact and efficient. This system utilizes the ThingSpeak platform as a web server which is freely available for use. This platform provides real-time data visualization in the form of a graphical representation and percentage based liquid level on an Android application.

#### **MAIN OBJECTIVES**

- To ease the monitoring & controlling the water level through IoT.
- To monitor and control water level at industry and commercial establishments.
- To overcome the problem of low level & overflowing of water occurred during manual observation.
- To enable the human to manage their water level time to time.

www.isteonline.in Vol. 46 Special Issue, September, 2023

The specification of the required components has been given in the Table 1.

Table 1: Used components in the circuit

Sr No	Component	Rating	Pictures	Quantity
1	Node MCU with Wi-Fi module ESP8266	Memory 128 Kb Stroge 4 Mb	THE REAL PROPERTY OF THE PARTY	01
2	Ultrasonic sensor (HC-SR04) (Simple and water proof)	5V		01
3	Connecting wires			As per requirement
4	Water pump	12V	0	01
5	Plywood			
6	Adapter	5.5V		01

7	OLED Display	5V	OLED Display	01
8	Battery	9V		01

### METHODOLOGY OF THE PROPOSED WORK

The internet of things brings up prospects for more direct integration between the physical world and computer-based improving systems, efficiency, accuracy and economic value. This is made possible by the ability to remotely manage objects through existing network infrastructure. The Hardware, NodeMCU, Ultrasonic sensor and relay that make up an IOTbased water level monitoring system are joined by an IOT platform like Things Speak and IFTTT. There is a Wi-Fi module included into NodeMCU that handles wireless connectivity, allowing for quick, secure and precise information sharing. This method for wirelessly monitoring water use in the water tank is based on a hardware and software integrated solution.

#### **WORK FLOW**

It's distributed into two phases as follows:

Phase 1: Phase 1 consists of understanding the different hardware components, sensor and microcontroller viz. OLED display, Single channel Relay, Pump, Ultrasonic sensor, NodeMCU and their interconnection.

Phase 2: It consists of understanding and using the Software i.e. Arduino IDE, Things speak, IFTTT and related programming.

**System Architecture:** This system indicates the architecture of IOT based water level monitoring system with alert notification. The Fig 1 system indicates the architecture of IOT based water level monitoring system with alert notification. The flow of data transfer is from ultrasonic sensor to Node MCU after that with the help of Wi-Fi module the information is given to the web server and then it shows the real time data on the android application and it controls the water level.

Fig 1: System architecture

Fig 2: Flowchart of the proposed water monitoring and controlling system

Working of NodeMCU with ultrasonic sensor: The NodeMCU is used with Ultrasonic sensor, ThingSpeak cloud service & Android application (Mobile). The NodeMCU has a 30 pin but out of that, it is used only 10 pins i.e., D0, D21, D2, D3, D4,2(3V3), 3(GND) which is (GPIO16, GPIO5, GPIO4, GPIO0, PIO2) pin, 3V3 pin & GND. O-LED display has 4 pins i.e. Ultrasonic sensor (HC-SR04) which has 4 pin VCC, TRIGGER, ECHO and GND as shown in Fig 3. For notification and displaying the real time water level on cloud, the ultrasonic sensor which calculate the distance and give in the percentage form of present water in the tank. To calculate distance, there is a requirement to dump the program in NodeMCU which contain Wi-Fi module with the help of Arduino software.

Fig 3: Interfacing of NodeMCU with Ultrasonic sensor

Ultrasonic sensor calculates the distance and that is giving NodeMCU where the EP8266 Wi-Fi is inbuilt and connected to web server which give a real time data of water level and the result can view on the android application and shows the notification. Here firstly, set the overflow level of water tank and the level of water. By considering this, if water is field up to the overflow level then it shows the 100% and also firstly set the upper threshold value i.e., 90% & lower threshold i.e., 10% then it shows notification and give an alert notification regarding the water level and analysis time to time.

Once the echo goes high (5V) and external interrupt get that data then the counter is start in ISR (Interrupt Service Routine) for start and start counter for updated. Update memory of NodeMCU to get the distance continuously.

Calibration for the tank: Distance = 
$$\frac{D-340\mu S}{2}$$

% Level = 
$$\frac{H-D}{H} \times 100$$

H= Total Height of tank in cm

D= Distance between water level and sensor

Input of relay is connected to the output of NodeMCU and its 3v3 part has been connected to the VCC of relay. GND of relay is connect to GND of NodeMCU. IN pin of relay is connected D4 of node MCU which is shown in Fig 4. Output of relay is connected to the battery positive of battery is connect to the NO of relay and positive of pump is connect to common of relay. Negative of battery and pump is short. Battery gives the supply to the pump. When the water level less than 10% according to calibration motor on automatically and fill the tank above 90%. When water reach above 90% relay sense and motor is off automatically.

Fig 4: Interfacing of NodeMCU with Relay

#### **Advantages:**

- It is low cost with integrated support for Wi-Fi module.
- It is very compact product with very less component, reliable and highly efficient.
- It is the most modern IOT based it technology used for worldwide monitoring and low energy consumption.
- Water leakage detection and reduces the wastage of water.

#### **Applications:**

- Liquid level indication and control in industry.
- Oil and Fuel and all types of liquid level monitoring.
- STP (Sewage Treatment Plant) level indication.
- It's used in all types of commercial buildings.
- Offers RTC (Real Time Control) and RTA (Real Time Access).

#### HARDWARE AND IMPLEMENTATION

Fig 5: Hardware Implementation of Water Level Monitoring and Controlling System

#### **RESULTS AND DISCUSSION**

- 1) Arduino IDE: Arduino IDE (Integrated Development Environment) is an open-source software tool used for writing, compiling and uploading code to Arduino boards.
- Thinks speak application: Thing Speak is a webbased application and IoT platform that allows users to collect, analyze, and visualize data from connected devices
- 3) IFTTT: IFTTT (If This Then That) is a popular webbased service that allows users to create automated workflows and connect various internet-enabled devices and services together. It enables users to create applets, which are simple conditional statements that specify an action to be performed when a certain trigger event occurs.
- 4) Sending data to thing speak: Prior to getting started, one must first register for a ThingSpeak

account, sign in and select "Get Started". Go to the "Channels" menu now and on the following page, select "New Channel" to continue. Now, a form for creating the channel is displayed and then completes the "Name and Description fields" as necessary. Next, fill in the label for Field 1 with water and check the boxes next to both Fields. Additionally, check the box next to "Make Public" on the form, then click "Save" as shown in Fig 6. The new channel has now been established.

Now click on "API keys" tab and save the Write and Read API keys, here the use of only using "Write key". Get link as marked in the image which is need to "Copy" the key and link in the program.

Fig 6: Data is transferred to ThingSpeak IOT based paltform

**IFTTT:** There are many applications for sending SMS alert, in which mostly GSM module is used. But in this work, there has been a use of IFTTT which is a free web-based service to create chains of simple conditional statement called applets as shown in Fig 9.

Fig 7: Creating an applet

Steps use for IFTTT: It is necessary to create an IFTTT applet that links to Particle in order to send messages to the phone. Set up the SMS service first. The present connection should function if this has already been configured. Setup the Particle service right away. Create the new applet now, as seen in Fig 10. For the service field (then), select "Particle". Choose "new event published" from the list. The "Event Name Field" can be given any distinctive name, as illustrated in Fig 11. Select SMS in the "that" field as displayed in Fig 12. The message is written as "Water level monitoring" as per the work.

Fig 10: Making a applet with an trigger block for the required service accordingly

Fig 11: Choosing an Android SMS service with publishing an event name

Fig 12: Receiving an SMS of alert notification as per the applet title

#### **CONCLUSION**

The main objective of the proposed system is to implement smart water quality monitoring in a planted tank. Monitoring water quality in real-time is crucial for maintaining the health and safety of aquatic plants and animals. The system described in this paper offers a cost-effective and efficient model for continuous water monitoring. To automate the control of water level, a relay is incorporated into the system. The relay acts as a switch that can turn the water pump or any other water control mechanism on or off. When the water level reaches 90%, the relay is triggered to turn off the water supply, preventing overflow. Conversely, when the water level drops below 10%, the relay is activated to turn on the water supply ensuring that the adequate level is maintained.

Additionally, the Thing Speak mobile application can also be used to monitor the values remotely. To enhance the system's functionality, IFTTT (If This Then That) applets are incorporated. These applets utilize the services offered by Thing Speak such as Thing HTTP and Thing Speak Reacts. By setting up appropriate applets in IFTTT using Things peak's URL, the system can notify the owner when the calculated sensor values exceed a predefined threshold.

#### Kiran M. Tajne

Associate Professor Government College of Engineering Nagpur

#### **ABSTRACT**

Wireless Sensor Networks (WSNs) have emerged as a promising technology for dense forest monitoring due to their low-cost, easy deployment, and efficient data collection. This research paper aims to conduct a comprehensive survey of various WSN technologies that can be used for dense forest monitoring. In this study, we compare the performance of various WSN technologies including LPWAN, ZigBee, Wi-Fi, Bluetooth, GPRS, GSM, and RFID for dense forest monitoring based on their range and power consumption. Our results indicate that LPWAN technology provides the longest range and lowest power consumption, making it a suitable option for monitoring dense forests. Wi-Fi and Bluetooth have higher data rates but shorter range and higher power consumption, while GPRS and GSM offer global coverage but with moderate to high power consumption. Although RFID has lower range, it has low power consumption. Our findings suggest that LPWAN is the most suitable WSN technologies for dense forest monitoring due to their low power consumption and moderate to high long range capabilities.

KEYWORDS: Wireless sensor networks, Dense forest monitoring, ZigBee, Bluetooth low energy, Wi-Fi, LoRaWAN

#### INTRODUCTION

orest is one of the most important ecosystems on earth, providing essential services such as carbon sequestration, oxygen production, and biodiversity conservation. However, forests face various threats such as deforestation, climate change, and forest fires. To protect forests and their inhabitants, it is essential to monitor the forest ecosystem continuously. The dense forest environment makes it difficult to collect data manually. Hence, there is a need for an automated monitoring system that can collect data efficiently and accurately [1]-[5].

Wireless Sensor Networks (WSNs) have arisen as a promising technology for forest monitoring due to their low- cost, easy deployment, and efficient data collection. WSNs consist of a large amount of tiny sensor nodes that can talk with each other wirelessly

to collect data from the environment. Each sensor node can measure various environmental parameters such as temperature, humidity, light intensity, air quality and animal tracking. The collected data is sent to the base station for processing and analysis. Nowadays, main wireless standards are in use namely Wi- Fi, Bluetooth, Zig-Bee, RFID, GPRS, GSM, and Low Power Wireless Area Network (LPWAN) [16]-[25]. The evolution of different wireless communication technologies used for node to node communication is depicted in Figure 1.

Wireless sensor network based surveillance systems for remote deployment and control are more cost effective than traditional methods and they are easy to deploy at location of interest. They can even reach areas where satellite signals are not. Additionally, they have a secure mode of data transmission for longer duration. Real time data collected with the help of different

www.isteonline.in Vol. 46 Special Issue, September; 2023

sensors can be transmitted to a remote station through wireless protocols. This will vastly reduce the human requirements and delay of signal transmission in dense forests. Wireless sensor nodes are capable of organizing themselves into a network and communicating with each other by with the help of different routing protocols. When a sensing node detects data, it reports the occurrence of events to the base station or server with wireless communication technology and grid topology [28]-[34].

This research paper aims to conduct a comprehensive survey of various WSN technologies that can be used for dense forest monitoring. The paper is organized as follows. Section 2 provides Literature review of WSN technologies, their applications in dense forest monitoring, different aspects of dense forest monitoring and the requirements of WSN technologies for each aspect. Section 3 presents an analysis of different WSN technologies such as ZigBee, Bluetooth Low Energy, Wi-Fi, and LoRaWAN. In section 4 paper ends with conclusion.

Fig. 1. Evolution of Different Wireless Sensor Network Communication Technologies used in Forest Monitoring

#### RELATED WORK

Extensive work has been carried out in forest monitoring and reported in terms of hardware and software development relating to sensor node arrangement and deployment. Practical experiments were conducted to understand how data communication is affected by environmental conditions, like forest density, high humidity, and temperature variations. Wireless Sensor Networks (WSNs) have gained significant attention in recent years for environmental monitoring and forest management. Alomari et al. (2017) provided a

comprehensive review of recent trends and applications of WSNs in environmental monitoring. Khan and Anjum (2018) highlighted the potential of WSNs in improving forest management. Wang et al. (2019) discussed the application of WSNs for forest monitoring. Li and Luo (2019) reviewed the use of WSNs for forest fire detection. Shi et al. (2020) also reviewed forest fire detection using WSNs. Soares et al. (2020) discussed the use of WSNs in forest management. Zhang et al. (2020) provided a general review of WSNs for environmental monitoring. Sehgal and Kundra (2020) reviewed WSNs for forest monitoring. Zhang and Lin (2020) reviewed WSNs for forest fire detection. Zhang et al. (2021) discussed the use of WSNs for forest ecology monitoring. Guo et al. (2021) reviewed WSNs for forest ecosystem monitoring. Zeng et al. (2021) reviewed WSNs for forest insect pest monitoring. Li et al. (2021) provided a review of WSNs for forest soil monitoring. Al-Fuqaha et al. (2015) present a comprehensive survey of the enabling technologies, protocols, and applications of the Internet of Things (IoT). The authors discuss the various IoT architectures and their components, such as sensors, RFID, and smart objects. They also review the key communication protocols and networking technologies, including Wi-Fi, Bluetooth, and ZigBee, as well as the security and privacy issues related to the IoT. Shrouf et al. (2017) provide a review of the concept of smart factories in Industry 4.0 and discuss the energy management approaches used in such factories. Kanhere and Srivastava (2005) discuss the routing protocols used in wireless sensor networks and their characteristics. Dinh et al. (2013) survey the architecture, applications, and approaches used in mobile cloud computing. Wang and Hasan (2014) present a wireless sensor network-based forest fire detection system. Liu et al. (2010) review the RFID technology and its applications, while Xu et al. (2014) discuss the energy-efficient RFID- based tracking for cold chain management. Balasubramanian et al. (2009) analyze the energy consumption of mobile phones and its implications for network applications. Phuc et al. (2016) analyze the power consumption of GSM, GPRS, and EDGE for machine-to- machine (M2M) applications, while Merlino et al. (2014) investigate the energy consumption of M2M devices in cellular networks. Zheng et al. (2016) provide an overview of the

Low Power Wide Area Network (LPWAN) technology, and Elgala et al. (2011) discuss the potential and stateof-the-art of indoor optical wireless communication. Chen, T., et al. (2016) developed a real-time forest fire monitoring system using a wireless sensor network (WSN) that employs temperature sensors to detect fires. The authors built a communication system based on the ZigBee protocol to enable real-time monitoring and early detection of forest fires. In another study, Kumar, P. & Prasad, R. (2017) conducted a comparative analysis of different WSN technologies for the Internet of Things (IoT), comparing ZigBee, Bluetooth Low Energy, and other technologies. They evaluated the suitability of these technologies for IoT applications based on factors such as energy efficiency, communication range, and other features. Other studies reviewed in this literature review include Gautam, S. & Singh, S. (2017) comparing ZigBee and Bluetooth Low Energy for IoT, Karpuram, G., et al. (2016) developing an RFID-based forest fire monitoring system, Faiyaz, A. & Prasad, R. (2017) reviewing WSNs for forest fire detection and monitoring, Peng, S., et al. (2015) designing a forest environment monitoring system based on GPRS and WSN, and Ha, T., et al. (2018) building a forest fire monitoring system based on LoRaWAN technology.

# NEED OF WSN IN FOREST MONITORING

With detail review following assumptions are noted for WSN in forest monitoring related to applications, aspects, requirement and different technologies.

### Overview of WSN Applications in Dense Forest Monitoring

The following are the advantages of using WSNs for forest monitoring:

- Low cost: WSNs contain of a huge number of tiny sensor nodes that are low-cost and easy to deploy.
- Easy deployment: WSNs can be deployed quickly without the need for any wiring or infrastructure.
- Efficient data collection: WSNs can collect data from the environment efficiently and accurately.
- Real-time monitoring: WSNs can provide real-time monitoring of the forest ecosystem.

 Remote monitoring: WSNs can be accessed remotely, making it easier to monitor forests in remote areas

### Different Aspects of Dense Forest Monitoring and Requirements of WSN Technologies

Dense forest monitoring involves various aspects such as environmental monitoring, fire detection, and animal detection. Each aspect requires different types of sensors and WSN technologies. The following are the requirements of WSN technologies for each aspect:

Environmental Monitoring: Environmental monitoring involves measuring various parameters such as temperature, humidity, light intensity, and air quality. WSN technologies such as ZigBee, Bluetooth Low Energy, and Wi-Fi can be used for environmental monitoring as they provide low power and low-data rate communication, which is suitable for environmental monitoring. The sensor nodes used for environmental monitoring should have a low power consumption and a long battery life to ensure long-term monitoring.

Fire Detection: Forest fires are one of the biggest threats to forests, and early detection is critical to prevent the spread of the fire. WSN technologies such as ZigBee, Bluetooth Low Energy, and LoRaWAN can be used for fire detection. The sensor nodes used for fire detection should be able to detect smoke, heat, and flame and should be able to transmit the data in real-time to the base station.

Animal tracking: Forests are home to a variety of animals, and monitoring their behavior is essential for wildlife conservation. WSN technologies such as ZigBee and Bluetooth Low Energy can be used for animal detection. The sensor nodes used for animal detection should have low power consumption and should be able to detect animal movements and communicate the data to the base station.

# WSN TECHNOLOGIES IN DENSE FOREST MONITORING

#### Zigbee

Zigbee technology has been widely used in forest monitoring due to its low power consumption, low cost, and ability to support large networks. Zigbee is a

wireless communication technology that uses the IEEE 802.15.4 standard for wireless communication, which provides reliable and secure data transmission. Zigbee technology is highly suitable for forest monitoring applications because it can operate at low power levels and can cover long distances, making it ideal for remote forest locations. The Zigbee protocol operates in the 2.4 GHz frequency band and is based on the IEEE 802.15.4 standard for wireless personal area networks (WPANs). The Zigbee protocol is designed to provide lowpower, reliable, and secure wireless communication between devices in a network. In a mesh networking architecture, zigbee allows for the creation of large networks with multiple devices. Each device can act as a router, allowing the network to be self-healing and providing redundancy. Even, the Zigbee protocol uses a star network topology, where a central coordinator node controls the network and communicates directly with the other nodes. The other nodes can only communicate with the coordinator node, and they do not communicate with each other directly.

#### **Bluetooth Low Energy (BLE)**

Bluetooth technology has also been used in forest monitoring applications due to its low power consumption, high data rate. In forest monitoring applications, Bluetooth technology can be used to collect data from sensors deployed in the forest and transmit it wirelessly to a mobile device or a remote monitoring station. Bluetooth Low Energy (BLE) is a variant of Bluetooth technology that is particularly well-suited for low-power IoT applications. BLE devices can operate on a single coin-cell battery for several months or even years, making them ideal for use in remote locations. But the main drawback of Bluetooth technology is low range, because of which no one can prefer it for development and deployment.

#### Wireless Fidelity (Wi-Fi)

Wi-Fi technology offers a high-data-rate and widely available option for forest monitoring applications. Its use of Wi-Fi access points makes it possible to collect data from a large number of sensors deployed in the forest, and its compatibility with high-resolution imaging and video data makes it an attractive option for applications such as forest health monitoring. However,

its high power consumption and susceptibility to interference may limit its use in certain applications.

#### Radio Frequency Identification (RFID)

In forest monitoring applications, RFID tags can be attached to trees or other objects of interest, and RFID readers can be used to collect data on the location and condition of these objects. RFID technology has several advantages for forest monitoring applications, including its ability to read tags at a distance, its low cost, and its ability to operate in harsh environmental conditions. However, it also has some limitations, such as its limited data storage capacity and its limited range compared to other wireless communication technologies. Therefore, RFID technology is often used in combination with other wireless communication technologies, such as Zigbee or Bluetooth, to create more robust and versatile forest monitoring systems.

#### **General Packet Radio Service (GPRS)**

General Packet Radio Service (GPRS) is a packet-switched wireless data communication service that allows devices to transmit data over a cellular network. GPRS technology can be used in wireless sensor networks (WSN) for forest monitoring applications to transmit data from remote sensors to a central server or monitoring station. In GPRS- based WSNs, the sensors are equipped with GPRS modems that transmit data over a cellular network to a central server. The data can then be processed and analyzed to monitor environmental conditions such as temperature, humidity, and air quality in the forest.

#### Global System for Mobile Communications(GSM)

Global System for Mobile Communications technology has also been used in Wireless Sensor Networks (WSN) for forest monitoring applications. GSM is a cellular communication technology that operates on licensed frequency bands and provides wide coverage and high data transfer rates. In forest monitoring applications, GSM-based WSN can be used to collect data from sensors deployed in the forest and transmit it wirelessly to a remote monitoring station or a cloud-based server for storage and analysis. GSM-based WSN typically require a GSM modem, which is connected to the sensor nodes and provides wireless communication capabilities.

#### Low Power Wireless Area Network (LPWAN)

LPWAN (Low-Power Wide Area Network) technologies are emerging as a promising solution for forest monitoring applications due to their ability to provide long-range wireless communication with low-power consumption. LPWAN technologies are designed to provide long-range communication with low data rates and are ideal for IoT and WSN applications that require low-power, long-range connectivity. There are several LPWAN technologies available today, including LoRaWAN, Sigfox, and NB-IoT. These technologies operate in unlicensed or licensed frequency bands and offer long-range connectivity with low-power consumption, making them ideal for use in remote locations where power supply is limited.

#### REVIEW ANALYSIS

According to the tabular comparison in Table 1, LPWAN technology offers the longest range and lowest power consumption among the listed wireless sensor network technologies for dense forest monitoring. ZigBee also has low power consumption and moderate range, while Wi- Fi and Bluetooth have higher data rates but shorter range and higher power consumption. GPRS and GSM offer global coverage but have moderate to high power consumption. RFID has lower range but low power

consumption. Overall, LPWAN and ZigBee appear to be the most suitable WSN technologies for dense forest monitoring due to their low power consumption and moderate to long range capabilities as shown in Fig. 2 and Table 1.

Fig. 2. Comparison of different WSN Technologies in terms of data rate, cost and range

Table 1 providing a comparative analysis of energy consumption of WSN node using Wi-Fi, Bluetooth, ZigBee, RFID, GPRS, GSM, and LPWAN WSN technology in dense forest monitoring. The values are based on research studies as shown in figure. The energy consumption may vary based on several factors, such as the application, network architecture, and environmental conditions. The comparative analysis of energy consumption by each different technology is shown in Table No. 1 and column No. 6.

Table No.: 1 Tabular Data for Different WSN Technologies Used In Forest Monitoring

Sr. No.	Technology	Frequency	Data Rate	Range	Energy Consumption	Cost	Suitability for Forest	Referen- ces
					(mJ/bit)		Monitoring	
1	Wi-Fi	2.4 GHz	Up to 866 Mbps	Up to 100 m	10 - 100	High	Not suitable for remote locations and low-power applications	[16], [17], [28]
2	Bluetooth	2.4 GHz	Up to 3 Mbps	Up to 100 m	0.3 - 0.5	Low	Suitable for short-range and low-power applications, but limited range	[18], [19] [29]
3	ZigBee	2.4 GHz	Up to 250 Kbps	Up to 100 m	0.03 - 0.05	Low to Moderate	Suitable for low-power and low-data rate applications, but limited range	[20], [21], [30]
4	RFID	Various	Up to 640 Kbps	Up to 10 m	10 - 1000	Low to Moderate	Suitable for asset tracking and identification, but limited range and data rate	[8], [22], [31],
5	GPRS	2G/3G	Up to 115 Kbps	Up to 35 km (Line of Sight)	100 - 1000	High	Suitable for long-range and high-data rate applications, but high power consumption	[9], [23], [32]
6	GSM	2G/3G	Up to 384 Kbps	Up to 35 km (Line of Sight)	1000 - 10000	High	Suitable for long-range and high-data rate applications, but high power consumption	[12], [24], [33]
7	LPWAN	Various	Up to 50 Kbps	Up to 10 km (Ur- ban), up to 40 km (Ru-ral)	0.001 - 0.1	Low to Moderate	Suitable for long-range and low-power applications, ideal for remote locations and harsh environments	[13], [27], [34]

www.isteonline.in Vol. 46 Special Issue, September, 2023

# **CONCLUSION**

This research paper highlights the importance of Wireless Sensor Networks (WSNs) in dense forest monitoring and provides a comprehensive survey of various WSN technologies that can be used for this purpose. The comparative analysis of different WSN technologies based on their range and power consumption reveals that LPWAN technology is the most suitable option for monitoring dense forests due to its low power consumption and long range capabilities. This study emphasizes the significance of selecting the appropriate WSN technology based on the specific requirements of the dense forest monitoring application to achieve optimal results. The use of WSNs in dense forest monitoring can enable effective data collection and analysis, leading to improved forest management and conservation.

#### **ABSTRACT**

The integration of Wireless Sensor Networks (WSNs) with 5G networks, using Device-to-Device (D2D) communications, enables direct interaction between nearby user equipment (UE) through cellular or ad hoc links. This integration aims to optimize spectrum utilization. The D2D communication architecture is hierarchical, where centralized network software (SDN) communicates with the cloud-based head to minimize the number of long-term requested communication links (LTE) and optimize energy consumption. This paper explores D2D communication in various 5G frequency bands. The concept of a local controller and a centralized architecture ensures operational continuity in cases of infrastructure damage and traffic fluctuations. D2D communication in different frequency bands of 5G is implemented using Matlab, and a comparison analysis is performed.

**KEYWORDS:** 5G, D2D communications, LTE, WSN

#### INTRODUCTION

Tireless Sensor Networks (WSNs) consist of distributed micro-devices equipped with various sensors, enabling the monitoring of environmental parameters and the transmission of information for further analysis by end users. Given the widespread use of WSNs, it is crucial to explore integration techniques with 5G networks. With the growing demand for smart devices and the rapid expansion of internet services, it is projected that mobile data traffic will increase significantly in the coming years. The transition from 4G to 5G is currently being standardized, and both industry and academia are actively working towards a consensus on the key 5G technologies and how to effectively combine them. Several emerging technologies are being developed to enhance data rates and promote environmentally friendly communication. Considering the promise of improved data rates in 5G, it becomes essential to

utilize the 5G frequency bands in WSNs to meet the requirements of modern applications.

#### RELATED WORK

The integration of Wireless Sensor Networks (WSN) with the Internet of Things (IoT) through LTE/5G has proven to be more efficient than previous systems. In order to achieve this, it is important to compare the characteristics of WSN traffic with the regular traffic supported in LTE networks. The integration of WSN and IoT in 5G technology requires the study of new technologies to ensure efficient WSN traffic management [1]. The deployment of 5G technologies offers significant potential in creating an advanced ICT infrastructure for efficient communication in an Internet of Things context. Cognitive radio (CR) technology in 5G can address many of the challenges faced in smart city ecosystems based on ICT [4]. Deploying Wireless Sensor Networks in 5G network environments

presents unique challenges due to low-power sensor nodes operating in diverse environments with limited resources. Energy efficiency and security are major concerns in WSNs [2]. WSN environments can be either static or dynamic, and research has shown that dynamic networks consume less energy compared to static networks [2]. To extend the lifetime of networks, clustering techniques have been introduced to enhance Quality of Service (QoS). Existing work has primarily focused on proposing solutions to extend network lifetime, with limited efforts made in clustering to improve transmission reliability or reduce network latency [3].

#### **5G WSN NETWORKS**

#### A Hierarchical D2D Network

Wireless Sensor Networks (WSNs) can be seamlessly integrated with 5G networks through the utilization of Device-to-Device (D2D) communications, enabling direct interaction among nearby User Equipment (UE) via cellular or ad hoc links. This integration aims to optimize spectrum utilization. A hierarchical D2D communication architecture is illustrated in Figure 1. In this architecture, centralized network software (SDN) facilitates communication with the cloud-based head, reducing the number of long-term requested communication links (LTE) and optimizing energy consumption. The concept of a local controller and a centralized architecture ensures operational continuity in cases of infrastructure damage and fluctuating traffic situations [1].

Figure 1: D2D Communication in 5G Networks

#### **Signaling for Cloud Formation**

The process of forming clouds involves the initiator broadcasting a request for cloud formation over the Wi-Fi interface. Mobile devices within the area, interested in participating in the service exchange, respond with their resources or services. The SDN application running on each mobile device maintains a database of all the services and resources that a mobile user is willing to share. Upon receiving a cloud formation request from a User Equipment (e.g., smartphone), the SDN initiates the sharing of the complete database with all concerned User Equipment. The SDN's cloud driver records assign an authentication key to the formed cloud. Subsequently, the initiator sends the authentication key individually to each User Equipment. Once the cloud is formed, the devices within it can communicate during their operational duration unless the cloud head sends a termination request.

# Frequencies for 5G

In October 2014, the Federal Communications Commission (FCC) of the United States published a Notice of Inquiry (NOI), soliciting comments on various potential frequency bands for 5G. 5G systems are expected to provide enhanced capabilities, and the spectrum allocation for 5G must encompass all the applications envisioned for future networks [1].

Table 1: Band of Frequency for 5G [1]

Frequency Band	Allowed Frequency Range
24 GHz	27.5-28.35 GHz, 29.1-29.25 GHz, y 31-31.3 GHz
39 GHz	38.6-40 GHz
37/42 GHz	37.0-38.6 GHz y 42.0-42.5 GHz
60 GHz	57-64 GHz y 64-71 GHz (extension)
70/80 GHz	71-76 GHz, 81-86 GHz, 92-95GHz

#### Traffic Model for WSN

It is important to understand the expected traffic patterns of wireless sensor networks. The traffic characteristics differ according to the applicationn as WSN when interact with the environment in order to detect specific phenomena. The traffic is generated when the phenomenon of interest is detected in event-

based WSNs that are used in different applications and real-time monitoring applications. On analysis of the traffic information like the average load, the bandwidth requirements for different applications, and numerous other details can be found out [1]. Traffic models enables network designers to make assumptions about the networks being designed. The different traffic models each have its own pros and cons.

#### RESULTS AND DISCUSSION

We evaluate the performance of D2D communication using Matlab 5G Simulation toolbox considering virtual scenario and evaluated the performance parameter such as data rate, delay and throughput for different frequencies as discuss above in table No. 1 and drawn the conclusion as; The experimental results obtained for different frequency bands are as follows. At a frequency of 24 GHz, the system demonstrated a throughput of 104.4 kbps with a delay of 0.096 ms at a sure distance of 5 meters. For undertrained distances of up to 10 km, the system achieved a throughput of 582 kbps with a slightly reduced delay of 0.0937 ms and a data rate of 106.8 bps. Similarly, at a frequency of 39 GHz, the system achieved a throughput of 169.65 kbps with a delay of 0.059 ms at a sure distance of 5 meters, while for undertrained distances of up to 10 km, the throughput remained consistent at 932.1 kbps with a slightly decreased delay of 0.0591 ms. Finally, at a frequency of 60 GHz, the system demonstrated a throughput of 261 kbps with a delay of 0.038 ms at a sure distance of 5 meters. Undertrained distances of up to 10 km exhibited a higher throughput of 1425 kbps with the same delay of 0.0384 ms. These results highlight the varying performance characteristics of the system across different frequency bands and distances, showcasing the potential of higher frequency bands for achieving higher throughputs at shorter distances. It is observed that for all the three performance parameter namely data rate, delay and throughput, the error value approaches to zero. Hence we can conclude that the distance does not affect the performance of D2D communication in 5G infrastructure for WSN.

# For Certain Distance = 5Km Delay vs time

39 GHz	169.65	0.059	169.65	932.1	0.0591	169.65
60 GHz	261	0.038	261	1425	0.0384	261

Table 2. Comparative Analysis of parameters (Throughput, Delay and Data Rate) for sure and uncertain distance

#### **CONCLUSION**

In our Wireless Sensor Network (WSN) integrated with a 5G frequency band, several performance metrics exhibit notable trends. As the frequency band increases, the throughput also tends to increase. This indicates that higher frequency bands allow for higher data transfer rates in the network. Similarly, the data rate, which measures the amount of data transmitted per unit of time, also increases with an increase in the frequency band. Another significant observation is that the delay, or the time taken for data packets to travel through the network, decreases as the frequency band increases. This implies that higher frequency bands lead to reduced transmission delays in the WSN.

#### **ABSTRACT**

In this work, a circularly polarized narrowband fractal antenna operational at 4.5 GHz for Indian National Satellite (INSAT) Narrowband Internet of Things (NB-IoT) applications have been presented. The overall antenna dimension is 26 mm X 26 mm. The FR-4 substrate with a 4.4 dielectric constant and 1.6 mm height has been selected for the design. Characteristic Mode Analysis (CMA) have been performed in Computer Simulation Technology (CST) software to find the optimal feed location for probe feed in order to achieve the circular polarization. The design is simulated in an Integral Equation Three- Dimensional (IE3D) software. The software results confirm the circular polarization with a Right-Hand Circularly Polarized (RHCP) with gain of 2.5 dBi. The antenna exhibits axial ratio below 2 dB with antenna efficiency of 60%. The antenna is suitable for satellite assisted NB-IoT applications.

**KEYWORDS:** NB-IoT, Characteristic mode analysis (CMA), Fractal antenna, Circularly polarized, Satellite communication, Probe feed location.

# INTRODUCTION

The Internet of Things (IoT) is gaining added importance with increasing wireless devices and the need for connectivity between them. Recently Telecom Regulatory Authority of India (TRAI) came up with a need to connect the remotest areas having deprived wireless connectivity with the help of satellite and IoT [1]. The antenna that is needed to provide satellite to IoT devices connectivity is one of the major challenge. The small size of IoT devices making it even more complicated for an antenna designer to arrive at the desired specification with a compact design. Microstrip antennas being small and low weight antennas with their ease of fabrication and conformability are the suitable candidate for IoT applications [2]. INSAT which operates at 4.5 GHz in the C band [3] is the major transforming technology in Indian satellite communication system mainly focussing on telecommunication, disaster management, news gathering, weather forecasting applications, INSAT can

help in connecting the IoT coverage on remotest areas on earth where mobile connectivity is deprived. Direct-To-Satellite IoT, Indirect to satellite IoT and a hybrid approach for providing NB-IoT with the help of satellite is discussed in [1]. The polarization of the antenna is the important aspect, satellite communication for extending IoT connectivity demands circularly polarized antenna at the IoT device end for more reliable operation. Some techniques have been proposed in the earlier literature to obtain circular polarization in microstrip antennas such as truncated corner [4], by exciting orthogonal modes [5], direct to satellite communication system is discussed in [6], elliptical slot (ES) [7], offset feeding network with complimentary ground to improve the polarization [8], Metamaterial structure also helps in attaining circular polarization [9]. As miniaturization is the main objective in IoT antenna design, fractal microstrip antenna becomes an ideal choice [10], [11], [12]. Finding the optimal feed location imposes a special challenge.

www.isteonline.in Vol. 46 Special Issue, September, 2023

In this paper, a Minkowski Inspired fractal antenna geometry is designed and analyzed up to 3 iterations for NB-IoT applications. The paper is conversed in four sections, section one describes the introduction, section two gives the iterative development of proposed antenna with dimensions. In section three the Characteristic Mode Analysis (CMA) of proposed antenna have been performed to predict the feed point location based on characteristics angle. Section four depicts the simulated results obtained from the IE3D software with feed information derived from section 3. Section five concludes the paper. The designed antenna gives circular polarization at 4.5 GHz (C-Band). The novelty of this work lies in choosing an appropriate feed location for achieving circular polarization at required frequency 4.5 GHz.

#### ANTENNA GEOMETRY

A Minkowski Inspired fractal antenna is designed by considering a square patch as an initiator and subtracting the scaled version of the initiator to its sides in consecutive iterations with the scaling factor of 2, the process of iterative design is shown in figure 1. The detailed dimensions are given in figure 2. the design is completed up to the third iteration.

c. Iteration 2

d. Iteration 3

Fig. 1. Iterative development of Minkowski Inspired fractal antenna

Fig 2. Detailed dimensions of a Minkowski Inspired fractal antenna

#### **Mode Analysis**

Characteristics Mode Analysis (CMA) is a valuable tool for predicting natural resonance. According to [13], the impedance measurements derive the mathematical equations governing CMA.,

$$Z = R + jX \tag{1}$$

$$XJ_n = \lambda_n RJ_n \tag{2}$$

R = Z matrix's Hermitian Real component

X = Hermitian Imaginary Z matrix component.

Jn = eigen current

 $\lambda_n$  = eigenvalue

The crucial parameters to pay attention to in the case of CMA are Eigenvalue, Modal significance, and the characteristics angle. Modal significance, which is determined by equation III and has a range of 0 to 1, demonstrates the contribution of a specific mode to the radiation.

$$MS = \left| \frac{1}{1 + j\lambda_n} \right| \tag{3}$$

The characteristic angle denotes a mode's resonance frequency. At resonance,  $\lambda_n = 0$  and  $a_n = 180^{\circ}$ 

$$\alpha_n = 180^o - \tan^{-1}(J_n) \tag{4}$$

When the eigenvalue at resonance is zero, it indicates that the modes are radiating; when it is greater than zero, it indicates that the modes are storing magnetic energy. Therefore, the optimum value for  $\lambda_n$  is zero for the antenna to function as an effective radiator.

The CMA Have been performed in CST Microwave studio. The geometry has been analyzed with CMA and is shown in figure 3(a). Required modifications have been performed in the original geometry for optimal performance based on the information obtained from CMA as shown in figure 3(b).

To observe the natural resonant point and the suitable feed location the current distribution (Figure 4), Farfield and characteristic angles are seen at the first five resonant modes (Figures 5 and 6). The current distribution is more concentrated on edges extending inside the geometry at a frequency of 4.5 GHz, as seen in Figure 4.. From the current distributions the idea of the portions which are responsible for radiation at 4.5 GHz are located and are marked in circles in Figure 4. The Mode 1, Mode 2, and Mode 4, Mode 5 are found to be degenerate modes, giving almost the same response of characteristics angle (figure 6). The characteristic angle is observed to be 90 degrees out of phase between the pair of degenerate modes (Figure 7), making them orthogonal. Exciting the orthogonal modes gives rise to circular polarization which is an essential factor in providing better signal receptivity in satellite-based NB-IoT applications. The geometry have been modified on the basis of current distribution in such a way that, mode 1 and mode 4 are dominant and orthogonal the modified design is shown in figure 3b. The feed point have been placed at the modified locations and the performance of antenna have been observed in Mentor Graphics (IE3D) software simulations. The details of which have been explained in section 4.

Fig 3. (a) Original design in CST

Fig 6. Characteristics Angle , at s=4.5GHz (a) Mode 1 (b) Mode 2 (c) Mode4 (d) Mode 5

Fig 7. Characteristics Angle showing orthogonal modes
Antenna Simulation

The feed location predicted in CMA has been used to provide a probe feed in mentor graphics simulation (Figure 8) and it is observed that the antenna designed in IE3D resonates exactly at 4.5 GHz (Figure 9) as predicted in characteristics mode analysis (Figure 7) thus confirming the usefulness of characteristics mode analysis in determining the exact feed location in order to excite the antenna with desired polarization and S11 characteristics. Probe feed have been used to power the antenna because it has been proven as a better choice in case of narrowband antennas in the past literatures.

Fig 8. Minkowski Inspired antenna geometry in mentor graphics

Fig 9. S-Parameters

#### RESULTS AND DISCUSSION

Probe feed has been incorporated in such a way that Mode 1 is excited and Mode 4 being orthogonal to Mode 1 at 4.5 GHz (Figure 7), the geometry resonates at 4.5 GHz with the S11 of -28 dB with the narrow percentage bandwidth of 3.5% (Figure 9) and VSWR less than 2 (Figure 10) and Z11 of 50 Ohm (Figure 11) at 4.5 GHz showing the perfectly matched port. The radiation pattern shows gain above 2.5dBi. (Figure 12 (a), (b)) shows azimuth and elevation gain display respectively and directivity above 6 dBi. (Figure 12 (c), (b)) shows azimuth and elevation directivity display. With the excitation of orthogonal modes the right hand circular polarization is observed with the RHCP gain of 2.5 dBi as described in Figure 13(b) and RHCP directivity of 5.5 dBi as represented in Figure 13 (d). The total gain is observed to be 2.5 dBi as shown in Figure 13(a)) and total directivity is 6.4 dBi as given in Figure 13 (c). The axial ratio plot in Figure 13 (e) shows that the proposed antenna is circularly polarized. The radiation efficiency of up to 60% is achieved as shown in Figure 13 (f).

### **CONCLUSION**

The CMA helps in choosing the feed location in an antenna with the choice of desired polarization. The CMA predictions from CST match the Electromagnetic simulations from Mentor Graphics, thus proves that CMA is effective in assisting the antenna designer by providing feed location and nature of polarization at the specific feed point. The proposed Minkowski Inspired fractal antenna with circular polarization and compact in size is suitable for the satellite assisted NB-IoT applications. It helps for connecting the areas having depraved mobile network connectivity with the help of IoT and thus can serve the various applications such as disaster management, supply chain management, asset tracking applications and many more.

# **ABSTRACT**

This research paper explores the use of natural language processing (NLP) techniques for customer review analysis. The effectiveness of feature extraction techniques such as TF-IDF, CountVectorizer, and Word2Vec, followed by model training using Logistic Regression, KNN, SVM, and Random Forest. Different experiments were conduct on two datasets to evaluate the accuracy of the proposed methods. The results show that NLP is an effective method for analyzing customer feedback with accuracies ranging from 80% to 95%. The insights gained from analyzing customer reviews can inform business strategies and improve customer satisfaction. Our research highlights the potential benefits of NLP in customer review analysis and provides a foundation for future research to improve the accuracy of customer feedback analysis.

**KEYWORDS:** TF-IDF, Natural language Processing, Word embedding, Word2Vec, Machine learning

#### INTRODUCTION

In recent years, e-commerce has seen a significant rise in popularity as consumers increasingly prefer the convenience and accessibility of online shopping. With this growth, customer reviews have become an essential aspect of online shopping, providing valuable feedback to potential customers while influencing their purchase decisions. However, as the volume of reviews continues to increase, it becomes increasingly challenging for businesses to analyze and make sense of this data manually. This is where Natural Language Processing (NLP) and machine learning techniques come in.

NLP is a branch of artificial intelligence (AI) that focuses on how people and machines interact through language. It involves processing and analysing natural language data, such customer reviews, using computer approaches. Businesses may automatically extract insights from customer reviews using NLP and machine learning techniques, such as sentiment analysis, aspect extraction, and topic modelling, to better understand the needs, preferences, and pain points of their target market. The benefits of review analysis using NLP and machine learning techniques are numerous. For one, it enables businesses to identify areas where they are

excelling and where they need to improve, providing opportunities for targeted optimization of their products or services. Additionally, analyzing customer reviews can help businesses identify emerging trends, allowing them to be more proactive in their product development and marketing efforts.

In this research paper, we will explore the use of NLP and machine learning techniques in the context of customer review analysis in e-commerce. Specifically, we will investigate how NLP techniques can be used to extract valuable insights from customer reviews, including sentiment analysis, aspect extraction, and topic modeling. We'll also look at how machine learning methods may be used to make these NLP models more accurate and speed up the review

and analysis process. By doing this, we hope to give businesses a thorough grasp of the potential advantages of applying NLP and machine learning approaches for review analysis as well as insights into the difficulties that come with this strategy.

## LITERATURE REVIEW

The sentiment analysis of customer suggestion is studied in [1] using the dataset of reviews of women's e-commerce clothing. To address the issue five well-

www.isteonline.in Vol. 46 Special Issue, September, 2023

known machine learning algorithms were used which include XGBoost, Support Vector Machine (SVM), Random Forest, LightGBM and Logistic Regression. This study set out to determine the relationship between product recommendations and reviews. The LightGBM algorithm produced the best results, with an AUC value of 0.96 and 0.98 as the maximum accuracy.

The categorising of opinions is [2]'s fundamental goal. As feature extraction methods, Bag of Words (BOW) and Term Frequency-Inverse Document Frequency (TF-IDF) are used. Customer reviews are believed to be successful in carrying out the task, and voting ensemble classifier has also been employed to evaluate improved performance. It is clear from the outcomes that Unigram makes use of the dataset and enhances performance. A deep learning technique called Deep Convolutional Neural Network, which extracts sentiment from a corpus of text, is introduced in the paper in [3]. The IMDB and Amazon product reviews are used to evaluate the performance of this model. With some minor adjustments to the hyperparameters, such as the filter's size, the number of kernels, and the dropout probability, the trained model can generalise with greater accuracy. The study[4] looks on the extraction and restoration of user experience (UX) data, which supports product design, from customer online reviews. The method for gathering UX knowledge from online customer evaluations is then recommended to support UX-centered design efforts. Users' and designers' reactions to significant features and usage situations are demonstrated in a case study on smart phone evaluations using UX data examples.

[5] presents a methodology for measuring customer happiness in the aviation business. To examine the online consumer reviews, text mining techniques are applied. In order to forecast customer recommendations for airlines, a database of more than 55,000 evaluations is analysed. The Latent Dirichlet Allocation model is used to determine 27 categories of customer happiness, which are each described by 882 adjectives. This resulted in accuracy of 79.95%. To perform feature-focused sentiment analysis, [6] customer reviews from online shopping apps like Amazon are examined. These reviews are related to various mobile devices and manufacturers. Based on the reviews, the suggested

models grade mobile phones based on 108 features. The accuracy is low and is upto 52.3% and if the one star integer rating error is tolerated it becomes 93.8%. It is suggested in [7] to use Naive Bayes sentiment analysis on customer reviews of eateries. Data from Tripadvisor restaurant reviews is collected using a web crawling technique, and TextBlob sentiment analysis is performed using the Naive Bayes method. Data is scanned using WebHarvy Tools. Names of restaurants and reviews are among the data gathered. As a consequence of the data collection, 337 data are received, 269 data are utilised for training, and 68 data are used for testing. Additionally, the results demonstrate that, with an accuracy value of 72.06%, the Naive Bayes approach is only slightly (2.94%) better than TextBlob sentiment analysis.

Main objective in [8] is to examine consumer feedback on several restaurants in Karachi. The SWOT'S guide to Karachi's eateries, a very popular Facebook community, is where customer reviews are gathered. Comments on food quality, ambiance, service, and value for money are automatically categorised using text classification techniques. For training and testing, a carefully annotated dataset including about 4000 entries was employed. The random forest method produced the best results, which was 95% accurate. Using sentiment analysis and statistical data analysis, a method for determining relative consumer satisfaction with cosmetics companies was developed in [9]the current study. The top 26 cosmetics brands in the world were used in an empirical case study, and the results included an analysis of relative brand satisfaction and a look at the key factors influencing both positive and negative ratings. NLP was applied to the crawled reviews using the RapidMiner programme. Sentiment scores for the sentences were calculated using the Opinion Lexicon for the Sentiment Dictionary. In [10]Studied deep learning, explainable artificial intelligence, and machine learning techniques. Although DL models in other domains perform well in terms of accuracy, they fall short in terms of explainability, a problem that an implementation of XAI can solve. XAI implementation can enhance DL methods' interpretability, according to the results, which show that they have good accuracy but low interpretability...

The study in [11] investigated the relationships between

underlying factors and customer satisfaction in online ratings from visitors to the Hong Kong Disneyland hotel. Factor analysis, linear regression analysis, and semantic network analysis by Netdraw and SPSS 26.0, respectively, were some of the data analytic techniques used. The highest frequency words in the semantic network were investigated based on their co-occurrence matrix. To discover the hidden relationship between these terms, Freeman's degree and Eigenvector centrality were calculated. In [12] Text analytics was utilised to investigate the relationship between customer experience and associated satisfaction using big data on consumer experiences with front loading washers as reflected by reviews and ratings on the BestBuy website. Utilising linear regression analysis, the quantitative impact of each component was evaluated. By using factor analysis, the original 42 qualities, which were used as keywords in the evaluations, were reduced to 29 traits, which were then broken down into seven components.

#### **METHODOLOGY**

The proposed system is implemented using the methodology mentioned in fig 1. Dataset is preprocessed using different preprocessing steps. Then preprocessed data is used to extract features from the text using TF-IDF and word2vec. Extracted feature vectors are then passed to various machine learning algorithms.

Fig. 1. Block Diagram of proposed Methodology

#### Dataset

In this study, various datasets have been used to examine model performance. A total of 413841 text-based reviews of mobile phones make up the first dataset. Name of the product, brand name, cost, star rating, and number of reviews. [12] used big data on customer experiences with front-loading washers as evidenced by reviews and ratings on the BestBuy website to study the relationship between user experience and associated satisfaction. The quantitative influence of each component was assessed using linear regression analysis. The 42 original features that were used as assessment keywords were condensed to 29 traits using factor analysis, which were then divided into seven components.

#### **Data Preprocessing**

- a) Tokenization: The first step in preprocessing text data is to tokenize it, which means breaking the text into individual words or tokens. This can be done using various techniques such as whitespace splitting, regular expression, or using pre-trained models such as spaCy
- b) Lowercasing: Convert all the words in the text data to lowercase. This helps in standardizing the text data as it treats words in uppercase and lowercase as the same.
- c) Stop words removal: Stop words are common words that do not add much meaning to the text data, such as "the," "and," "a," etc. Remove these stop words from the text data as they can lead to noise and make the analysis less effective.
- d) Punctuation removal: Remove any punctuation marks in the text data, such as commas, periods, or question marks. This helps in standardizing the text data and reducing noise.
- e) Lemmatization or stemming: Reduce words to their base form using lemmatization or stemming techniques. Lemmatization involves reducing words to their base form based on their part of speech, while stemming involves reducing words to their root form. This helps in standardizing words with different inflections and reduces the dimensionality of the text data.

- f) Handling contractions: Expand contractions, such as "don't" to "do not," "it's" to "it is," etc., to ensure consistency in the text data.
- g) Handling special characters: Remove any special characters from the text data, such as HTML tags, emojis, etc.
- Spell checking and correction: Check for misspelled words and correct them to ensure consistency in the text data.
- Entity recognition: Identify and label named entities such as people, organizations, and locations in the text data. This can be done using pre-trained models such as spaCy or using rule-based methods.

Extract relevant features from the text data, such as n-grams, bag-of-words, or TF-IDF vectors, to represent the text data in a format that can be used for further analysis.

#### **Feature Extraction**

In natural language processing, feature extraction is a fundamental process that transforms text data into numerical feature vectors. This allows us to use machine learning algorithms to analyze and make predictions about the text. Three popular techniques for feature extraction are TF-IDF, CountVectorizer, and Word2Vec.

A statistical technique called TF-IDF determines a word's relevance in a document by multiplying its term frequency by its inverse document frequency. This means that terms that are frequently used in a specific document but uncommon throughout the corpus of papers are given more weight. The obtained feature vectors can be applied to tasks like information retrieval and text classification. Each row in the matrix produced by CountVectorizer corresponds to a document, and each column to a word in the corpus. The frequency of each word in the text is represented by the values in the matrix. This method is simple yet effective for text analysis tasks such as sentiment analysis and topic modeling. Word2Vec is a neural network-based approach that generates dense vector representations of words in a high-dimensional space. For tasks like language translation and sentiment analysis, these embeddings are very helpful since they capture the

semantic and syntactic links between words. We can produce embeddings for specific words or groups of words by training a Word2Vec model on a sizable corpus of text data. These embeddings can then be used as input features for machine learning models.

# **Model Training**

The choice of feature extraction technique depends on the specific requirements of the project and the nature of the text data being analyzed. It is important to experiment with different methods and compare their performance on the task at hand. By understanding these techniques, researchers can effectively analyze and make predictions about text data using machine learning. After extracting feature vectors from text using techniques such as TF-IDF, CountVectorizer, and Word2Vec, the next step in NLP model training is to pass these vectors to machine learning algorithms for classification or prediction tasks. In order to do this, the data must be split into training and testing sets. The models must then be trained on the training set, and their effectiveness must be assessed on the testing set.

Logistic Regression is a commonly used algorithm for binary classification tasks in NLP. It predicts the probability of a document belonging to a particular class, such as positive or negative sentiment. K-Nearest Neighbors (KNN) is another a text categorization system that is effective, especially when there are several classifications. A well-liked option for NLP jobs, Support Vector Machine (SVM) is a potent algorithm that performs well with high-dimensional data. Random Forest is an ensemble technique that blends various decision trees to increase the model's accuracy.

Following training and evaluation, metrics like accuracy, precision, recall, and F1 score can be used to gauge the models' performance. These measures aid in assessing model performance and contrasting the outcomes of various algorithms. It is significant to remember that the selection of an algorithm and hyperparameters depends on the particular project needs and the type of data being analysed. Overall, it has been found that the training of NLP models is most successful when feature extraction methods like TF-IDF, CountVectorizer, and Word2Vec are combined with machine learning algorithms like Logistic Regression, KNN, SVM, and Random Forest.

#### RESULTS AND DISCUSSION

Vectors obtained through feature extraction methods were used to train the model. Text data vectors are produced using TF- IDF, CountVectorizer, and Word2Vec. Vectors are then fed into a variety of machine learning training algorithms, including SVM, Logistic Regression, Random Forest, and KNN. Table 1 lists the accuracy for each model on the Phone dataset.

Table 1. Result of Phone review dataset

Feature	Model	Accuracy
	SVM	0.946908
TE IDE	Logistic Regression	0.931531
TF-IDF	Random Forest	0.925219
	KNN	0.767077
	Random Forest	0.920524
	SVM	0.904014
Word2Vec	Logistic Regression	0.890741
	KNN	0.888152
Count Vectorizer	Logistic Regression	0.933959
	Random Forest	0.923438
	SVM	0.914212
	KNN	0.839430

From results in Table 1, TF-IDF outperforms all other techniques and provide accuracy in the range of 76% to 94%. TF-IDF SVM performs best out of all models and gives accuracy of 94%. KNN gives lowest accuracy in all models.

As we know that TF-IDF vectors are providing highest accuracy therefore used in training of musical instrument review dataset. Logistic Regression performs better than SVM and provide highest accuracy of 88% as mentioned in Table 2.

Table. 2. Result of Musical Instrument review dataset

Feature	Model	Accuracy
TF-IDF	Logistic Regression	0.88090
	SVM	0.87964
	KNN	0. 87164
	Random Forest	0.81785

Below in Fig. 2 confusion matrix is shown

Fig. 2. Confusion Matrix of Music instrument review dataset.

#### **CONCLUSION**

In this research paper on customer review analysis using NLP, we explored the effectiveness of feature extraction techniques such as TF-IDF, CountVectorizer, and Word2Vec, followed by model training using algorithms such as Logistic Regression, KNN, SVM, and Random Forest. Our experiments on two datasets resulted in accuracies ranging from 80% to 95%, highlighting the potential benefits of NLP in analyzing customer feedback for businesses. By identifying areas for improvement and gaining insights into customer preferences and opinions, businesses can enhance the customer experience and inform product development and marketing strategies.

#### **ABSTRACT**

DME is the main reason for loss of vision in diabetics and a major cause of diabetic retinopathy (DR). Excessive flow and deposition of the extracellular fluid inside the macular region are the main reasons for diabetes mellitus. Therefore, it has become a danger to people's health and lives. This article reviews DR, its features, causes, machine learning models, cutting-edge DL models, challenges, benchmarks, and future directions for research. Using fundus images and OCT scans, DME can be diagnosed at any level of DR. An autonomous detection method with computer vision can provide ophthalmologists with a detailed analysis of abnormalities, which is beneficial to them for diagnosis. This is why the introduction of deep learning (DL), the new field of machine learning, With efficient data processing, the DL model can handle small data sets. However, they often include larger datasets for their deep models to improve image extraction and classification performance.

**KEYWORDS:** Diabetic retinopathy, Fundus images, OCT images, Deep learning.

#### INTRODUCTION

ndia is going to be the "Diabetes Capital of the World" by counting the number of diabetic patients According to the IDF, the population of diabetic patients was 53.7 crore in 2021 and is expected to reach 78.3 crore by 2045. The World Health Organization (WHO) revealed in its World Vision Report that more than 220 million people suffer from vision loss or impairment, with half of them being cured by proper treatment. As shown in Fig. 1, 3.9 million of these one billion people had vision-threatening DR. Prolonged diabetes, low blood pressure, and poor glycemic control are strongly connected with DR. Globally, DR, proliferative DR (PDR), and DME affect 6.96%, 6.81%, and 10.2% of the population, respectively. DME, therefore, affects 21 million people globally. The most frequent cause of visual loss in DR-affected individuals may be DME [1].

Common signs and symptoms of DR are blurred vision, hovering and blinking, and vision loss. DR is caused by changes in retinal vascular metabolism caused

by irregular blood flow, leakage of blood and blood components through the retina, and thus damage to the macula. This causes the retinal tissue to swell, making vision cloudy or blurry. The disease affects both eyes and if diabetes is prolonged without treatment, DR leads to blindness and eventually diabetic maculopathy. When left untreated and undiagnosed, diabetic retinopathy (DR) progresses to more severe stages, leading to a decline in a person's vision. The disease can exhibit periodic or random progression, resulting in the formation of retinal lesions caused by ruptured retinal blood vessels (RBVs). These lesions include microaneurysms (MAs), haemorrhages (HEs), exudates (EXs), cotton wool spots (CWSs), the foveal avascular zone (FAZ), fibrotic bands, intraretinal microvascular abnormalities (IRMAs), neovascularization on the disc (NVD), neovascularization elsewhere (NVE), tractional bands, and more. These retinal abnormalities manifest in the fundus, which is the rear view of the eye. Timely detection of these retinal lesions and abnormalities is crucial as it aids in identifying the different stages of DR.

www.isteonline.in Vol. 46 Special Issue, September, 2023 196

Fig. 1. Comparative analysis of vision impairment versus ocular diseases

To find out the advantages and drawbacks of various DME classification models that have used Deep Learning algorithms that use Color fundus images or OCT images in the diagnosis of DME is the main purpose of this study. It also summarizes the progression of the methods over time and highlights various re-searchable problems which need to be addressed in the context of autonomous DME diagnosis.

#### Aspects of diabetes mellitus

A chronic medical disorder called diabetes mellitus is brought about by insulin resistance or by altered insulin production in the blood. In people with diabetes, high blood sugar or glucose levels, known as hyperglycemia, can cause long-term difficulties with various body parts like the eye, kidney, neuro system, and cardiovascular diseases [2]. Long-term DME caused diabetic retinopathy and can cause vision loss in people of working age. Microaneurysms (b), haemorrhages (e), hard exudates, soft exudates (c,d,e,f), and neovascularization which are the lesions in the retina that results in blindness are the characteristics of DR which are shown in Fig. 2.

Fig. 2 Characteristics of DR

Fig. 3 Retinal Lesions

# Various image modalities

Fundus Images

Fundus image has the potential to be a strong tool for the examination of diabetic ocular disorders and determining their progressive stages and how they respond to the treatment in diabetic patients. It is beneficial to evaluate DR because it allows for the visualization of intra-retinal microvascular abnormalities (IRMAs), venous beading, soft and HE lesions, microaneurysms, haemorrhages, and neovascularization [3]. Fig. 3 is obtained using a camera to capture the fundus images, shows DR lesions. The publically available standard data sets are given in the following Table 1.

Table 1: Publically available data sets for fundus images

Data set	Total images	Resolution	Field view of camera (in degree)
EyePACS	88702	NA	
APTOS	5590	NA	
MESSIDOR	1200	1440X960 2240X1488 2304X1536	45
MESSIDOR 2	1748	NA	45
IDRiD	516	4288X2848	50
DDR	12522	NA	45
E-Ophtha	463	NA	50
DiaRetDB1	89	1500X1152	50
DRiDB	89	768X584	45
ROC	100	768X576 1058X1061 1389X1383	45

Optical coherence tomography (OCT)

With optical coherence tomography (OCT), eye surgeons can take a cross-sectional view of the retina with the help of light waves in three dimensions. This allows the ophthalmologist to determine the density of various layers of the retina. The publically available standard data sets such as Biomedical Image & Signal Analysis (BIOMISA), Dukes, OPTIMA Cyst segmentation challenge, Noor Eye Hospital (NEH), Mendeley (Ker- many datasets), Dukes2, Retinal OCT Classification Challenge, RETOUCH, OCTID which are used by researchers. Sample OCT scan is as shown in Fig. 4 with marked features.

Fig. 4 Sample OCT scan

The research conducted by numerous researchers is discussed in Section 2 of this article. The effectiveness of various algorithms depending on various factors is examined in Section 3. A comparison-based conclusion is drawn in Section 4.

#### LITERATURE SURVEY

#### DME detection using fundus images

DME in fundus imaging is defined by the presence of lesions like hard and soft exudates (EX). For quick identification and analysis of the DME, it is essential to consider the location of the macula, fovea, OD, or lesions close to the macula. The many ML-based methods that have been used in these experiments to determine DME from CFP are addressed in this section.

Various Deep learning algorithms are used to detect DR from fundus images. The methods are mainly based on custom convolutional Networks (CNN), Object detection, Ensemble of DL classifiers, Generative adversarial Networks, Transfer-Learning (TL) methods,

Auto Encoder (AE), and CNN models with attention Mechanism.

The authors [4] proposed a novel methodology to identify diabetes-based ocular diseases, which consists of DME, DR, and Glaucoma with the application of FRCNN (Fast Region Based Computational Neural Network) with FKM (Fuzzy K-means Clustering) FKM The technique consists of two phases. The first phase consists of the detection of disease and localization phase. The second phase includes the segmentation of the localized regions using FKM clustering. The proposed network can locate the deep features with an absolute representation of ocular diseases and this results in increased efficiency of segmentation in contrast.

The layers for the CNN model consist of Convolution, poll and completely connected layers. The deep architecture of CNN is what gives it its power because it can automatically retrieve distinctive features at many levels of abstraction. The author proposed a novel method with the DME Net 120 algorithm. It pre-processes the fundus image in two stages. The first stage consists of classification between normal and infected images and the next stage classifies the infected image into various stages of DR. It uses the Hierarchical Ensemble of Custom Convolutional network for the classification [5].

S. Wang et al [6] trained an MGAN (Multi-Channel based Generative Adversarial Network) to classify fundus images into various stages of Diabetic retinopathy. This model extracts a series of sub-fundus images which are related to various features of DR. MGAN is capable of identifying the various features of Fundus images without reducing the size of high-resolution images. It gives the advantage of reducing the dependency on labelled data.

Researchers [7] proposed the DR-GAN (DR-Generative Adversarial Network), to process high-resolution images with configurable grading and lesion details. This facilitates the augmentation of data on a larger scale for DR segmentation and grading applications. The retina generator is conditioned through structural and lesion masks and adaptive grading vectors from the latent grading space enabling adjustable severity

for synthesized grades. Moreover, this includes a multiscale spatial and channel attention module.

As discussed by the work in [8], it is essential to have the capacity to estimate the topology of the vascular networks in complex networks to have a comprehensive grasp of vascular changes and the many diseases that they might cause. To assist in the diagnosis and treatment of eye diseases, the retinal vascular trees are often mechanically dissected into the accompanying arteries and veins. The need to take into consideration projective ambiguity in addition to slight differences in lighting, contrast, and geometry adds to the complexity of the situation. Researchers have developed a novel method that uses the topology of the vascular network to differentiate between arteries and veins in CF images of the retina. This method is based on the fact that veins are more prominent than arteries. Both the estimation of the topology of the retinal blood vessels and the categorization of the A/V are framed as issues of pairwise clustering, and researchers use dominant set clustering to solve both. A graph may be constructed by first finding nodes, then segmenting pictures, and finally making an image. The "weight" of the edge may be determined by dividing the inverse Euclidean distance between its endpoints by the ratio of the edge's intensity, direction, curvature, diameter, and entropy. This then yields the "weight" of the edge. Aortas and veins that have undergone effective healing have a particular morphology and level of intensity.

#### **DME detection using OCT scans**

It is feasible that 3D-to-2D image segmentation in OCTA scans may be accomplished by using an innovative end-to-end architecture that is known as an image projection network (IPN). This design was proposed by medical imaging experts [9]. The creation of a projection learning module (PLM) that chooses and eliminates features concurrently via the use of a unidirectional pooling layer is their key contribution. By merging several PLMs, the proposed network can analyse 3D OCTA data and give 2D segmentation including the segmentation of retinal outputs, vascular structures. The measurement of retinal indicators does not need the use of projection maps or segmentation of the retinal layers. The researchers put their network to the test by requesting that it extract

retinal vasculature (RVs) and the foveal avascular zone (FAZ) from photographs of the retina. The use of IPN as a 3D-to-2D segmentation network is successful, as shown by experimental data derived from 316 OCTA volumes. IPN is an advancement of state-of-the-art procedures since it integrates data on many modalities as well as volumetric measurements.

According to research that was presented in [10], scans obtained from retinal optical coherence tomography (OCT) might potentially be used to identify visual problems. The underlying factors that contribute to these visual irregularities include shifts in the orientation of the optical coherence tomography (OCT) B- scan and inconsistencies in the layers of the retina. The accuracy of the OCT image analysis will suffer as a result of these alterations. Researchers have developed a pre-processing method that may be used for B-scan alignment as part of this study. The investigators begin by putting forth a TV-UNet model as a means of precisely locating the retinal pigment epithelium (RPE) layer in each B-scan. Researchers determine a baseline and a curvature curve by making use of the RPE layer that has been revealed. To retain the size and form of the sick lesion, a one-of-a-kind alignment strategy that is window-transferring based is required. This strategy must be used to coerce curve points into constructing a straight line. For both training and testing the TV-UNET, the researchers used a wide variety of datasets.

As shown in [11], optical coherence tomography angiography (OCTA) is a non-invasive imaging technology that may be used to examine retinal capillaries. This method offers resolution on the micron scale. Studies that demonstrate a link between micron-scale parameters and the degree of the retinal disease have pro- vided evidence that confirms the diagnostic utility of macular OCTA vascular measures. These metrics have their foundation in the statistical summaries of the retinal layers and regions of interest in 2D and face projection images. OCTA pictures are used by re-searchers to generate a map of retinal vascular density. This is done so that they may investigate the changes in retinal vasculature that occur across different populations and longitudinal scans. Researchers can get a high-quality three-dimensional representation of OCTA-based vessel networks by

using curvelet-based denoising and optimally guided flux (OOF). After that, a three-dimensional map of the density of the blood vessels in the retina should be created. After that, the vessel mask from an OOF-based analysis is diffused throughout the whole of the picture volume to provide a vessel density image (VDI). To conduct inter-patient comparisons of retinal vasculature, non-linear three-dimensional OCT image registration is used. To demonstrate the efficacy of their methodology, the researchers tracked the progression of two diseased patients who had oedema during their studies. Their method is statistically tested by employing simulated capillary dropout data, along with a normal control population that is broken down into two age groups, and patients who have diabetic retinopathy (DR). Even in the presence of oedema, researchers have the potential to see localized vascular abnormalities as a result of simulated capillary loss, natural ageing, and DR illness. These results provide evidence that the framework has the potential to identify microvascular alterations and monitor the progression of retinal diseases.

Experts in the field of retinal image processing [12] believe that medical image registration could be used to evaluate longitudinal and cross-sectional data, objectively track the progression of a disease, and direct a computer-assisted diagnosis and treatment plan. These are just some of the potential applications of this technique. There has not been a lot of research done on de-formable registration for retinal OCT pictures, which is a method that enables more precise and quantitative comparisons. According to the findings of this study, a 3D retinal OCT registration approach known as OCTR expert (OCT RE) should be used. This method is the first attempt to full 3D registration for retinal OCT photographs, and it may be used to analyse longitudinal OCT data for persons who are healthy as well as those who have diseases. To implement this method, initially, an eye motion artefact reduction technique will need to be carried out, and then a design detection deformation registration procedure will need to be performed. During the process of creating a picture, many properties are affixed to each voxel that makes up the image. The process of "detection" involves picking voxels that are "active" and building "point-to-point" correspondences between them. The picture undergoes a hierarchical transformation as a result of the multi-resolution

deformation process. The recommended method was put to the test utilizing longitudinal OCT images on a total of twenty healthy participants in addition to four patients who had choroidal neovascularization (CNV).

Researchers [13] have developed a bias-free method of automated segmentation that may be used for optical coherence tomography (OCT) images in this study. The intensity, gradient, and adaptive normalized intensity scores of the segmented scans are taken into consideration by deep neural network regression while attempting to predict the retinal border pixel (ANS). Recasting the problem of segmentation as one of regression removes the need for a large dataset and simplifies the work at hand. On OCT scans with intensity changes, low contrast, speckle noise, and blood vessels, the use of ANS enhances the method's accuracy while also increasing its processing speed. During testing with 114 photos, it took 10.596 seconds for each image to identify eight boundaries, but during training, it took 30 seconds per boundary line. The dice comparison found a similarity index of 0.966 between the two sets, suggesting a good level of precision in the results. Researchers were able to attain an average disparity of 0.612 pixels between human and automatic segmentation by adhering to the strategy that was advised.

According to the findings of the study [14], a modalityspecific attention network (MSAN) may be used to classify multi-modal retinal images. This network may use diagnostic pictures of both the fundus and the OCT. MSAN is equipped with two different focus modules: one is for fundus images, and the other is for OCT Scans. Ophthalmologists are required to do a local as well as global analysis of the fundus picture (e.g., from microaneurysms at the micrometre level, optic disc at millimetre level to blood vessels through the whole eye). Therefore, the researchers provide a multi-scale attention module that is specially adapted to fundus visuals. Images obtained with OCT that include substantial background patches cannot be utilized for diagnosis. As a result, it has been recommended that an attention module that is led by regions be used for encoding retinal layer information in OCT images. In the end, researchers develop a retinal image categorization network by fusing modalityspecific characteristics into a multi-modal feature. The model takes into account aspects that are unique to each modality so that it may provide a more precise diagnosis. Their MSAN surpasses previous singlemodal and multi-modal retinal image classification systems, as shown by experimental results employing a multi-modal retinal image dataset (fundus and OCT) gathered in a clinical context. Researchers [15] have developed a system that is based on ensemble learning (EL) that can segment retinal boundaries in OCT images in a way that is resistant to defects in the retina. The recommended method's accuracy in segmentation was evaluated using two datasets that were available to the general public. These datasets included photos of severe retinal oedema. The suggested strategy was evaluated alongside two other approaches that are more common. The recommended technique was an improvement over the conventional approaches since it was better at differentiating between normal and pathological retinal boundaries. After conducting an exhaustive reliability examination, it was shown that the manual Measures computed using human annotations and the manual measures produced by applying the suggested technique yielded results that were significantly concordant with one another.

# **OBSERVATIONS**

Based on the review of existing retinal image processing models, it can be observed that bioinspired & deep learning models outperform existing methods in terms of applicability and performance metrics. To further validate this claim, a comparative analysis of these methods is provided in this section, where the reviewed methods are evaluated in terms of accuracy of disease detection (A), precision (P), delay needed to identify diseases (D), computational complexity (CC), and scalability (S) of deployment for different use cases. Accuracy & Precision were directly inferred from the reference documents, but delay, complexity and scalability levels were quantized into ranges of Low (L=1), Medium (M=2), High (H=3), and Very High (VH=4), which will assist readers to compare these techniques on a uniform set of scales. Based on this strategy, the comparison of these models is tabulated in Table 2 and a graphical comparison is given in Fig 5 and Fig 6 respectively.

Based on this evaluation, INSPIRE, PLM, OOF, ANS, MSAN and UNet showed higher accuracy, which is the best method for deep learning for retinal imaging tasks. Therefore, these models should be deployed for very precise use cases. OOF and DRIVE demonstrated higher accuracy using a simplified classification interface. Therefore, these techniques can be used for applications that require high consistency of retinal image processing for various batch operations.

In terms of computational complexity, EL and CAMR are superior to other models and are very useful for low-complexity applications. Therefore, these models should be used for high-performance and low-complexity deployments. It is observed that PLM and ANS are faster, so they can be used in low-latency cases. These models are also useful for large-scale applications that require high throughput with some level of efficiency.

Table 2 Comparison of performance of various algorithms

Model	A	P	CC	D	S
INS PIRE [8]	95.1	91.4	Н	VH	Н
PLM [9]	97.4	92.7	Н	Н	Н

#### CONCLUSIONS

In terms of applicability and performance metrics, bioinspired and deep learning models outperform existing methods for retinal image processing based on a review of existing models. Due to the use of deep learning for retinal image processing operations, PLM, OOF, MSAN, RAVIR and GLUE demonstrated greater accuracy based on accuracy evaluations. Therefore, these models must be deployed for use cases requiring high precision. Similarly, OOF, MSAN, Seg RAVIR, CAMR, UNet, and RL exhibited greater precision due to the application of simplified classification interfaces. Thus, these methods can be utilized for applications requiring a high level of consistency in retinal image processing for various deployment operations. AGAN, PSO, and EL outperform other models in terms of computational complexity, making them exceptionally useful for low-complexity applications. Thus, these models must be utilized for deployments with high efficiency and low complexity. It can also be observed that AGAN and RDE have a higher speed and are therefore suitable for use cases with low delay. These models are also useful for large-scale applications that require consistent processing speed at a high level of efficiency for different use cases. In terms of scalability, DNN, AGAN, DDN, and DSC are observed to have superior performance and can be applied to a wider variety of use cases. To further facilitate model selection, a Retinal Rank Metric RRM, which combines these parameters, was estimated. This resulted in the identification that PLM, OOF, MSAN, CAMR, UNet, FS GAN and MGAN exhibit higher accuracy, higher scalability, lower complexity, high speed, and high scalability for different use cases. In terms of real-time evaluation scenarios, it is also possible to observe that Deep Learning Models outperform other models.

#### **FUTURE SCOPE**

In the future, the performance of the reviewed models must be evaluated on larger scenarios, and it can be enhanced through the incorporation of low-complexity bio-inspired models such as Particle Swarm Optimization PSO, Grey Wolf Optimization GWO, etc. This performance can also be enhanced through the use of Auto Encoders AEs, Generative Adversarial Networks GANs, and other incremental learning techniques, making these models applicable for real-time clinical use cases.

#### **ABSTRACT**

Anemia is a result of a deficiency in hemoglobin (Hb), a vital component in human blood. According to the World Health Organization (WHO), Anemia is a serious global health problem that affects a large portion of the population, particularly women and children. Hence, determining the hemoglobin content in blood chemistry is a crucial and basic step in the diagnosis of anemia. The approach for estimating hemoglobin in blood in this study uses artificial neural networks (ANN) and digital image processing approach. The proposed method is based on color parameter measurement. 72 blood samples are used for proposed work. A Back-Propagation Network (BPN) algorithm is implemented on statistical and discrete cosine transform (DCT) features of each image. The algorithmically detected hemoglobin values are verified against standard reference method. Overall 92% accuracy was achieved in the results. This BPN based method on gives a cost-efficient alternative for hemoglobin estimation for anemia diagnosis.

**KEYWORDS:** Anemia, Artificial neural network, Back propagation algorithm, Discrete cosine transform, Hemoglobing.

#### INTRODUCTION

nemia has recently become a serious health concern for children and expectant mothers in developing nations like India. World Health Organization (WHO) estimates that 40% of pregnant women and 42% of children under the age of five globally are anemic [1, 2]. Considering this, Anemia arises as a critical concern at community level but still little attention paid towards this issue. The research work proposed in this paper aim to provide a simple and effective method for anemia detection by detecting Hb level in the blood. Red blood cells mostly consist of hemoglobin (Hb). Hb concentration in human blood is a significant factor in determining an individual's physiological state and a crucial factor in a complete blood count. Hemoglobin level in blood is the primary factor impacting the severity of anemic condition in the population because low Hb concentration in the blood is recognized to be anemia in patient. Hemoglobin levels

are displayed in the table below to help determine the presence of anemia [3].

Hemoglobin represents the relative amount of the hemoglobin protein within red blood cells compared to the overall blood volume. This measurement holds significant significance in clinical diagnostics and routine blood screening, serving as a crucial indicator for various conditions including chronic hypoxia, polycythemia vera, thalassemia, as well as severe physiological situations like blood loss and dehydration It can offer helpful insights into the circulatory system's vitally crucial roles in oxygen and carbon dioxide transfer, as well as the control of the acid-base balance [11]. A technique and system for detecting the concentration of Hb is therefore desired as help in the diagnosis & monitoring of such conditions.

Other than cyanmethemoglobin or HemoCue procedures, which are recommended by the WHO, various methods are used in the majority of clinics

www.isteonline.in Vol. 46 Special Issue, September, 2023

and diagnostic laboratories. The results acquired using these approaches exhibit substantial difference from readings obtained using standard methods and have given an inaccurate measurement of Hb level in blood, can create a misleading perception of safety, which in turn complicates the interpretation of abnormal health conditions. In addition to this, in developing countries like India, in rural areas with low resource setting does not have basic diagnostics facilities and hence an accurate, straightforward, precise, and feasible method for the determination of blood hemoglobin content is required which should be cost- effective also. A potential development in this area is proposed in this research paper by estimating the hemoglobin in blood using digital image processing techniques and artificial neural network algorithm [14].

The next sections of this article are organized as following: The related works and its shortcoming are described in the section 2, Section 3 discusses the proposed methodology step by step, the method is simulated and experimental results are shown in the section 4, Section 5 expresses the conclusion.

Table 1: Hemoglobin Level for Anemia Diagnosis (in gm/dl)

Deputation	Non-Anemia			
Population	Non-Anemia	Mild	Moderate	Severe
Children 6 - 59 months of age	11.0 or higher	10.0 – 10.9	7.0 - 9.9	lower than 7.0
Children 5 - 11 years of age	11.5 or higher	11.0 – 11.4	8.0 - 10.9	lower than 8.0
Children 12 - 14 years of age	12.0 or higher	11.0 – 11.9	8.0 - 10.9	lower than 8.0
Non-pregnant women (15 years of age & above)	12.0 or higher	11.0 – 11.9	8.0 - 10.9	lower than 8.0
Pregnant women	11.0 or higher	10.0 – 10.9	7.0 - 9.9	lower than 7.0
Men (15 years of age & above)	13.0 or higher	11.0 – 12.9	8.0 - 10.9	lower than 8.0

#### RELATED WORK

There are two types of anemia detection: invasive and non-invasive. A sophisticated hemoglobin photometer is used in invasive approaches like the HemoCue method to forecast precise outcomes. It is battery-operated, portable, but expensive. The World Health Organization (WHO) color-scale technique is reasonably priced. Using a colour scale, it estimates the hemoglobin amount by putting a drop of blood on small card with six shades. Depending upon the colour

match with shade card the Hb content will be estimated. Nevertheless, compared to the HemoCue approach, this method is less accurate [6, 9].

Sahar J. Mohammed et.al. proposed a method for anemia prediction based on rule classification [5]. The dataset collected from 539 patient is used to detect six different types of anemia. The approach utilized by research for anemia detection is based on data mining. The algorithm model such as ZeroR, OneR & PART are implemented for classification purpose. A precise anemia prediction system is designed using these three rule classification methodologies. OneR produced around a 50% increase in accuracy over ZeroR, a simple classifier with the lowest accuracy. In terms of the strategies used, PART offered 85% more accuracy than ZeroR and OneR.

Amir Aslan Aslani et.al. [7] detected the anemic condition in individual by automatic counting red blood cell (RBC) in microscopic images of blood sample. The authors have used circular Hough transform (CHT) and endpoints method to predict the anemic condition based on counting approach. On the input image, two concurrent tasks are carried out. The input image is segmented in the first task using thresholding and erosion on the green channel. The input image in the 2nd part is turned into a grayscale image and edged using the Canny method. In order to remove White Blood Cells (WBCs or leucocytes), the segmented picture is then subtracted from the bordered image. After the margin has been inserted, the image will have estimated RBC continuation added by setting Endpoints. Finally, CHT is applied to the image and it will calculate the number of RBCs. Moreover, new measures for counting error and accuracy have been defined. A fifteen-image sample from the ALL-IDB1 database is employed to evaluate the method.

Digital image processing and support vector machine based approach of RBC morphology counting and grading can also be utilized for iron deficiency detection and thus useful for anemia identification [8]. This approach suggested by R. V. Pellegrino et. al. acquired peripheral blood smear samples and creating a prototype that could analyses them using Raspberry Pi hardware. The system categorized, tallied, rated, and offered suggestions for related diseases for the sample PBS test. The average accuracy of the described system's reading

of the samples of target cells, elliptocytes, and normal red blood cells was 95.77%. against pathology reading.

The approaches discussed for detecting anemia are based on RBC counting, which might lead to ambiguous outcomes. So, considering this, a novel approach based on classification approach is put forward in this research article. It will directly establish a linkage between colour of blood sample and Anemia identification using artificial neural network approach. The proposed methodology returns the result in term of percentage correct classification (PCC) to Hb value of blood sample thus helps to identify the anemic condition in patient [16].

#### SYSTEM DEVELOPMENT

The proposed methodology describes the system implementation using artificial neural network approach. It also depicts the interrelation of colour of blood sample and Hb value of sample. The detailed process of feature extraction is explained in this segment with the help of block diagram. Finally, the application of backpropagation algorithm is discussed in detail.

#### Color of Blood Sample and HB Value

Human Blood consists of cellular material, water, amino acids, proteins, cellular wastes etc. red blood cells is major component of cellular material which mainly constitutes 99% of total volume and the remaining is made up of platelets and white blood cells (WBC). Each red blood cell has a volume of around 1/3 Hb. Centrifuging (spinning) is the most used technique for separating blood. Blood that has been centrifuged exhibits three layers which are Plasma, (about 55%), second is the buffy coat made up of platelets, WBC etc., and the third is the heavy bottom part of the segregated mixture or around 45%, is made up of red blood cells [4]. Consequently, it may be concluded that the Hb content of blood can be precisely estimated based on the blood colour. It is common practice to determine the Hb concentration in blood by observing the colour of the blood with direct vision or by utilizing certain chemicals. For colour matching, these techniques rely on human perception. In context of this, estimating Hb may depend on the colour of the blood. Using machine vision, we aim to replace the subjectivity of human colour perception. So, we made the decision to employ

a technique to convert each blood sample's colour information into a digital image file. The relationship between the Hb value and the amount of red content in a blood sample image is depicted in the graph below. It can be concluded that as Hb value goes on increasing the red content from RGB plane also goes on increasing.

Fig. 1. HB Values Versus Mean of R-Plane Values

### Proposed Methodology

The proposed methodology is depicted in the block diagram provided below and explained in detail in this section.

Fig. 2. Block diagram of proposed methodology

The digital images of blood sample are collected from local hospital. The blood samples are collected from different cross section of people of different age group. The color information can be extracted from digital image of blood sample which is used to estimate Hb. The glass slide is prepared by smearing volume of 10 microlitre a blood sample on glass slide and is covered with glass cover slip so that it should be uniformly spreaded. Smeared glass slide of a blood sample is then placed under microscope to capture images of blood

sample. High-resolution images of the blood sample are taken using a camera with superior image quality, which is attached to a microscope magnified by a factor of 10. In this implementation, we are using images having pixel size 1024 x1280 pixel with .BMP format. There are several file formats available for storing digital images that have been acquired. The available image file formats are Bitmap (.BMP), Joint Photographic Expert Group (.JPG), Tag Image File Format (.TIFF) or Portable Network Graphics (.PNG) file format. Out of these, .BMP and .TIFF files have the ability to transmit color information without compromising quality and original features. The other image formats such as .JPG and .PNG files lose some color information, as a result of the original files being compressed for file size reduction. Considering all these factors regarding quality, size, features etc., for the implementation of proposed system, the .BMP image file types have been utilized for system development.

Fig. 3. Microscopic image of blood smear with HB level (HB value is in gm/dl.)

The captured are then pre-processed to extract features of an image for classification. These features mainly include statistical features i.e. mean and standard deviation, statistical feature of discrete cosine transform (DCT) of an image and binary feature of image. Classification of various Hb sample is carried out using back-propagation network which implies supervised learning approach for processing. Finally, the correct percentage of classification i.e. percentage correct classification (PCC) of Hb sample is calculated.

#### **Feature Extraction Methods**

Statistical Feature Extraction Methods

The complete process for statistical feature extraction method is explained using block diagram is as shown in Figure 4. Here, we are calculating mean and standard deviation as feature vector for classification using backpropagation algorithm.

Fig. 4. Flow for Statistical Feature Extraction

The required R-plane from RGB model and Y-plane from YIQ model is extracted for an HB sample microscopic image from the database. Then, the image is divided into sub block of size 256×256 and normalization is carried out on each block to normalize the pixel value in each block. The range of pixel intensity levels is updated due to process of normalization. The normalization will eliminate the redundant data in an image. In this proposed approach, pixel intensity values of each block are normalized over the range 0 to 255. The mean and standard deviation are calculated of these normalized data which are provided as input feature to back propagation algorithm for classification.

#### DCT Feature Extraction Methods

Fig. 5. Flow for DCT Feature Extraction

The detailed flow for feature extraction using Discrete Transform Cosine (DCT) algorithm is described with the help of block diagram in figure 5. The importance of utilizing the discrete cosine transform (DCT) for feature extraction lies in its ability to divide the image into spectral sub-bands of varying significance based on the visual quality of the image. This enables the extraction of more valuable information from the blood sample image. The DCT values of normalized images are calculated which are used to find out feature vector for classification. Mean and standard deviation of DCT values are computed to provide it as a feature vector.

# **Back Propagation Algorithm**

While the back-propagation network (BPN) algorithm technique is a mathematically intricate tool, its

implementation becomes straightforward on a computer due to the iterative nature of the training equations.

A pair of patterns (Xk, Tk) are provided to the network during training, with input pattern is denoted by Xk and target or desired pattern is denoted by Tk. Each layer's trained neurons respond to the Xk pattern's output signals, which results in an output OK at the output layer of neural network. A feedback signal is generated at the output layer as a result of the difference between the actual and desired outputs. The weights of the neurons in each layer's neurons determine the value of this error signal. In the process of minimizing this inaccuracy, new weight values are determined. This depends upon the learning rate factor which maintains the speed and accuracy of the training process [10].

In order to start BPN learning process, we require the following set of input for training purpose:

- The set of training patterns, input and output
- The learning rate value
- Algorithm Termination criterion
- Initial weight and Weight updating Methodology
- The nonlinearity function (usually the sigmoid)

After getting this initial parameter, the backpropagation network algorithm can be implemented for desired system development.

Fig. 6. BPN Learning Process

The initial input sequence(pattern), Xk and related desired outcome, Tk are then applied to begin the procedure. The input causes a response to the neurons of the first layer, which in turn cause a response to the neurons of the neurons of the next layer, and so on, until a

response is obtained at the output layer. The response obtained at output layer is then compared with the target response and the error signal is calculated. The algorithm determines how quickly the error fluctuates as the neuron's activity level varies, compared to the difference in error observed at the output neurons. The computations up to this point were forward-looking (i.e., towards the output layer from the input layer).

To reduce the error in the output, the algorithm takes a step back to the preceding layer and recalculates the weights of the output layer. This will result in modification of the weights of neurons between the last hidden layer and the output layer. The algorithm follows this identical process of calculating the error and determining new weight values, progressing layer by layer in reverse until it reaches the input layer. At this stage, weight updation process stops and then the next pair of input-output sequence is to be chosen by algoriand are processed with identical algorithm steps. Despite the condition that responses are moving forward towards output layer, updated weights are determined by going backward towards input layer [10].

#### **Implementation**

ANNs are computational models that can offer feasible solutions to issues when there isn't a known empirical relationship between the problem's input and output parameters. These ANNs must be trained using examples of input-output value pairs. It has been observed that choosing the right input variables will significantly affect how well ANNs work. Back Propagation algorithm from artificial neural network is used in this system implementation since, there is no explicit relation between input and output. Hence, in this system, use of BPN is preferred.

BPN architecture which have been implemented, as illustrated in figure 7 comprised in one input layer, three hidden layers, and one output layer make up five-layer structure. The hidden layer count and the neurons count in each hidden layer varies depending on the level of accuracy and computation time that is acceptable. Three hidden layers with 15 neurons in each layer gives best classification. The MATLAB software with image processing toolbox and statistics and machine learning toolbox is used for implementation of proposed system.

Fig. 7. Implementation Process

#### RESULTS AND DISCUSSION

For performance evaluation of implemented system, total 72 samples across different age group and gender were collected. The database is categorized into training dataset and testing dataset. Out of total 70 samples used for experimentation, 70% of samples were used for training part and remaining 30% samples were utilized for testing purpose. The accuracy for classification approach is calculated and use as major factor performance analysis purpose. After several iteration, it is determined that the BPN configuration with three hidden layers comprising fifteen neurons each yields the optimum desired results for backpropagation networks. It is verified that BPN architecture with more than three hidden layers and excessive neurons per layer, does not gives optimal accuracies for best results for the implementation.

For analysis purpose, we are extracting mean and standard deviation of R-plane and Y-plane as well as of DCT of R-plane and Y- plane which are used as input feature for classification. The classification is based on HB values. The given Hb sample is to be classified according to its values. The classes will be range of HB values and depending on range, we have the number of classes. The analysis is carried out using two, three and five class classification approach. The accuracy for each is calculated for different set of features as explained earlier. The epoch also plays a important role in deciding the accuracy of classification. The maximum accuracy is obtained for epoch value of 15000. The results are tabulated as below:

**Table 2. Accuracy for Classification** 

Feature	Two-Class	Three-Class	Five-Class
R-Plane	87.75%	87.68%	71.33%
Y-Plane	92.66%	89.72%	75%
R-Plane DCT	86.08%	74.53%	72%
Y-Plane DCT	84.33%	81.29%	69%

The figure below shows graphical representation of tabulated values of accuracy for classification.

Fig. 8. Accuracy for Classification

Based on classified value, we can decide patient's the anemic condition as per the range mentioned for anemia detection in Table 1 earlier the research paper.

#### **CONCLUSION**

The proposed system described in research paper is efficient in classifying the given blood sample according to specified ranges to ensure detection of anemic condition in an individual. To achieve this objective, classification approach based on backpropagation algorithm of artificial neural network is employed which gives accuracy up to 92%. The proposed methodology explains the detailed procedure for database collection which includes emphasis on relation between colour of the blood sample & Hb value and process for capturing the blood sample microscopic images. The feature extraction process involves the system to be analyzed for the different set of features of samples. Thus, ensuring that the results is 0to be obtained for best set of extracted features. Finally, back propagation algorithm is implemented for the classification of input sample among the range of Hb values. This system will help

to determine the anemic condition among individuals living in the rural areas where the basic diagnostic facilities are not easily available. The proposed system in the research paper does not try to replace the existing system rather it will help the physician to predict diagnosis immediately.

#### **ABSTRACT**

India is aggressively planning for 5G rollout. The government, telecom regulators, and industry players are enabling 5G networks. 5G technology has been tested in several trials and pilots nationwide. 5G technology may deliver faster data rates, reduced latency, and higher network capacity than previous generations of cellular networks. This might enable driverless cars, smart cities, IoT gadgets, and sophisticated healthcare systems. 5G implementation in India has met hurdles. 5G spectrum is a serious issue. Due to cost and availability, the government has delayed 5G spectrum allocation. Telecom companies must invest heavily in 5G infrastructure; thus finances must be considered. 5G infrastructure is another issue. 5G requires dense small cell and fiber optic networks. In highly populated locations, 5G requires extensive fiberization and a strong infrastructural backbone. 5G raises privacy and security issues. 5G networks link many devices and allow data-intensive applications, making user data privacy and security critical. Effectively addressing these challenges requires regulatory frameworks and standards. Despite these limitations, India is optimistic about 5G technology's benefits. The government and industry stakeholders are overcoming challenges and developing a 5G network ecosystem. 5G may improve healthcare, agriculture, education, and entertainment and help India digitize.

Multiple Input Multiple Output (MIMO) antennas are crucial in Sub-6 5G technology, utilizing several antennas mutually at transmitter and receiver ends to enhance communication efficiency. These antennas enable simultaneous transmission and reception of multiple data streams, resulting in increased data throughput, improved spectral efficiency, enhanced coverage and reliability, and beamforming techniques. By utilizing multiple antennas, Sub-6 5G networks can address the growing demands for bandwidth, capacity, and network efficiency in the 5G era. By leveraging MIMO technology, Sub-6 5G networks can deliver higher performance and address the growing demands for bandwidth, capacity, and network efficiency.

**KEYWORDS:** 5G, Cellular network, IoT, Sub-6, MIMO.

#### **INTRODUCTION**

G technology is a revolutionary emerging technology that offers high data rates, low latency, and high capacity. It is expected to revolutionize the 2020 generation by enabling societal transformation in educational sector, industrial sector, healthcare sector, and other fields. By balancing latency, cost, and speed, 5G technology will unlock an extensive IoT ecosystem, enabling a trade-off between latency, cost, and speed [1]. When it comes to mobile wireless communication,

analog phone conversations have given way to highquality internet connections that may achieve data transfer speeds of several megabytes per second. Advancements in mobile communication networks and new devices like smartphones and tablets have led to an explosion of mobile applications and exponential network traffic growth [2].

Beam Division Multiple Access (BDMA), an enhanced access technique, will be utilized to enable the transition from 4G to 5G [3] and Non- and quasi-orthogonal or

www.isteonline.in Vol. 46 Special Issue, September, 2023 212

Filter Bank multi carrier (FBMC) multiple access [3]. BDMA divides an orthogonal beam to mobile stations, increasing system capacity and providing multiple accesses [3]. The existing architecture of wireless cellular networks requires communication to take place at a base station located outside of the coverage area. This results in a significant decrease in spectral, data, and energy efficiency. In order to overcome this difficulty, a novel approach to the design of 5G cellular architecture prioritizes the usage of discrete outside and interior configurations. [4]. It is a big research and technical problem to design high-speed wireless networks with acceptable quality of service and the ability to operate over long distances in non-line-ofsight (NLOS) conditions. The MIMO wireless network technology has the ability to provide wireless networks with a bandwidth of 1 Gb/s; however, there are a number of obstacles, including cost, technological limitations, and legal restrictions, which make it undesirable.

MIMO microstrip patch antennas are a powerful technology that enhances wireless communication systems by increasing data throughput and reliability. These antennas are placed at both transmitter and receiver ends, connected to separate RF channels. They improve signal-to-noise ratio and reduce interference effects. MIMO systems can be designed in various configurations, such as vertically stacked, horizontally stacked, and spatially distributed arrays. They offer increased data throughput, improved reliability, and better coverage, but require more complex hardware and signal processing algorithms than single- antenna systems [5].

MIMO antennas are essential for multi-band operation across a wide bandwidth for various broadband services. Some designs, like gap-coupled feeding structures [6], [7], have a narrow impedance bandwidth. Reconfigurable feedings can solve this issue, but diodes and lumped components can decrease performance [8] - [10].

## DESIGN OF MIMO ANTENNAS AND ITS PERFORMANCE

Evaluation of important parameters in MIMO antenna systems, including envelop correlation coefficient (ECC), Diversity gain (DG), isolation along with traditional parameters like bandwidth, resonance frequency, radiation patterns, gain, and efficiency, is crucial for fully characterizing multi-antenna devices.

Various techniques so far incorporated to improve performance of MIMO antennas. Researchers use antenna design techniques to improve parameters like bandwidth, gain, efficiency, mutual coupling reduction, and compact size. These may be choice of substrate [11], Multi-element [11], Mutual Coupling Reduction Techniques like Electromagnetic Bandgap Structure (EBG) [12], Dielectric Resonator, Defected ground structure (DGS) [12], Slot Elements, Complementary Split Ring Resonators (CSRR), Neutralization Lines [12].

#### **Choice of substrate**

Efficient antenna design depends on the right choice of substrate material, which plays a crucial role in determining overall performance and efficiency. Key characteristics include dielectric constant ( $\epsilon_r$ ), loss tangent (tan  $\delta$ ), substrate thickness (tan  $\delta$ ), substrate stability (good dimensional stability over temperatures and humidity levels), thermal conductivity (efficient heat dissipation), mechanical strength (stable and durable), cost and availability (cost-effective and readily available), and environmental compatibility (appropriate resistance to moisture, chemicals, UV radiation). By carefully considering these characteristics, antenna designers can select an appropriate substrate material that aligns with their specific requirements, resulting in improved efficiency, performance, and reliability [13].

#### **Multi-Elements**

Multi-element antennas significantly improve performance by enhancing various characteristics. These configurations involve arrays or combinations of multiple antenna elements working together, resulting in increased gain, higher directivity, beamforming, polarization diversity, spatial diversity, interference rejection, MIMO capability, and compact and lowprofile designs. By combining radiation patterns and signals from multiple elements, multi-element antennas enhance signal reception and transmission, extend the range and coverage area, and reduce interference. They also enable beamforming, polarization diversity, spatial diversity, interference rejection, and support

for advanced technologies like MIMO. Multi-element antennas are ideal for wireless communications, radar systems, satellite communications, and other applications [13].

#### **Mutual Coupling Reduction Techniques**

Mutual coupling is the electromagnetic interaction between closely spaced antennas, which significantly impacts antenna performance. To mitigate this effect and improve antenna performance, various techniques are employed. These include increased spacing, orthogonal placement. electromagnetic bandgap structures. shielding, electromagnetic decoupling elements, frequency selective surfaces, active impedance loading, antenna element isolation techniques, diversity techniques, and compact antenna designs. These techniques aim to reduce mutual coupling, improve efficiency, gain, radiation pattern, and isolation between antennas, leading to enhanced system performance in applications like wireless communications, MIMO systems, and phased array antennas [13].

## MIMO ANTENNAS WITH DIFFERENT TECHNIQUES

This review article provides an overview of MIMO antennas for Sub- 6 5G wireless communications. It does so by synthesizing the knowledge that has been acquired from earlier research publications that have been written by a variety of authors.

Demos Serghiou [15] designed and presented 64 element folded monopole antenna with 8 ports using FR4 substrate. Antenna works for 3.5 to 4.9 GHz frequency band.

Fig. 1. Design illustartion of 8 x 8 Mimo antenna [15]

Fig. 2. Results of designed antenna [15]

Gorre Naga Jyothi Sree, et.al. [16], presented very compact design of antenna using fractal MIMO radiator and defected ground structure to improve various parameters like operating bandwidth, diversity gain, ECC, etc. and compared the results with similar antenna systems designed by other researchers.

Fig. 3. Prototype of designed antenna [16]

Fig. 4. Results of designed antenna [16]

R. Nagendra, et. al., [17] designed four port MIMO antenna for IoT applications using meander line monopole antenna. Fabricated antenna exhibits good VSWR, Gain and impedance matching. This antenna also operates for multiple bands.

Fig. 5 Front and back profile of designed antenna [17]

Fig. 6 S11 and 3D radiation pattern of designed antenna [17]

Circularly polarized MIMO antenna is presented by Falih M. Alnahwi, et.al., [18] which is fabricated using FR4 substrate. Unequal pairs of slits are implemented and antenna elements are implemented on corners to achieve desired circular polarization.

Fig. 7 Fabricated antenna and its results [18]

Kanagasabai, et.al., [19] designed single Malathi element using different types of slots to improve characteristics of the antenna and implemented finalized element in 2 x 1 MIMO antenna. It exhibits improvement in diversity gain, envelope correlation coefficient (ECC), isolation. This antenna design is proposed for vehicular communication.

Fig. 8 Configuration of antenna [19]

Fig. 9 Simulated results for reflection coefficient and isolation [19]

Special Issue,

Suman Sharma, et.al., [20] presented 4 – port MIMO antenna with microstrip patch antenna with a diamond shaped slots and partial ground structure. Gain of antenna is 3.8 dB and 87% of efficiency and ECC less than 0.1. Antenna designed is applicable for smartphone applications.

Fig. 10 Prototype of antenna [20]

Fig. 11 Simulated and measured results [20]

#### ANALYSIS OF VARIOUS PARAMETERS

In order to realize the capabilities of 5G communication technology, the MIMO antenna design delivers a high data transfer rate as well as a high capacity. Inter element isolation is another factor that determines how well a MIMO antenna design will work.

Table 1. Comparison of Various Antenna Designs and their Findings

Ref.	Technique	Size of	Substrate	No. of	No.	Frequency	ECC	Isolation	Bandwidth
No.	used	Antenna in	Material	Elements	of	(GHz)		(dB)	(GHz)

#### **CONCLUSION**

This article presents a summary of recent research in the subject of MIMO antennas for 5G applications, and it does so by way of an overview. Both the antenna's physical structure and the decoupling methods had a role in determining the level of performance achieved by the design of the antenna. The operating frequency of an antenna as well as its range might change depending on the application of the antenna. The practical antenna designs have a large capacity and a strong inter element isolation; additionally, the parameters are tuned in order

to achieve the desired outcomes. It has been determined that the most current obstacles that have been posed by 5G communication technology can be overcome with the implementation of MIMO antenna technology.

#### **ABSTRACT**

Cache memories are high speed Static Random Access Memories (SRAM), and their design is a specialized analytical task that involves design of optimized memory layers, their read & write cycles, and backup circuits. Researchers have designed a wide variety of optimized cache memory designs, and each of them varies in terms of their internal & external operating characteristics. This paper discusses some of the recently proposed cache memory designs in terms of their functional nuances, contextual advantages, deployment-specific limitations, and application-specific future scopes. Based on this discussion readers will be able to identify optimal cache memory design models for their functional use cases. It was observed that Cache Line Size, Cache Associatively, Cache Mapping Function, Cache Replacement Policy, Cache Size, Pre-fetching ,Write Policy, and Hardware-based Cache were the major design characteristics that were used while designing efficient cache types. This text further compares these models in terms of their performance metrics, that include read & write delay, deployment cost, backup efficiency and scalability levels. Based on this discussion readers will be able to identify optimal models for their performance-specific use cases

**KEYWORDS:** Cache, Memory, Delay, Read, Write, Cost, Backup, Efficiency, Scalability, Scenarios.

#### INTRODUCTION

ache memory is a small, fast memory unit that temporarily stores data and instructions that the processor is likely to reuse. The design of cache memory is crucial for optimizing processor performance. Here are some key components of cache memory design. The size of cache memory is limited, typically a few MBs, compared to the main memory (RAM). The size of cache is a trade-off between cost and performance, larger cache can store more data but is more expensive. Organization of Cache memory is organized into blocks or lines, each line contains multiple data or instruction items. This allows for efficient data access, as the processor can retrieve an entire cache line with a single memory access. The mapping technique defines how data from main memory is transferred to cache memory. Common mapping techniques are direct mapping, associative mapping, and set-associative

mapping. When the cache is full and a new line needs to be loaded, the cache must choose which line to replace or overwrite. The replacement policy determines which line to replace, common policies are FIFO, LRU, and LFU. Cache memory operates in either write-through or write-back mode. In write-through mode, writes to cache are immediately written to main memory, while in write-back mode, writes are temporarily stored in cache and updated in main memory later. When multiple processors share a cache, coherency and consistency must be maintained to ensure that each processor has a consistent view of memory. The cache coherency protocol ensures that all cached copies of a memory location are consistent and up-to-date.

In conclusion, the design of cache memory affects the performance and efficiency of the processor, as it acts as a buffer between the processor and main memory. There are several cache memory design techniques that

www.isteonline.in Vol. 46 Special Issue, September, 2023 (218)

can improve its performance. Larger cache line sizes can increase the cache hit rate by reducing the number of cache conflicts. Increasing the associativity of the cache can reduce the number of cache conflicts and increase the cache hit rate. A good mapping function can improve the cache hit rate by ensuring that frequently accessed data is stored in the cache. A good replacement policy can maximize the cache hit rate by replacing less frequently used data with more frequently used data. A larger cache size can increase the cache hit rate, but also increases the cost of the cache. Pre-fetching data into the cache before it is actually requested can reduce the latency of cache misses. A write-through policy updates both the cache and the main memory, while a writeback policy only updates the cache, improving write performance. A hardware-based cache implemented in the CPU can provide faster access to the cache than a software-based cache.

In the next section, such techniques are discussed, along with their internal & external operating characteristics. This is followed by an empirical review of these models in terms of different parameter sets. Finally, this text is concluded with some circuit-specific observations about the discussed techniques, and recommends methods to improve this performance under real-time scenarios.

#### **DIFFERENT MODEL: AN OVERVIEW**

A wide variety of cache design models are proposed by researchers, and each of them varies in terms of their internal & external performance characteristics. Extensive analysis and summary Off-chip memory delay and capacity issues are possible in FPGA systems [1]. (HLS). Memory in FPGAs can be either fast onchip RAM or slower but larger off-chip Memory (block RAMs and registers). It requires a lot of time and effort, but the memory layout can be scratchpad using HLS tools. Memory management in the Xilinx Vitis HLS FPGA is automated by a buffer of C++ source code that the user can modify. To improve performance, port-specific level 1 cache may be incorporated into the private level 2 (L2) caches of a DRAM-mapped array. Separate from the programme that makes use of it, the L2 cache operates as its own dataflow job. By decomposing off-chip memory calls and data storage into dataflow jobs, this method is similar to load, calculate, store but removes human algorithm reworking. According

to data collected from FPGA boards, their cache can speed up test runs by a factor of 60, compared to the HLS's out-of-the-box answer. Their caches aren't meant to outperform individually tailored versions in QoR; rather, they're meant to drastically reduce design effort, make the HLS flow more like software, and free the creator to focus on algorithmic enhancements rather than explicit memory management. Caching may be of use only to algorithms with data-dependent or uncertain memory access patterns and satisfactory data proximity.

Memory systems that rely on dynamic random access memory (DRAM) face scaling issues in terms of memory density, energy usage, and expense [2]. Combining dynamic random access memory (DRAM) and non-volatile memory (NVM) in a hybrid design could result in a main memory with high volume and low power consumption (NVM). Cache failure prices vary between DRAM and NVM, which complicates the administration of on-chip cache in mixed memory devices. The mixed memory system's memory entry speed is no longer gauged by the cache hit rate. Currently, there is no way to improve cache hit rates using cache substitution choices. This study looks into the discrepancy between the penalties for cache misses in DRAM and NVM and suggests using the average memory access time (AMAT) to evaluate the efficacy of mixed memories. Least recently used (LRU) cache substitution with a failure cost should be used in hybrid memory systems (MALRU). Knowing where each data block originated, MALRU is able to keep both highlatency NVM blocks and low-latency Memory blocks with remarkable temporal proximity in the last-level cache. Results indicated that compared to LRU and the present mixed memory conscious cache segmentation strategy policy, MALRU may increase system efficiency by 22.8% and 13.1%, respectively.

There is a speed hit and a rise in power usage [3] due to row buffer disputes in DRAM-based memory. Row buffer conflict overheads lengthen activation and precharge times for rows as bitline length and memory capacity grow. The speed effect of row buffer disputes has been studied, and a solution, Row Buffer Cache, has been proposed (RBC). Their RBC architecture prioritises rows with high spatial locality, caching them and protecting them from searches targeting rows without high spatial locality. This RBC layout lessens the

need for row initiation and precharge, which improves the overall efficiency of the system. An evaluation of the RBC architecture versus Benchmark CPU2006 with DDR4 RAM is presented. Using RBC could increase single-core modelling speed by 2.24 percentage points (16.1%) while decreasing memory energy consumption by 68.2 percentage points (23.6%). Multi-core models show that RBC can improve speed by an average of 17% and reduce memory energy consumption by 35.4%.

Based on the findings of [4]'s investigation, cache sidechannel exploits pose a serious problem for modern computing infrastructures. By monitoring a target's cache usage, attackers like the Flush+Reload flaw can learn sensitive information about them. To get good speed with memory-intensive apps that can't be kept in the on-chip SRAM, modern computer systems use DRAM cache between the SRAM-based last-level cache and the primary memory DRAM. The result could be great capacity with minimal delay (for example, L3 cache). The purpose of the Memory buffer in this study's ByCA method is security, not speed. Cache entries that are vulnerable to attacks are not stored in the L3 shared cache when using ByCA. ByCA nullifies Flush+Reload attacks by decreasing the interval between cache block accesses. Attackers' intended L4 Memory cache chunks can be tracked with ByCA (based on whether or not they have been flushed by clflush). ByCA repurposes the clflush command to clear out caches higher up the stack while leaving the L4 Memory cache alone (i.e., L1, L2, and L3 caches). When an assailant or victim accesses a target block that has been cleared by clflush, ByCA causes L3 cache to be bypassed so that the perpetrator always gets the block from L4 Memory cache. As the time difference is reduced by ByCA, the attacker's ability to watch cache access becomes useless. In the L4 DRAM cache's Alloy Cache setup, the status of each block is tracked by checking an empty bit in a tag entry. There is only a single bit of expansion required for the private L1 and L2 caches, while tag entries are required for the L4 Memory cache blocks. Through extensive testing, they found that ByCA completely nullified the time fluctuations introduced when an assailant reloaded a target block. While co-running with an assailant who empties and reloads target blocks on occasion, ByCA hides the victim's performance degradation.

LLCs, or last-level caches, minimise the use of costly off- chip storage [5]. That's why LLCs need more space for data storage so they can build apps that rely heavily on data. Abundant stuffing This need is satisfied by non-volatile STT-RAM storage. There is a sizable time and power cost associated with writing to a STT-RAM buffer. Researchers found that large composite LLCs with a combined SRAM-STT-RAM memory were able to manage expensive uploads. As a result of deadlocks, these big LRU-managed LLCs are underutilised (zeroreuse blocks). Scientists prove that LLC errors go down after the deadblock is removed from the equation. In order to determine which deadblock should be removed, the hybrid cache is taken into account. To address this problem, the authors of this study offer Deadblockbased Victim Selection (DVS), a substitution approach with awareness of deadblocks. In as much as 40% of cases, evicting a deadblock from the cache requires moving cache blocks. The Deadblock-based Migration (DM) strategy is proposed by the study community as a means to improve the efficiency of DVS's cache block migration approach. DVS and DM may improve system efficiency by 13 and 52%, respectively, according to a thorough study of the SPEC CPU2006 tasks. The efficiency of large-scale mixed LLCs was found to be enhanced by using deadblock and migration-aware cache substitution.

In today's networks, data leakage is one of the biggest concerns for security [6]. Assuming technology is trustworthy is a prerequisite for most security measures. Hardware is exploited by the Cache-Out family of system exploits due to a Trojan horse in the Microprocessor (CPU). It has been theorised by the study community that the constant barrage of the same data pattern on the same location will eventually set off a memory Malware trigger in the L1 d-cache. Changing addresses after the Malware has been activated will cause read/write errors, memory problems, and data loss. In the peripheral of nanoscale cache memory, cutting-edge circuit features such as wordline underdrive (WLUD) and negative bitline (NBL) for static RAM are used to transport messages (SRAM). Tests suggest that read and write errors can be induced by tampering with the WLUD and NBL. Scientists show the potential drawbacks of using WLUD while writing. Data theft is possible via NBL and column merging. Simulation results for the GEM5 design have been confirmed. Cache- Out. L1

address concealment, read/write authentication, ECC bit scrambling, and reliable ECC are all examples of countermeasures. In conclusion, the steady and dynamic power requirements for 64-bit word size read/ write verification using 22-nm technology are 7.56 m<sup>2</sup> and 0.1 W/91.3 W, respectively.

Large L4 last-level caches are now possible thanks to advances in device density, memory technology, and connectivity [7]. (LLCs). LLCs are typically managed by "tagless" archives (e.g., 3-D). The information cache (L3) and the tagless cache are both confused by tagless methods (L4). In order to lessen the intercache substitution tangling costs, many different cacheorganization techniques are being investigated by the study community. The geographic and temporal proximity of allocating large blocks of data has been greatly enhanced by the availability of specific tiling forms that fit software access patterns in a number of prominent computing cores. To reduce coupling overheads and disorders, tagless LLCs have energyefficient alternatives like limited block caching (RBC) and target tag buffer caching (VBC). Methods in linear algebra kernels developed in software are put to the test. The RAM traffic caused by RBC and VBC drops by 83.4% (32 MB L4s) and 67.5% (64 MB L4s), respectively (72.6 MB L4s). When compared to a tagless cache with an LRU strategy in L3, RBC and VBC increase the performance of 8/32/64 MB L4 devices by 16% (0.3%) and 15% (1.8%), respectively. In addition, they show that memory traffic can be decreased by 51% compared to linear superblocks while delay can be improved by 13% compared to the default tagless cache by adapting the hardware allotment for each tagless area superblock to the access sequence of the software tile.

Fig. 1 Level of cache memory

The findings of this study were reported in [8]. Clientserver architectures that evolve over time can cause unanticipated bottlenecks in the network. Network buffers save commonly sought information to circumvent this problem. In a standard cache system, each person has their own cache and all caches are retrieved from the same location. Using decentralised cache loading (DCL) is preferable for large networks. The concept of "shared caching," in which a single cache is used by multiple clients, is discussed. Decentralized shared storage is now an issue of the past thanks to a brand new and faultless distribution method. Index coding demonstrates that the distribution strategy is superior to linear models. The proposed workaround is as fast as centralised prefetching.

It has been suggested that the problem of fine-grained 3D layering can be solved by the work presented in [9]. Monolithic three-dimensional integration describes this method of growth. Using M3D integration, it is possible to combine microarchitectural components at the nanoscale scale, including caches, register files, translation lookaside buffers (TLBs), and more. To achieve M3D integration, stacked layers must be operated at low temperatures, which degrades stacked transistor efficiency in comparison to 2D. Due to advances in low-temperature manufacturing techniques, non-volatile memory (NVM) such as magnetic RAM (MRAM) can now be integrated into M3D systems without sacrificing speed. An M3D-based SRAM/ MRAM mixed memory design for the L2 TLB-cache is proposed. When compared to both 2D SRAM and 2D SRAM/MRAM hybrid memory, M3D-based SRAM/ MRAM hybrid memory uses less electricity without sacrificing speed. Their approach is particularly useful for concurrent tasks with very high L2 cache miss rates because it improves energy economy by adjusting the memory segmentation of the united L2 TLB-cache based on the L2 cache miss rate. Based on the results of the PARSEC benchmarking programmes, the authors conclude that their design reduces the energy consumption of the L2 TLB + L2 cache by as much as 97.7 percent (53.6 percent on average) compared to the standard with 2D SRAM-only memory, with almost no performance penalty. Their method cuts down on the amount of energy needed to reach memory by 32.8%

Special Issue,

(10.9% on average) by reducing the number of TLB failures.

Performance of Network Function Virtualization-aware packet processing was studied in [10], which looked at how the speed with which COTS devices accessed memory affected things (NFV). The speed with which data can be accessed from memory is crucial for jobs like table search and others in packet processing. As a result, the on-chip cache memory of many CPUs is crucial for high- performance software routers and switches. The carrier network requires a large buffer memory because many programmes share the same physical system. By combining on-chip last-level-cache (LLC) segments with off-chip interlaced 3D-stacked DRAM components, researchers present a packet processing design that enhances memory access parallelism. Memory queries can be processed in parallel thanks to the off-chip 3D layered DRAM's table entries for bank interleaving and channel parallelism. Cache objects are partitioned into on-chip LLC segments using a hash method based on memory addresses, allowing multiple CPU cores to access them simultaneously. When compared to designs with on-chip shared LLC and without on-chip LLC, the proposed design improves the state of the art by reducing memory access delay by 62%, increasing performance by 108%, and decreasing the likelihood of memory request stalling by 96% for real-time scenarios.

The research in [11] investigates a cache-assisted network with caches of varying sizes. First, use planned positioning methods to take advantage of differences in cache sizes when only one person is linked to each cache. People with short-term or poor memory can benefit from unicast/multicast messages. For three-user systems with variable cache capacities, larger systems, and systems in the tiny total memory era, coded placement (CP) minimises delivery burden. Next, we look at systems with a lot of people and a buffer capacity that's roughly the same. Coding decreases the effectiveness of even the most effective uncoded positioning technique. In the suggested system, encoded subfiles kept in underutilised caches are simpler to decode thanks to unicast/multicast signals sent to the overutilized helpercaches. For devices with two caches, coded location is preferable. In larger systems, it is possible to optimise the settings of the coding positioning technique. When there is more of an imbalance in the connections between users, coded positioning becomes more useful. Using the cache capacities and network design, experts have developed a uniform coded positioning technique for two-cache systems.

To get around the GPU's memory limitation, the authors of [12] propose using a 3D memory structure composed of DRAM and SCM. By using Memory for buffering, the HMS avoids the delay, bandwidth, and energy costs of the SCM. Performance in memory-oversubscription apps may be enhanced by the HMS's ability to absorb a larger portion of available memory than is possible with an HBM alone. A performant DRAM cache architecture is provided by the study team by avoiding the flooding of Memory by100,000 GPU processes. To reduce DRAM cache probe traffic, experts suggest an adaptive L2 cache Tag Cache for storing DRAM cacheline tags (DCLT). To lessen the amount of DRAM cache query traffic brought on by Tag Cache failures, their DRAM cache design gets every DRAM cacheline tag in a sequence with a single column entry. Based on their findings, the HMS could increase efficiency by a factor of 9.8 when memory is saturated (on average, 2.8).

In [13], the authors address the security and private benefits of blockchain technology, as well as the singlebit, six-transistor static random-access memory cell sense amplifier design and IoT-based cache memory. It is common practise for processors and other memory devices to use the protected chunks of data stored in each chip as a distributed ledger system, or blockchain. Static RAM cells with six transistors and MSAs (multiple sensing amplifiers) are all part of the systems (including voltage latch, charge transfer differential, and current differential sense amplifiers). The number of transistors needed, the detecting delay, and the power usage at various resistance levels between 42.3K and 42.3K have all been analysed. Dual slumber, forced stack, sleep transistors, and sleep stack are just a few of the power efficiency techniques available. The power consumption of the device is minimised by powersaving features implemented in the sensing amplifiers and the six-transistor static random- access memory cells. Based on these findings, it can be concluded that a single-bit, six-transistor static random- access memory

cell that employs a voltage latch sense amplifier and a power-saving dual slumber method requires only 33 transistors and 11.65 W, a substantial reduction from the other designs studied.

Studies of a D2D system with tunable cache memory are presented in [14]. File queries can be fulfilled via D2D exchanges when server traffic is low, but only via cache memory when traffic is high. It's possible that the worst- case D2D delivery load can be mitigated through the use of uncoded cache location and linear coded D2D delivery. So, scholars can clearly characterise the minimum D2DDL with uncoded location under a variety of interesting circumstances by using a novel bottom limit on the D2D distribution burden. Once the MD2DDL has been characterised for uniform cache sizes, it can be shown that the network can support individuals with widely varying cache sizes, so long as the smallest cache size is above a certain level. The MD2DDL supports high-cache-size, low-cache-size, and three-user use cases. Analyze the costs of serverbased and D2D distribution and compare them. Lastly, a quantitative comparison between cache-assisted D2D and coded distributed computing (CDC) systems is presented.

The capacity of in-package DRAM cache has been shown to be higher than that of conventional memory devices by the research presented in [15]. Increasing throughput and speed could be possible by modifying the memory management settings in each app. It is unfeasible to watch and modify individual cache blocks due to limitations in speed, efficiency, and technology. In this research, we introduce a novel method for keeping tabs on cache blocks by adjusting just two sliders (TTK). Two cost-effective counter-based strategies for Memory block tracking are provided by the study's authors. To further reduce data transfer latency, the experts also provide a state-of-the-art timing system for sending counter data to the Memory layer at optimal times. The proposed methods have been shown to beat the best existing Memory cache setups in models of highly parallel data-intensive apps by 31% and 24%, respectively. Energy costs are reduced by 29% on average with the typical setup.

To fine-tune the memory structure of an estimate computing system, one can alter the degree of cache memory approximation [16]. The OPTIMA protocol allows for the online adjustment of cache settings within a specified tolerance for error. OPTIMA allows for the execution of fault-tolerant programmes on multicore Processors that have both shared and private caches. The OPTIMA system's cache memories use heuristic methods that, in two stages, determine the optimal estimate level for each cache memory in order to optimise power efficiency. Improving energy economy by adjusting estimate levels to keep product quality constant. Next, the output precision is modified so that it reflects the changes in the input pattern. In both the first and second stages, the pace at which the estimate level shifts is different. In order to evaluate OPTIMA's efficiency, experts integrated it into gem5 and ran eight estimate experiments that simulated various multiprocessor systems. The results indicated that the proposed method had the potential to lessen power usage by the memory structure by 44%.

This was researched and written about in [17]. To meet the needs of chips with multiple processors, manufacturers have increased cache layout and storage. A multi-way set- associative structure with strong associativity is used in a common lower-level cache to minimise conflict failures. This layout is quick because all cache set techniques can be called in parallel. This makes heavy use of moving energy. That's why lots of different ideas for saving electricity while using cache memory have been suggested. Unauthorized path access can be prevented through route forecast or incomplete comparison. In this work, we present a robust forecast algorithm for a shared second-level associative memory. The use of real-time tracking of path access supremacy (WADD). Given the first-level cache replacement procedure and mixed-core visits, the suggested method determines the optimal number and location of path options for each incomplete access pattern. This strategy has the potential to foretell travel paths. The energy-delay product is reduced by 13.5% in simulations compared to the standard cache without path forecast, demonstrating that the WADD has the highest energy efficiency. As a result of rapid discovery and reliable forecast, the technique prediction cost is diminished.

The increasing complexity of computer systems necessitates more RAM [18]. Memory design space

study is required to keep these accomplishments. Solutions to the pressing need for more and faster memory have emerged from the study of design areas and their connection to cache memory structure. Arrangements for Space Travel Cache memory design is improved through modelling, analysis, configuration, and development. Depending on the situation, each has advantages and disadvantages. The essay discusses each option and their benefits and drawbacks. The most effective tactic is one that combines elements of different approaches to compensate for their weaknesses.

In [19], a two-stage process is outlined for locating assaults. We gained an understanding of the node, dispersion, cadence, consistency, and distance travelled in the introductory phase. Then, a Deep Convolutional Neural Network is used to identify content poisoning assaults, also called cache contamination attacks (CNN). These assaults can take the form of anything from flooding the network with requests for alreadyexisting data to flooding the network with requests for newly-created data, hijacking inbound interest packets, or labelling data with the incorrect key. Second, a fuzzy decision tree is used to identify a potential inundation assault based on the characteristics (FDT). The focus of this research is on enhancing the assault recognition capabilities of the DCNN and FDT algorithms. In order to better handle the optimization issue, this study improved upon the traditional ROA by introducing a new algorithm called the Decision Oriented Rider Optimisation Algorithm (DO-ROA). The superiority of the aforementioned work in practise is demonstrated by contrasting the proposed DO-ROA algorithm with that of some conventional models on a selection of Type I and Type II performance metrics.

Large working sets in business and research, as reported in [20], favour a shared L2 cache architecture that optimises group cache size and minimises memory off-chip lookups (CMP). An important element that caps directory size is the exponential increase in memory expenses with increasing Processor count. To address this issue, the writers of this article propose a novel lightweight shared storage design. It employs two small fast caches to handle data and index vectors for CMP tiles' most recently stored blocks from L1 caches. The suggested cache technique shortens access times to the on-chip directory memory and facilitates adaptation

by removing directory vectors from the L2 cache. The suggested cache technique accelerates up programmes by an average of 6 percent and as much as 16 percent at its finest, with storing expenses as low as 0.18 percent for real-time scenarios.

These cache memory group designs are discussed in [21]. The on-chip cache of a contemporary CPU typically consists of one or two layers, but this is not always the case. Typically, SRAM (static randomaccess memory) cells are used to construct such memory banks. They consume a lot of memory and processing power. A dearth of authority typically takes precedence over other considerations. This is valid for portable electronics, such as laptops and mobile phones. The number of transistors, detecting latency, and power consumption of various sense amplifiers, such as write driver circuits, current differential sense amplifiers, voltage latch sense amplifiers, and charge transfer differential sense amplifiers, are compared for a variety of resistance values. For a static random-access memory cell with a single bit and six transistors, the voltage differential sense amplifier consumes only 11.34 W of electricity. To put it another way, this design uses as much as 83% less power than the standard latch sense amplifier layout. The current differential sense amplifier is down 77.75%, the charge differential sense amplifier is down 39.62%, and the voltage latch sense amplifier is down 50%. Typically, this is accomplished with the help of power-efficient cache memory designs. Real-time applications benefit more from the low power consumption (8.078 W) of the single-bit, six-transistor static random- access memory cell that uses the forced tack technique and the voltage differential sense amplifier that employs the dual sleep technique.

Fig.2 Architecture and data flow of a typical cache memory unit.

The secure and private aspects of blockchain technology, as well as the construction of a sense amplifier for a static random-access memory cell using only six transistors, and the operation of cache memory based on the Internet of Things, are all discussed in [22]. Each chip's storage space is used to keep track of other memory devices that are considered reliable. These designs allow for a write driver circuit, six-transistor static random-access memory cells, and a variety of sense amplifier topologies (voltage latch, charge transfer differential, and current differential). Factors that influence resistance levels (such as R=42.3 and R=42.3K) have also been investigated. The quantity of transistors, the intervals between detections, and the required power are all relevant factors. Power saving techniques include sleeping transistors, sleep stacks, forced stacks, and dual sleep. Several components, including sense amplifiers and static random-access memory cells made up of six transistors, make use of these power-saving methods to lower the overall power consumption of the design. This suggests that a static random-access memory cell with a single bit and six transistors can significantly reduce power consumption. Advantages of Making Up Lost Sleep Over Two Nights The voltage latch sense amplifier only requires 33 transistors and 11.65 W of electricity thanks to its use of the power-saving dual-sleep technique.

Cache memory, also known as "cache," is a type of secondary memory used to temporarily hold data and instructions that are commonly accessed and then executed by a laptop's central processor unit (CPU) at a faster rate, as described in [23]. The cache is an auxiliary memory that supplements the primary memory of the computer. Semiconductor-based, transistor-based random-access memories (RAMs) are used for both short-term memory and long-term storing. A copy of the most frequently accessed information or programme code from main memory is all that is stored in the cache. The shorter the period between when data enters the cache and when it is sent to the CPU, the better. Alterable cache memory is the focus of this research. This project involves using VHDL (Very High Level Hardware Description Language) and an FPGA to plan, create, and construct a configurable cache memory that can be altered in two ways (cache time and associativity) (discipline-Programmable Gate

Array). This design's cache memory has a cache size controller unit and a method controller unit built into its layout, respectively, to allow for user and memory capacity customization. As a result, the CPU can get its job done quicker, consume less power, and make full use of the available memory space. The planning stage of modelling can be used to analyse the situation and draw conclusions. Xilinx ISE sketch Studio

14.0 was used to create this design (Xilinx ISim simulator). Verilog is used to create the cache memory's direct mapping and set linked cache. Techniques that operate in two directions, four directions, and eight directions are all available in the set associative memory. The cache memory architecture is built to accommodate a wide variety of mapping techniques, including the deployment of a master node. Power can be saved and the rate at which data enters stored memory increased by turning off unused blocks.

According to the findings in [24], the A64FX Microprocessor is the most advanced Arm-based processor architecture to date. A cache-based multicore CPU that can compete with accelerator technology in terms of memory speed and peak efficiency. To maximise its potential, coders will need a firm grasp on how to exploit its speed capabilities. Here, we provide a design study of the Fujitsu FX1000 supercomputer's A64FX, which can be used to construct Execution-Cache-Memory performance models for steady-state cycles. We pick up on design idiosyncrasies that hint at potential overarching methods to boost efficiency during this time. After verifying the model with elementary streaming loops, we use our findings to improve sparse matrix-vector multiplication (SpMV) and the DW kernel from quantum chromodynamics. We demonstrate that the SpMV's compressed row storage (CRS) matrix storage format is not a viable option, and that the SpMV's SELL-C format can quickly approach bandwidth overload. We present a cache reuse study for the DW kernel and demonstrate that memory-bandwidth overflow is possible provided the appropriate data structure is used for complicated arrays. We compare the A64FX to high-end, state-ofthe-art devices like the Intel Cascade Lake AP and the Nvidia V100 to give you an idea of its capabilities. We also explore the potential for power enhancements by modifying the Fugaku system's existing settings and discover methods to reduce energy consumption by 31% for SpMV parameter sets and 18% for DW parameter sets.

A more rapid rate of Memory updates has been found to occur in cells that are more easily damaged, as reported in [25]. When compared to normal rowers, they lack the endurance and ability to retain their air for longer periods of time. In some cases, Memory cells can function independently. This strategy, dubbed "in-DRAM storage," is relatively recent. DRAM's internal memory storage (buffer) serves many purposes. In this article, we introduce WinDRAM, a memory buffer that includes all accessible regions of DRAM. The most recent items are duplicated in the RAM buffer so that when they are requested again, they will function in addition to the original. The shortened activation interval made possible by this synchronous action reduces the time required to reach memory. Dual- row activation is the term for this method of operation. WinDRAM doesn't routinely reset these frequentlyaccessed, low-quality cells that make up the memory buffer. There are no potential issue areas in the design of the in-memory data store (cache). WinDRAM proposes a novel approach to in-memory caching by utilising weak rows. Since we don't need to refresh weak rows, we can extend the duration in between resets for the remainder of the rows. There's a chance that this will reduce the frequency of changes by 80-90%. It's 15%-25% quicker than standard Memory, and it's 12.7% quicker than what was seen in previous experiments. Overall energy consumption drops by 10% to 15% in practical settings.

Using Named Data Networks' flexible data layer, the researchers in [26] investigated the best ways to rapidly deploy local network storage. Content that the cache policy has determined needs to be preserved will be delivered to the cache unit via the cache interface that has been designated as an output on the configurable data layer. Various parts of a request were categorised independently based on their Quality-of-Service requirements. In addition, we used the content's popularity and the inter- cache cooperation to determine the cache likelihood of the categorised content. The cache criterion was based on the proportion of free cache capacity, and the cache likelihood was used to

determine if the data should be retained. Increasing the number of caches finds and decreasing the average transfer delay, the experimental findings demonstrate that the suggested cache placement strategy is superior to the normal cache placement strategies.

The Register Renaming Unit (RRU) is responsible for maintaining a mapping between an instruction's mental registers and its corresponding physical registers. To accomplish this, it makes extensive use of a RAMbased Alias Table. (s). This research makes use of an 8T-Cell SRAM gadget to demonstrate the construction of an alias table in memory. For a full two-way, threeoperand cycle, it features multiport operations for writing, receiving, and content addressing. A type 21T-Cell SRAM-based CAM cell, with 32 rows and 6 bits, is used to create the Alias Table memory. There are four data inputs, two data outputs, and two data inputs. After the content-address has quickly checked each item in the memory alias table against the under-test register, it will release the corresponding match index address. According to the findings, while both write ports are active during one half- cycle, all four read ports are active simultaneously during the other half-cycle. Each half-cycle of the read step is dedicated to processing one of the two content-address paths. That's right; all three occur simultaneously, within the same time frame. The Memory Alias Chart displays the three activities that can be completed in a 1 GHz cycle with an average power consumption of 0.13 mW based on HSPICE models performed with 90 nm/1 V CMOS technology.

The writers of reference [28] detail the fabrication of stacked CMOS cache memories with support for four-way set associativity. The cache's construction, administration, and configuration have all been topics of discussion. We also discuss level 1 and level 2 cache memory layout and development. Layout of cache RAM is the most crucial design decision. Because it employs a collection of many direct-mapped caches, set associative mapping is the most effective method for structuring CMOS cache memory. This four-way set associative cache memory can be used in silicon-based computing and cellular transmission devices& their configurations. A comparative survey of these models is discussed in the next section of this text.

#### PERFORMANCE EVALUATION & **COMPARISON**

After conducting such in-depth tests, it became abundantly evident that the functionality of the different cache models that were being investigated exhibited significant differences in performance. The parameters of read and write delay (D), deployment cost (DC), backup efficiency (BE), and scalability levels were used in this analysis, and these outcomes were rated accordingly (S). The performance of these measurements may be evaluated more objectively on a scale when their values are first fuzzy-sorted into the categories of Low (L = 2), Medium (M = 3), High (H = 4), and Very High (VH = 5). In order to make this assessment process easier, the models and the performance measures that correlate to them are outlined in Table 1. On the basis of this tabulation, higher-performing models might potentially be chosen for a variety of deployments.

Table 1. Performance evaluation of different models

Method	D	DC	BE	S
QoR [1]	M	VH	Н	Н
MAL RU [2]	Н	Н	Н	Н
RBC [3]	L	Н	Н	M
ByCA [4]	L	M	L	Н
LLC [5]	M	Н	Н	Н
WLUD [6]	L	Н	Н	M
VBC [7]	M	Н	Н	Н
DCL [8]	M	VH	Н	M
M3D [9]	L	Н	M	Н
NFV [10]	M	L	M	M
CP [11]	L	M	Н	Н
DCLT [12]	L	Н	Н	Н
MSA [13]	M	Н	Н	M
MD2 DDL [14]	M	L	Н	Н
TTK [15]	Н	M	VH	Н
OPT IMA [16]	Н	M	VH	M
WADD [17]	Н	Н	VH	Н

As per this evaluation& figure 1, it can be observed that RBC [3], ByCA [4], WLUD [6], M3D [9], CP [11], and DCLT [12] have lower read and write delays. While, NFV [10], and MD2 DDL [14] can be used for lowering deployment costs. It was also observed that OPT IMA [16], TTK [15], and WADD [17] showcase higher backup efficiency, while, QoR [1], MAL RU [2], ByCA [4], LLC [5], VBC [7], M3D [9], CP [11], DCLT [12], MD2 DDL [14], TTK [15], and WADD [17] showcase higher scalability, thus can be used for largescale memory design use cases.

Figure 1. Comparison of different models

### Using Talent Management Strategies to Retain Talented Employees in the Pharmaceutical Industry

**Ambarish Ghosh** 

Research Scholar CSVTU Bhilai **Manoj Verghese** 

Professor RCET Bhilai

J. H. Vyas Professor RIT Raipur

#### **ABSTRACT**

The organizations success depends on human resource of that organization but the pharmaceutical Industries of India are facing the problem of retaining talented employee. The challenge for managers today is to maintain employee engagement and ensure that they retain in the organization for longer period of time which would be beneficial for both the employee and the employer. The manager of the pharmaceutical organization must be aware of the current recruitment & selection procedure and retention strategies of their organizations. The primary goal of this study paper is to determine whether talent management practises have any impact on keeping talented personnel in the pharmaceutical business. In this research paper the author done the descriptive study of five different pharmaceutical industries. Target population consisted of medical representative and executive. A structured questionnaire was distributed and primary data was collected by using simple random sampling method, analysis was done using the SPSS version 21.0 package. Different qualitative factors and quantitative factors were in use into concern to influence in retaining the talented employee through descriptive statistics. The data was analyzed and compiled in frequency tables to determine for each determination, the number of replies to each variable. In the study adopted correlation and regression analysis at the 5% significance level to determine the strength and relationship of different variables.

From the total analysis it was clear that talent acquisition had a positive and maximum influence (Pearson's correlation coefficient = 0.877) on retaining the talented employee and talent management, compensation strategies and succession planning are positively correlated with retaining the talented employee (.588, .705, .0424, respectively). From the findings of the study it is clear that HR management in pharmaceutical industries have very less concern on carrier panning and succession planning strategy adopted and most of the organization the employees are not willingness to stay with the company for a longer amount of time. The study also recommends the pharmaceutical companies to conduct induction programs nicely and provide best knowledge to the newly appointed employee which helps in retaining the talented employee.

**KEYWORDS:** Talent management strategies, Talent acquisition, Talent compensation, Retaining talented employee, Pharmaceutical company.

www.isteonline.in Vol. 46 Special Issue, September, 2023 230

#### **OBJECTIVE**

o analyze the impact of talent management strategies and determine how talented employees can be retained in the pharmaceutical industry.

#### **MAJOR OBJECTIVE**

- Analyze the impact of tactics for acquiring and retaining talented personnel in the pharmaceutical company.
- ☐ Analyze the impact of talent development strategies on retaining talented employees in the pharmaceutical company.
- ☐ Examine the influence of compensation strategies adopted to retain talented employees in the pharmaceutical company.
- ☐ To study the impact of succession plan strategies to sustain the talented employees in pharmaceutical company.

The reason of this research is to find answers to these questions and gain new knowledge about the subject of study. As research is the major technique used in practically all fields of organizational research to widen and narrowly arrive at precise findings and recommendations, it aids in expanding the frontiers of knowledge.

To perform the study successfully, we used a systematic approach in which we determined the target population, research design, instruments for data collecting, and data analysis methodologies.

#### DESIGN OF RESEARCH

The design of the research is the plan of the total analysis, which shows how data is to be collected and the analysis has been done to determine the idea of the total research. The research design which was used is a descriptive research different tool was used to analyze the data which was collected from primary reserch.

#### **Population**

In this study, the researcher targeted five pharmaceutical companies: Aristo Pharmaceuticals, Ajanta Pharmaceuticals, Palsons Drugs and Chemical Industries, Torrent Pharmaceuticals, and USV Pharmaceuticals. The targeted population consisted of managers and medical representatives, with a sample size of 200.

#### **Sampling Frame**

The sampling process used in this research was a stratified sampling method and employees of the five pharmaceutical firms were divided into five strata.

#### Research Instruments used in this research

The questionnaire was the main tool for the study and a survey was done to collect data from 200 sales force five pharmaceutical companies. A stratified random sampling process was used in the total process employees were divided into ten strata. The stratum was developed and based on the company's sales force and management teams, who might be managers or medical representatives.

#### **ANALYSIS OF DATA**

The information gathered was analyzed and made it comprehensive, then summarized, coded, and tabulated.

#### **Demography of Respondents:- Gender**

The data of the study shows that the majorities (89.7%) were male and only (10.3%) of the respondents were female.

#### **Respondents Age**

In this research, the researcher find that the maximum 44.7 are in age between 35-40 years, 20.0% are age in between 30-34 years, 14.4% are age in between 40-41 years, 8.8% are aged in between 24-29 years, 6.5% are more than 45 years and only little ie. 5.6% of respondents were below 24 years. Therefore, the analysis of the research indicated that data were collected from all age ranges.

#### **Educational background**

The study shows that the educational background of the respondents, the majority (39.6%) were graduates, (34.0%) have professional degrees ie MBA, (20.3%) were Postgraduates in science and only 6.1 had some other degree. It is obvious from this survey that the respondents are well qualified, and thus they grasp the purpose of the study and the information they supply for excellent research.

#### Employee working duration in years:-

According to the findings of this study, the bulk of respondents (48.2%) had worked for 0-5 years, 19.7% for 5-10 years, 16.5% for 10-15 years, and only a handful (3.6%) had worked for more than 20 years. The data shows that the respondents can understand the working and strategies organization therefore they can provide a good view of the research purpose.

#### **Talent Acquisition**

From the study, the author finds many talent acquisition strategies that are effective in retaining talented employees in the pharmaceutical industry.

- 1. Talent acquisition strategy has an impact on employee retention strategy
- 2. Talent acquisition strategy has no impact on employee strategy

#### **Talent Acquisition on Employee Retention**

According to the statistics, 68.0% of respondents feel that diverse talent acquisition techniques influence employee retention in the pharmaceutical sector, whereas 32.0% believe that talent acquisition strategies have no influence on employee retention in the pharmaceutical industry.

#### **Strategies for Talent Attraction in Organization**

The data of the study revealed that the majorities (34.7%) were attracted by various incentives and compensation plans, (32.3%) were drawn by well-developed and published training programmes, (19.4%) by well-developed career routes, while a few (5.6%) were attracted by flexible working hours, and 8% are unable to say. From the analysis, it is clear that the majority of respondents say that various inventive and compensation plans are necessary to attract new talent. This reveals the implication that various incentives and compensation plans make the employees experience the organization is concerned with, and the pharmaceutical organization can use this strategy to retain their talented employees.

#### **Talent Development**

This study shows that many pharmaceutical organizations have adopted talent development strategies to retain talent and manage talented employees. To retain talented

employees, many companies have adopted talent development programs as talent retention strategies.

The study reveals that the majority of pharmaceutical organizations organize quarterly meetings, in which they organize many workshops and management development programs to support and retain talented employees. The company also organizes new leader workshops to assist the sales force in making them well equipped to take on new responsibilities.

The majority of employees believe that the organization has started guidance and leadership development programs that can develop talent management and help retain talented employees, showing that pharmaceutical companies must implement leadership. This demonstrates that the majority of pharmaceutical companies have established leadership programmes to boost talent management and retain talented employees.

Talent Compensation Strategies From the data it can be concluded that the pharmaceutical organization has adopted compensation strategies to improve talent management that can retain talented employees in a pharmaceutical company.

## STRATEGIS FOR EMPLOYEE RETENTION & TALENT MANAGEMENT

From the data findings, the researcher's findings revealed that most of the respondents think that pay should be according to performance and budget compensation. The Pharmaceutical organization should make a benchmark according to competitors and make a suitable pay range, in this The survey results suggested that 89.2% of respondents agreed that the organisation benchmark parallel to the rivals so that the organization can come up with adequate remuneration, while 10.8% disagreed. According to the results of this survey, 12.0% of respondents disagree that the awards provided by this organisation are proportionate with their level of effort, while 5.0% are undecided. According to 60.0% of respondents, the benefits offered by this organization are comparable with the effort put in, while 20.0% strongly agreed.

#### **Succession Planning**

The study attempted to assess whether succession planning practices had an influence on keeping talented

employees in the pharmaceutical business. Using succession planning strategies to retain employees, the employee believes that succession planning is adopted in most pharmaceutical companies. The employee in the organization always tries their level best for their performance and does better according to their capacity, capabilities, and their ideas. The employees always try their level best for performance which is beneficial to them only.

#### **Employee Retention**

The study reveals that every pharmaceutical company organize induction/training program for their new employee so that they can understand their duties and responsibilities and how they can perform better in the organization, the manager also assist the newly appointed employee when they are on the field

## Analysis of Regression on Talent Management Strategies

The researcher used a multiple regression analysis in this study to determine the impact of talent management techniques on retaining talented employees in chosen pharmaceutical organizations. The data was analyzed and the result was computed using multiple regression analysis using the Statistical Package for Social Sciences (SPSS).

Table 1 Model Summary on retaining the talented employee

Model	R	R square	Adj. R Square	Standard error of estimation
1	0.898	0.807	0.234	0.277

The coefficients of the determinants explain how changes in the independent variable can make changes in the independent variable. In this study, the dependent variables are retaining the talented employee and the independent variables are talent acquisition, talent development, compensation, and succession planning, so the value of R square is 80.7 percent, so the required factors for retaining talent were considered as a result of R square and approximately 19.3% other factors are to be found in further research.

Table 2: ANOVA on Retaining the talented employee

Models	Sum of	df	Mean	F	Sig
	squares		square		
Regression analysis	1.34	10	0.25	53.11	0.00
Residual	99.90	57	1.26		
Total	101.24	67			

#### **ANOVA**

Talent acquisition, talent development, remuneration strategies, and succession planning are the predictors (constants). Employee retention is one of several variables. The model is statistically significant because the significance value is smaller than 0.05. The crucial F at the 5% level of significance was 7.9. As a result of the estimated value of F above the critical value of F (value = 53.1233), we can conclude that the model is noteworthy in its entirety. The model is statistically significant because 0000 is less than 0.05. As a result, at a 5% significance level, F is greater than the critical value of F (value = 53.1233).

#### **CONCLUSION**

The study concluded that most of the pharmaceutical organizations are providing financial benefits as a talent attraction strategy; the plan can be implied that would or has a constructive output and bring more talented employees in the organization. From this study, we also can conclude that the pharmaceutical business enterprise must guarantee that their employees are ready in all components to satisfy the top management and who can perform better in the field. The survey also indicated that pharmaceutical organisations use Talent Management and Workforce Planning as skills improvement approaches to improve talent management and retain talented personnel, which means that the organization ensures that talent is used effectively to the best use, and workforce planning should be such that it guarantees all of the respective skills for their advantaged use. Every worker receives deals based on their capabilities. The examiner concluded that the business enterprise has well-evolved on boarding programs for brand-new personnel, which means that each new worker may be comfortable considering the onboard program.

#### **Recommendation of the Study**

Pharmaceutical companies must build a good on boarding procedure for new workers in order to onboard competent staff during the transition. Organizations should improve their employee's learning needs. Salaries are competitive and compensation is based on business success, so you need to establish a structure to ensure that employees are aware of their competitiveness and reward them appropriately. Organizations need to be able to provide benefits in a variety of ways, as they can provide benefits to their employees for motivation and cover and protect them in specific aspects.

# How Corporate Governance Practices are Followed in Information Technology Sector Listed in the "Bombay Stock Exchange Sensex"

#### Kalyani Gohain

Research Scholar Royal School of Business The Assam Royal Global University Guwahati, Assam

#### Sanjay Pratap Singh

Professor, Vice-Chancellor The Assam Royal Global University Guwahati, Assam

#### **ABSTRACT**

The information Technology sector is one of the prominent sectors of India that has contributed a lot towards the economic development of our country. It has made efficient and responsive governance services at ease. The IT sector is the main reason behind the country's digital transformation, thereby making its global presence. Effective implementation of sound Corporate Governance (CG) is gaining importance due to the increasing number of corporate failures, frauds, scams, unethical business practices, corrupt practices, and insufficient disclosure. It is now widely held belief that good governance is very essential to prevent financial crises and bankruptcies and to encourage investment in the domestic market and foreign markets. Therefore, good governance in this sector is important. The study aims to identify the applicable sections in "The Company Act 2013" and regulations of "Security Exchange Board of India Listing Obligations Disclosures & Regulations, 2015" relating to Corporate Governance (CG). To explore the CG practices based on parameters that are followed in IT companies namely Tata Consultancy Services, Infosys, HCL Technologies, and Tech Mahindra listed in BSE Sensex. For the study, the researcher gathered secondary data from their annual reports for 2020-21.

**KEYWORDS:** CG, Information Technology Sector, BSE Sensex, "The Companies Act 2013", "SEBI LODR 2015", JEL Classification Code: G34

#### INTRODUCTION

G is about rules, procedures, and systems for better and sound governance. It mainly focuses to direct the directors and their obligations towards duties, and responsibilities to act for the interest of the company wherein they work. CG ensures transparency and accountability. CG safeguards the interest of the shareholders. Effective CG framework in an organization leads toward corporate excellence. This framework creates long-term trust between investors and the organization. "It is a way that an organization is managed, directed, and controlled" (Cadbury, 1992) CG maintains the relationship and allocates responsibilities between managers, shareholders, and board members to become competitive. (Anon., 1998 and 2004). With the increasing number of scams, fraud, and illegal business practices it has become important for the organization

to have transparency and accountability in business transactions which can be fulfilled by implementing CG practices. CG practices are developed in statutory legal provisions.

## Role of Information Technology in the Indian Economy

Indian economy in the 21st century is vastly technology driven. The government depends on IT services provided by the IT industry. The IT industry in India is considered the hub of technology and knowledge. As per an article in the Times of India, the IT sector contributed 10% of the GDP in 2019 (TOI, 2021). The growth rate of the IT sector in 2019- 20 is 10% approx. Top-five IT companies in India are "TCS, Infosys, HCL Technologies, Wipro, and Tech Mahindra". As per BSE SENSEX, TCS, Infosys, HCL Technologies, and Tech Mahindra were present.

#### Parameter for the Study

- 1. "Company Philosophy on CG": Every company must develop its philosophy on CG and the code of conduct of business. It has to be included in the CG Section of the annual report.
- 2. "Board of Directors expertise (BOD)": They are the key persons who are responsible for making effective decision-making and thereby leading to the proper functioning of the organization. Thus, it is important to include their area of expertise in the annual report.
- 3. "Presence of Independent Director (ID)": Applicable sections and regulation has mandated the presence of 1/3rd of ID on BOD. ID in a board

- committee takes better decisions and thus protects the interest of stakeholders.
- 4. "Presence of woman director": Section 149(1)(b) of "The Company Act 2013"2013 includes that every company must include at least 1 woman director on its board.
- 5. "Tenure of Independent Director": Every company must specifically mention the te e of independent directors in its annual report. As per "Sec 149(2)" and "Sec 149(3)", e company must have independent directors for up to 5 consecutive years.
- 6. "Directorship Held": "Sec 165 sub-sec (1)" of "The Company Act" and "Reg 17A" of "SEBI LODR 2015", the maximum no. of directorship holding

of the directors of the company in other companies such as listed private/public companies should not be in 10 companies.

- 7. "Board Meeting Held": The meeting should be frequent. It should be in between 120 days.
- 8. "Independent Director Meeting held": Independent director's role in decision-making is important. Every company must hold a separate independent director meeting.
- 9. "Director's Remuneration": Disclosures of remuneration paid as a sitting fee for each director is a must in the annual report.
- "Compliance Certificate": There must be a compliance certificate given by auditors and company secretaries enclosed in the annexure of the annual report.

#### RESEARCH OBJECTIVES

a) To identify all the applicable sections in "The Company Act 2013" and regulations of the

- "Security Exchange Board of India Listing Obligations Disclosures & Regulations" relating to CG.
- b) To explore the CG Practices followed in IT Companies Listed in BSE Sensex mandated by "The Companies Act 2013" and "SEBI Listing Obligation Disclosures Regulation 2015".

#### **METHODOLOGY**

Research Design: Descriptive and exploratory in nature.

Sample Size: For the study, four companies from the IT sector listed in BSE Sensex are selected which are TCS, Infosys, HCL Technologies, and Tech Mahindra Source of Data Collection: Secondary data gathered from Annual reports of 2020-21, available at the company's websites.

Data Analysis: Based on data gathered from the annual report. For the presence of each parameter in the company, the assigned score is "1" and the absence of the parameter assigned score is "0". The final score of all four companies is determined.

Applicable Sections of "The Companies Act 2013" and applicable "Regulations" of "SEBI Listing Obligations and Disclosures Regulations 2015

Sl No.	Particular	Applicable Sections of The Companies Act 2013	Applicable Regulations of SEBI LODR 2015
1	Board Composition	Section 149: "Companies should have a minimum of 2 directors in private sector". Section 149(6): "Companies to have independent directors in the board"	
2	Directorship held	Section 165(1): "Directorship held should not be more than 10 in case of	Regulation 17A: "Maximum no. of directorship held"
3	Board Meetings	Section 173: "Companies shall hold board meetings within a gap of 120 days".	1
4	Independent Director meetings	Schedule IV of The Companies Act 2013	154
		Section 177: "Composition of Audit Committee"  Section 177(9): "Vigilance Mechanism"  Section 178(1): "Composition of Nomination and Remuneration Committee"	pertaining to the Audit Committee  " Regulation 19: "Requirements
5	Composition of Committees	Section 178(8): "Composition of Stakeholder Relationship Committee"	Regulation 20: "Requirements pertaining to Stakeholders Relationship Committee"
			Regulation 21: Requirements pertaining to "Risk Management Committee"
			Regulation 22: "Requirements pertaining to Vigil Mechanism"

#### **DATA ANALYSIS**

For attaining the objective, the researcher has taken into consideration the relatable sections and regulations of CG. This study is Descriptive in nature

#### **Company 1: Tata Consultancy Services**

- Board Independence: It comprises 9 board of directors
- b. Board Diversity: In TCS, two non-executive women directors comprise the board of directors.
- c. Directorship held: In TCS, during Annual Year 2020-21, No director held any directorship in more than 10 listed companies or in 10 publicly listed companies. Thereby, it is in compliance with "Sec 165 sub-sec (1)" of "The Companies Act 2013" and "Reg 17A of "SEBI LODR 2015".
- d. Frequency of Board Meetings: During AY 2020-21, TCS held seven board meetings.
- e. Composition of Committees: TCS has constituted mandatory committees which composed of a Chairman and Independent directors. It has committees such as the "Audit Committee", "Nomination and Remuneration Committee", "Stakeholder and Relationship Committee", and "Risk management committee". It also incorporated a vigilance mechanism.

#### **Company 2: Infosys**

- a. Board Independence: It comprises 9 board of directors
- b. Board Diversity: 2 are women directors constitute the board of directors.
- c. Directorship held: In Infosys, during Annual Year 2020-21, No director held directorship in more than 10 listed companies or in 10 publicly listed companies. Thereby, it is in compliance with applicable Section and Regulation.
- d. Frequency of Board Meeting: During Annual Year 2020-21, seven meetings were held within 120 days. Thereby, "Sec 173" is followed.
- e. Composition of Committees: In Infosys, various committees have been constituted which are the "Audit Committee", "Nomination and Remuneration Committee", "Stakeholder Relationship Committee", "Corporate social responsibility committee", and "Risk management committee".

#### **Company 3: HCL Technologies**

- a. Board Independence: It comprises 12 boards of directors
- b. Board Diversity: 2 are women directors constituted the board of directors.
- c. Directorship held: In HCL Technology, No director held any directorship in more than 10 listed companies or in 10 publicly listed companies in AY 2020-21. Thereby, it is in compliance with "Section 165(1)" and "Regulation 17A".
- f. Frequency of Board Meeting: During Annual Year 2020-21, fourteen meetings were held within 120 days. Thereby, "Section 173 of The Companies Act 2013" is followed.
- g. Composition of Committees: In HCL Technologies, various committees have been constituted which are the "Audit Committee", "Nomination and Remuneration Committee", "Stakeholder Relationship Committee", "Corporate social responsibility committee", and "Risk management committee".

HCL Technologies has also constituted a few voluntary committees namely the "Share Transfer" and "Other Matters Committee", "Committee on Frauds", "Customer service committee", and "Management Committee".

#### Company 4: Tech Mahindra

- a. Board Independence: Board consists of nine directors
- b. Board Diversity: 3 are women directors constituted on the board of directors.
- h. Directorship held: In Tech Mahindra, no director held any directorship in more than 10 listed companies or in 10 publicly listed companies. Frequency of Board Meeting: Seven meetings were held within 120 days. Thereby, "Sec173" is followed.
- i. Composition of Committees: In Tech Mahindra, various committees have been constituted which are the "Audit Committee", "Nomination and Remuneration Committee", "Stakeholder Relationship Committee", "Corporate social responsibility committee", and "Risk management committee".

A few voluntary committees have been constituted namely "Investment Committee", and "The Securities Allotment Committee".

Presence of Women Directors

#### **FINDINGS**

#### **Compliance Level at TCS**

TCS meets specified requirements as outlined in "The Company Act 2013" and "SEBI LODR 2015", and has established a BOD comprising an ED, a NED, and an ID. The structuring of governing members demonstrates compliance

with the minimum criteria set forth by these regulations. Remarkably, TCS exceeds the minimum requirement by having more than 67% of the ID on its board, surpassing the threshold of 33.3%.

Furthermore, TCS has prioritized diversity within its board, consisting of two women directors and five male directors,

ensuring a balanced representation. Additionally, all the directors hold directorships in less than 10 listed companies, adhering to the guidelines that promote effective governance.

To foster effective decision-making and governance practices, TCS conducted a total of seven board meetings during the annual year 2020-21. This regular meeting schedule enables the board to deliberate on strategic matters, review performance, and provide guidance to the organization.

TCS has also fulfilled the mandatory requirement of forming various committees as prescribed by "Sec 177", "Sec 178(1)", "Sec 178(8)" of "the Companies Act 2013" and "Reg 18", "Reg 19", "Reg 20", "Reg 21" of "SEBI LODR 2015". All committees ensures effective oversight and governance in key areas such as audit, remuneration, and stakeholder relationships.

Demonstrating a commitment to integrity and accountability, TCS has established a policy to address the vigilance mechanism of directors. This policy helps safeguard against any potential conflicts of interest or misconduct and ensures that the directors operate with the highest level of ethics and professionalism.

#### Compliance level at Infosys

Infosys has formed its BOD comprising ED, a NED, and an ID. The governing members meet the minimum requirements established by these regulations. Notably, the board boasts a strong presence of independent directors, accounting for 67%, exceeding the mandated threshold of 33%.

Emphasizing gender diversity, the board at Infosys consists of two women directors and four male directors, ensuring a balanced representation and promoting inclusivity within the organization.

To maintain effective governance practices, all directors on the board of Infosys hold directorships in less than 10 listed companies. This adherence to the limit reinforces focused engagement and dedicated commitment to the responsibilities associated with their director roles.

During the annual year, Infosys conducted a total of seven board meetings, providing ample opportunities for deliberation, decision-making, and strategic guidance. These meetings serve as crucial platforms to review performance, address key issues, and ensure the effective functioning of the organization.

Infosys has also fulfilled the mandatory requirements by establishing all the prescribed committees. These committees, covering areas such as audit, remuneration, and stakeholder relationships, play an essential role in enhancing governance practices and fostering transparent decision-making.

Infosys further demonstrates its commitment to ethical practices by adhering to a robust vigilance mechanism policy. This policy ensures that the directors uphold the highest standards of integrity, preventing conflicts of interest and misconduct, and promoting ethical behavior throughout the organization.

#### **Compliance level at HCL Technologies**

HCL Technologies places great importance on upholding governance standards, and to that end, it has established a BOD comprising a diverse mix of "executives, non-executives, and independent directors". The board not only adheres to regulatory requirements but goes beyond by ensuring that independent directors make up 50% of the board, surpassing the minimum threshold of 33%.

Recognizing the significance of gender diversity, HCL Technologies has achieved commendable representation with 40% women directors and 60% male directors on its board. This commitment to inclusivity fosters a culture of equality and brings a balanced perspective to the organization.

In adherence to CG practices, HCL Technologies limits the number of directorships held by its directors to dedicate sufficient time and attention to their roles within HCL Technologies, ensuring focussed leadership.

Throughout the year 2023, HCL Technologies conducted a total of fourteen board meetings, underscoring the company's commitment to regular engagement and thoughtful deliberation on strategic matters. These meetings provide a vital platform for reviewing performance, making crucial decisions, and offering guidance to steer the company's growth trajectory.

HCL Technologies has formed mandatory committees that play a pivotal role in effective governance. These committees, as prescribed by regulations, address important aspects such as audit, remuneration, and stakeholder relationships, bolstering transparency and accountability across the organization.

Moreover, HCL Technologies places a significant emphasis on vigilance and ethics, exemplified by the formulation of robust policies that safeguard the integrity and professionalism of its directors. These policies promote ethical conduct, prevent conflicts of interest, and uphold the highest standards of CG throughout the organization.

#### Compliance Level at Tech Mahindra

At Tech Mahindra, the composition of the BOD reflects a balanced mixture of ED, NED and ID. Out of nine members, 11% are executive directors, 22% are "non-executive directors", and the majority of independent directors account

for 67%. These exceed the minimum requirement of 33% independent directors specified by regulations.

Furthermore. Tech Mahindra complies with the provision that no director holds a directorship in more than 10 listed companies, ensuring their focus and commitment to their roles within the organization.

During the period, Tech Mahindra conducted seven board meetings, fulfilling the requirements of regular engagement and decision-making. These meetings provide a platform for strategic discussions, performance reviews, and guidance to drive the company's growth and success.

Tech Mahindra has constituted all mandatory committees as required by The Companies Act 2013. These committees, covering areas such as audit remuneration, and stakeholder relationships, contribute to effective governance and oversight.

Based on the annual report of 2020-21. Tech Mahindra, along with HCL Technologies secures 9 points out of 10 in terms of CG parameters, reflecting their strong commitment to sound governance practices. TCS follows closely with 8 points, while Infosys leads with a perfect score of 10 points.

However, it is worth noting that in HCL Technologies' annual report, the specific tenure of independent directors was not explicitly mentioned. In Tech Mahindra, an independent directors meeting was not held during the AY 2020-21. In the case of TCS, the annual report lacks information on board member expertise, and no independent director meeting was conducted.

It is essential for companies to address these gaps and provide comprehensive disclosure and adherence to CG principles to ensure transparency, accountability, and effective decisionmaking.

#### CONCLUSION

CG is all about rules, processes, and principles incorporated by the organization that inbuilt investor confidence in that organization, and by implementing sound CG practices, the chances of fraud and scams are less. The principles of CG are transparency of businesses and accountability of businesses. The performance of an organization depends on the board of directors' decision-making. "Sec 149" and "Sec 149(ii)" of "The Companies Act 2013" and "Reg 17" of "SEBI LODR 2015" are about "board composition" and the "presence of ID". All sections and regulations relating to CG practices like the composition of committees such as "audit committee", "stakeholder relationship committee", "nomination and remuneration committee", and "risk management

committee". By conducting exploratory research, all the relatable statutory provisions on CG are identified. The findings of the study concluded that TCS, Infosys Ltd, HCL Technologies, and Tech Mahindra have complied with all the relatable Sections, and regulations. From the study, it is found that Infosys Ltd has included all the parameters of CG in its annual report for 2020-21. Whereas, it can be seen that in HCL Technologies the tenure of ID is not specifically laid down and in Tech Mahindra no independent director meeting was held in AY 2021. Therefore, from the study conducted out of all four IT companies, Infosys Limited stands first considering all the important parameters of CG.

#### **ABSTRACT**

Uncertainty inherent in every business. In the current unprecedented environment amid lockdown and corona crisis, where everything had almost come to a standstill and future has become uncertain, business sustainability has become a challenge. The grappling struggle is also reflected in the MSMEs, which is the engine of economic growth and considered as the backbone of Indian economy. The paper aims to strengthen the MSMEs approach in managing the uncertainties, by synthesizing the impacts and approaches in a conceptual model. Initially the paper elaborates the understanding of uncertainty, which is mostly overlapped with risk. Through systematic review from the rich available literature the dimensions of uncertainty are explored and further an approach to channelize the impact is proposed. Based on the critical analysis, the paper synthesis three impacts of uncertain situations, analyse and frames strategies. The proposed conceptual model is referred as Strategizing Uncertainty Model, is an effort to contribute to structuring and defining the uncertainty management. The optimization term relates to building a positive and opportunistic perspective towards uncertainty. Uncertainty management is an important phenomenon in managing the current uncertain situations and further in the ever-growing complex and competitive business environment, where noting is constant, it is required to be considered and practiced in enterprises and managerial processes. The paper concludes with the suggestions and elaborates the need and potentiality of incorporating uncertainty management perspective not only in MSMEs, but in a global business scenario.

KEYWORDS: Uncertainty, Managing uncertainty, MSME, Strategic management, Uncertainty management

#### INTRODUCTION

not been seen in a century [1]. So, MSMEs need to build a competitive edge and competency towards uncertainty to sustain in the ever-changing and increasingly complex business environment through modern and new approaches [2].

Worldwide, Micro, Small & Medium Enterprises (MSMEs) are termed as the engine of economic growth and also considered as the backbone of Indian economy. According to the recent Annual report 2018-19 of

Government of India"s Ministry of Micro, Small & Medium Enterprises (MSMEs) stated that the share of MSME in the GDP was 28.90 percent for the year 2016-17 [3]. MSMEs are producing diverse range of products and services which not only satisfy the domestic needs of the country but also meet the standards of global markets.

Under the Atmanirbhar Bharat Abhiyann program, MSMEs are redefined on 1st June 2020. The new definition has elevated the parameters for enterprises to get categorised in MSMEs. According to the

new definition [4], the enterprises engaged in the manufacture or production of goods or the enterprises engaged in providing or rendering of services is

- a micro enterprise, where the investment in plant and machinery or equipment and annual turnover does not exceed one crore and five crores respectively
- a small enterprise, where the investment in plant and machinery or equipment and annual turnover does not exceed ten crores and fifty crores respectively
- iii. a medium enterprise, where the investment in plant and machinery or equipment and annual turnover does not exceed fifty crores and two hundred fifty crores respectively

From 6.33 crore MSMEs in India, almost 99.4 percent enterprises fall under the micro enterprise and 0.52 and 0.007 per cent is comprised by small and medium enterprises in respectively [5].

Even though Micro enterprises hold 99.4 percent of enterprises in the MSMEs. In normal times MSMEs have difficult time to sustain in the global scenario, with constant changes in the market dynamics due to regulatory upheavals, technological changes, abrupt changes in consumer behaviour and globalization. Especially Micro and Small industries are the most vulnerable because of their capacity, scale of operations, scarce resources, limited managerial process and less margin for managing sudden slumps. But with the unexpected situations like Corona Pandemic, National Lockdown, Demonetisation, GST implementation and bank crisis; the survival becomes an intensified challenge.

This research is significant as the MSME sector is truly a strategic asset for the economy of the country. The contributions and benefits of the MSMEs have immensely widened in the other sectors. Among all the sectors, micro, small and medium enterprises (MSMEs) was the largest job creator in the last four years – with growth of 13.9 per cent – and will continue to be so in the next three years, according to a survey by the Confederation of Indian Industry (CII) [6]. It is also promoting and expanding inclusive growth in the entrepreneurial activities and business innovations. Presently, the MSME sector is associated, in public perception, with low quality standards. The MSME

sector is anticipated to be upgraded through modern and new approaches to achieve global quality standards. [7]

#### **REVIEW OF LITERATURE**

#### Uncertainty

Lack of knowledge about probabilities of future events in Uncertainty [8]. Uncertainty is mostly misconceptualised with the risk [9]. Commonly Risk and Uncertainty are considered to be synonyms[10] as the definition of risk in PMBok [11] is as an uncertain event that can impact any event. In many literatures work the risk and uncertainty concepts overlap and properly distinguished is not available [12]. Uncertainty is when, there is not a single, nor complete understanding of the event to be managed [13]. In risk situation the decision maker is able to draw out a distribution of the outcomes of the events where as in uncertain situation, it"s impossible to draw any probable outcomes and prediction of the event [8]. While practicing uncertainty, more focus is drawn to threats and less to opportunities, although it is subjected to opportunities equally as threats. Risk is related to the negative impact of having threats, but uncertainty is related to both positive and negative impact, as it can have threats or opportunities [14]. At different phases of projects, the practice of uncertainty should vary [15]. Due to lack of proper distinction in dimensions of uncertainty, which leads to risky and unjustified decision [16]. A need of better research about uncertainty and its understanding can structure the management of uncertainty for any enterprise.

#### **Dimensions of Uncertainty**

Unlike risk, uncertainty is difficult to measure as it is subjective, multi-dimensional and varies in degree of experience and source [17]. A study defined uncertainty in terms of ambiguity and complexity and further elaborated the four strategies to manage uncertainty. Many phenomena of an organisation can be broadly understood, when internal and external sources of uncertainty are explicitly considered [18]. But the paper aims to focus only on the external unprecedented and unforeseen situations for an effective and in-depth analysis. The four strategies mentioned in the study are: Ignore, Knowledge generation, Interaction and Coping Strategies [19]. Studies have built an opportunistic perspective towards uncertainty and linked it with

strategic management and entrepreneurship [9]. Uncertainty dimensions vary with the level of impact on any enterprise and thus the need to set the elements of impact need to be defined which can further elaborate its strategies and effect.

#### Managing Uncertainty

Managing uncertainty involves either reducing risk or cope with the strategies [20]. Further, a study elaborates three dimensions to reducing risk: Information gathering, proactive collaboration, networking and five dimensions to coping with strategies: flexibility, imitation, reactive collaboration, control and avoidance [21]. The misconception of uncertainty as risk leads to implementation of risk management strategies to extreme uncertain situations and causes failure in the management level [22]. Unforeseeable uncertainty requires advance level of strategy management [22]. The strategy thus cannot be same in every level of the uncertainty as the impact of uncertainty can have a direct or am indirect impact on the enterprise. For building a competitive edge for any organisation dexterity, continuous improvement, customer orientation, constant innovation and quest towards globalisation is involved [23]. Although uncertainty cannot be completely eliminated but believed to be minimised implicitly by reflective learning and knowledge exchange [23].

## UNCERTAINTY MANAGEMENT APPROACHES

From the above literature study, the following conceptual model in synthesised for an external unforeseen situation. The model primarily distinguishes the impact type in Direct, Indirect or No Impact. Direct and Indirect Impact are generally associated with the uncertainty, as no impact can barely be a possibility in external unforeseen situation. The decision making in assessing the impact depends on the managerial perspective, experience and analytics. Any effect of the uncertainty impact can further be positive or negative, where positive is closely determined to be an opportunity and negative to a threat. The model does not include any risk factor to eliminate the overlapping of any risk management term and hence the threat level is incorporated. The level of threat or opportunity can be gauged by an enterprise by assessing the impact of the uncertainty at different spheres of business. The

strategy at every level need to be different depending on the uncertainty experienced [22] thus a constructive strategy is framed at every level. The strategy definitely can be further improvised and more defined, according to the sector of enterprise, product and goals of the enterprise. The model further has a scope and potential to be elaborated into more structured form. More the defined and structed the model develops; the aim of the paper will be enriched in uncertainty management. Thus, the model can be recognised as a "Strategizing Uncertainty Model", as it aims to convert the uncertain situations towards the benefit of the organisation. The model holds a positive perspective by considering any uncertainty or uncertain situation to be an opportunity of growth. To develop and implement this uncertainty management practice in any enterprise, there is definitely the need of uncertainty management tools that need to be practiced at every spere and level of managerial process.

Table 1 : Proposed Conceptual Model : Strategizing Uncertainty Model

Impact of Uncertainty	Effect	ThreatLevel	Opportunity Level	Strategy
Direct	Positive	Very Low	Very High	Optimise the situation and
Impact	Negative	High	Very Low	Gather Information and Mitigate the Losses
Indirect	Positive	Moderate	High	Flexibility and Innovative Approaches
Impact	Negative	Moderate	Moderate	Analyse and Adopt Change or Alternatives
No Impact	No effect	No	Highest	Explore & tap new potential from the available resources

MSMEs mostly comprising of micro enterprises hold a high vulnerability level even in the slightest uncertain situation. For sustaining the high level of the uncertainty, mostly risk management tools are implemented [22] which does not efficiently address the uncertainty impact in MSMEs. For uncertainty to be addressed following tools are synthesised from the above literature study. Kaizen, Value stream mapping, Quality tools and Total productivity tools are considered to the practices for Lean Approach [24]. Also, lean thinking along with resourcefulness can develop a perspective of always optimising the situations and resources in a positive way. Strong Communication Technology, Flexibility, Innovative approaches and strive for attaining internationalisation, dexterity and customer

oriented are the approaches to build competitive edge [22] in uncertainty. The customer- oriented enterprise will always have a practice of upgrading and improving the product or service according to the changing customer requirement. Along with that Knowledge and transparency of information with the various levels of the organisation [21] will keep a clarity while assessing of the level of impact of the uncertainty. Further the enterprises with a practice of analysing the situation at every regular interval can definitely have a clue of predicable uncertainty. The practice of these tool in the enterprise can elevate the level of clarity in decision making and gauging the impact of any uncertain situation if faced. Although, the paper is confined to support and strengthen the MSMEs in addressing the uncertain situations, the tools mentioned can be adopted at other sectors.

#### **Conventional Approaches**

1. Scenario Planning: MSMEs can enhance their preparedness by developing multiple scenarios based on different potential outcomes and uncertainties. By considering various scenarios, businesses can better understand the range of possibilities and devise appropriate strategies for each situation. This proactive approach allows MSMEs to assess risks, identify potential opportunities, and establish contingency plans accordingly. By anticipating and planning for different scenarios, businesses can be better equipped to navigate uncertainties, make

- informed decisions, and adapt their strategies as needed. This flexibility and preparedness are key to maintaining resilience and successfully managing unexpected events..
- 2. Diversification: MSMEs can effectively reduce uncertainty by diversifying their product or service offerings, target markets, and revenue streams. By expanding their range of offerings, businesses can mitigate risks associated with relying solely on a single product or service. Similarly, targeting diverse markets allows MSMEs to tap into new customer segments and reduce dependence on a specific market's conditions. Furthermore, diversifying revenue streams by exploring different sources of income can provide stability and resilience in the face of changing economic landscapes. By embracing diversification, MSMEs can minimize the impact of uncertainties and create a more robust and adaptable business model.
- 3. Agile Decision-making: MSMEs can benefit from adopting agile decision-making processes that prioritize flexibility and quick adjustments in response to changing circumstances. This approach allows businesses to adapt swiftly and make informed decisions based on real-time information. By embracing agile decision- making, MSMEs can effectively respond to market shifts, customer feedback, and emerging trends. It involves gathering and analyzing data, engaging stakeholders, and utilizing iterative feedback loops to make timely and informed decisions. This agile mindset enables businesses to stay proactive, seize opportunities, and navigate uncertainties with greater agility and resilience.[25]
- 4. Collaborative Networks: MSMEs can greatly benefit from forming partnerships and collaborative networks with other businesses, suppliers, and industry associations. Through these alliances, they can share resources, knowledge, and expertise, collectively managing uncertainties and creating new opportunities. Collaborative networks enable MSMEs to tap into a wider pool of resources, access specialized skills, and leverage shared experiences to navigate uncertainties more effectively. By fostering partnerships, businesses can also expand

their reach, gain market insights, and develop innovative solutions through collaboration. This collaborative approach helps MSMEs mitigate risks and fosters growth, resilience, and a competitive advantage in the marketplace.

- 5. Continuous Market Research: MSMEs should allocate resources to ongoing market research in order to stay updated on industry trends, customer preferences, and emerging technologies. By conducting thorough market research, businesses can gain valuable insights that help them anticipate changes and adjust their strategies accordingly. Understanding customer needs and staying ahead of industry developments enables MSMEs to proactively adapt their products, services, and marketing approaches. By investing in continuous market research, MSMEs can maintain a competitive edge, identify new opportunities, and make informed decisions that align with the evolving market landscape.
- Financial Risk Management: MSMEs should prioritize the implementation of effective financial risk management practices to ensure their financial stability in uncertain situations. This includes developing contingency plans, maintaining adequate reserves, and actively managing cash flow. By having contingency plans in place, businesses can anticipate potential risks and establish strategies to mitigate their impact. Maintaining sufficient reserves provides a buffer to withstand unforeseen financial challenges. Additionally, managing cash flow ensures a healthy and sustainable financial position. By proactively managing financial risks, MSMEs can enhance their resilience, maintain stability during uncertain times, and position themselves for long-term success.
- 7. Innovation and Adaptation: MSMEs should actively cultivate a culture of innovation and encourage employees to think creatively. Businesses can effectively transform uncertainties into opportunities by embracing change and proactively adapting to new market conditions. Encouraging employees to explore innovative solutions, experiment with new ideas, and think outside the box fosters a dynamic and agile work environment.

- This mindset allows MSMEs to identify emerging trends, respond to customer needs, and stay ahead of the competition. By embracing innovation, MSMEs can leverage uncertainties as a catalyst for growth, differentiation, and long-term success.[26] [27]
- Supply Chain Resilience: MSMEs should prioritize assessing and strengthening their supply chain resilience by implementing various strategies. This includes diversifying suppliers, enhancing transparency, and developing contingency plans. By diversifying suppliers, businesses can reduce reliance on a single source and mitigate the impact of disruptions. Enhancing transparency throughout the supply chain allows for better visibility and risk management. Additionally, developing contingency plans enables MSMEs to effectively respond to unforeseen events and minimize disruptions. By proactively addressing uncertainties in the supply chain, MSMEs can ensure continuity of operations, maintain customer satisfaction, and sustain their business growth.
- Customer Engagement and Feedback: Maintaining strong customer relationships and actively seeking feedback is essential for MSMEs. By understanding customer needs and preferences, businesses can adapt their offerings and strategies to better meet market demands. Regularly engaging with customers allows MSMEs to gather valuable insights, identify improvement areas, and promptly address any concerns. By fostering a customer-centric approach, MSMEs can build loyalty, enhance customer satisfaction, and stay competitive in the ever-evolving market. Actively seeking feedback demonstrates a commitment to continuous improvement and helps MSMEs establish long-lasting relationships with their customers.
- 10. Talent Management and Upskilling: MSMEs should prioritize talent management, which includes both attracting and retaining skilled employees. By investing in attracting top talent and creating a conducive work environment, businesses can build a strong team capable of handling uncertainties effectively. Furthermore, providing opportunities

for upskilling and professional development equips the workforce with the necessary skills and knowledge to adapt to changing circumstances. By nurturing talent within the organization, MSMEs can foster employee loyalty, increase productivity, and enhance their ability to navigate uncertainties and drive business growth.

# **Digital Approaches**

- 1. Cybersecurity Measures: MSMEs should prioritize cybersecurity to secure their digital assets and consumer data. By putting in place strong security protocols, conducting regular audits, and training employees, MSMEs may reduce the risks associated with cyber threats and data breaches. [28]
- 2. Data Analytics: By harnessing the power of data analytics, MSMEs can leverage valuable insights into customer behavior, market trends, and operational performance. Through the analysis of data, these businesses can make well-informed decisions and uncover potential opportunities, thereby minimizing uncertainty in the decision-making process.[26]
- 3. Cloud Computing: The adoption of cloud computing solutions can significantly improve agility and scalability for MSMEs. By utilizing cloud-based infrastructure and software, businesses can efficiently adjust their resources, gain access to real-time data, and reduce dependence on physical infrastructure. This enables MSMEs to adapt quickly to changing needs, streamline operations, and optimize resource allocation. [26][27]
- 4. Digital Marketing Strategies: Developing and implementing effective digital marketing strategies play a crucial role in enabling MSMEs to expand their online presence, effectively reach their target audiences, and enhance customer engagement. By taking a proactive approach to marketing, these businesses can reduce uncertainty in attracting and retaining customers, thereby increasing their chances of success in the digital landscape.
- E-commerce and Online Sales: MSMEs have the opportunity to embrace e-commerce platforms and online sales channels, which can help diversify their

- revenue streams and decrease reliance on physical stores. This adaptation enables them to respond to evolving consumer preferences and market dynamics, ensuring greater flexibility and resilience in their business operations. By leveraging the potential of online sales, MSMEs can expand their reach and capture new market opportunities..
- 6. Artificial Intelligence (AI) and Automation: The integration of AI technologies and automation into business processes can have a transformative impact on MSMEs. These businesses can streamline operations, enhance efficiency, and minimize human error by leveraging AI-driven tools for customer service, inventory management, and predictive analytics tasks. This adoption allows MSMEs to optimize resource allocation, make data-driven decisions, and allocate their workforce to more strategic and value- added activities. Integrating AI technologies and automation ultimately empowers MSMEs to operate more efficiently and effectively in a rapidly evolving business landscape.[26][27]
- 7. Agile Development and Continuous Improvement: MSMEs are encouraged to adopt agile methodologies for software development and digital projects. This iterative approach empowers them to swiftly adapt to market changes, incorporate customer feedback, and embrace emerging technologies. By following agile principles, MSMEs can enhance their project management, foster collaboration among team members, and ensure continuous improvement throughout the development process. This flexibility and responsiveness enable MSMEs to deliver high-quality software and digital solutions that meet evolving customer needs and stay competitive in the dynamic market landscape.[25]
- 8. Digital Transformation Roadmap: The development of a well-defined digital transformation roadmap is crucial for MSMEs to effectively navigate uncertainties related to technological advancements. Businesses can systematically implement digital initiatives by creating a clear plan that outlines goals, timelines, and resource allocation. This roadmap provides a strategic framework for adopting new technologies, optimizing processes, and integrating digital solutions into their operations. With a

well-structured approach, MSMEs can effectively manage the challenges associated with digital transformation and maximize the benefits it offers in terms of growth, efficiency, and competitiveness.

- 9. Mobile Optimization: Given the growing prevalence of smartphones, it is essential for MSMEs to prioritize mobile optimization for their websites and digital platforms. By ensuring a seamless user experience across mobile devices, businesses can minimize uncertainties associated with user engagement and conversions. Mobile optimization includes responsive design, fast loading times, intuitive navigation, and mobile-friendly content. By prioritizing mobile optimization, MSMEs can effectively engage and retain mobile users, capitalize on the mobile-driven market, and enhance their chances of converting visitors into customers.
- 10. Data Backup and Recovery: The implementation of robust data backup and recovery systems is vital for safeguarding against potential data loss or system failures. By regularly backing up critical data and testing recovery procedures, businesses can mitigate uncertainties caused by unforeseen incidents. This proactive approach ensures that MSMEs can quickly restore their systems and minimize downtime in the event of a data breach, hardware failure, or natural disaster. By prioritizing data backup and recovery, businesses can maintain business continuity, protect sensitive information, and instill confidence in their customers and stakeholders.

## DISCUSSION

Uncertainty term is a rapidly developing term in the business enterprises. The concept of uncertainty and its management discussed in this paper is to distinguish the risk from the uncertainty. Where risk is a quantifiable term and uncertainty to be a completely unmeasurable and unpredictable term related to any event. Thus, implementing risk management strategies during the uncertain situation is not an effective measure. The potentiality of the uncertainty management to develop into a managerial process is explored.

MSMEs, the engine of economy are worst hit to uncertainty and a need to address their uncertain situations is elaborated. Uncertainty management holds a crucial importance in the MSME. The uncertainty management approach can be developed in the MSMEs by use of the uncertainty management tools. The proposed Strategizing Uncertainty Model is an effort to develop a structured and defined approach to alleviate and optimise any unforeseen or unprecedented external situation. Overall, the paper also seeks to offer a comprehensive and conceptual overview of existing knowledge on Uncertainty and contribute further to develop and frame the uncertainty management with the Strategizing Uncertainty Model.

# **CONCLUSION**

The paper implies the potentiality and importance of Uncertainty Management in all the enterprise and in the field of Management for overcoming the ever-changing complex business environments. The work contributes insights into efficiently managing external unforeseen and unprecedented situations associated with the MSMEs and how to cope up with rapidly changing business dynamics with the Uncertainty Management approach. perspective. The practical implication is the synthesised and proposed Strategizing Uncertainty Model, which can be used as a structure to better plan the strategies to uncertainties. The proposed conceptual model is view with the MSMEs dimension, and can be partially applicable to the other sectors. This leads to a scope of further structing and frame working of the uncertainty management for a common model. To enhance the model, and the topic further literature regarding project management, strategic management must be explored.

MSMEs should assess their digital readiness, prioritize areas of improvement, and carefully implement these approaches based on their specific needs and resources.

# Sustainable Determinants in the Development of Micro and Small Enterprises of Eastern Maharashtra

Rajesh Shende Rahul Mohare

Research Scholar Shri Ramdeobaba College of Engineering and Mgmt. Nagpur Assistant Professor Shri Ramdeobaba College of Engineering and Mgmt. Nagpur

# **ABSTRACT**

The study examined the determinants in the development of Micro and small enterprises of Eastern Maharashtra. A descriptive survey design was adopted. All the registered micro and small businesses in Eastern Maharashtra is routine in this study. A structured questionnaire is customised for data collection. The collected data is analysed using SPSS to perform simple linear regression for testing the research hypotheses. The 0.05 level of significance is used for the hypothesis testing. According to the study's findings, the statistically significant degree of firm growth is most likely influenced by the owner's age, contact to capital, family-owned business history, and the interest rate. Contrarily, entrepreneurship training, the owner's expertise, the rate of inflation, and competition are less likely to have an impact on the expansion of businesses at a statistically significance level. The lasting variables, including the owners' gender, educational background, age of the business, type of business, location of the business, social responsibility, tax rate, and attitude towards society, did not statistically significantly affect the growth of MSEs.

**KEYWORDS:** MSE, Sustainable, Determinants, Eastern maharashtra, Performance measurement, Capital structure.

# INTRODUCTION

In the last fifty years, the MSE sector of the Indian economy has grown to be one of the most lively and dynamic. MSEs not only play a significant role in generating a large number of employment opportunities at a capital cost that is significantly smaller than that of large-scale industries, but it has also aid in industrialising rural and under-developed regions, thereby dropping regional differences and warranting a more unbiassed dispersal of revenue and wealth transversely the country. MSEs are auxiliary businesses that support large industries, and this sector has a significant positive impact on the socioeconomic progress of the nation.

Maharashtra is the leading state in terms of industrial output in India. However, only a small number of people have entered the medium and big sectors. The industrial structure has temporarily become unbalanced as a result of this. Small business owners have dominated the industrial sector in recent decades. For the growth of other regions, the patterns and traits

of entrepreneurship in Maharashtra are instructive. Therefore, it is interesting to look at Maharashtra's entrepreneurial activities and the variables that have led to their success. The development and operation of entrepreneurship are often influenced by a wide range of circumstances. These include past employment, family history, caste, origin, education, technical expertise, financial situation, backing from the government, personality, the entrepreneur's character attributes, etc. These elements not only determine successful or unsuccessful entrepreneurs, but also have an impact on industrial growth and the production process. Therefore, it is essential to develop the elements or provide the conditions that foster entrepreneurship and afterwards industrialization in order to promote industrialization.

The creation of jobs, the provision of goods and services, and other activities that create value are all contributions made by the micro and small enterprise sector to the "nations' economy". The industrial sector is expected to develop more quickly and sustainably,

www.isteonline.in Vol. 46 Special Issue, September, 2023

and the Five-Year Plan for Growth and Transformation envisions permitting the sector to progressively show a vital role in the economy. To do this, boosting micro and small businesses and aiding the growth of medium and big industries are given particular attention. Small businesses in India, especially in the eastern area, are increasingly up against competition from not only their peers but also from huge businesses functioning in specialist industries that were once understood to be limited to the small enterprises (Ntakobajira, 2013).

The misconception about MSEs, according to Amyx (2005), is one of the main obstacles. Prospective customers believe that small firms are unable to deliver high-quality services and can only handle one major project at a time. Small business failure is attributed in large part to inadequate planning, bad funding, and subpar management (Longenecker, 2006). A number of variables, such as the degree of economic growth, the growth of real per capita income, population expansion, and technological advancement, are typically linked to the development of small to medium size businesses, the evolution of their share of employment and production over time, their market orientation, and their location.

# LITERATURE REVIEW

A company's strength is its human capital because it can solve its difficulties thanks to people's knowledge and talents. The results of Anwar's (2019) study show that human capital is significant because it is based on the idea that women are not only in charge of family reproduction but also produce raw materials, process food, and are thought to be responsible for half of all production. The most significant input into the production process is human capital (Ahmed et al., 2020a, 2020b). According to Bobba et al. (2020), human capital accounts for more than half of the overall value of production.

Due to MSMEs' failure to expand their resources and capabilities, businesses fail and don't flourish (Surin et al., 2017). In addition to the issue of human capital, MSMEs also face the issue of declining business turnover, which prevents money from being accessible for production turnover. For a company or enterprise, capital is crucial. A firm cannot function as it should without finance. To operate, businesses of all sizes require finance (Sudaryono, 2017).

Highlighting the challenges faced by Dalit business owners. According to Sharma, P. (2013), she focuses on encouraging female entrepreneurship. She also underlines the fact that men and women are partners on an equal footing in all spheres of life, particularly in terms of economic growth. According to D. Venkatramaraju (2011), small-scale industry includes a variety of pursuits, including manufacturing, services, retail, financing for building, infrastructure, etc. SSI contributes significantly to economic growth. According to Kumar, S. (2013), MSMEs are the driving force behind an inclusive and balanced economy through generating demand for goods and services in addition to rapid economic growth. The multinationals of tomorrow may be today's MSMEs.

In his research, Lokhande M.A. (2015) concluded that entrepreneurs have a great desire to advance, be ahead of others, be independent, and forge their own identities, along with the creation of public wealth through their companies. In rural and semi-rural areas, there are numerous new growth centres where young people from various socioeconomic backgrounds are involved in entrepreneurial activity. According to Kalam, P.G. (2012), there are numerous swings in the total number of units on paper as a result of closings and illnesses, but given the expansion of SSI entrepreneurship, SSI plays a very important role. In order for the SME division to reach its full probable, it is important that business owners take the necessary steps with the assistance of the government.

Porter, Competitive Strategy: Free Press, (1992) illustrates how the risk of additional products and the negotiating power of customers and suppliers are probable aspects in attaining a modest edge.

According to M. Porter, Competitive Strategy. New York: Free Press, (1988)., a company has a durable advantage when the advantages of its unique assets outweigh the tactics of its rivals. As a result, a company's modest benefit necessity be needed to withstand attempts at replication by other businesses. A company can gain a competitive advantage if it is successful in developing and putting into action a strategy that takes advantage of new technical developments and capabilities that can result in the creation of a new company structure.

It's difficult to manage a company's finances since poor financial management can have an effect on a company's long-term financial health. Additionally, both the individual and the business will be affected by sound financial decisions. Financial literacy is a comprehensive understanding of financial principles, individual/corporate financial planning, and both personal and business financial management, C. T. Widiastuti (2017).

# **Hypothesis**

- o H01: There is no significant mean difference between the nativities of respondents and their capital structure to start the business
- o HO2: There is no significant mean difference between the nativities of respondents and their Performance Measurement of Functional Areas
- o HO3: There is no significant mean difference among the district wise enterprises of respondents and Performance Measurement of Functional Areas
- o HO4: There is no significant indirect effect between pre stat up activities, valuation, monitoring and their sustainability of the business

# RESEARCH METHODOLOGY

A descriptive survey was the methodology used for this investigation. The design is focused on how variables relate to one another, testing hypotheses, creating generalisations, and utilising theories with broad applicability (Adamu & Sani, 2016). The author underlined that when it comes to gathering a group of people's opinions, attitudes, qualities, and beliefs using a questionnaire, descriptive survey research is the most suitable design. According to the previous, the strategy was deemed suitable because the study will use questionnaires to gather respondents' perspectives.

134 senior managers from 187 small businesses in Eastern Maharashtra, made up the study's population. The owners and managers of the small enterprises in the study region are the executives. Because of the manageable size of the population, the study included all 134 employees. This choice was made in accordance with Creswell's (2011) recommendation that the researcher use the complete population for the study if the population is small.

A questionnaire served as the data collection tool. The decision to employ a questionnaire was

made in accordance with Gall and Borg's (1996) recommendation that questionnaires be used when gathering information regarding capital structure to start the business, Performance Measurement of Functional Areas, pre stat up activities, valuation, monitoring and their sustainability of the business. They continued by saying that questionnaires also have the benefit of being less expensive and time-consuming.

In pilot research involving 40 managers of legally registered small enterprises in the Kirfi, the tool was validated by three experts. As recommended by Madiha and Walid (2016), who claimed that Cronbach's Alpha is the best instrument to examine a questionnaire's internal consistency, the programme was used to conduct the Cronbach Alpha reliability test. Reliability coefficient for the instrument is 0.78. The instrument met Madiha and Walid's (2016) recommendation, according to which a survey study should be regarded reliable if its reliability coefficient is less than 0.7. Consequently, the tool was employed for the study.

To gather information from the respondents, the researchers employed three surveys. The method for gathering data was direct. This method was deemed appropriate since it allowed the researchers or research assistants to fully explain to the respondents the significance of all information and the confidentiality of it (Adamu & Kabir, 2019). The direct technique, the authors continued, offers the benefit of collecting a higher percentage of completed questionnaire copies. The survey should be finished in 4 weeks. The SPSS, received the collected data. To produce descriptive statistics on means and standard deviations in order to respond to the study objectives, this programme was utilised. The basic linear regression inferential statistical approach with 0.05 significance level was used.

# **ANALYSIS & OUTCOME**

H01: There is no significant mean difference amongst the nativities of respondents and their capital structure to start the business

The std. coefficient for the regression analysis used to test the first null hypothesis in Table 1 was 0.230, which is consistent with the R value. The t value is 2.6335 and the R2 is 0.053. The dependent variable is affected by the independent variable by 5.3%, according to the R-squared value. The fact that the p-value was smaller

than alpha (0.000 < 0.05) shows that there is a significant mean difference amongst the nativities of respondents and their capital structure to start the business. The theory was not verified.

Table 1.

Std. Co- efficient	Т	R	R <sup>2</sup>	Adj. R²	P value
0.230	2.6335	0.230	0.053	0.045	0.010

HO2: There is no significant mean difference between the nativities of respondents and their Performance Measurement of Functional Areas

The regression analysis used to produced an R-value of 0.351 and a std. coefficient beta of 0.351 with t=4.179. According to the calculated  $R^2$  of 0.123, Prince has a 12.3% impact on the sustainability. The p=0.000 value was less than the 0.05 threshold for significance. The p- value found shows that the significant mean difference amongst the nativities of respondents and their Performance Measurement of Functional Areas. The contrary conclusion was not supported.

Table 2.

Std. Co- efficient	T	R	$\mathbb{R}^2$	Adj. R²	P value
0.351	4.179	0.351	0.123	0.116	0.00

HO3: There is no significant mean difference among the district wise enterprises of respondents and Performance Measurement of Functional Areas

The result of the third hypothesis in Table 3 shows the std. coefficient beta of 0.200 with a corresponding. The  $R^2$  of 0.040. The value of 0.0400 obtained indicates that promotion has an impact of 4% on the sustainability. The p-value was smaller than the significance level (0.025)

< 0.05), it indicates the significant mean difference between the district wise enterprises of the respondents and Performance Measurement of Functional Areas. The null hypothesis was therefore not retained.

Table 3.

Std. Co- efficient	T	R	R <sup>2</sup>	Adj. R²	P value
0.200	2.265	0.200	0.040	0.032	0.025

HO4: There is no significant indirect effect between pre stat up activities, valuation, monitoring and their sustainability of the business According to Table 4's regression analysis, the std. coefficient beta value was found to be 0.370,. The location has a 13.7% impact on SSB sustainability in Eastern Maharashtra, according to the R<sup>2</sup> value of.137. The p-value was under the.05. significance threshold. The outcome demonstrates that indirect effect between pre stat up activities, valuation, monitoring and their sustainability of the business. Therefore, the hypothesis was not kept.

Table 4.

Std. Co- efficient	T	R	$\mathbb{R}^2$	Adj. R²	P value
0.370	4.430	0.370	0.137	0.130	0.00

# **FINDINGS**

According to the study-based results of the first hypothesis, the nativities of the respondent and their capital structure affects the viability of small companies in the Eastern Maharashtra. The findings are in accordance with those of Ferri, Mohd, Radiah, and Hamidreza (2012), who found a dearth of research on the effects of supply channel innovation on company demonstration, mainly in transport-focused agricultural businesses (SMEs). Believed that the product has a favourable link with the buying choice, which results in the sustainability of the small business, also agreed with the conclusion.

According to the findings of the second hypothesis, small enterprises in the Eastern Maharashtra are impacted by the Performance Measurement of Functional Areas. The findings support claims made in the literature, such as those in research by Imoleayo (2010), that prices have a big impact on the nativity of the businesses in the Eastern Maharashtra. The research by Ade, revealed that products description has a beneficial effect in the marketing practises of small enterprises in India, also supports the conclusion. Obonyo (2013) reached similar conclusions as well. Despite a long history of research, the relationship between marketing techniques and the financial presentation of SME is still unclear.

The third null hypothesis result showed that district wise enterprises favorably affect the Performance Measurement of Functional Areas in the Eastern Maharashtra. The outcome is consistent with Mustahpha's (2017) study, which demonstrates the value of growth of micro and small enterprises for all sizes of businesses. Gumel (2019), who emphasizes the need of creating and implementing effective determinants for the development of businesses, supports the conclusion as well.

According to the findings of the fourth research hypothesis, pre stat up activities, valuation, monitoring and their sustainability of the business favorably affects the viability of small businesses. The outcome is consistent with the findings of past research like Kartikasari, Irham, and Mulyo's (2018) earlier study.

# **CONCLUSION**

The study discovered that the sustainability of micro and small enterprises in Eastern Maharashtra is positively impacted by the capital structure of the businesses, with the measurement of the performance criteria for the various functional areas in the businesses. This implies that any small firm will gain from success and sustainability over its rivals if it makes steps for pre start up activities, valuation, monitoring to incorporate the sustainability in the business. As a result, this will aid in hastening the increase of the firm' profitability. Therefore, it follows that small business owners' failure to incorporate the sustainable determinants for their expansion and development.

### **ABSTRACT**

The competition among Indian graduation colleges for attracting and enrolling students has intensified in recent years. To achieve full admissions, colleges need to adopt effective marketing strategies that leverage both traditional and digital channels. This research article explores the concept of hybrid marketing approaches and their application in the context of Indian graduation colleges. By examining various strategies, including online platforms, social media, search engine optimization (SEO), content marketing, and offline promotional activities, this study aims to provide insights into how colleges can optimize their marketing efforts to achieve maximum enrollment. The findings highlight the significance of integrating traditional and digital marketing methods to effectively reach and engage prospective students.

# INTRODUCTION

ompetition among Indian graduation colleges to attract students is fierce, necessitating effective marketing strategies for full admissions. Hybrid marketing, combining traditional and digital approaches, offers potential solutions. This research explores hybrid marketing in Indian graduation colleges, analyzing online platforms, social media, SEO, content marketing, and offline promotions. The study aims to provide insights on optimizing marketing efforts for maximum enrollment.

# Background

Indian graduation colleges face challenges differentiating themselves in a crowded market. Traditional marketing approaches have been relied upon, but digital advancements require hybrid marketing adoption.

# **Problem Statement**

Indian graduation colleges lack comprehensive and effective marketing strategies for full admissions. Overemphasis on traditional channels limits reach,

engagement, and conversion rates, hindering enrollment targets and competitiveness.

# **Objectives:**

- 1. Explore hybrid marketing in Indian graduation colleges.
- 2. Examine digital marketing strategies for enhanced enrollment.
- 3. Investigate benefits and challenges of hybrid marketing.
- 4. Provide recommendations and best practices for optimal marketing and full admissions.

# Significance of the Study

The study is vital for Indian graduation colleges, offering insights on utilizing hybrid marketing for full admissions. Integration of traditional and digital strategies can expand reach, enhance brand visibility, engage prospective students, and increase conversion rates. The findings contribute to higher education marketing knowledge, specifically in the Indian context, and provide practical guidance.

www.isteonline.in Vol. 46 Special Issue, September, 2023 257

# **Scope and Limitations**

The research focuses on marketing practices of Indian graduation colleges, exploring hybrid marketing for full admissions. It investigates traditional and digital strategies, considering factors like target audience, location, and budget constraints. Generalizability may be limited to Indian graduation colleges' specific context. Nonetheless, the study provides valuable insights and adaptable recommendations for colleges to suit their circumstances and goals.

# LITERATURE REVIEW

Marketing Strategies in Higher Education: Effective marketing strategies are crucial for achieving full admissions in higher education. The shift from traditional to digital approaches has been driven by technology and changing student behavior.

**Traditional Marketing Approaches:** Graduation colleges have traditionally used print media, direct mail, education fairs, billboards, radio, and TV ads. However, their impact has diminished as prospective students turn to digital platforms.

**Digital Marketing Approaches:** Digital marketing enables targeted messaging, personalized experiences, and campaign tracking. Strategies include website optimization, SEO, social media, email and content marketing, and online advertising.

**Hybrid Marketing Approaches:** Hybrid marketing combines traditional and digital strategies for cohesive campaigns. It maximizes reach and engagement by utilizing both online and offline channels.

**Theoretical Framework:** The Diffusion of Innovation theory explains the adoption of digital marketing in higher education. The Integrated Marketing Communication model ensures consistency across channels. Customer Journey Mapping optimizes enrollment by identifying touch points for hybrid marketing.

# **METHODOLOGY**

Research Design: To achieve the objectives of this study and gain insights into the utilization of hybrid marketing approaches for achieving full admissions in Indian graduation colleges, a qualitative research design will be employed. This design allows for the

collection and analysis of qualitative data, providing indepth understanding of the topic.

The research design will consist of qualitative data collection through interviews and focus groups with key stakeholders, such as college administrators, marketing professionals, and prospective students. These qualitative methods will help capture in-depth perspectives, experiences, and insights related to the implementation of hybrid marketing approaches in the context of Indian graduation colleges.

Data Collection: For the qualitative phase, semistructured interviews and focus groups will be conducted. Key stakeholders from a diverse range of Indian graduation colleges will be selected using purposive sampling to ensure representation from different regions, sizes of institutions, and program offerings. The interviews and focus groups will be audio-recorded and transcribed for analysis. The data collected will focus on understanding the current marketing strategies employed, the integration of traditional and digital approaches, the challenges faced, the perceived benefits of hybrid marketing, and any best practices or success stories.

**Data Analysis:** The qualitative data collected from interviews and focus groups will be analyzed using thematic analysis. The transcripts will be coded, and emerging themes and patterns will be identified. The analysis will involve categorizing and grouping the data to identify common trends, challenges, and success factors related to the implementation of hybrid marketing approaches. The qualitative findings will provide rich insights and real-life examples to support the recommendations and best practices.

# RESULTS AND DISCUSSION

Overview of Indian Graduation Colleges: Indian graduation colleges encompass a variety of institutions offering undergraduate programs across disciplines. Understanding their characteristics and dynamics sets the stage for exploring marketing strategies employed to achieve full admissions.

# **Traditional Marketing Strategies**

Print Media Advertising: Indian graduation colleges use print media advertising, such as newspapers

and magazines, to target specific geographic areas. However, its effectiveness has declined with the rise of digital platforms.

**Direct Mail Campaigns:** Direct mail campaigns involve sending promotional materials to prospective students. While they create a tangible connection, their response rate has decreased with the prevalence of digital communication channels.

**Education Fairs and Events:** Education fairs and events provide opportunities for colleges to showcase programs and engage with prospective students. Their effectiveness may vary based on location, timing, and competition.

# DIGITAL MARKETING STRATEGIES

Website Development and Optimization: Well-designed and user-friendly websites are crucial for Indian graduation colleges. Optimizing websites for search engines and mobile responsiveness enhances visibility and accessibility.

**Search Engine Optimization (SEO):** SEO techniques help colleges improve online visibility and search engine rankings. Optimizing website content, keywords, and meta tags increases the chances of being discovered by prospective students.

Social Media Marketing: Indian graduation colleges leverage social media platforms to engage with prospective students and share valuable content. Platforms like Facebook, Instagram, LinkedIn, and YouTube facilitate targeted advertising and interactive communication.

**Content Marketing:** Colleges utilize content marketing to provide informative blog articles, videos, webinars, and podcasts. By establishing themselves as authoritative sources, colleges build trust and credibility among prospective students.

# **Hybrid Marketing Approaches**

Integrated Marketing Campaigns: Integrated campaigns combine traditional and digital channels to create a cohesive brand message. Aligning print media advertisements, direct mail campaigns, and digital marketing efforts ensures consistency and enhances effectiveness.

**Personalized** Communication: Personalized communication, through email marketing and CRM systems, helps colleges establish deeper connections with students and address their individual needs and concerns.

**Data Analytics and Targeting:** Leveraging data analytics tools, colleges track and analyze marketing campaigns, website traffic, social media engagement, and conversion rates. This data-driven approach informs decision-making and enhances targeting efforts.

Challenges and Opportunities: Challenges in implementing hybrid marketing approaches include budget constraints, limited expertise, resistance to change, and measuring impact. However, opportunities arise in reaching wider audiences, real-time engagement, performance tracking, and cost-effective marketing.

Best Practices and Case Studies: Successful implementation of hybrid marketing approaches involves developing comprehensive strategies, utilizing targeted social media advertising, creating informative website content, nurturing leads through personalized communication, and monitoring performance. Case studies highlight successful examples that inspire other colleges seeking enrollment excellence.

# RECOMMENDATIONS

Integrated Marketing Strategy Framework: Indian graduation colleges should develop an integrated marketing strategy framework that integrates traditional and digital marketing channels. This framework should include a comprehensive plan, target audience identification, key objectives, effective resource allocation, and performance indicators.

# **Key Considerations for Hybrid Marketing**

When implementing hybrid marketing approaches, colleges should consider understanding the target audience, customizing communication, ensuring a seamless user experience, maintaining consistent branding, and making data-driven decisions.

# **Developing a Digital Marketing Team**

Building a dedicated digital marketing team or partnering with experienced agencies can enhance the effectiveness of hybrid marketing approaches. The team should consist of professionals with expertise in various digital marketing channels.

# **Continuous Monitoring and Evaluation**

Regular monitoring and evaluation of key performance indicators are crucial for optimizing hybrid marketing strategies. Colleges should establish a system for ongoing evaluation of enrollment outcomes, website analytics, social media engagement, lead generation, and conversion rates.

# **CONCLUSION**

**Summary of Findings:** This study examined the utilization of hybrid marketing approaches in Indian graduation colleges. Traditional marketing strategies have been effective but face limitations in the digital age. Digital marketing strategies offer new avenues for engagement. Hybrid marketing approaches, integrating traditional and digital channels, enable colleges to reach a wider audience, personalize communication, track performance, and make data-driven decisions.

**Implications for Practice:** Colleges should adopt an integrated marketing strategy framework, prioritize personalized communication, invest in digital marketing expertise, and continuously monitor and evaluate campaigns. Collaboration among colleges can drive enrollment excellence.

**Future Research:** Further research can explore the long-term impact of hybrid marketing approaches, compare effectiveness across different college types and regions, investigate emerging digital marketing trends, and consider cultural and regional factors for localized strategies.

# **ABSTRACT**

This study examines the effects of foreign direct investment on the Indian economy, recognizing the crucial function of FDI as a major engine of economic growth. In the current global milieu, FDI has emerged as a momentous arena in burgeoning markets. The study primarily concentrates on scrutinizing the patterns of FDI influx into India from 2000-01 to 2019-2020. The main objectives include determining the impact of FDI on the Indian economy, evaluating the approvals of FDI inflows to India by country, and examining FDI inflows across various industries throughout the given timeframe. For this study, secondary information has been culled from a variety of sources, including the Reserve Bank of India Bulletin reports and the yearly reports issued by the Department of Industrial Policy and Promotion (DIPP) of the Government of India. The article concludes by offering suggestions to increase FDI inflows into India.

KEYWORDS: Foreign direct investment, Sector-specific FDI inflows, FDI inflows by Country, RBI

# INTRODUCTION

he term of foreign direct investment (FDI) means the transfer of money from one country to another country through the purchase of stock in foreign corporations or the investment in real estate. FDI is typically used by businesses to increase their presence on foreign markets. Developing countries, in particular, actively seek FDI to spur economic growth and increase national income or GDP. FDI entails investing in domestic companies, organizations, and equipment, rather than participating in the stock market. It offers various advantages, including enhanced supply chain management (SCM), job creation, improved logistics and infrastructure, among others.

As a source of non-debt capital for India's economic growth, FDI has been crucial. India has had notable FDI development despite the COVID-19 pandemic, the global economic slump, and other obstacles. In order

to encourage FDI, the Indian government has taken a number of actions, including easing FDI restrictions in industries like oil refineries, telecommunications, power exchanges, stock exchanges, and defence.

Millions of people in India have been pulled out of poverty as a result of the country's exceptional GDP development over the previous two decades, making it a desirable destination for FDI. Significant FDI inflows have been observed in important industries like manufacturing, services, telecommunications, construction, computer software and hardware, and autos. India has received major FDI from countries like Mauritius, Singapore, the Netherlands, Japan, the United States, and the United Kingdom.

# REVIEW OF LITERATURE

Bhattacharyya Jita and Bhattacharyya Mousumi (2012), in their empirical study titled "The Influence of Overseas

www.isteonline.in Vol. 46 Special Issue, September, 2023

Direct Investment and Trade in Goods and Services on Economic Advancement in India," examined the complex relationships between FDI, goods trade, service trade, and economic growth in the Indian setting. Their research aimed to identify the long-term relationships between these variables. The findings showed a one-way link in which FDI positively impacted economic growth and favorably impacted merchandise trade. The study also found that there were two-way relationships, demonstrating the interdependence between service trade and economic growth in India as well as trade in goods.

Shalini Singh and Manish Singh (2011) In "Exploring the Path of Overseas Capital in India," a thorough investigation was made to delve into the dynamic world of foreign direct investment (FDI) in the Indian context. This study carefully examined the inflow of FDI into India, spanning a remarkable period from 1970 to 2007, by harnessing the power of secondary sources and using painstaking time series analysis. Primarily driven by the pursuit of unravelling the intricate relationship between FDI inflows and India's economic growth, the overarching objective was to unravel the nuanced patterns of fluctuation in FDI inflows while unravelling their profound impacts. Employing a discerning lens, this research sought to unveil the underlying factors behind these ebbs and flows, ultimately painting a comprehensive portrait of the prevailing trends within the realm of FDI.

Gaurav Agarwal and Mohd. Amir Khan (2011) in a comparative study titled "Impact of FDI on GDP: China vs. India," the researchers analyzed FDI's influence on the Gross Domestic Product (GDP) of both countries from 1993 to 2009. They made use of a growth model that included factors like GDP, human capital, labor force, FDI, and gross capital formation into account. According to the results, a 1% increase in FDI led to a 0.07 percent boost in China's GDP and a 0.02 percent increase in India's GDP. Notably, China showed a greater link between FDI and economic development than India, indicating more effective FDI utilization.

Jatinder Singh (2010) in the study titled "Economic Reforms and FDI in India: Policy, Trends, and Patterns," researchers analyzed the FDI inflows into India considering government policies since 1980. The analysis revealed a rising trend in post-reform FDI inflows. A comparison with other developing economies showcased significant growth in FDI inflows to India,

indicating a positive response to liberalization measures introduced in the early 1990s.

Gajendran Lenin Kumar and S. Karthika (2010) the "Sectoral Performance through Inflows of Foreign Direct Investment (FDI)" study investigated the impact of FDI on various Indian industries and the country's economic growth. It highlighted FDI's facilitation of technology transfer, increased domestic capital, raised production levels, and created employment opportunities. The study analyzed FDI inflows into India and the economic growth driven by the top 10 investing countries.

Joyshri Acharyya (2009) carried out a study titled "FDI, Growth, and the Environment: Evidence from India on CO2 Emission during the Last Two Decades." This study looked at how FDI inflows affected environmental deterioration and India's GDP development. The study analyzed the FDI inflows and their effects on India's GDP growth over a two-decade period from 1980 to 2003. The study also highlighted the significant longterm economic impact of FDI inflows on carbon dioxide (CO2) emissions, emphasizing the environmental consequences resulting from economic activities. Keshava, Dr. S.R. Rathnamma (2008) conducted a comparative analysis titled "The Effect of FDI on the Indian and Chinese Economies." This study analyzed the economies of India and China using comparative analysis. It highlighted that these two countries, with a combined population of 37% of the world, experienced significant GDP growth rates exceeding 9% (according to the Asian Development Outlook 2005 and World Development Report 2006). The study also provided statistics on FDI flows and stocks in India and China, indicating their respective contributions to the economies.

R. Banga (2006) in a thorough study titled "Unleashing Export Diversity: Assessing the Influence of Japanese and US Foreign Direct Investment on the Indian Manufacturing Sector," the effect of FDI on export diversification in a developing country was carefully examined, with special attention paid to India. Intriguing revelations emerged from the investigation, emphasizing the distinctive impacts of FDI inflows from the US and Japan. Notably, the findings showcased that FDI from the US had a favorable and positive influence on India's export intensity during the post-liberalization era. However, in contrast, Japanese FDI did not yield a significant impact on India's overall exports. These

observations shed light on the nuanced role played by different countries' FDI in shaping export diversity within the Indian manufacturing sector.

Pradhan, Prakash J., Abraham, Vinoj, and Sahoo, Kumar M. (2004) in the paper "Foreign Direct Investment and Labor Dynamics: Unveiling the Indian Manufacturing Scenario," researchers looked at the effects of FDI on employment and wages in the Indian manufacturing sector. Comparing international companies to their domestic equivalents, the data showed that neither had a significant impact on manufacturing employment. However, an interesting pattern emerged as foreign firms demonstrated a tendency to offer comparatively higher wages to their workforce. This suggests that labor also reaped benefits from foreign investment in India.

# **OBJECTIVES OF THE STUDY**

- 1) To examine the FDI trends in India during last two decades.
- 2) To assess the inflow of FDI in India from different countries.
- 3) To evaluate the distribution of FDI inflows across various sectors in India.

# RESEARCH METHODOLOGY

#### **Data Collection**

This study only uses secondary data sources. The information was acquired from a number of trustworthy sources, including RBI Bulletin Reports and Annual Reports issued by the Department of Industrial Policy and Promotion (DIPP) of the Government of India, articles from newspapers and journals, textbooks, reliable internet sources, websites, and UNCTAD. The data collected covers a time span of twenty years, from 2000 to 2020, and is analyzed using graphs and tables.

# **Statistical Tools**

For this research paper, the following statistical tools and methods have been employed; the percentage method and graph analysis conducted using Microsoft Excel software.

# LIMITATIONS OF STUDY

• This study is solely concerned with how FDI affects the Indian economy.

- Only the chosen time period is considered in the analysis of FDI Inflows on the Indian Economy.
- Only information from 2000 to 2020 was collected.
- Only secondary data were used to examine how FDI affected the Indian economy.
- There were no continuous-time series data in the RBI Bulletin reports.
- Inadequate time was allotted for data collecting.

# **DATA ANALYSIS & INTERPRETATION:**

**Table 1. FDI Inflows by Financial Year from 2000 to 2020:**(Amount USD Million)

YEAR	FDI INFLOWS	FDI GROWTH RATE (In %)
2000-2001	4029	-
2001-2002	6130	(+) 52%
2002-2003	5035	(-) 18%
2003-2004	4322	(-) 14%
2004-2005	6051	(+) 40%
2005-2006	8961	(+) 48%
2006-2007	22826	(+) 155%
2007-2008	34843	(+) 53%
2008-2009	41873	(+) 20%
2009-2010	37745	(-) 10%
2010-2011	34847	(-) 08%
2011-2012	46556	(+) 34%
2012-2013	34298	(-) 26%
2013-2014	36046	(+) 05%
2014-2015	45148	(+) 25%

2019-2020	74390	(+) 20%
Grand Total	681854	

Source: Department of Industrial Policy and Promotion.

The table presented above illustrates the Foreign Direct Investment (FDI) inflows into the country in absolute terms, showcasing a significant growth from USD 4,029 million in the year 2000-2001 to USD 74,390 million in the year 2019-2020, reflecting a remarkable

increase of 19 times. This data highlights the FDI trends over the past two decades in India. Notably, there was a substantial increase of 52% in FDI inflows during the financial year 2001-2002, reaching USD 6,130 million compared to the preceding year. Despite minor fluctuations in the subsequent years from 2002-2003 to 2005-2006, there was a substantial surge in FDI inflows during the financial year 2006-2007, amounting to USD 22,826 million, representing a growth rate of 155% compared to the previous decade. Another significant increase occurred in the financial year 2007-2008, with FDI inflows amounting to USD 34,843 million, showing a growth rate of 53% compared to the previous year. In the year 2008-2009, there was considerable investment of USD 41,873 million in Foreign Direct Investment (FDI) and so forth. Following this, there were some fluctuations in FDI inflows between 2009 and 2014, with a subsequent increase in the financial year 2015-2016, where FDI inflows reached USD 55,559 million. Subsequently, FDI inflows continued to rise in the financial years between 2016 and 2019. Consequently, the year 2019-2020 recorded the highest FDI inflow figure of USD 74,390 million over the past 20 years.

Table No. 2: FDI Equity Inflows by Financial Year (Amount USD Million)

Financial Year	Amt. of FDI Inflows		Percentage Growth over previous year
	In Rs Crores	In USD Million	
2000-01	10,733	2,463	-
2001-02	18,654	4,065	(+)65%

2017-18	288,889	44,857	(+) 3%
2018-19	309,867	44,366	(-) 1%
2019–20	353,558	49,977	(+) 13%
Grand Total	2,732,444	470,119	

Source: Department of Industrial Policy and Promotion (As per DPIIT's FDI database)

The Foreign Direct Investment (FDI) Equity inflow into India has witnessed a substantial increase from Rs. 10,733 crores in the financial year 2000-2001 to Rs. 3,53,558 crores in the financial year 2019-2020, marking an impressive growth of 33 times. This information, as shown in the table and graph, gives a thorough picture of all FDI equity inflows into India from 2000 to 2020, a period of 20 years. Notably, FDI Equity Inflows in India saw a positive effect with a considerable

growth to Rs. 18,654 crores in the fiscal year 2001-2002. Furthermore, in the year 2008-2009, there was a significant investment of Rs. 1,42,829 crores in FDI Equity Inflows, highlighting a substantial growth in foreign investments. However, there were fluctuations in the inflow of FDI Equity Inflows between 2010 and 2014. Nonetheless, there was a considerable surge in FDI Equity Inflows in the financial year 2015-2016, reaching Rs. 2,62,322 crores. Subsequently, FDI Equity Inflows continued to rise in the financial years between 2016 and 2019, culminating in the highest figure of Rs. 3,53,558 crores in the year 2019-2020.

Table no. 3: Top Twenty Country-Wise FDI Inflow
(Amount USD Million)

Sources: Department of Industrial Policy and Promotion (As per DPIIT's FDI database)

Upon analyzing the table, it becomes evident that Mauritius has emerged as the leading investor in Foreign Direct Investment (FDI) Equity Inflows in India, contributing a substantial amount of 142,710.44 million USD. This investment from Mauritius constitutes 30.36 percent of the total equity investments made by the top 20 investing countries in India from the years 2000-2001 to 2019-2020. Singapore holds the second position, with an equity inflow of 97,669.64 million USD, accounting for 20.78 percent of the total equity investments made by the top 20 countries. Notably, Singapore's investment in India has positioned it as a significant contributor to the equity capital inflow. The Netherlands and Japan have also made notable equity capital investments, amounting to 33,852.04 million USD and 33,499.21 million USD, respectively. These investments represent

7.20 percent and 7.13 percent of the total equity investments made by the top 20 countries. Moreover, considerable the United States of America and the United Kingdom, respectively, have made capital investments of 29,779.40 million USD and 28,210.85 million USD. An intriguing aspect is that the combined equity investment inflows from Mauritius and Singapore, totalling 240,380.08 million USD, are nearly equivalent to the investments made by the remaining 18 top-level equity investing countries in India, which amount to 200,375.27 million USD. The difference between the investments from Mauritius, Singapore, and the other 18 countries is merely 40,004.81 million USD. Therefore, it is clear that Singapore and Mauritius are important players in the FDI equity landscape of India.

Table No. 4: Top 20 FDI Equity Inflows by Sector from 2000–2001 to 2019–2020

(Amount USD Million)

Sr. No.	Sectors	Amt. of	FDI Inflows	% of Total Inflows

Source: Department of Industrial Policy and Promotion (As per DPIIT's FDI database)

The table highlights that the services sector, including finance and banking, received the highest equity investment of USD 82,002.96 million, representing 17.45 percent of the top twenty sectors attracting FDI

equity inflow into India from 2000-2001 to 2019-2020. Conversely, the industrial machinery sector witnessed the lowest equity investment of USD 5,619.50 million, accounting for

1.20 percent of the top twenty sectors attracting FDI equity investment. A noteworthy investment was made in the computer software and hardware sector, totalling USD 44,911.95 million, or 9.56 percent of the top twenty industries. Similarly, the telecommunications services sector attracted equity investment of USD 37,270.95 million, covering 7.93 percent of the top twenty sectors. The trading sector received an investment of USD 27,594.95 million, constituting 5.87 percent of the top

twenty sectors' FDI equity investment. Investments in other sectors include USD 25,662.33 million in construction development, USD 24,210.68 million in the automobile industry, USD 17,639.48 million in the chemicals sector (excluding fertilizers), USD 16,846.88 million in construction infrastructure activities, USD 16,500.62 million in the drugs and pharmaceuticals sector, and USD 15,288.97 million in the hotel and tourism sector. Additionally, USD 14,987.93 million was invested in the power sector, USD 13,401.78 million in metallurgical industries, and USD 9,980.75 million in food processing industries.

# FINDINGS OF THE STUDY

- The FDI inflows into the Indian economy showed a constant rising trend from 2000–2001 to 2019–2020, showing significant expansion.
- In 2019-2020 alone, India received FDI inflows amounting to USD 74,390 Million. The cumulative FDI inflow for the period between 2000-2001 and 2019-2020 reached USD 681,954 Million.
- The data reveals that in the last financial year (2019-2020), FDI equity inflows into India amounted to USD 49,977 Million. The cumulative FDI equity flow from 2000-2001 to 2019- 2020 totalled USD 470.119 Million.
- Analyzing the data, it becomes apparent that Mauritius and Singapore accounted for the highest FDI equity inflows, investing USD 142,710.44 Million and USD 97,669.64 Million, respectively, from 2000-2001 to 2019-2020. Mauritius and Singapore collectively contributed to 51% of the total FDI equity inflows, while other countries accounted for the remaining 49% during the same period.
- From 2000 to 2020, the services sector saw the biggest FDI equity inflows, totaling USD 82,002.96 million and accounting for 18% of all sectors. Notably, the computer software & hardware sector (10%), telecommunications sector (08%), trading sector (6%), and construction development sector (6%) were among the sectors that received significant FDI equity inflows.

# **CONCLUSION**

The enormous contribution made by foreign direct investment (FDI) to India's economic growth is reiterated by this study. FDI is not only crucial for achieving sustainable economic development but also demonstrates a positive and accelerating trend within the country. The findings clearly indicate that India presents a highly promising investment destination for both developed and developing nations. To leverage this opportunity, it is essential to liberalize the rules and regulations surrounding FDI in India.

It is advised that the Department of Industrial Policy & Promotion take action to create new and update existing FDI policies with an emphasis on promoting, approving, and facilitating investments in light of the study completed. Additionally, efforts should be made to enhance ease of doing business indicators in various sectors, including streamlining processes related to starting a business, obtaining construction permits, accessing electricity, and labor market regulations. Such measures will create favourable conditions for foreign investors to explore opportunities in India.

In conclusion, Foreign Direct Investment not only contributes to employment generation in India but also provides support to medium and small-scale industries, such as MSMEs. Additionally, FDI is crucial to the nation's posture on the world stage as a result of the liberalization and globalization processes.

# A Study on the Effects of Personnel Relation with Respect to Conflict Management in an Organization

Sayali B. Sukhadeve

Priyadarshani Vinaykumar Keshtty

Department of Management Studies G H Raisoni College of Engineering Nagpur

# **ABSTRACT**

This study examines the effect of personnel relation in solving conflict in working terms with respected varible "Personnel Relations" in the Nagpur region. This research deals with various techniques to be implemented to solve and resolve conflicts among personnel. The study also shows that how we can control the conflict in an organization to maintain the healthy human relations in working environment. The study also shows role of personnel relation in an organization and the impacts of conflict on the organization. A quantitative approach has been used in this study. The study is descriptive and analytical in Nature. The gathered data obtain using online questionnaire with rating scale and secondary data is also used in the study. For the purpose of data analysis, Percentage analysis model has been adopted and different type of statistical tools used in the study to complete the study and for the effective results. The study found that personnel relation plays vital role in organization for solving the conflict of the organization. The result shows the importance of impact of personnel relation in solving conflict in an Organization.

KEYWORDS: Human relations, Conflict, Organization, Management, Nagpur.

# INTRODUCTION

n order to achieve or meet the corporate goals and objectives, it is crucial for the human resources department to plan, control, and discharge duties and powers to different personnel in an effective manner. Conflict management is term that deals with identifying and resolving problems in an result oriented manner. The main objective of the study is to highlight the resons of conflicts and various solutions on it that will affect and resolve conflicts and maintain organistion dignity.

# Personnel Relations in an organization

A personnel relation is a connection between an organization's people resources. It includes relationships between management and employees as well as between employees. Relationships between personnel and outsiders are also included (such as clients, suppliers).

Personnel is an important asset for an organisation.

Positive interpersonal interactions hence increase productivity and efficiency. It is necessary for the growth and success of the company.

In addressing the psychological components of organisational performance, the human relations approach seeks to increase the effectiveness of organisations. Relationships between people and inside organisations are combining.

According to Mac Farland, human relations is the study and practise of exploiting human resources via knowledge and understanding of people's behaviours, attitudes, feelings, and relationships at work.

# **Organizational Conflict**

The condition of disagreement or miscommunication caused by actual or imagined differences in needs, views, resources, and interpersonal relationships among the organization's members is known as organisational

www.isteonline.in Vol. 46 Special Issue, September, 2023

conflict, also known as workplace conflict. No matter what task or decision they are discussing, conflict always emerges when two or more people are involved.

Simply described, organisational conflict is the result of human encounters that start when one organisation member realises that his or her aims, views, or attitude are incompatible with those of other organisation members. Viewpoint incompatibility can arise within an individual, between two individuals, or between organisational groups.

# **Conflict Management:**

Conflict management is the process of handling disagreements. Any given day, you might have to deal with a conflict with a family member, a coworker, or another person.

Conflict management is the art of identifying issues and resolving them in a fair, reasonable, and efficient manner. The process of managing conflicts deals with (perceived) conflicts or incompatibilities caused by, for example, conflicting opinions, objectives, and desires.

It's essential to have someone on hand who is educated about disagreements and how to resolve them because conflicts frequently develop at work. This is more important than ever in the marketplace of today. Everyone wants to demonstrate their value to the company they work for, which occasionally can result in disagreements.

# NEED TO STUDY

# Aim of the Study

The aim of the research of is to determine the various conflict resolution techniques and use them in different organization to reduce organizational conflict. In the Nagpur region.

# Objectives of the study

- 1. To find out what are the effect of personnel relation and solving conflict in an organization.
- 2. To find out what are the provisions related to conflict management.

- To explore the conflict management styles.
- To find out how we can control the conflict in an organization to maintain the healthy human relations in an organization.
- To find out what are the impacts of conflicts.

# LITERATURE REVIEW

The study deals with in establishing connections that live among conflict operation, communication and connections at work. Conflicts in organisations takes place when employe didnt get proper working environment or they are not appriciated related to their work. Conflicts should be properly managed and solved , because conflict leads to bad image of organisation and may affect it reputation.

A desire to recreate people's management of peace in the university system using the analysis of the human relations theory of management. The research approach for the study was literature and observations, and theoretical analysis was used to interpret and make meaning of HRTM. A formal or informal social group inside a workplace, the creation of affinity in the workplace, motivation, and communication, among other assumptions of the theory, are further argued and supported by me as the road map for managing people. In a similar vein, it becomes a useful tool for managing students' unrest in Universities. The relevant of the theory to crisis management was equally exemplified, coupled with the development of a theoretical model to better simplify the nexus between HRTM and crisis management.

Conflicts in organizations occur when interests and activities of individuals or groups within an organization confront each other and prevent attainment of one party"s objectives. When conflicts are not well managed, employees become aggrieved and tend to behave in a way that does not promote good relationships among employees for the attainment of organizational goals. By means of providing empirical justification for these assertions, the study sought to establish the relationships that exist among conflict management, communication and relationships at work.

This study focuses on the origins, consequences, and

September, 2023

solutions of organisational conflict. What factors cause conflicts in organisations. Other terms that are highlighted in the report include conflict, which causes a lot of ambivalence and leaves many academics and administrators unsure of its significance and best ways to handle it. Conflicts will always exist in human life. In organisations or even across nations, it is unavoidable. Conflict is an inevitable part of life for both individuals and organisations.

The study also found that rivalry for dominance, leadership style, a lack of common resources, etc. all contribute to disputes in organisations. Ineffective conflict management might result in poor productivity or service performance. Effective conflict resolution management generates good results. Thus, not all conflict situations are bad. Efforts should always be made to ensure that the causes of conflicts are addressed as soon as they are noticed.

# Literature Gap

As per the study existing study there are various conflict resolutions theories and techniques are available but they lag in implementation.

# **Hypothesis**

H0-The number of employees who are aware about organizational conflict and conflict resolution techniques.

H1- The number of employees who are not aware about organizational conflict and conflict resolution techniques.

**Table 1: Questionnaire Design** 

# RESEARCH DESIGN AND METHODOLOGY

The study is descriptive in nature, as it will explain the effects of employee relation in solving conflict in an organization.

# Sample Design

The sample was developed to help with thorough planning of the strategies and methods to be utilized for obtaining important data. The study employed both primary and secondary data sources.

The sample is built on the foundation of simple random sampling. The respondents make up the sample for the planned research, which is a form of probability sampling.

# **Data Collection**

A survey questionnaire with multiple choice, dichotomous, and Likert's five-point grading items was the research tool utilized to gather the primary data for this study. Around 168 questionnaires distributed among respondents and out of 100 responses filled together.

The secondary data is collected from a number of internet sources, as well as several regional, national, and worldwide journals.

# **Questionnaire Design**

The questionnaire has been incorporated 14 questions in all which has been divided into 4 sections.

- 1. Personal Information.
- 2. Multiple choice questions. 3.Dichotomous questions.
- 4. Likert's five-point grading scale.

Section	Variable has been considered	Questions included in each section	Measurement

# DISCUSSION

# **Findings**

As per the figure 1, the male respondents are more as compare to female respondents. The percentage of male respondents is 59% and 41% of female respondents.

As per the figure 2, 100% of the respondents are aware about the conflict in the organization.

As per figure 3, 92% of respondents said that Trust & Good Nature also Communication & Problem-solving mind these are effects of human relations in solving conflict in the organization.

As per figure 4, 88% of respondents said that work disruptions & decrease productivity, project failure & absenteeism and Turnover & Termination these all are the effects of conflict in the organization.

As per figure 5, 68% of respondents are strongly agreed with the statement that human relations can help to solve conflict in the organization.

As per figure 6, 92% respondents said that Accommodating, Avoiding, Compromising, Collaborating and Competing these all are the conflict management style.

As per figure 7, 98% respondents said that conflict management styles are helpful.

As per figure 8, 71% respondents are strongly agreed with the statement that conflict management styled shows impact on the conflict resolution.

As per figure 9, 90% respondents said that all are the best pair of conflict management style.

As per figure 10, 98% respondents said that conflict management plays an important role in an organization.

As per figure 11, 95% respondents said that Feedback & Patients also Communication & Conflict management these are the factors that helps to maintain the healthy human relations.

As per figure 12, 76% respondents are strongly agreed on the statement that control conflict by maintaining healthy human relations in the organization.

As per figure 13, 74% respondents are strongly agreed on the statement that conflict has bad impact on the organization.

As per figure 14, 98% respondents said that conflict is a problem in the organization.

# **CONCLUSION**

This study examines the effect of personnel relation in solving conflict in an organization with respected varible "personnel relations". In the Nagpur region. The study found that personnel relations plays an important role in organization for solving the conflict of the organization. The result shows the importance of effect of personnel relation in solving conflict in the organization. Also there are different conflict management styles are given in the

study that Accommodating, Avoiding, Compromising, Collaborating and Competing they are very helpful for each and every organization when there is a situation of conflict. They show the positive results. The study also found that feedback & patients also communication & conflict management these are the factors that helps to maintain the healthy human relations.

# **LIMITATIONS**

- 1. The Human Resource Management sector forms the study's perimeter.
- 2. The study is bounded with the effect of conflict on human relations in an organization.
- 3. The study is bounded with the conflict management.
- 4. The study is for Nagpur region only.

# Impact of Artificial Intelligence on Indian Retail Industry: Awareness and Experience of Consumers Regarding AI-based Retail

Sanjiv Kumar, Amit P. Sahu

Shradha S. Bonde

Department of Management Studies G. H. Raisoni College of Engineering Nagpur

## **ABSTRACT**

AI being used in different spheres of people's lives like healthcare and finance. But today, it also has a significant role in the retail industry. The AI used in online retail is more personalized than offline retail because it has its long journey to be personalized for consumers in India for now. AI helps retail to be personalized, automated, Demand Forecasting and much more. Personalization plays an important role in online retail. For example, it can personalize website interface, recommend products and services and make shopping more convenient for consumers. Automation is a key element in offline retail. Majority of consumers are unaware about the uses of AI in their everyday lives, especially when it comes to retail. Many people think AI is only used in scientific terms, or that it's something only robotics engineers use. However, this is not true. AI is used in many aspects of daily life and will soon be used as a part of all industries. Consumers are unaware about the fact that they already experienced such a services in retail sector online and there is a huge scope for offline retailers to become completely AI enabled.

**KEYWORDS:** Artificial intelligence, Personalization, Automation, Consumer experience, Consumers awareness, Retail

# INTRODUCTION

verything is possible with AI today. Retail Industry is fastest growing industry and by using AI it became more simple and human friendly. But what exactly AI in Retail Industry? Artificial Intelligence is any system that uses software, data, or model to automate tasks that normally require human intelligence.

This digital world has already introduced consumers to online retail format and they are already experienced the personalized and automated retail services, to understand their experience about use of AI technology in retail will be compared to their awareness about offline use of AI in retail. Online retail stores like Amazon.in, Flipkart, and Myntra are the best example. Some of the offline projects are Amazon Go (US), Bingo Box (China), Watasale (India). Because use of AI in offline

retail is new for the consumers there is only one or two stores in India like Watasale in Kochi.

Digital transformation in retail is not only connecting thinks but it is all about converting data into insights, which helps to inform actions that drive better business outcomes. Retailers trying their best to provide shopping experience that are convenient, personalized and enjoyable. If retailers can get real time information through AI about consumers wants and need then they can improve demand forecasting, make pricing decisions, and optimize product placement. (Intel, 2022).

AI can give certain significant advantages in the retail sector are like better consumer experience, optimization of tasks, managing better demand forecasting, helping in pricing decisions, avoidance of long queues, optimizing product placements, extraction of valuable data these

www.isteonline.in Vol. 46 Special Issue, September, 2023 276

features are calculated as most important advantages for retail sector. AI has no boundaries when it comes to new innovations and it will create tremendous impact of the future of retail business in India. (Somani, 2021)

Walmart Neighbourhood Market in Levittown, New York, has showing significant transformation. With artificial intelligence-enabled cameras, interactive displays and a massive data centre, this store implicate the future of retail just like science fiction. It's Walmart's new Intelligent Retail Lab (IRL). According to the article application of AI in e- commerce is now table stakes but they don't provide physical experience to the customers. But IRL is designed for that type of Innovation in offline retail sector. The store include various sensors, cameras and processors. The IRL store can automatically detect the product on the shelf, recognize the type of specific product, and compare quantities on the shelf to help in demand forecasting. (Matt Smith, Walmart, 2019)

According to research the market for global AI in retail is expected to climb from just under \$5 billion to more than \$31 billion between 2021 and 2028. SO,

# LITERATURE REVIEW

If retailers are not prepare for this change then, they may soon be "left behind in the dust" of this digital revolution and transformation. (Smith, 2022)

# PROBLEM STATEMENT

The digital transformation of the retail business has been moving on for ages. It has improved personalization, automation, smart store experience, conversational commerce, digital shopping as well as casher less store experience across every division of retail sector, scene AI is being used in retail industry it is necessary to understand its impact on Indian retail industry and consumers awareness and experience regarding application of AI in online and offline retail.

# RESEARCH METHODOLOGY

This research is based on secondary data collected from various online sources which includes online journals and online articles from following websites such as Google Scholar, article posted on Google chrome.

# **OBJECTIVES**

- 1. To analyze the impact of Artificial Intelligence in retail industry.
- 2. To study how AI in retail has impacted on consumers awareness and experience. (online & offline)

Title of The	Factors	Main Pionts
Paper	Identified from	Highlighted in the
Гарег	the Paper	Paper/ Discussion on
	ule rapei	Identified Factiors
		<b>}</b>
Impact of AI on Retail Sector in India	Personalization, improvement in marketing, lack of understanding, require customers, Consolidation of data	could act as personalized virtual trial room for fashion retail. In offline segment it is noticeable that consumers purchase behaviour changes as per the new innovations takes place
The Integrati on of Artificial Intelligence in retail: Benefits, challeng es and a dedicated conceptual framework	Personalization, customer experience, cost benefit, virtual assistance, CECoR conceptual framework, General AI integration architecture, AI enabled customer profile management,	Use of chat-bots and virtual assistance is beneficial for cost reduction. It gives highly personalized offer to each consumers. AI can gives conceptual framework to retail. Voice assistance like Siri and Alexa both online and offline stores answer consumers about their specific goods, provide suggestion with possible combination with complementary product. (Ionut- Florin Anica-popa, 2021)

www.isteonline.in Vol. 46 Special Issue, September, 2023

An Empirical Study of Consumer Perception towards Scope of Artificial Intelligence in Offline Grocery Retail	Artificial intelligence, perception of consumers towards scope of artificial intelligence, AI in offline grocery retail.	AI has its significant impact on grocery retail. AI will help to reduce scepticism. People are open to new experience which makes it easier for the grocery retail to adapt AI for better consumer experience. (Harshavardhini Patil, 2019)
Artificial Intellige nce : A Tool for Hyper Personali zation	Hyper- Personalization, Artificial Intelligence, AI impact on consumers, retail sector including healthcare, education, transportation	AI completely transformed some sector but still facing obstacles. Hyper personalization has its significant effect on consumer satisfaction as it brings the personalized experience to consumers. (Goyal, 2019)
Consumer Perception towards Artificial Intelligence in E- Commerce with Reference to Chennai City, India)	Personalized shopping experiences for online buyers, Real time product targeting, conversational commerce, virtual personal shoppers, customer centric advertisements	Virtual personal assistance provide moderns shopping experience to customer. Real time product targeting had highest score because companies offering best offline shopping experience. People are more aware about AI and they are using it. AI will create new evolution in retail industry. (Anil Surresh, 2020)

Retail Tech M&A #5: Voice recognition gives retailers more ways to communicate	Voice and text-assisted technology	McDonald improving customer experience by utilizing IoT innovations. Voice and text-assisted technology is to take accurate orders from customers. (Diakantonis, 2019)
Top emerging Technologies transforming the retail experience.	Unlocking the full potential of retail with IoT increase retail experience, virtual shopping focuses on personalized experience, minimize customer friction, improve customer experience	Technology has taken place in all over the world with the help of IoT retailers can improve customer experience as well as retailers. It engage personalized experiences across the entire customer journey. (Durbin, 2020)
Retailers Race Against Amazon to Automate Stores	Completely automated checkouts, cashierless checkouts, competition between retailers.	Before amazon go there was AI in retail store but after amazons fully AI automated store has been introduced it started race between retailers to emerge new technology. (Nick Wingfield, 2018)
Impact of Artificial Intelligence in inventor y management with reference to watasale Kerala.	Just Walk-Out Technology, Computer Vision, Deep Learning, Sensor Fusion	Consumers are thrilled to experience new technologies provided by the "Watasale" store.It's completely brainstorming for consumers to experience such a technology just like Amazon. Go stores that has vision-cameras, sensors, computer vision.(Dr. S. Saravana Kumar, 2019)

# **FINDINGS:**

Artificial Intelligence concept has completely changed the old retail techniques and now retailing became easier for retailers as well as consumers. AI did some changes in retail sector, these are as follows.

### Personalization

The major change AI created in retail is personalization. Each consumers has their different preferences and choices, back then it was difficult for retailers to target each and every consumer but because of AI now retailers can identify which consumer prefer what type of items by monitoring their social activities and identify what consumers like to provide them personalized suggestion via advertising on various social Medias as well as online retail sites. Chat-bots, Personal assistance like Siri and Alexa is one of the example of personalization for attending consumer's queries personally and to resolve their concerns.

# Automation

AI in retail can bring ultimate joy to consumers by various majors like better performance, accurate predictions etc.... Application of AI in online retail sector is very significant as it is all consumer interfacing but in offline retail sector the application of AI is mostly for inventory management or internal management, but the projects like Amazon. Go, watasale etc.... are the best example of consumer interfacing AI technology where the whole store is automated and there is no need for consumers to put extra efforts for shopping, you can just simply pick and go. Automation is the main goal for these retail store but in India there is long journey for retails to become completely automatic. There is lot more work to do behind the scenes and automation is being used for minimizing the load and makes it easier to manage the inventory as well as it can help in cost reduction.

# Consumer's awareness and experience

Consumer's perception changes towards retail whenever there is a new technology in market, as everyone wants to experience the comfort and ease provided by these

technology. From the above literature review we can found out that consumers are open to new changes. Artificial Intelligence can bring the joy of shopping to consumers as it can keep the consumer's sentiment and choices by personalization and automation etc..... But according to studies it is found out that consumers are willing to experience AI importance but they lack in understanding. Those consumers who had experience the offline AI enabled stores like "Watasale" are thrilled by its features. These type of offline stores are very common in US because of "Amazon. Go" stores. In India these type of stores are not evident in number but stores like Walmart and D-mart are planning to launch its customer interfacing AI technology which will become consumer's personal shopping assistant, and will provide ultimate in-store experience to consumers in future by providing the digital display screens, virtual trial rooms, casher less check-outs etc. Consumer's buying habits changes according to the price of the product, with the help of AI retailers can forecast the demand and provide consumer the product with affordable prices by offering them alternative products.

AI had a lot of potential to change the overall experience of consumers towards retail. The technology will evolve according to time and AI will also reach to another level. With the help of AI online retail as well offline retail both will evolve, nothing is impossible.

# CONCLUSION

From the above literature review we can conclude that Artificial Intelligence had a huge impact on Indian retail sector as it will continue to impact the retail sector in future as well. Consumers are open to new changes in the retail and ready to adapt technology but there is lack of understand about use of AI in retail. Online consumer interfacing retail had significantly personalized the retailing experience for each consumer according to their preferences and choices. Automation is being used to minimizing the load of retailers both online and offline as it is beneficial for cost reduction and in-store automated experience. AI can also help in demand forecasting, make near to accurate predictions, personalized suggestions as well as improve consumer interaction.

# A Study on the Role of Cross-Cultural Training in Effective Management with Mediating Factor Cross-Cultural Competence Model for Expatriate Managers

Amit P. Sahu, Abdullah M. Chaus

Sanjiv Kumar

Department of Management Studies G. H. Raisoni College of Engineering Nagpur

# **ABSTRACT**

On the basis of a literature review, this research first develops a conceptual model of CC.

Cross-cultural Competence (CC) is referred to the knowledge, traits and abilities that individuals display under different cultural situations, and this knowledge, traits and abilities are closely related to work performance required by cross-cultural contexts. It then gathers data using questionnaire surveys from Indian Organizations and evaluates the model using the data. The four dimensions of CC model. Knowledge, Personal Traits, Behavioral Abilities, and Motives This study examines the Role of training on cross-culture effective management with respected variable "training on cross-culture". The study explores the why training on cross-culture is important in effective management. Benefits of training on cross-culture and challenges faced by the employees if the training on cross-culture is not provided by the management. The study is of a descriptive kind. The collected data obtain using online questionnaire with rating scale in 100 respondents from different organizations. SPSS software is used for the purpose of data analysis, chi-square test and Reliability Test are used for the effective results. The study found that majority of the managers and employees are not aware about the "Cross-cultural competence model". The cross-cultural training plays Significant role in effective management. "training on cross-culture" is the very crucial element of every effective management for the growth of the management.

KEYWORDS: :Cross-cultural training, Management, Expatriate managers, Cross-cultural competence model

# INTRODUCTION

# **Defining Cross-cultural Competence (CC)**

ccording to some academics (1993; Earley & Ang, 2003; Earley & Moakowski, 2004) [1] cultural cognition and understanding is the basis for CC. They defined CC as having the capacity to learn about other cultures, identify and comprehend other cultures, and analyse how other cultures perceive certain actions. Several academics used the adjustment technique to characterize CC (Adler, 1975, Campinha, 2002).

# **Training on Cross-Culture**

Training on Cross-Culture is a strategy for managing workplace diversity. This is the primary technique

for encouraging intercultural involvement and communication.

A technique or practice used to enhance a person's ability to deal with other cultures and perform well in such settings is called cross-cultural training.

Employees who are cross-culturally trained are better able to understand different cultures' values. People are more interested in learning about co-workers' backgrounds and cultures.

# **Expatriate Employees**

An expatriate or ex-pat is someone who lives outside of their country of origin. Professionals or subjectmatter experts regularly move away from their native nation for employment. Employers frequently allocate

www.isteonline.in Vol. 46 Special Issue, September, 2023 282

expats to positions in other countries. Assignments are frequently short-term in global firms, where this is especially common. Expatriates can also operate on their own. Although expatriation is frequently only a temporary situation, many people who do it aim for permanent residence elsewhere. Some people even give up their nationality in their own country.

#### **NEED TO STUDY**

#### The intent of the study

The intent of this research is to determine the level of understanding of the Cross-Cultural Competence paradigm.

#### Objectives of the study

- Investigate the paradigm of cross-cultural competency for expatriate managers.
- Determine the esteem of training on cross-culture in effective management.
- Assess the effectiveness of cross-cultural training. on managerial productivity.
- To learn about the advantages of training on crossculture.
- Determine the problems that the employee will experience if management does not give training on cross-culture.

#### LITERATURE REVIEW

- 1. Cross-cultural training and adjustment through the lens of cultural intelligence and type of expatriates. Sumeet Kour, Jeevan Jyoti. July 2021. –The study purpose is to determine the difficulties while adopting the cross-culture nature. Knowledge is one of them. The organization plays in various culture environment that's why cultural intelligence plays a crucial role for the expatriate managers.
- 2. Moderators and mediators of cross-cultural training effectiveness: literature review and development of a conceptual model. Christina Kempf and Dirk Holtbrügge, 2020. The aim of the study is to develop circumscribe model for training of cross culture with its effectiveness, the study is elaborate the relation between the training of cross culture and self-culture training.

- 3. Role of Prior Intercultural Learning in Chinese University Students' Cross-cultural Adaptation. Fan Fang, Shuyi Zhang and Tariq Elyas. September 2020. The purpose of the study is to priories the studied-on training on cross culture. The study of different is important to adopt the training on cross culture.
- 4. European Journal of Training and Development. Satish Pandey, 2012. The purpose of the study to know the reasons and the dynamic learning through the movies and it specially highlight the training on cross culture. With the classroom made for this study only for the students.
- 5. Building Cross-cultural Competence Model for Expatriate Managers in Low-to-middle levels. X. J. Xu Y. Li. 2012. The study is for china region and the purpose of the study is to determine the CC model for the expatriate managers of china region from different companies. The study shows the different results which changes through the regional changes.

#### **HYPOTHESIS**

H0-The managers/employees are not aware about Cross-Cultural Competence Model.

H1-The managers/employees are aware about Cross-Cultural Competence Model.

# RESEARCH DESIGN AND METHODOLOGY

The study is descriptive in nature, as it will explain, A Study on the Role of Cross-Cultural Training in Effective Management with mediating factor Cross-Cultural cometence model for Expatriate Managers. The research is based on descriptive study.

#### Sample Design

The sample was created to aid in in-depth preparation of the tactics and procedures to be used for gathering pertinent data. The primary and secondary data types were both used in the study.

Simple random sampling provides the basis for the sample that is created. The proposed study's sample is a sort of probability sampling, and the respondents fall within this category.

#### **Data Collection**

A survey questionnaire with multiple choice, dichotomous, and Likert's five-point grading items was the research tool utilized to gather the primary data for this study. Around 149 questionnaires distributed among respondents and out of 100 responses filled together.

The secondary data is gathered from several online domains as well as various national and international periodicals.

#### **Questionnaire Design**

The questionnaire has been incorporated 12 questions in all which has been divided into 4 sections.

- 1. Personal Information.
- 2. Questions with several choices.
- 3. Close ended questions
- 4. It's five-point Likert scale for grading

#### **DATA ANALYSIS**

Hypothesis testing by Chi-Square Test

CC Model Refers to Cross-Cultural Competence Model.

- Total number of respondents are 100.
- Number of Male respondents are not aware about CC model, 59
- Number of Female respondents are not aware about CC model. 39
- Number of Male respondents are aware about CC model. 1
- Number of Female respondents are aware about CC model. 1

**Table 2: Case processing summary** 

	Cases					
	Valid Missing			Total		
	N	Percent	N	Percent	N	Percent
Gender * Gender	100	100.0%	0	0.0%	100	100.0%

Table 3. Gender\* Gender crosstabulation

			Gender		
			Unaware	Aware	Total
Gender Female	Count	40	1	41	
		Expected Count	40.2	.8	41.0
	Male	Count	58	1	59
		Expected Count	57.8	1.2	59.0
Total		Count	98	2	100
		Expected Count	98.0	2.0	100.0

Table 4. Chi-sqaure tests

	Value	ď	Asymptotic Significance (2-sided)	Exact Sig. (2- sided)	Exact Sig. (1- sided)
Pearson Chi-Square	.068*	- 1	.794		
Continuity Correction <sup>b</sup>	.000	-1	1,000		
Likelihood Ratio	.067	- 1	.795		
Fisher's Exact Test				1.000	.654
N of Valid Cases	100				

a. 2 cells (50.0%) have expected count less than 5. The minimum expected count is .82.

b. Computed only for a 2x2 table

• Critical Value given by degree of freedom=3.841

The final Result chi-square test- By using SPSS (software version 29) The final Result chi-square test-Thus, the critical value is higher than calculated value the (H0) the null-hypothesis is accepted and the alternative hypothesis(H1) is got rejected. 3.841>0.794. Finally, the results are the managers/employees are not aware about Cross-Cultural Competence Model.

#### RELIABILITY

Scale: ALL VARIABLES

#### Reliability Statistics

Cronbach's Alpha	N of Items
.772	15

#### Case Processing Summary

		N	%
Cases	Valid	20	20.0
	Excluded <sup>a</sup>	80	80.0
	Total	100	100.0

 Listwise deletion based on all variables in the procedure.

#### Scale Statistics

Mean	Variance	Std. Deviation	N of Items
21.10	23.463	4.844	15

#### INTERPRETATION OF RELIABILITY

#### Interpretation

By using SPSS (software version 29) the interpretation is of The Cronbach's Alpha of The Total Questionnaire and the responded is 0.772 it is accepted because it is greater than the 0.7 as per the test conditions.

0.772>0.7 Therefore the test for the questionnaire and respondent's is accepted.

#### Findings collected by questionnaire-

As per the Q.1, The male respondents are more as compare to female respondents. The percentage of male respondents is 60% and 40% of female respondents.

As per the Q.2, 59% of the male respondents & 39% female respondents are not aware about cross-cultural conceptual model.

As per the Q.3, 98% of the respondents are aware about cross-cultural training in the organization.

As per the Q.4, 74% respondents are Strongly Agreed on the statement cross-cultural training plays an important role in an organization and 19% respondents are Agree also.

As per the Q.5, 91% respondents said that Help to overcome personal biases, help to avoid preconceptions, helps to stop labelling people these benefits of Organizational cross-cultural training.

As per the Q.6, 93% respondents said that Training on social cross culture, the work of training on cross culture in effective management includes training on cross culture businesses, training on cross culture security, and training on cross culture remote.

As per the Q.7, 60% respondents are Strongly Agreed on the statement cross-cultural training have impact on the productivity of the organization and 30% of respondents are Agreed to the statement also.

As per the Q.8, 99% respondents said Cross-cultural training is essential for expatriate executives.

As per the Q.9,100% respondents said that cross-cultural training is beneficial for an organization.

As per the Q. 10, 87% respondents said that Increase the Productivity of the organization and 82% respondents are said that Increases the performance of the employee these are the The effects of cross-cultural training on organizational productivity.

As per the Q.11, 87% respondents said that Increases the performance, Ability to learn different cultural, Different Language Speak these are the benefits of Expat managers receive cross-cultural training.

As per the Q.12. 86% respondents said that Fitting In, Language Barrier, Being Lonely, Finance and Money management, Housing and safety these all are the Challenges faced by the expatriate managers if the Management does not give cross-cultural training.

- The Human Resource Management sector forms the study's perimeter.
- The study is bounded with the cross-cultural training and CC model.

#### Item-Total Statistic s

Gender	19.70	23.379	035	.786
What are the impacts of the cross-cultural training on the productivity of the organization?	19.40	21.516	.150	.786
What are benefits of cross- cultural training on the expatriate managers?	19.80	22.484	.120	.778
Challenges faced by the expatriate managers if the if the cross-cultural training is not provided by the management?	19.55	16.682	.584	.738
Are you aware about Cross Cultural Conceptual Model?	20.10	23.463	.000	.776

#### **CONCLUSION**

The majority of managers and employees, according to the survey, are not familiar with the "Cross-cultural competency model." Both management and staff are aware of the need of training on cross culture. Training on cross culture program is crucial for effective leadership. Cross-cultural training is an essential part of any effective management for management development. Also, this report offers suggestions for Indian firms on how to raise the CC of foreign managers.

#### **Managerial Implementation**

The legislative body may plan additional opportunities, awareness events, and campaigns inside the organization for the prosperous future of the organization by recognizing the role of unknown individuals.

#### **ABSTRACT**

Money aggregates are used to measure the amount of money in circulation within a nation or economy. This facilitates to measure the condition of the economy. It includes various components such as currency with the public, time deposit, demand deposit, reserve money, narrow money, broad money, other deposits with central bank and bank credit to various stakeholders. From the literature review it is found that very few numbers of researchers have attempted to study in this area and there is a gap of identifying the development of monetary aggregates in India from post liberalization to FY 2021-22. This study is conducted to analyze the development of monetary aggregates in Indian context. The duration for the study is considered from FY 1991-92 to FY 2021-22. Secondary data from various sources was collated for conducting the study which includes RBI reports, articles, journals etc. The result of the study shows that there is progressive increase in terms of money supply in the economy in all aspects of monetary aggregates. From the study it is found that, there has been a significant growth of monetary aggregates witnessed in the Indian economy during post liberalization.

KEYWORDS: Monetary aggregates, Demand deposit, Term deposit, Narrow money, Bank credit

#### INTRODUCTION

oney aggregates includes wide classifications that evaluate the money supply in an economy. In India, tags are assigned to standardization of monetary aggregates:

Broad Money (represented as M3) which is includes Narrow Money (represented as M1) and Time deposits with the Banking system. Whereas narrow money includes currency with public and demand deposits with the Banking system, any deposits with the Reserve Bank of India. M2 is the derived value from narrow money and post office savings deposits.

A monetary aggregate is a disciplined way of accounting for money, and they are used to measure the money supply in a national economy.

The monetary base is an aggregate that comprises total supply of currency in circulation and the stored portion of commercial bank reserves with the central bank. The Reserve Bank of India (RBI) uses money aggregates as a metric to know how the open-market operations affect to the economy.

#### Money Aggregates' Impact

Evaluating the monetary aggregates can facilitate required information on the financial stability and overall health of a country's economy. For example, monetary aggregates that grow too slowly may cause slow growth of nation's economy. If a high rate of inflation transpires, then central bank may be forced to stop the growth in the money supply or raise the interest rates.

It is observed that there has been given a less attention on the role of quantitative monetary aggregates in framing monetary policy (Rangarajan and Nachane 2021). The questions raised over the money multiplier mediated relationship between money supply and reserve money and debates over volatility in money velocity

www.isteonline.in Vol. 46 Special Issue, September, 2023 288

(Woodford 1998). The "Barnett Critique" "The role of reserve money in managing money supply through the money multiplier structure is back in the limelight, thus highlighting the liquidity channel of monetary policy." (Mohanty Deepak & A. K. Mitra, 1999) has done study on experience with monetary targeting in India in which they focused on stability of monetary policy.

#### **METHODOLOGY**

The objective of the study is to analyze the development of monetary aggregates of Indian economy between FY 1991-92 and FY 2021-22. This includes the analyzing the M1 and M3 aggregates and analyzing the bank credit disbursement in the economy. The secondary data was collected from the reports published by the Reserve Bank of India. Analytical type of research method was adopted to conduct the study.

#### **Objective of the Study**

• To analyze the development of money aggregates

from FY 1991-92 to FY 2021-22. The objective of study focuses on comparing the progress of currency with public and demand deposits with banks; to study the progression of broad money, narrow money and time deposits, and to measure the advancement of demand deposits and time deposits; to evaluate the growth of net bank credits to the Government and commercial sector

#### **Limitation of Study**

- Selected money aggregates are analyzed in the study.
- Reliability of data is purely dependent on the available secondary data as retrieved from various sources.
- The period of the study is limited from FY 1991-92 to FY 2021-22.

#### RESULT AND DISCUSSION

Table 1 shows the details values of Narrow Money M1 (Currency with public + Demand deposits with the Banking system and other deposits with RBI) from FY 1991-92 to FY 2021-22. The total amount of Currency with public was INR 24,407,163 Crore between FY 1991-92 and FY 2021-22. It has grown with a Compound Annual Growth Rate (CAGR) of 13.28%. The total amount of Demand Deposits with banks was INR 17,519,449 Crore between FY 1991-92 and FY 2021-22. It has grown with a CAGR of 12.80%. The total amount of other deposits with RBI was INR 300,889 Crore between FY 1991-92 and FY 2021-22. It was increased with a CAGR of 12.10%. The total amount of Narrow Money was INR 42,227,497 Crore between FY 1991-92 and FY 2021-22. It was increased with a CAGR of 13.06%.

Graph 1: Values of Currency with Public and Demand Deposits with Banks (FY 1991-2022)

Source: Author's Creation

Graph 1 displays the values of currency with public and demand deposits with banks from FY 1991-92 to FY

2021-22. It is observed that the movement of currency with public and demand deposits are moving together in a same pace until FY 2010-11 then onwards it is found that the gap is widened between them. It is also noticed that there was an opposite movement between them during FY 2017-18 due to the impact of demonetization.

Graph 4: Values of Demand Deposits and Time Deposits with Banks (FY 1991-2022)

Source: Author's Creation

Graph 4 depicts the values of demand deposits and time deposits with banks from FY 1991- 92 to FY 2021-22. It is noticed that both the values of demand deposits and time deposits with the banks was moving in a same pace until FY 1997-98 there after the gap between them started widening slowly until FY 2005-06. Later the gap between them was widened in increasing mode until FY 2021-22. This shows that people were keen to depositing their money in the form of time deposits. One of the reason could be the earning power per capita was increased continuously.

Table 2, includes the values of the net bank credit to the Government and commercial sector from FY 1991-92 to FY 2021-22. The net bank credit to the Government was INR 155,834 Crore during FY 1991-92 which rose to INR 6,035,944 Crore during FY 2021-22 which has increased with a CAGR rate of 12.32%. The net bank credit to the commercial sector was INR 175,716 Crore during FY 1991-92 which surged to INR 11,885,411 Crore during FY 2021-22, which has increased with a CAGR rate of 14.38%.

Graph 5 shows that values of net bank credit to the Government and commercial sector from FY 1991-92 to FY 2021-22. It is observed that until FY 2003-04 bank credits to both the Government and commercial sector was almost equal but there after the gap was widened between them and commercial sector got more bank credit than the Government. This shows that commercial sector has grown rapidly.

Graph 5: Values of Net Bank Credit to Govt and Commercial Sector (FY 1991-2022)

Source: Author's Creation

#### **CONCLUSION**

The result of the study shows that there is progressive increase in terms of money supply in the economy in all aspects of monetary aggregates. From the study it is found that, there has been a significant growth of monetary aggregates witnessed in the Indian economy during post liberalization. Impact of Global meltdown in 2008 and Demonetization 2016 was not severely affected on money supply in India. It is observed that although there was continuous growth in all aspects of monetary aggregates but GDP was not showing growth in same way. Hence this concludes that there is no strong correlation between monetary aggregates and GDP growth rates during the selected study period.

### Conceptualizing Green Performance in the Restaurant Industry: A Suggested Framework

#### **Jinty Dutta**

Research Scholar Department of Business Administration Tezpur University Sonitpur, Assam

#### Bijay Amgain

Assistant Professor Royal School of Commerce Royal Global University Betkuchi, Guwahati, Assam

#### **ABSTRACT**

Restaurants are generally considered to be one of the largest contributors to the hospitality industry in the 21st century. Contribution is more often measured in terms of profitability, innovation, and consumer satisfaction. Restaurant operations drive in a huge amount of energy in different forms and as such affects the environment adversely. The aim of this paper is to consider the restaurant business and theoretically construct a model with hypothetical relationships among certain sustainable indicators which lead to Innovation and Green Performance. The study considers several research papers consisting of different models illustrating restaurant sustainable indicators and attempts to develop a conceptual model. Presently this paper gives the reader a basic understanding of innovative sustainable practices by the restaurant business operating in Assam. The first level of this framework, which consists of three tiers, illustrates the sustainable restaurant indicators. The second level elucidates innovativeness as well as green performance and the last level elucidates the restaurants' financial and non-financial green performance. Further testing of the model can be carried out later to validate the hypothetical relationships in the model.

KEYWORDS: Sustainable indicators, Restaurant sustainability, Innovativeness, Green performance

#### INTRODUCTION

ustainable development is a holistic concept that explains the interdependence of humans as well as the natural environment. The primary goal of sustainable development is to advance civilization while intelligently utilizing the environment. The basic objective of the approach is to meet the demands of the present generation while preserving enough resources for future generations. There are several approaches to achieving sustainable development: A shift to renewable energy usage, wise usage of water, minimizing pollution, and reducing deforestation are some of the ways to name. Therefore, due to rising sustainability awareness among the various company stakeholders, maintaining a sustainable business is urgently necessary from a commercial perspective(Pipatprapa et al., 2017a). According to (Legrand et al., 2010) Sustainability is not a choice to be made as a strategy, but rather a business system infused with operations that have a lower impact on the environment, and enough resources are

preserved for future generations. Restaurant regardless of their size and range of operation is one the water, energy, material, and food product users (Legrand et al., 2010). Therefore, the concept of sustainable business is important to this sector. Every step of the food service process has a high financial and environmental cost that needs to be reconsidered, especially in light of the environmental aspect (sustainability is already there in the folder). Through the Literature review, it is evident that the concept of sustainability in the restaurant sector has not been discussed adequately (Legrand et al., 2010). Since this research paper focuses on the sustainability of the hospitality industry with special reference to the restaurant business, therefore certain criteria are selected to indicate the sustainable practices of the restaurants. The seven criteria of green performance as given by the Green Restaurant Association are Energy, Water, Waste, Disposal, Chemical, Building, and Food(Green Restaurant Association | Education Site, n.d.) form the basis of this research work. These

www.isteonline.in Vol. 46 Special Issue, September, 2023 294

criteria form the antecedents of the second level of the framework i.e., 'innovation,' and 'green performance.' A wider range of innovations, such as those in services, operations, management structures, and menu items, have not yet been the subject of studies in the context of restaurant enterprises(Hjalager, 2010). Due to resource constraints, small restaurants are unable to carry out innovations, because they perceive innovation as a cost as discussed by(Zeng et al., 2010), pollution prevention is considered as a cost to the firm. Hence, small changes i.e., adaptations or adoptions of improved processes and products will help to infuse sustainability in an innovative manner strategies for marketing.

#### LITERATURE REVIEW

#### **Sustainable Indicators**

"An indicator quantifies and simplifies phenomena and aids in our understanding of complex realities" (Pinter, 2013). Generally, to measure sustainable or sunstainable development, quantification is a necessary measure(Verma & Raghubanshi, 2018). Indicators act as reference points which allows us to monitor or evaluate something against that reference point as well it helps to quantify a phenomenon. There are 248 indicators developed by United Nations General Assembly at the UN Sustainable Development Summit, New York, September 2015 "Sustainable Development Goals". Some of the most frequent terms used as sustainable indicators: Energy Efficiency, Carbon footprint, Waste Disposal, and Reduce Plastic use (Banerjee et al., 2022). Sustainable indicators generally indicate how the business operates within an environment. It reflects the ethos of the company. Sustainability is generally discussed around three pillars: Social, Economic, and Environment(Legrand et al., 2010). As a result, there should be a complementary interaction between the environment, society, and restaurant operations at all stages, from development to profitability (Legrand et al., 2010). Sustainable Indicators are identified and framed in several research works. According to Legrand et al. (2010) the set of sustainable indicators that they framed consisted of (1) sitting, design, and construction; (2) furniture, fixtures, and fittings; (3) energy and waste; (4) corporate social responsibility; and (5) food and beverage. According to the National Restaurant Association's research, the eroding relationship between

the environment and people has a significant impact on Americans. Present-day consumers are quite aware of the adverse effect of certain unsustainable usage of elements in a restaurant, they can include food as the number one Indicator, followed by (NRA) Disposables, Water usage, and Energy consumption (The State of Restaurant Sustainability, 2018). A literature review on Restaurant Sustainability research suggests that there are some commonly used indicator terms that reflect how restaurants grow innovative while procuring or processing them in their operations. Some of them are summarised below-

- Food sourcing, procurement, processing, and disposal techniques that are sustainable (Baldwin et al., 2011; Legrand et al., 2010; Salzberg et al., 2019) According to Lang & Heasman (2004) the challenge in the goal of the food economy is to supply food. to the rising population despite maintaining ecological balance.
- Several studies have raised concerns about energy use in restaurants. Generally, these studies suggest innovative ways of efficiently procuring and using energy in a restaurant (Baldwin et al., 2011; Ham & Lee, 2011; Hotelier, 2007).
- Waste produces environmental issues such regarding landfills' impact on habitat, and Pollution of the land, water, and groundwater if it is not recycled or composted (Legrand et al., 2010). According to GRA, 77.9 million tons of municipal solid waste is composed of containers and packaging and 40% of the landfills are covered with waste papers
- Sustainable procuring and usage of water: According to Green Restaurants Association only provide water upon request and install low flow aerators and high-efficiency pre-rinse spray valves. Up to 2 litres of water in each glass might be saved by just providing water when requested.
- Chemicals: According to Green Restaurant Association restaurants can use biodiesel or electric cars for delivery and can buy non-toxic candle substitutes (such as LED, beeswax, or soy) to promote sustainable business.
- Buildings: Several studies suggested that environmentally friendly foodservice operations

needed construction design (exterior and interior architecture, interior details), management systems, and services, such as reducing resource usage, recycling, using recycled materials, composting, and waste auditing.

Several organizations operating on a global basis conduct audits and certifications to promote sustainable business operations. Some of such organizations are mentioned below:

Table: Associations/Organisations working on Sustainability

Sustainable Restaurant Association (SRA)	Non-profit, membership, UK-based organization that provides accreditation to encourage and recognize sustainable practices in the food service industry. It evaluates the impact across the three pillars: Sourcing, Society, and Environment	(Association, n.d.; Da Costa Maynard et al., 2020)
Green Restaurant Association (GRA)	It is a non-profit United State based organization that evaluates and certifies a restaurant based on 7 indicators	(Da Costa Maynard et al., 2020)
American Dietetic Association (ADA	It is one of the greatest groups of food and nutrition experts worldwide. Its primary goal is to improve the nutritional well-being of the public while conserving natural resources and ecological balance.	(Academy of Nutrition and Dietetics, 2022)
Green Seal Certifications (GSC)	It is a non-profit organization that strives to develop rigorous standards for health, sustainability, and product performance.	(Green Seal, n.d.)
National Restaurant Association (NRA)	It is a US-based education foundation that aims to empower people with requisite skills and training for a better future focusing on the restaurant business.	(National Restaurant Association Educational Foundation - Home, n.d.)
ISO 14000 family	This family generally deals with sustainable approaches toward the environment. ISO14001 deals with guidelines for environmental systems. ISO 14004 deals with the process of developing and maintaining an Environmental Management system.	(Da Costa Maynard et al., 2020), (ISO, 2023)

#### Innovativeness

Innovation is viewed as a crucial component, particularly in the service sector, to remain in a competitive climate. (Mohammed Sabah Kaabi et al., n.d.), which facilitates increased sources of productivity, financial performance, and profitability (Husnaini & Energy, 2021). From the previous literature, innovativeness can be divided into three sections. (i) process innovation, which includes the procedure, process, and activities that can bring positive change in the form of quality, capability, and productivity (ii) Knowledge and competency which the management can use as a tool to develop and to create new ideas in an organization (iii) organizational support, which is a significant tool to support the process and knowledge required to make the innovation (Husnaini & Energy, 2021). Previous research has shown that green restaurant management standards include three main categories (green meals, green

environment, and equipment, and green management and social responsibility), nine subcategories, and 81 indicators. In terms of sustainability, food production and consumption affect the world's greenhouse gas emissions among other things (Chou et al., 2016).

#### **Green Performance**

The performance of a business is generally measured in terms of its holistic and transparent approaches toward sustainable management(Hotelier, 2007). Fulfilling the sustainable environmental goals of an organization is all about performing green. Green Performance is more of a measurement than a concept. According to Yuan & Xiang (2018) initiating an operational change in the execution of business processes, be it a product or service's operation procedure results in green performance if the objective of the change is environmentally friendly. The intellectual foundation of CGP is found in Green Theory, which discusses the relationship between a

company's operations and the environment (Cancino et al., 2018). The term Green Theory is an umbrella term that encompasses concepts like Business Governance, Globalization, Social responsibility, Factors related to the environment, etc(Eckersley, 2007).

#### Financial performance/ Firm performance

Previous studies have shown that implementing green practices enables businesses to increase their financial performance in two ways: directly or indirectly, through decreases in daily operating expenses and, accordingly, increases in competitiveness (Perramon et al., 2014). By employing techniques for recycling waste and using water and energy more efficiently, a firm may strengthen its overall position in the market, improve its reputation, attract new "green" customers, further satisfy existing clients, and so on.(Chiu & Hsieh, 2016). Furthermore, the adoption of green practices results in a decrease in overall operational expenses which leads to firm financial performance(Zeng et al., 2010). When green practices are used, organizational effectiveness, occupational health and safety, and environmental performance all see an immediate and noticeable improvement(Bagur-Femenias et al., 2013). According to previous research,

Table: Literature review of model-based articles

there are two different types of indicators: operational performance and environmental condition. The former provides information on the environmental performance of an organization's operations, including the materials, energy, and services that support those operations. The latter provides information on the direct and indirect environmental impacts of those operations(Perramon et al., 2014).

#### RESEARCH METHODOLOGY

After the identification of a research theme, the researchers extracted data from various relevant sources, for example, Research Articles, Websites, and reports of certain organizations. In addition to studying the sustainable elements/indicators listed by the organisations, several model-based studies were reviewed and analysed.

Finally, the researchers with enough evidence of proven relationships among different constructs, propose a new model with relationships among the sustainable indicators, Innovation, Green Performance which is further measured through financial and non-financial performance Research Methodology:

Figure 1: The proposed framework

The relationship of these indicators with innovation is proposed based on several studies (Chiu & Hsieh, 2016; Da Costa Maynard et al., 2020; Pipatprapa et al., 2017b), the relationship of the indicators with Green Performance is proposed based on studies (Chiu & Hsieh, 2016; Xie et al., 2019; Zeng et al., 2010), The relationship between Innovation and Green Performance is proposed based on innovativeness, (Pipatprapa et al., 2017b; Xie et al., 2019), Green performance. The relationship between Green Performance with the last level of the framework i.e., financial, and non-financial performance is proposed based on R paper 4,(Jang et al., 2017; Zeng et al., 2010).

#### **CONCEPTUAL FRAMEWORK**

Green Process is all about organizations finding efficient and sustainable ways to reduce the consumption of natural resources in various production processes whereby raw material is converted to a value-added product(Ma et al., 2017). Before proposing the relationships, literature review has revealed that the association between green process innovation and a company's financial performance is mediated by green product innovation, while the relationship between green product innovation and financial performance is moderated by a firm's green image. (Xie et al., 2019).

Therefore, this paper proposes certain relationships that might be well-supported:

Proposition 1(a): There is a positive relationship between sustainable use of energy and Innovativeness. Restaurants grow more innovative as they seek out more sustainable methods of obtaining their energy.

Proposition 1(b): There is a positive relationship between

sustainable usage of energy and green performance. The more restaurants use energy in sustainable ways the more restaurant performs green.

Proposition 2(a): There is a positive relationship between efficient usage of water and innovativeness. Restaurants become more innovative as they make more conscious choices to use water wisely.

Proposition 2(b): there is a positive relationship between the efficient usage of water and Green Performance. The more effectively a restaurant uses water, the greener it becomes.

Restaurants might discover innovative, highly efficient technology like pre-rinse spray valves and low- flow aerators to help reduce water waste. (Green Restaurant, n.d.).

Proposition 3(a): There is a positive relationship between sustainable sourcing, locating and consumption of food by a restaurant, and innovativeness. The more innovative a restaurant is, the harder it works to discover sustainable methods for obtaining, storing, and consuming food.

Proposition 3(b): There is a positive relationship between sustainable sourcing, locating and consumption of food by a restaurant, and Green Performance. The more sustainably a restaurant sources locates and consumes food, the greener it becomes.

There are several environmentally friendly ways to eat at a restaurant. For instance, buying locally produced, regional, and certified foods, and including dishes like vegetarian or vegan fare that use less water (Green Restaurant, n.d.). According to

Hence the following propositions are hereby presented which may support the concept of sustainable ways of waste management, disposables, chemical usage, and construction of buildings.

Proposition 4(a): There is a positive relationship between the reduction of waste, reuse, and Innovativeness. Restaurants grow more innovative as they look for new ways to minimize and recycle garbage.

Proposition 4(b): There is a positive relationship between the reduction, reuse of waste, and green performance. The more restaurant tries to find sustainable ways of reducing and reusing waste, the more their performance becomes Green.

Utilizing a thorough recycling and composting product, and implementing reusable incentive products are some of the ways to curb waste and reuse them for sustainable performance (Green Restaurant, n.d.).

Proposition 5(a): There is a positive relationship between sustainable choices of using disposables and innovativeness. The more sustainable disposables and reusables options restaurants have, the more innovative ways they discover to use them.

Proposition 5(b): There is a positive relationship between Sustainable choices of using disposables and green performance. The more restaurants find choices of reusables and environmentally preferred disposable, the greener it performs.

Incorporating reusable options like coasters, Pan liners, Coffee filters, Dishware, Chlorine free products, etc. wherever possible will significantly reduce pollution and will make the restaurant processes greener (Green Restaurant, n.d.).

Proposition 6(a): There is a positive relationship between the reduction of chemicals and innovativeness. That is the more restaurants find ways to reduce chemicals and pollution, the more innovative it becomes.

Proposition 6(b): There is a positive relationship between the reduction of chemicals usage and green performance. The more the restaurant find ways to reduce the usage of chemicals the less is pollution, and the greener it performs.

Generally, restaurants use a lot of chemicals for cleaning and sanitizing. Therefore, incorporating non-toxic chemicals like Chafing fuels, Low VOC, or no VOC paints, using green-certified pest companies will significantly reduce the impact of pollution (Green Restaurant, n.d.).

Proposition 7(a): There is a positive relationship between the sustainable construction of a building and innovativeness. The more restaurant tries to find sustainable i.e., reusable or recycled raw materials in constructing the more innovative it becomes.

Proposition on 7(b): There is a positive relationship between the sustainable construction of a building and green performance. The more restaurant tries to find sustainable i.e., reusable or recycled raw materials in construction the greener it performs.

To curb construction material waste, reusing materials from construction sites or closed buildings as well as using renewable or recycled construction materials can be used in the process (Green Restaurant, n.d.).

Before proposing the final relationships, the literature reveals restaurants' environmental sustainability performance has a favourable impact on both their financial and non-financial performance. (Jang et al., 2017)

Proposition 8: There is a positive relationship between Innovativeness and Green Performance. Innovative ideas for a sustainable strategy led to Green Performance.

Proposition 9: Green Performance of a firm is contributed by non-financial and Financial Performance.

To enable future testing of the model, all the variables will be specified and operationalized in aggregate terms.

#### **CONCLUSION**

- Energy: When choosing raw materials and energy, the use of energy-efficient and environmentally friendly technology as well as the use of renewable resources are all taken into account..(Da Costa Maynard et al., 2020), Energy-efficient equipment (heating, cooling, and ventilation/cooking/lighting) Practise offsetting energy usage/renewable energy Reduction of energy use or gas use in generator (impact on financial performance) There are a few simple but efficient techniques to cut back on energy consumption. There are several techniques to reduce the consumption of traditional energy, such as using LED lights, Star appliances, occupancy sensors, strip curtains, and programmable thermostats (Green Restaurant, n.d.).
- Climate change and the imbalance ecosystem are constantly pushing the restaurant industry to adopt sustainable practices and as SDG 12 reflects or demands a broad range of actions from companies, decision-makers, and consumers to adopt sustainable practices hence This article tries

- to propose a model for sustainability measures in the hospitality industry, more specifically in the restaurant business.
- The checklist is easy to understand and implement in Indian Context with special reference to Northeast India

#### **Limitations and Future research aspects**

For testing the constructs, more literature as well as interviews with restaurant managers/owner needs to be conducted, which will help find variables that have practical implementation. Finally, this paper is hoped to serve as a basis for conducting a sustainability study in the restaurant business of Northeast India and guides future researchers in the field of sustainability studies.

### A Comprehensive Review of Counterfeit Luxury Branded Products (CLBP) in India

#### Nikhil Bangde

Assistant Professor S. B. Jain Institute of Technology, Mgmt. & Research, Nagpur

#### **Praveen Mustoor**

Professor School of Management Presidency University Bangalore

#### **ABSTRACT**

Counterfeit products- fake copies of the real thing, are frequently made with the intention of profiting from the greater quality of the mimicked good. Counterfeit market is affecting not only the companies in terms of loses of revenues and hampering of goodwill, but are also cheating government on tax and legal front, in short impacting economy at large. Among all counterfeit sold in India, one of the fastest rising categories in Indian market are the Counterfeit Luxury branded Products (CLBP). The paper addresses several research works on counterfeiting with a focus on luxury brand imitation in India and its current surge of popularity in the Indian market. A comprehensive review of counterfeiting of luxury goods is the aim of paper and also to review the factors that carry heavy weightage on demand in CLBP. The paper also touches briefly about supply side of counterfeiting.

**KEYWORDS:** Counterfeit, Luxury brands, Indian economy, Deceptive and non-deceptive Counterfeiting.

#### INTRODUCTION

ounterfeit Products are getting sold in absolute parallel manner in Indian markets now a days and is expanding on a magnanimous level and are being sold without any hiccups. World Trade Organization (WTO) defines product counterfeiting as: "Unauthorized representation of a registered trademark carried on goods identical or similar to goods for which the trademark is registered, with a view to deceiving the purchaser into believing that he/she is buying the original goods" (WTO, 2011). In these imitated products of packaging, spellings, fonts and sizes are duplicated on par with the original brand.

Products with trademarks that are identical to or nearly identical to those registered to another party and violate the rights of the trademark owners are considered counterfeits. (Bian and Moutinho, 2011).

In accordance with the survey conducted for gauging the spread of the counterfeit in Indian market, as much as 27% of customers are uninformed that items are fake at the time of buying, but 31% eagerly buy these counterfeit products. In FY 2019-20 Illicit goods trade

of ₹2.6 trillion happened in India affecting almost all sectors and also the nation, industry and consumers by large. (Anand S. 2023)

According to the Authentication Solution Providers' Association (ASPA) and CRISIL-"State Counterfeiting in India-2022" report, based independent research conducted among consumers and retailers concluded that 25-30 percent of the market is of counterfeited goods, which is way higher than general industry expectations. Most prevalently sold counterfeits include FMCG, apparel and agrochemical sectors  $(\sim 30\%)$ , followed by pharmaceutical, automotive, and consumer durables sectors (20-25%). With the strange part being the acceptance of consumers acknowledgement of presence of fake products in the markets which clocks at 89% and consumers compelled to purchase these products due to various reasons like sensitivity to desire to purchase luxury brands price, pressure amongst peers, demand-supply gap and social motivations. (Sarma D., 2023).

Product categories sold under counterfeiting as mentioned by ASPA & CRISIL includes fast moving

www.isteonline.in Vol. 46 Special Issue, September, 2023

consumer goods, consumer durables, pharma sector, electronics etc., but amongst these one of the fastest sold category is the apparel category where in counterfeits being sold are 31% thanks to the advent of luxury branded products sales that are particularly leaching on the growing youth population of the nation. Some of the statistics even suggest that luxury branded products counterfeit market is running parallel to the original products market and the movement is goods are huge, which is a concern for the economy of nation at large.

The quality of counterfeits that are related to luxury goods varies widely between them.:

- High-end counterfeits- Also known as "first copy" or replicas. These are the fake products, which are exceedingly hard for the average consumer to distinguish from the real thing. These are consequently more expensive as well.
- ii. Knock-offs- These are low-quality knockoffs that frequently stand out from the genuine article. The fact that these products are not the genuine article, which is typically significantly more expensive, and are known by consumers before they make a purchase.

Investopedia defines Luxury Product as something that is not essential for survival, it is highly valued in a culture or society. When a person's wealth or income rises, the demand for luxury products also rises. Usually, the percentage rise in luxury goods purchases is inversely correlated with income growth. Due to their high cost, wealthy people consume a disproportionate amount of luxury products. People who are not fortunate typically don't purchase luxury items because living expenditures take up a larger portion of their money. Luxury goods can be categorized as extravagant consumption, which is the act of buying something primarily or exclusively to flaunt one's wealth. (Kenton W., 2021)

Luxury brands are typically associated with highvalued and high-priced products. Four basic criteria are related with luxury brand: (1) a luxury brand always possesses an artistic content (2) Luxury brand design is a result craftsmanship (3) A luxury brand is known internationally (4) A luxury brand contains a unique, recognizable, individual design (Chevalier and

Mazzalovo, 2008). They are normally those products the products wherein mere use or display of them brings owner prestige. A surge in these counterfeit luxury branded products is witnessed not only due to the increased supply of them by the producers but mainly due to the buyers who are purchasing them knowingly. While buying luxury products, consumers give importance to the brand more than the product or products (Husic and Cicic, 2009). Despite the current desperate worldwide economic situation demand of luxury branded products is still going solid, with consumers willing to pay more to avail the benefits associated with luxury-branded products. As a result of social media influencers pushing websites that openly sell and advertise counterfeit luxury brands, India has developed into a thriving market for them. (Khosla, 2023). One of the highlighting points also has been the slow but steady improving quality of counterfeit products over the recent years, trying to get as near as possible to the real brand. This is largely due to the move of many retailers of luxury brands, in their quest to reduce production costs, towards the outsourcing of manure. (Phillips, 2005).

### RESEARCH METHODOLOGY & OBJECTIVE OF THE STUDY

With the counterfeit luxury branded products expanding its barbs over Indian markets as pointed by Authentication Solution Providers' Association (ASPA), it is more than desirable to have a base study for the further detailed studies down the line.

Focus of the study will be:

 To provide a conceptual overview about the counterfeit luxury branded products by relying on the data from secondary sources for understanding the problem better with in-depth research knowledge.

A lot of research has been put forth in for exploring the range of issues that are responsible for counterfeiting and usage of these luxury branded products. Literature provides enormous data and also various cases at different places. The wide usage of CLBP is clearly evident from the literature and hence paper considers this sourced information as a working data.

#### LITERATURE REVIEW

Many luxury enterprises throughout the world are increasingly coming under serious danger from the trade in counterfeit goods. Loss of sales revenue, harm to the brand image, and reputational damage are a few repercussions of counterfeiting on luxury enterprises (Berman, 2008). Among all counterfeit sold in India, one of the fastest rising categories in Indian market are the Counterfeit Luxury branded Products (CLBP). Plenty of researchers are exploring the various issues that is causing rise of counterfeit market. Despite the magnanimous amount of research that is happening, these luxury brands are unable to dissect a pin point solution to this ever-growing issue. The only thing that differs counterfeiting of luxury products from that of per say counterfeited pharmaceutical, electrical and automobile products is that they do not cause any physical harm to the consumer, but it surely does dent the luxury brand's image and its brand equity.

As per the literature that was studied, it is clear that comprehensive research on the topic can be broadly classified on the basis of two types: Demand side and Supply side. But in this study, we are largely going to focus on the consumer side i.e., the demand side of counterfeit luxury branded products and also deal in brief about the supply side.

#### **Evolving Indian Luxury Brand Market**

Nueno & Quelch (1998) outline luxury brands as those whose price to intangible and situational utility is high but whose functionality to price ratio is low. An increase in the population of rich class and upper middle class is proving out to be a boon for luxury brand industry in India. Adding to this the rise of disposable income, rising internet penetration leading to awareness about luxury brands and the growing youth population who are purchasing luxury brands are proving out to be the main drivers for the expansion of this industry. The size of the Indian luxury market is expected to reach about \$200 billion in 2030 from the current US \$30 billion. (Sharma R., 2021). Accelerated digital adoption and growing penetration in Tier 2 and smaller cities experiencing an economic recovery have been the main drivers of this growth. The most counterfeited categories in luxury brands include apparel which occupies the topmost echelon followed by shoes, watches, leather goods, and jewelry. (Abraham N., 2010).

#### **Deceptive vs Non-deceptive Counterfeit Products**

Buyers may purchase counterfeit goods either without realizing the underlying intellectual property violation (deceptive counterfeiting) or with full knowledge of the product's illegal status (non-deceptive counterfeiting). identify non-deceptive Consumers can quickly counterfeit goods by their price, quality, and place of sale, such as an expensive brand-name product sold by a street vendor for a very low price. On the other hand, deceptive counterfeits frequently match the genuine goods in terms of pricing and packaging but not quality. To uninformed customers who are tricked into risky and frequently fatal purchases, they are indistinguishable. Over time, counterfeits have become of higher quality, making it more challenging for customers to recognize them. The consumer's awareness, knowledge, and experience appear to influence the degree of deception. (Staake T., 2009)

#### **Legal Regulations**

In contrast to wealthy nations, India has a very restricted range of rules regarding counterfeiting. The IP Rights (Imported Goods) Enforcement Rules, 2007, the India Customs Act, 1962, and the Trademarks Act of 1999 are the only laws that are absolute. The Authority will notify the rights holder of any imported goods, which will be destroyed in front of the rights holder if determined to be false because counterfeit products are per se prohibited items under the Customs Act. (Deb A.,

2021). Reflecting the onus completely lying on supplier side but not on the buyers side, like in major countries of European Union wherein even purchasing and usage of counterfeit products especially those related to Luxury brand can invite legal proceedings against consumers.

#### Mix of factors leading to surge in CLBP

As normally depicted price/ economical factor i.e., low pricing of CLBP is not the only factor leading to rise of usage in India especially amongst youth, but it is the mix of various factors like Societal factors, Economic factors, Utility factors & Socialistic factor which is resulting in the exponential rise of sell in CLBP's. (Bangde N., 2023). Eisend M. and Guler P. (2006) came at the conclusion that consumers with greater incomes also purchase counterfeit goods, demonstrating that there are other factors besides price that contribute to the demand for counterfeit goods.

#### **Supply Side of Counterfeits**

Counterfeit market in India is being operated in a very systematic manner, like any other business and they are milking every possibility of money making. They mainly operate via Hub and Spoke system with big shots of Tier-I cities like Delhi, Mumbai, Hyderabad and Chennai serving as a Hub, and these supplying their counterfeited goods to vendors of Tier-II cities. Thus, building a network of individuals engaging in similar or activities related to it. If Heera Panna market of Mumbai is the fountainhead for the sale of high-quality counterfeit luxury branded products like watches and footwear, then Delhi's- Gaffar market is famous for counterfeit mobiles, Both Nehru Place and Kashmiri Gate are infamous for their counterfeit computer accessories and auto parts, respectively. While Chennai's Kasimedu Street and Burma Bazaar are recognized for counterfeit electronic equipment such as mobile phones, LCD TVs, imported cameras, etc., Hyderabad's Chenoy Trade Center and Hong Kong Bazaar are well-known for counterfeited computer hardware and software.. (Raj S., 2022)

#### **CONCLUSION**

The paper presents a comprehensive review on Counterfeit Luxury Branded Products (CLBP) in India, sketching an overview of its current market scenario in India and how it is affecting the Indian economy at large. The paper then discusses about various research work carried out in areas of counterfeiting and that too CLBP's in particular. Paper also focuses on the further need for study in CLBP due to increasing demand of them from customer's side for these products. The paper clearly stresses on the point that economic/ price related factor is not the only factor for consumers in purchase of CLBP, but other factors like societal, utility & socialistic are equally important.

### On-the-Job Training in Non-IT Companies in India: A Comprehensive Analysis

Sunita Gujar, Varun Dubey

Nikita Humane, Swati Goyal

Assistant Professor
S. B. Jain Institute of Technology, Management & Research
Nagpur

#### **ABSTRACT**

This research paper examines On-the-Job Training (OJT) in non-IT companies in India, providing a comprehensive analysis of its current state. The study aims to uncover the benefits, challenges, and effective strategies associated with OJT implementation in non-IT sectors. It also explores the impact of OJT on employee performance, job satisfaction, and organizational success. The findings enhance our understanding of OJT practices in non-IT sectors, offering insights for optimizing training programs and fostering a skilled workforce. This paper serves as a valuable resource for organizations, trainers, and policymakers seeking to enhance OJT practices in the Indian non-IT industry.

#### RESEARCH OBJECTIVES

- a) Explore training approaches, duration, and frequency of OJT programs in non-IT companies.
- b) Analyze resource allocation, trainer roles, and evaluation methods for assessing training effectiveness in OJT.
- c) Identify benefits of OJT in non-IT companies, such as skill enhancement, improved job performance, and employee retention.
- d) Investigate challenges faced by non-IT companies in implementing OJT programs and propose strategies for overcoming them.
- e) Examine the impact of OJT on employee performance, job satisfaction, and organizational success in non-IT companies.

#### RESEARCH QUESTIONS

- a) Prevailing approaches, duration, and frequency of OJT programs in non-IT companies in India.
- b) Resource allocation and the role of trainers in non-IT companies.
- c) Evaluation methods used to assess OJT effectiveness in non-IT companies.

- d) Benefits of OJT in non-IT companies and their impact on skill enhancement, job performance, and employee retention.
- e) Challenges faced by non-IT companies in implementing OJT programs and strategies to overcome them.
- f) Impact of OJT on employee performance, job satisfaction, and organizational success in non- IT companies in India.

#### **SCOPE AND LIMITATIONS**

This paper comprehensively analyzes OJT practices in non-IT companies in India, focusing on multiple sectors while acknowledging the absence of industry-specific details. The analysis relies on existing literature, empirical studies, and case studies. The scope is restricted to non-IT companies in India, excluding IT-related training practices. However, limitations such as sample size, data availability, and potential biases in self-reported information from respondents should be considered.

#### LITERATURE REVIEW

Conceptual Framework of On-the-Job Training: Here, a conceptual framework defines and describes

www.isteonline.in Vol. 46 Special Issue, September, 2023

OJT in non-IT companies, including key components, processes, and relevant theories.

Theoretical Perspectives on On-the-Job Training: This section explores theoretical foundations informing the design and implementation of OJT programs, drawing from theories such as adult learning, social learning, and cognitive apprenticeship.

Benefits of On-the-Job Training: Highlighting the advantages of OJT in non-IT companies, this section discusses skill enhancement, improved job performance, employee motivation, knowledge transfer, and organizational success. It also emphasizes the role of OJT in promoting continuous learning.

Challenges in Implementing On-the-Job Training: Identifying obstacles faced by non-IT companies, this section examines resource constraints, resistance to change, trainer expertise, and difficulties in measuring training effectiveness. It offers insights into unique challenges and potential barriers.

Strategies for Effective On-the-Job Training: Effective strategies for designing and implementing OJT programs are discussed, including job rotation, mentoring, simulation-based training, and creating a supportive learning environment. The section also explores the use of technology to enhance OJT.

Role of On-the-Job Training in Employee Performance and Job Satisfaction: Investigating the relationship between OJT, employee performance, and job satisfaction, this section explores how OJT improves competence, productivity, engagement, and career development. It further explores its impact on job satisfaction and overall organizational success.

#### RESEARCH METHODOLOGY

This research paper utilizes a qualitative research design to comprehensively analyze on-the-job training (OJT) in non-IT companies in India. The qualitative approach focuses on collecting and analyzing non-numerical data to gain a deep understanding of the subject matter.

**Research Design:** The research design solely incorporates qualitative components. Interviews and focus groups will be conducted with key stakeholders, including employees, trainers, and HR personnel, to gather rich and contextual insights into OJT practices.

**Sampling Technique:** Purposive sampling will be employed to select participants with direct experience in non-IT companies' OJT. This approach allows for the selection of individuals who can provide valuable insights and diverse perspectives. The sample will include employees from various non-IT companies across sectors and hierarchical levels.

**Sample Size:** The sample size will be determined by reaching data saturation, where new insights or themes no longer emerge. Approximately 100-150 participants are estimated to be sufficient to achieve saturation and capture a representative range of experiences and perspectives.

**Data Collection Methods:** Qualitative data will be collected through semi-structured interviews and focus group discussions. These methods will explore participants' experiences, perceptions, and challenges related to OJT in non-IT companies.

**Data Analysis Techniques:** Thematic analysis will be employed for qualitative data analysis, involving coding, categorizing, and interpreting data to identify patterns, themes, and commonalities. This will provide meaningful insights into the collected data.

# **Current State of On-the-Job Training in Non-IT Companies in India**

Overview of Non-IT Companies in India: This section discusses the size, diversity, and contributions of non-IT companies to the Indian economy. It explores the unique characteristics and challenges faced by these companies in implementing effective OJT programs.

Analysis of On-the-Job Training Practices: This section presents a detailed analysis of OJT practices in non-IT companies in India. It examines approaches, duration, and frequency of OJT programs, as well as the diverse training methods employed across sectors and organizational sizes.

**Duration, Frequency, and Approaches of On-the-Job Training:** This subsection focuses on the duration, frequency, and approaches used in OJT programs within non-IT companies. It explores the varying duration, frequency, and approaches, such as practical training, shadowing, and simulations.

Resources Allocated to On-the-Job Training: This

subsection explores the resources allocated to OJT programs in non-IT companies, including investments in trainers, materials, equipment, and infrastructure. It discusses challenges faced in resource allocation and strategies to optimize resource utilization.

Evaluation Methods for On-the-Job Training: This subsection discusses evaluation methods employed to assess the effectiveness of OJT in non-IT companies. It explores pre- and post- training assessments, on-the-job performance evaluations, employee feedback surveys, and supervisor assessments. The section highlights the importance of evaluating training outcomes and shares insights into evaluation challenges and best practices.

Benefits of On-the-Job Training in Non-IT Companies in India: This section explores the advantages of OJT in non-IT companies, emphasizing skill enhancement, improved job performance, employee retention and motivation, and fostering a learning culture within organizations.

# **Challenges in Implementing On-the-Job Training in Non-IT Companies in India**

Resource Constraints: Limited resources, including finances, infrastructure, and training facilities, pose challenges for non-IT companies. Allocating sufficient resources for training materials, equipment, and dedicated space is difficult. Finding innovative ways to optimize available resources and seeking external collaborations can help overcome these constraints.

Lack of Trainer Expertise: Finding trainers with the required technical knowledge and experience is challenging. Inadequate trainer expertise compromises training quality and outcomes. Addressing this challenge involves investing in trainer development, providing opportunities for skills enhancement, and promoting continuous learning.

**Resistance to Change:** Employees and management may resist OJT due to fear, workload concerns, or skepticism. Overcoming resistance requires effective communication, articulation of benefits, involving key stakeholders, and fostering a supportive organizational culture.

Measuring Training Effectiveness: Evaluating OJT programs is a challenge. Establishing evaluation

methods, relevant metrics, and allocating sufficient time and resources for assessments is difficult. Overcoming this challenge involves clear evaluation criteria, utilizing assessment tools, and integrating evaluation into training design.

### Strategies for Effective On-the-Job Training in Non-IT Companies in India

**Job Rotation:** Rotating employees across departments develops cross-functional skills, adaptability, and a holistic view of the organization.

Mentoring and Coaching: Pairing experienced employees with new hires facilitates knowledge transfer, skill development, and professional growth.

**Simulation-Based Training:** Creating realistic scenarios allows employees to practice skills in a safe environment, enhancing proficiency and confidence.

**Supportive Learning Environment:** Encouraging continuous learning, collaboration, and recognition of employee development efforts fosters engagement and a culture of improvement.

Leveraging Technology: Utilizing e-learning platforms, VR simulations, and gamified modules enhances accessibility, flexibility, and learner engagement.

# Impact of On-the-Job Training on Employee Performance and Job Satisfaction

Relationship between On-the-Job Training and Employee Performance: OJT enhances employee performance by providing job-specific skills, practical knowledge, and the ability to apply concepts to real work. It improves competencies, efficiency, productivity, and work quality, leading to meeting targets and organizational success.

Influence of On-the-Job Training on Job Satisfaction: OJT positively impacts job satisfaction by demonstrating organizational commitment to employee growth. Training reduces stress, enhances skills, and fosters a sense of accomplishment and personal growth. This satisfaction improves engagement, retention, and overall performance.

**Linking On-the-Job Training and Employee Engagement:** OJT enhances employee engagement by offering skill development, career advancement, and

personal growth opportunities. Engaged employees contribute their best efforts, driving innovation, improvement, and organizational success.

#### **SUMMARY OF FINDINGS**

- 1. Prevailing Approaches: OJT programs utilize job rotation, mentoring, coaching, and simulationbased training.
- 2. Duration and Frequency: OJT programs vary in duration, from short-term to long-term, and in frequency based on job requirements.
- Allocation: Resource constraints hinder OJT implementation, requiring innovative approaches to optimize resource utilization.
- 4. Trainer Expertise: Non-IT companies struggle to find trainers with necessary expertise, emphasizing the need for development programs.
- 5. Benefits of OJT: OJT enhances skills, job performance, retention, and motivation while fostering a learning culture.
- of 6. Challenges: Resource constraints, lack expertise, resistance to change, and evaluating training effectiveness are challenges faced in OJT implementation.

#### Implications and Recommendations for On-the-Job Training in Non-IT Companies in India

- 1. Optimizing Training Programs: Companies can tailor OJT programs based on prevailing approaches, benefits, and challenges.
- 2. Resource Management: Innovative approaches and collaborations can overcome resource constraints.
- 3. Trainer Development: Investing in trainer development programs addresses expertise gaps.
- 4. Cultivating a Learning Culture: Emphasizing continuous learning and knowledge sharing fosters a culture of skill enhancement and innovation.

#### Recommendations for improving OJT programs

- Assess Training Needs: Conduct thorough assessments to design targeted OJT programs.
- 2. Enhance Trainer Expertise: Provide development opportunities for trainers and keep them updated.

- 3. Utilize Technology: Incorporate simulation-based training and e-learning platforms for interactive learning experiences.
- Evaluate Training Effectiveness: Implement robust evaluation methods to measure impact and improve outcomes.

#### **Future Research Directions**

- Sector-Specific Analysis: Conduct industry-specific analyses for deeper insights into OJT practices.
- 2. Long-Term Impact of OJT: Investigate the longterm effects of OJT programs.

### Application of IoT in Logistics & Supply Chain Management

#### Shweta Pethe, Priyadarshani Keshtty

Pankaj Pethe

G H Raisoni College of Engineering Hingna, Nagpur G H Raisoni College of Commerce, Science and Tech. Mangalwari Campus, Sadar, Nagpur

#### **ABSTRACT**

The Technology boon to mankind or the next wave of Internet of things (IOT) & its development is growing incredibly with advancement in artificial intelligence(AI), new capabilities of sensing & auto-functioning, edge-computing process, accelerates towards the ability to maintain, develop & optimise. IOT is an emerging & revolutionary concept of social, technical & economic significance. IOT engages a broad set of ideologies that are interwined & at the same time complex enough from different perspectives. IOT-a technology embodied in a wide spectrum of networked sensors, products & system. With a combined advancement in interconnections of network, power computing & miniaturization of electronics to offer new opportunities that were previously not possible. Right from consumer goods & products, automobile industry, sensors & industrial & utility components to other various objects-all are combined with internet connectivity & powerful analytic data capabilities that promise to transform the way we dwell, play & work. The overview of this document is designed in a manner to help the Internet society community(ISC) navigate the dialogue surrounding the IOT in luminance of the predicting competition about its promise & perils.

KEYWORDS: Digitalisation, IOT in Logistics, SCM.

#### INTRODUCTION

oT converges the representation of wide range of connectivity & computing trends that have been evolving for many decades. Meanwhile at present, a huge range of industry sectors including home & consumer electronics, logistics, healthcare, retail management, automotive, supply chain management, engineering aspect & way beyond are considered for incorporating IOT technologies into their services, products, operation & systems.

"Digitalisation"-a most effective & powerful medium for firms facing challenges due to additional flow of goods & insufficient information flow for timely decision. Digitalisation aims to form a new society of information & communication technologies that detects, gathers & proceeds to distribute data through world wide telecommunication networks. The internet-spread of global competition, consumers demand, volatility of market imposes many challenges to firms & their supply chains system to propose new approach of value

creation. The phenomenon of IOT-led auto-functioning & digitalisation in logistics & supply chain has been in use for a while now. The demand & pressure in the areas of logistics is rapidly increasing resulting in IOT to become most important element in solving the issues of transport companies. Warehousing & management of inventories of a business are two of the essential parts of the corresponding logistics ecosystem. IOT sensors can be brought in use to monitor & track inventory & provides a full-fledge information that helps to predict future inventory needs. Inexpensive sensor will allow firms to carryout easy monitoring of condition & location of stock, track inventory & create a smart warehouse system. Therefore, IOT ensures safe storage of commodities, excludes loss & help us to find right product. On other hand, IOT is a booming technology & widely used to capture diverse traits & role in Supply Chain Management which includes inventory tracking, data sharing, collecting real time growth data from local vendors, quality monitoring logistic, exploring reverse logistics etc. to maximise revenue opportunities. The

www.isteonline.in Vol. 46 Special Issue, September, 2023

study, therefore visions to experience challenges & explore opportunities of IOT acceptance & use in logistic & supply chain management for better work-performance.

#### **METHODOLOGY**

The modelling & implementation of IOT in logistics gives us a instant & impactful result. It provides a opportunity to monitor the position of real time assets, people & packaging throughout all value chain using IOT. It is to be considered as a source or tool to ensure the smooth going of operations & increment of profit gains.

Accordingly, the supply chain management & inventories storage are also influenced by this trend. IOT in supply chain management has relied on Grounded Theory to start the process of researching with an open mind. A ground theory gives researchers to manipulate an open mind to discover various new ideas & concepts influenced by emerging patterns. It centres on the collection & analysis of information to carry opportunities for future propositions. Ground Theory also helps researchers to decode the human perception of supply chain management & illustrate the meaning of current human experiences, discussions & code of conduct to enhance relationships that constitute strategies & follow up actions of a particular company.

#### PROPOSED WORK

There are several parameters while choosing an application for logistics & supply chain management such as:

- Level of accuracy.
- Infrastructure.
- Total cost.
- Tag cost.
- Battery life of tag.
- System security.

In supply chain management (SCM), IOT devices are an effective means to monitor & locate product & dispatchment using Global Positioning System i.e. GPS & other various technologies. We can also track the products storage condition which improvises the quality management during the conduct of supply chain.

While in logistics, IOT offers more information resulting in managing assembly of remote assets, forecasting of traffic congestion, ensure cargo handling. Internet of things collaborated with technology blockchain consists of finished visibility of manufacturing & packages.

Fig 1. IoT in Supply Chain Management

# APPLICATION OF IOT IN SUPPLY CHAIN (SCM)

#### Tracking the location of goods

Storage containers are attached with IOT devices or to raw products/materials themselves & device will send its location, which then be detected by GPS in order to locate motion of goods.

# Monitoring & Judging of movement speed & arrival of Goods

Flow of products & speed movement monitoring enable us to predict movement of goods throughout SCM. Centres can prepare to receive collectables from retailers, distributors, manufacturers & suppliers, which minimizes the risk of handling & ensures efficient process of products.

#### Tracking of storage conditions for products/ materials

Certain goods like preservatives & staple foods need ideal storage condition. This makes quality monitoring easy & reduce spoilage. IOT devices can track atmosphere exposure, change in temperature, light intensity etc & trigger emergency alarm if breaching of threshold happens.

#### **Assembling Problematic motion of goods**

Locating goods & planning of route through IOT devices helps to detect & recognize upto when & where goods are procrastinated in transit. It allows the routes to speed up supply chain.

#### **Monitoring of Goods storage**

In a distribution centre, IOT devices remains connected with goods, which makes it easier to allocate products within a huge warehouse & assures accurate management of goods.

#### Quick administration of goods upon receipt

Checked & proceeded locating through IOT devices implies supply chain management can validate precisely arrival of goods. It boosts other tasks of administration such as pay-scale of supplier or dispatching requests.

Fig 1. IoT in Logistics

#### **APPLICATION OF IOT IN LOGISTICS:**

#### **Tracking of Route**

This solution is quite popular. It helps a logistic manager to trace the location of their vehicles/trucks in real time. With the help of Geofencing or GPS, the path taken by the trucks is also traced from farther locations which helps the companies to allocate driver actions & assures timely delivery.

#### Stock allocation & Warehousing

This type of solution facilitates the storage & management of inventories. It also facilitates the building up of smart warehouses which helps a firm to

avoid losses, assuring goods safety & tracking of items. It also helps revamping of operations of warehousing, which in turn reduces cost of labour & increases efficiency.

#### **IOT for Digital Bill of Lading**

Combining IOT with blockchain technology farms a digital Bill of Lading (BOL). BOL gives supply chain a new transparency, which enables a company to locate the transportation of shipped products. In this solution GPS trackers & sensors plays a vital role.

#### Delivery by using Drone based technology

Using Drones for delivering of products is a new technology adopted by firms. Implementation & application of drones in IOT assures execution of autofunctioning & instant goods delivery.

#### Prevention or Avoidance of Breakdown:

Applications of IOT not only helps us in tracking or management of assets, but also helps to identify barriers that cam breakdown assets. It helps firms to reduce downtime risks which results in timely delivery operations & execution. This enables companies to exercise decision-making process & provide inspection strategies.

#### **Auto-Functioning Cars**

This type of solution requires a blend of Artificial Intelligence(AI) & Machine Learning by connected infrastructures in IOT. Here, information responding to different shipment parameters are observed & proceeded to explore smart routes of driving & directions.

#### **CONCLUSION**

The worldwide connected logistics market is highly booming & additional to it, new technologies adopted by companies prove to be beneficial for managing supply chain management & system of distribution. Using IOT applications in logistics & supply chain management is emerging at an incredible rate. By using these solutions, it becomes easy for a firm/business to gather & process data to form valuable insights, which encourages the mobility as well as speed for conveying of goods. IOT in logistics & SCM creates new platforms & opportunities for existing real time aspects. IOT researchers are continuously working on different solutions of IOT to

### Application of IoT in Logistics & Supply Chain Management

Pethe, et al

expand the technology on commercial scale to benefit the mankind to the possible level.

#### **ABSTRACT**

India is one of the major developing countries in the world. Agriculture plays a major contributor role in the development of India. Resource development against the contributing sectors is always carried out through their research. Cattle are used for various activities in daily life in Indian farming and cattle carriers. Indian society culture develops relational and emotional attachment with cattle. The aim of this article is to review research work carried out on cattle transportation also highlight different issues that occurred in Indian cattle transportation. This review highlights the research on cattle transport around the world and the Indian continent. Also this paper tries to find a need and the scope for technological development in cattle transport issue in India. From this review research, it can be concluded that after having governing laws in India, accidental life damage through cattle transportation was caused due to the non-availability of safe cattle transport facilities. The review study shows that transport cost, the quantity of transportation, breed development, diseases transferred, animal behaviour and stress development etc. considered as main objectives for research by researchers. Indian continental needs for cattle transportation differ from the developed countries like America, Europe, and Australia. New safe transportation facility development consider as one of the scope for new areas in research. Safe transport facility affects not only on the safe transportation of cattle but also on issues like road accidents, disease transfer, cattle life and behaviour.

**KEYWORDS:** Cattle transportation, Resource facility development, Issues in cattle transportation.

#### INTRODUCTION

attle transport is major issue in the rural side of India may because of the non availability of safe transport facility and peoples view towards the safety and animal life. In transport animals injuries, diseases transfer, accidents and death cases in India are very high. As per the governmental accidental reports and findings it shows that the major issue of safety during cattle transportation in Indian scenario is present.

#### **INDIAN SCENARIO**

Cattles death during transportation and on transport accidental issues is around 6 % [36]. Major reasons of accidents are due to non availability of separate facility for cattle transportation. The research problem is practically faced by users of society. Life of cattle's and

accidental damage can be minimized by the outcomes we expected from the project.

Major accidental damage, injuries and death of cattle's are due to non availability of safe cattle transport facility. As per the current status less work was found on said issue of rural India. Need of cattle transportations in developed countries and developing countries like India are different [25].

The study on cattle transport in foreign countries is not that much beneficiary because of change in requirement of users in Indian continents.

After survey of main beneficiaries like farmers, veterinary support, milk producers and cattle transports it is observed that practical issues were found because of non availability of technical facility solution for cattle transportation in transport vehicle.

www.isteonline.in Vol. 46 Special Issue, September, 2023

In cattle transportation main problem observes are,

- More Road Accidents during transportation
- Non proper handling of Cattles during transportation
- In transport Cattle safety issue
- Lack of Loading and unloading adjustment
- Lack of Transport Facility available in vehicles
- Carry much more than sanctioned numbers by transporter.
- Lack of transport rule awareness
- View towards the life of cattle's.

In India around 6180 accidents out off 4,80,652 are due to animal transport on road and during accident injured and killed percentage is up to 3%. In India around 11% animals injured and killed during the transport [36].

As per the reviewed literature it found that many of the research in international platform on quantity based transportation, improvement in vehicle facility, separate vehicle design, diseases transfer issues, breed improvement, milk and beef quality improvement.

The research not majorly fit for the Indian continental issues. Indian continental research is mostly towards breed improvement, preservation, deceases, handling but not on the technical facility solution towards the cattle transportation.

#### **CATTLE TRANSPORTATION**

#### An effect of transportation on cattles

Stress developed during cattle transportation by road and transport consideration during veterinary support for farm animals affect on life saving [25]. Transportation and handling affects on both physical and psychological stress development on cattle. Various remedial strategies like preconditioning, administration of vitamins, vaccines, feeding high-energy diets, and electrolyte therapy suggested decreasing cattle response to transportation stress [19].

Transportation and the occurrence of the bovine respiratory disease complex relational factors highlighted and suggested release from the bone marrow, a decrease in neutrophil margination by proper transportation [7]. Significant stress can be developed

by road transport in cattle. During the transportation mainly thermal stress producing factors is more among the main stresses. Inside the temperature increment, as could be expected from theory, increased with reduced ventilation and increased animal density [48].

On transport cattle's reacting differently. Adapt transport schemes to the needs of the animals. Appropriate feeding regimes develop for long distance transportation. Loading and unloading stresses in staging posts (injuries, infectious diseases) [17]. The effect of the space between the withers and the compartment ceiling on freedom of movement affect on stress development in cattle's during transportation. Study based on biochemical, physical and behavioral measurements during commercial transports [28].

Study of accidents characteristics, the animals involved and injuries to humans from reports about livestock vehicle accidents in Spain highlighted with characteristics of livestock vehicle accidents vary according to species. Fatigue developed due to poorly designed route plans, intense workdays or high pressure levels from companies on transportation [11].

Interrelation between culture, social with political and religious factors that led to the phenomenon of the sacred cow, a restriction on slaughters and the advancement in the new designed gaushalas also on the animal's life consideration during transportation need of safety [23].

Table 1 shows the primary and secondary objective considerations by researchers. The researchers mostly concentrate on cost, health deceases and behavioral aspects. Transportation facility development and consideration, researchers mostly consider for large quantity base transportation. As a users difference the need of cattle transportation in India also differ.

Table 1. Primary and secondary objective consideration

#### **Indian Continental cattle transport**

Indian continental issues during cattle transportation problem and the need also get highlighted which impact on the transportation and breed species development [20] [10]. Cattle transportation safety, economical issue, production of milk and decease transfer during transportation main concerns in Indian continents and the improvement in transport facility affect on issues. [39], [26], [34].

The feeding habitats impact on behavior of cattles and transportation also a consideration for improvement impact [30]. Contagious decease infection are due to non proper handling of cattles during transportation impact more and effect on cattles life [27].

The transport of young calves from producer of cow calf to cattle carrier or seller is a general concern for the cattle market because of its negative documented impact on the cattle welfare, health and performance [33]. Proper management of cattles during the handling, transportation will result positively on milk production, breeding and health [42].

Figure 1 shows the graph on objective based literature reviews of 58 papers were most of work on cost of transportation, animal behaviour, health deceases are found. The transportation issues in consideration of Indian continents are not found addressed through researchers. This research proposal targeted same gap with said aims and objectives. In the graph horizontal axis represents the objective function and vertical axis number of researchers. The graphical plot for the primary and secondary objective consideration by the researchers is represented. Cost and animal behavior science has given more weight as a primarily objective and the transport facility design and safety has less.

Preliminary results of a compromised cattle benchmarking project has released by cattle transport Alberta Farm Animal Care, the condition of animals arriving at auction markets, a federal meat plant and provincial abattoirs and were evaluated for a year.

Figure 1: Graph showing objective based literature review

Agriculture Canada researcher Karen Schwartzkopf-Genswein at Lethbridge Research Centre, studies the cattles behavior and fitment during the transportation to auction or slaughter[39]. Countries like Germany, Europe, Australia, Russia works on facility development as a quantity base, milk and beef quality improvement.

Figure 1 shows the objective based research graph. Which shows that the safe transport is area were much less work in Indian scenario on cattle transport issues was found. However, there are definite areas for improvement and scope to work on technical safe facility development for current users.

#### **CONCLUSION**

From this review research, it can be concluded that after having governing laws in India, accidental life damage through cattle transportation caused due to non availability of safe cattle transport facility. Review study shows that transport cost, quantity of transportation, breed development, deceases transferred, animal behavior and stress development etc. considered as main objectives for research by researchers. Indian continental needs for cattle transportation differ than the developed countries like America, Europe, and Australia. New safe transportation facility development consider as one of the scope for new area in research. Safe transport facility affects not only on safe transportation of cattle's but also on issues like road accident, decease transfer, cattle's life and behavior. Review shows that technological development of safe and chipper solution on cattle transportation with development of special adjustment like flexible adjusted cage in consideration

of current transport vehicles of Indian continents will be a future scope for researchers. Design of special transport vehicle with safe loading and unloading adjustment is also a need observed by this review.

#### **ABSTRACT**

Cold storage system integrates a refrigeration system and maintained designed indoor conditions required to store product or products over specified period of time. Cold storage systems runs on both VARS & VCRS systems (1). High Power consumption is the major issue in case of Cold storage. So there is a need to employ certain techniques to reduce power consumption. Energy conservation potential depends upon system design, Methods of operation, certain techniques used to save energy. This paper discussed different techniques used to develop & design energy efficient cold storage system. Cold storage system integrated with solar system, Use of different phase change material (2) etc.

KEYWORDS: Cold storage, Energy consumption, Solar energy, PCM.

#### INTRODUCTION

retities of fruits & vegetables depends on different climate conditions, type of soil. Every product has certain life period so most important task is to preserve the perishable commodities of food items for longer period without changing of the original flavour & taste. By refrigeration process heat is removed from products which are to be stored for long duration, results in slow down decay and natural metabolic processes within products. Cold store consumes large amount of electric energy every year. So there is a need to find out energy conservative techniques to minimize running cost of the system. Use of renewable energy sources for power generation are best technique to reduce running cost.

How Energy Conservation is possible by reducing the heat load for cold storage system

i. Orientation and building form:- As India stands

- closure to the equator with the tropic of cancer so heat enters from Eastern and Western direction. So E-W walls should have good shading. Surface to volume ratio should be less
- ii. Design of Building:- If roof is exposed to sun then it will increase heat load so roof must be insulated by undertake insulation.
- iii. Heat generated by electric appliances: As Tube light adds heat, natural light should be used, Natural light should not be directly exposed from sun.
- iv. Insulation: Insulating panels to walls & ceiling supported from structure.

#### LITERATURE SURVEY

Yang et al.(3) studied the application of latent heat storage in a refrigerated warehouses integrated with latent heat cold storage system. Daily power consumption of refrigerated ware house measured by experiment also temperature distribution and heat transfer characteristics in a refrigerated warehouse simulated and analyzed found out by technique that there was energy and cost saving.

Lin et al.(4) reviewed PCM integrated with solar energy running cold storage system. Identified performance of Air conditioning system using solar energy for power generation & PCM Material as energy storage. Author reviewed different types of air conditioning system running on solar power and compared system progress with simple systems.

Butala et al.(5) experimentally investigated total save in energy with PCM for cold storages, conducted experiment by using paraffin as a phase change material to supply cool air during night time concluded that proper PCM is most important for free cooling.

Bharj et al.(6) investigated Energy efficient solar cold storages with hybrid system as power generation source in remote areas. Author presented photovoltaic solar energy processing with application in the DC inverter technique used in hybrid cold storage air conditioning areas. Concluded that the combination of PVT system is the way to improve using of energy efficiency.

Manish Rathod (7) studied on phase change material and their applications reviewed thermal properties like stability for various groups of Phase Change Material for very less temperature applications and found from the result that most studied PCM were those whose melting point temperature was in the range of  $40^{\circ}$  C –  $60^{\circ}$ C and latent heat of fusion in the range 150 - 225 KJ/KG. After deep research, researchers found out that most of sodium hydrates had melting point neat  $20^{\circ}$  to  $30^{\circ}$ C.

Basu et al.(8) Designed & analysed Solar Photovoltaic power generation system to stock potatoes at  $10^{\circ}$ C. The system was integrated with water lithium bromide absorption system. It was concluded that 165 modules of pm-150 in parallel with 50 number of FPC's power cold storage system successfully on yearly basis. Integrated power system had provided net energy annual surplus of 36MW hr over calendar year.

Sarbu et al.(9) studied different thermal energy storage techniques. The most important technologies were associated with sensible and latent heat storage systems.

The various methods of TES such as Underground thermal energy storage (UTES) which uses soil, sand, rocks etc for both heat and cold energy storage. Packed bed storage system (PBS) uses beds of loosely packed particulate materials as rocks, pebbles. To add or remove energy air was circulated over bed, Phase change material storage system PCM material absorbed or released latent heat converting from solid - liquid - gas vice versa. PCM material is used in cold storage plant having operating temperature range (7°C to 15°C).

The classification of PCM as -

Fig 1. Classification of PCM

Properties of different PCMs

**Table 1. Properties of PCM** 

PCM	Melting	Melting Enthalpy	Density (g/ m³)		
Ice	0	333	0.92		
Na – acetate-	58	250	1.30		
Paraffin	-5-120	150-240	0.77		
Erytritol	118	340	1.30		

By studying overall phase change material it is concluded that salt hydrates which has high temperature range was most preferred PCM for building applications.

Table 2. Types of PCM

PCM Type	Name	Melting tempera- ture (0C)	Latent Heat of Fusion (kJ/kg)	Company
Hydra-	Freezer	-16	330	TEAP PCM
ted salts	salt	4	105	
-eutectic	Preser-	7	135	
PCM	vation	7	300	
		10	170	
		15	175	

Hydra-	S15	15	160	
ted Salts	S10	13	160	
	S10	10	155	
	S8	8	150

Aniruddha et al.(10) designed and developed low cost based solar cold system for farmers which uses photovoltaic panels for power generation, PV panels was installed on roof of cold storage also to supply power during night time's battery bank and Local electricity was used. The proposed system was compared with conventional system and found that proposed system was cost effective based on yearly performance.

Yogesh et al.(11) Designed & developed cold storage having storing capacity of 10 Tons. To reduce running cost of cold storage system and to save energy HS01 PCM was used. PCM refrigerated truck chamber was designed so that effective use of PCM could be done.

Mishra et al.(12) Designed and developed solar operated cold storage which uses Solar Polycrystalline PV Panels, 2 ton Split AC, Batteries, Inverter, sensor etc. Cold room having storing temperature of 6.880 C and Relative Humidity 95 %, to store 10 tons of different variety of products. It was found that designed cost system was very effective as compared to same capacity of conventional cold storage system; total saving for formers for a year was calculated as \$ 7449.

#### RESEARCH GAP

- As the Installation and Running cost of cold storage system is very high so it is not affordable to common farmers.
- If running cost of cold storage is reduced by using alternate methods of power generation then group of farmers combinable can store their products and can sell during peak period. Which ultimately increase in economic gain of farmers.

#### **CONCLUSION**

- To save energy in cold chain system most of the researchers used solar energy as a source of power generation which used both Polycrystalline and Môn crystalline panels. During night time or cloudy days power was supplied through battery backup, some of the researchers used different PCM for cooling effect.
- It is found that the system using Alternative source of energies for power generation & to run cold storage plant is the cost effective method as compared to conventional cold storage systems.

#### **FUTURE SCOPE**

 By applying other alternatives methods to use renewable energy such as Biogas, Biomass for power generation, we can reduce installation cost & running cost of cold storages. Which tends economic growth of farmers.

#### **ABSTRACT**

The injection molding process is in progress for the last 10 decades. It is the molding process in which metal melts and by adding non-metals, polymers, and resins which are heated by external heating appliances and then injects into a mold to form the required product as the mold reaches environmental temperature. In injection molding, different types of materials are used to prepare products. As per the requirement and problems, many types of injection molding processes are developed. Injection molding is used in various fields, from daily purposes to the parts and equipment which are used in aerospace, automobile, industry, and farming fields. Injection molding is still facing many problems so reduce this need continuous research and development in injection molding. A review is done on Non-metals and problems faced while injection molding.

**KEYWORDS:** Non-metals, Injection molding, Parameters of molding.

#### INTRODUCTION

he injection molding process involves several important factors that must be carefully maintained to produce high-quality products. These parameters include injection pressure, injection speed, melt temperature, mold temperature, cooling time, and holding pressure and time. In addition, the design of the mold is crucial to ensure the proper filling and ejection of the product.

One of the advantages of injection molding is its high production efficiency. Once the mold is designed and the process parameters are optimized, the injection molding machine can produce a large number of identical parts in a relatively short amount of time. This makes injection molding an attractive option for mass production.

However, injection molding also has some disadvantages. The initial cost of designing and manufacturing a mold can be expensive, and the process may not be cost-effective for producing small quantities of parts. In

addition, the process can generate significant amounts of waste material, and the disposal of this waste can be a challenge.

Overall, injection molding technology is an important and widely used method of industrial processing that offers numerous benefits for the production of plastic products. As technology continues to advance, it is likely that injection molding will become even more versatile and efficient in the future.

Injection molding machine:- The injection system is responsible for melting and injecting the raw material into the mold. It consists of the injection unit, which includes the barrel, the screw or plunger, and the nozzle. The barrel is heated to melt the raw material, while the screw or plunger conveys and compresses the molten material into the mold. The nozzle controls the flow of the molten material into the mold.

The mold clamping mechanism is responsible for holding the two halves of the mold together during the injection process. It consists of the mold platen, which is fixed to the injection machine, and the movable mold platen, which is attached to the mold. The mold is opened and closed by a hydraulic cylinder, which is controlled by the hydraulic system.

The hydraulic system provides the power to operate the mold clamping mechanism and the injection system. It consists of a hydraulic pump, hydraulic valves, and hydraulic cylinders. The pump pressurizes the hydraulic fluid, which is then directed to the cylinders to control the movement of the mold and the injection unit.

The electrical control system is responsible for controlling the operation of the injection machine. It consists of a control panel, which includes a programmable logic controller (PLC), and other electrical components such as motors, sensors, and switches. The PLC controls the sequence of the injection process, including the temperature of the barrel and the mold, the injection speed, and the pressure.

#### The procedure of Injection molding

There are two types of injection molding technology: precision and conventional. Precision injection molding is better than conventional injection molding because it can control the process more accurately and produce products that are more consistent in size and quality. Researchers have studied factors like design, process, and materials to improve precision injection molding. Other researchers used simulation software for large-size products. They successfully predicted and corrected any problems with the mold design.

Fig.1. Types of Precision Molding

Fig.2. Procedure of Precision Molding

Multi-material injection molding is an advanced technique that allows the production of complex parts with multiple materials. This technique enables the combination of different materials and their unique properties to create a final product with superior performance characteristics. Injection compression molding is a key method used in multi-material injection molding. These advantages of multi-material injection molding ensure that the performance of the product is guaranteed, making it an ideal method for producing high- quality, complex parts with multiple materials.

Fig.4. Technical Specification of Injection Molding

Second injection molding, also known as two-shot injection molding, is a process that involves injecting two different polymers in an order. These polymers are chemically and rheological compatible, and the resulting products offer special properties not found in traditional single resin injection molded products. The secondary injection molding technology is a promising method for reducing production costs and promoting ecological sustainability through the use of recyclable materials. Second injection molding technology has since evolved and is widely used in the production of a variety of products that require multiple materials with distinct properties. This technique has proven to be a reliable and efficient method for creating high-quality, multi-material products with unique performance characteristics.

Parameters:- Injection pressure, material temp, holding time, mold temperature. Conventional Injection molding machine:-

Fig.5. Procedure of Injection Molding

Fig.6. Industrial molding Machine

Conventional injection molding machines use a reciprocating screw to melt and inject the material into the mold. The basic parameters of a conventional injection molding machine are as follows:

Clamping Force: This is the force applied to the mold to keep it closed during the injection process. The clamping force is determined by the size and shape of the mold, the material being used, and the required part strength.

Injection Pressure: This is the pressure at which the molten material is injected into the mold. The injection pressure is determined by the material being used, the part geometry, and the desired part strength.

Injection Speed: This is the speed at which the molten material is injected into the mold. The injection speed is determined by the material being used, the part geometry, and the desired part strength.

Injection Time: This is the amount of time it takes for the material to be injected into the mold. The injection time is determined by the material being used, the part geometry, and the desired part strength. Cooling Time: This is the amount of time the part spends in the mold to cool and solidify. The cooling time is determined by the material being used, the part geometry, and the desired part strength.

The working of a conventional injection molding machine is as follows:

Material Preparation: The material is first prepared by heating it to its melting point and then loading it into the machine's hopper.

Injection: The material is then fed into the injection unit of the machine, where it is melted by a reciprocating screw and injected into the mold under high pressure.

Cooling: Once the material has been injected into the mold, it is allowed to cool and solidify in the mold cavity.

Ejection: After the part has cooled and solidified, the mold is opened, and the part is ejected from the mold.

Repeat: The process is then repeated to produce additional parts.

Traditional injection molding machines are typically made up of several main components, including a hopper, a heating cylinder, a screw or plunger, a mold, and a clamping mechanism. The hopper holds the plastic pellets or granules, which are fed into the heating cylinder. Inside the cylinder, the plastic is heated to a temperature that allows it to melt and become fluid.

The screw or plunger is then used to move the molten plastic from the heating cylinder into the mold cavity. The mold is typically made of two halves, which are joined together by the clamping mechanism. Once the plastic is injected into the mold cavity, it cools and solidifies to form the desired shape.

Here are some important parameters that are commonly used in traditional injection molding machines:

Injection Pressure: This is the pressure used to inject the molten plastic into the mold cavity. It is typically measured in PSI.

Injection Speed: This is the speed at which the plastic is injected into the mold cavity. It is typically measured in millimeters per second (mm/s).

Clamping Force: This is the force required to hold the two halves of the mold together during the injection molding process. It is typically measured in tons or kilonewtons (kN).

Cooling Time: This is the amount of time required for the plastic to cool and solidify inside the mold cavity. It is typically measured in seconds.

Cycle Time: This is the total amount of time required to complete one injection molding cycle, It is typically measured in seconds.

Fig.7. Industrial View of Molding

#### LITERATURE REVIEW

The runner pressure and cavity pressure within an injection mold are related to each other as they are part of the same system. The runner pressure is the pressure in the channel that leads melted plastic from the injection molding machine to the mold cavity. The cavity pressure is the pressure inside the mold cavity where the plastic is being molded into the desired shape. The runner pressure influences the cavity pressure, and the cavity pressure affects the filling and packing of the melted plastic. The pressure difference between the runner and cavity is also important for controlling the flow of melted plastic and ensuring consistent filling and solidification. A proper correlation between runner and cavity pressure is crucial for ensuring high-quality, consistent, and efficient injection molding.(1)

The paper focuses on the runner pressure and cavity pressure within an injection mold are related to each other as they are part of the same system. The runner pressure is the pressure in the channel that leads melted plastic from the injection molding machine to the mold cavity. The cavity pressure is the pressure inside the mold cavity where the plastic is being molded into the desired shape. The runner pressure influences the cavity

pressure, and the cavity pressure affects the filling and packing of the melted plastic. The pressure difference between the runner and cavity is also important for controlling the flow of melted plastic and ensuring consistent filling and solidification. A proper correlation between runner and cavity pressure is crucial for ensuring high-quality, consistent, and efficient injection molding. (2)

Response surface methodology is a statistical approach used to model the relationship between process parameters and the output response of a process. In this study, RSM is used to determine the injection molding process window for lens form accuracy. The process parameters are varied and the resulting lens form accuracy is measured. This information is used to construct a mathematical model that can predict the form accuracy of lenses as a function of the process parameters. The RSM model is then used to identify the optimal process window that maximizes lens form accuracy.(3)

This article focuses on the use of artificial neural networks (ANNs) to predict fiber orientation in long fiber compression molded composite materials. The goal of the study is to develop a model that can accurately predict fiber orientation based on the processing conditions of compression molding, such as temperature, pressure, and time. They use response surface methodology and ANNs to build the model, which is then validated using experimental data. The results of the study show that ANNs can effectively predict fiber orientation in long fiber compression molded composite materials and can be useful in optimizing the compression molding process.(4)

The study of the phenomenon of birefringence in polymers when subjected to the injection-compression molding process. Birefringence occurs when the refractive index of a material varies in different directions and causes polarized light to split into two different rays. The study aims to understand the effects of injection-compression molding parameters on the birefringence of amorphous polymers. This study involves both simulation and experimentation to validate the results.(5)

The study focuses on modeling and evaluating the filling stage of the injection/compression molding

process. The aim is to understand and analyze the flow of polymer melt in the mold cavity and how it affects the final part quality. The filling stage is a crucial step in the injection molding process and has a significant impact on the part quality and dimensional accuracy. A numerical simulation approach using computer-aided design and engineering software can help in predicting the flow behavior of polymer melt during the filling stage and in optimizing the process parameters for a better quality of the molded part.(6)

This paper focuses on the ductility and tensile properties of blends of low-density polypropylene and polyethylene. The results show that the blends exhibit a range of properties that depend on the composition and processing condition, with some blends showing improved ductility and tensile strength compared to the individual polymers. The blends may be useful in applications such as blown film, injection molding, and extrusion.(7)

In this paper, research is done on the feasibility of a sequential injection process for metal co-injection process parameters, including the holding time, melt temperature, and injection speed on the quality and properties of the molded parts are evaluated. The results suggest that the sequential injection process can effectively produce metal co-injection molded parts with improved quality and mechanical properties. (8)

In this article the development of a numerical mold to simulate and study highlights the importance of understanding the bonding mechanism and optimizing the process parameters to improve the bonding strength in over-molded hybrid parts. (9)

The article describes the investigation of birefringence in polycarbonate plastic induced by cooling stresses. The process used is a variety of techniques including optical microscopy, polymer, and X-ray diffraction to study the molecular orientation of polycarbonate samples that were quenched at different cooling rates. They found that birefringence was highest in samples that were quenched rapidly and that molecular orientation was related to the direction of cooling stresses.(10)

This paper uses both experimental and computational techniques to study the formation and relaxation of residual stresses in polystyrene (PS) and poly(methyl

methacrylate) (PMMA) during injection molding. They compare their simulation results with experimental data obtained by birefringence measurements, which allows them to validate their simulation models and gain a better understanding of the underlying mechanisms involved in the formation of residual stresses. They then present their methods and results in a logical and concise manner, with detailed explanations of the simulation models used and the parameters involved in their calculations. The results presented in the paper are significant and contribute to a better understanding of the mechanisms involved in the formation and relaxation of residual stresses in amorphous polymers during injection molding. (11)

The research paper by Pantani et al. investigates the effect of packing pressure on the morphology evolution of a polypropylene (PP) polymer during injection molding. They use scanning electron microscopy (SEM) to analyze the changes in the morphology of the molded samples at different packing pressures. The authors also use rheological measurements to determine the viscosity of the PP during molding. (12)

This research paper focuses on the impact of binders on the viscosity of low-pressure powder injection molded Inconel 718 superalloy. The goal of the study is to understand how different binders affect the Inconel 718 powder mixture during the injection molding process. The research evaluates the performance of different binders in terms of their effect on viscosity and the results show that the choice of the binder has a significant impact on the viscosity of the incocel 718. (13)

In this paper, the effect of packing pressure on refractive index variation in injection molding of precision plastic optical lenses can vary depending on the specific parameters used in the molding process. In general, however, higher packing pressures may lead to greater variations in refractive index. This is because the higher packing pressure tends to produce a more uniform polymer melt, resulting in a more uniform refractive index.(15)

The study investigated the effect of different injection molding types on the birefringence distribution in polycarbonate discs. The injection molding types tested were conventional, shear controlled, and packingcontrolled. The results showed that the birefringence distribution was significantly different for each molding type with the shear-controlled and packing-controlled moldings exhibiting reduced birefringence compared to the conventional molding.(14)

The research paper by Ulsoy et al. validates their simulation results by comparing them to experimental measurements of the mold-filling process. The paper is well-written and structured, with a clear introduction that motivates the study and outlines the research questions the authors seek to answer. The authors provide a thorough explanation of their simulation methodology and the assumptions made in their mathematical model. (15)

The research paper by Su et al. presents a study of the use of variotherm systems in microinjection molding, which is a process for fabricating micro-sized parts with high precision. The authors investigate the effects of different heating and cooling strategies on the microstructure and properties of the molded parts. They use a variotherm system, which allows the mold to be heated and cooled at different rates in different regions, to optimize the molding process and improve the quality of the parts. The paper is well-written and structured, with a clear introduction that provides an overview of the importance of microinjection molding and the challenges associated with it. The authors provide a thorough explanation of the variotherm system and how it can be used to control the temperature of the mold during the molding process. They also present their results in a clear and concise manner, with detailed explanations of the effects of different temperature profiles on the microstructure and properties of the molded parts.(16)

The research paper by Zhao et al. investigates the effect of vacuum venting on mold surface temperature during micro-injection molding. The study aims to determine the optimal vacuum venting conditions for micro injection molding and to understand the underlying heat transfer mechanisms that occur during the process. The authors conducted a series of experiments using a micro injection molding machine and a polypropylene (PP) material to create micro-sized parts. The experiments were conducted with varying levels of vacuum venting, and the temperature of the mold surface was measured

and analyzed using infrared thermography. The paper is well-organized and presents the experimental procedure and results in a clear and concise manner. The authors provide a comprehensive explanation of the vacuum venting process and how it affects the mold surface temperature during micro-injection molding. They also provide a detailed discussion of the underlying heat transfer mechanisms that occur during the process. (17)

The research paper represents a method for measuring the fiber orientation in the part using imaging techniques. They have also developed a method for quantifying the fiber orientation distribution using an image analysis algorithm. This information is crucial in understanding the mechanical properties of the part as the orientation of the stiffness of the material. The method is effective in measuring fiber orientation distribution and this provides a valuable tool for quality control and optimization of the production process. (18)

The paper investigates the fabrication and properties of composite foams made from polypropylene (PP) and fibrillary polytetrafluoroethylene (PTFE) using foam injection molding. The authors present their findings on the effects of PTFE content and foam cell size on the mechanical and thermal properties of the resulting composite foams. Overall, this research paper presents a valuable contribution to the field of composite foam materials and provides useful insights for the development of lightweight and strong materials for various industrial applications. The findings are wellsupported by the experimental data, and the conclusions are well-justified. However, it should be noted that further research is needed to fully understand the longterm durability and environmental impact of these composite foams. (19)

The paper investigates the accuracy and reliability of micro-injection molding process simulations by comparing simulation results with experimental data obtained from high- precision measurements. The authors present their findings on the effects of various processing parameters on the flow behavior, filling pattern, and part quality of micro-injection molded parts. This research paper presents a valuable contribution to the field of micro injection molding and provides useful insights for the development of high-precision manufacturing processes for microscale components.

The findings are well-supported by the experimental data, and the conclusions are well-justified. However, it should be noted that further research is needed to fully understand the complex interactions between the various processing parameters and their effects on the final part quality. (20)

The paper presents a detailed investigation of the dielectric properties of aeronautical composite matrix resins using terahertz spectroscopy. The authors explore the effects of different chemical structures and compositions on the dielectric properties of the resins, and discuss the implications for the development of high-performance composite materials for aerospace applications. The paper also presents a thorough discussion of the potential applications of terahertz spectroscopy in the field of composite materials, such as in the optimization of resin formulations and the detection of defects and anomalies in composite structures. The authors suggest some future research directions for the development of terahertz spectroscopy as a tool for the characterization and quality control of composite materials.(21)

The paper presents an optimization study on the wear behavior of AA6061/Al2O3/SiC metal matrix composites fabricated using the squeeze casting technique. The authors investigate the effects of various process parameters such as applied pressure, pouring temperature, and stirring time on the wear behavior of the composite material, and use statistical analysis to optimize the process parameters for maximum wear resistance. Paper presents a valuable contribution to the field of metal matrix composites, and provides useful insights for the development of high-performance materials for various engineering applications. The findings are well-supported by the experimental data and the statistical analysis, and the conclusions are well-justified. However, it should be noted that further research is needed to evaluate the impact of other factors such as particle size and particle volume fraction on the wear behavior of AA6061/Al2O3/SiC metal matrix composites. (22)

#### **CONCLUSION**

The advancement in injection molding technology will likely lead to the development of new and

improved injection molding equipment, materials, and processing techniques. For instance, advancements in materials science and engineering will likely lead to the development of new types of polymers that are more durable, lightweight, and environmentally friendly. Additionally, the use of artificial intelligence and machine learning in injection molding equipment can optimize the process parameters for each individual part, leading to better quality products and faster cycle times. Furthermore, the acceptance of Industry 4.0, can lead to better monitoring and control of the injection molding process, leading to increased efficiency and reduced waste. Overall, the future of injection molding technology looks promising, with continued research and development efforts focused on improving the process and expanding its capabilities to meet the demands of various industries.

#### **ABSTRACT**

Natural resources contained in the crust of the planet are regarded as non-renewable and are only present in small amounts. This study intends to assess the feasibility of producing biodiesel from Argemone Mexicana seed oil with CuO 4ppm as a nano additive in the biofuel. The addition of the nano particle is done with the help of magnetic stirrer instrument. The role of additive is to increase the turbulence inside the engine cylinder. The testing of the biofuel is done on single cyl 4S DE on a computerised attached engine. The fuel used for the testing of performance and emission characteristics is blended as B00, B08, B16, B24, B30 and B36. The blends are tested and the result shows that the BP and IP of all the blends is greater than the neat diesel fuel. The important characteristics of performance BSFC is minimum or nearly same as like diesel fuel. The different parameter that is measured is vibration of engine cylinder showing less vibrations than the diesel for Mexicana blends. The emission properties like CO, NOx, soot particles have less emissions than the pure diesel blend. This Mexicana fuel with B24 blending can surely replace the diesel fuel is its land area and production increases in future.

**KEYWORDS:** Biodiesel production; Transesterification process; Argemone mexicana; CuO Nanoparticle. Vibration

#### INTRODUCTION

he In India, where energy demands are high and the population is dense, natural fuels are limited and researchers have been searching for alternative sources for more than 50 years. The demand for energy in India has led to a continuous increase in hydrocarbon consumption, prompting investigators to search for unconventional causes of energy, including non-edible vegetable oils [1] Researchers have been exploring unconventional causes of energy for decades due to the limited availability of natural fuels and the need to rise the quality of biodiesel. Vegetable

oils have been investigated as a cause of energy, but their properties, such as high viscosity and poor low-temperature pour ability, have caused challenges. For scientists in this subject, the transesterification process, which involves the conversion of vegetable oils into Fatty acid methyl ester (FAME) or biodiesel, has been a prominent topic of research. [2][3]

Argemone Mexicana is a plant that produces oil, which can be used to produce biodiesel. The oil is extracted from the seeds of the plant and undergoes a process called transesterification to convert it into biodiesel. The production process for biodiesel from Argemone

www.isteonline.in Vol. 46 Special Issue, September, 2023

Mexicana oil involves several steps including seed preparation, oil extraction, and transesterification. The seeds are first cleaned and dried, and then the oil is extracted using a mechanical press or solvent extraction method.[4]

The extracted oil is next transesterified, which involves reacting the oil with an alcohol, usually methanol or ethanol, while a catalyst, such as sodium hydroxide or potassium hydroxide, is present. As a result, biodiesel and glycerin are produced as byproducts. With some changes, the resulting biodiesel can be used as a fuel in diesel engines and has been demonstrated to have qualities similar to petroleum diesel fuel. More investigater is needed, however, to define the economic feasibility and scalability of employing Argemone Mexicana oil as a biodiesel feedstock. [5]

Non-renewable natural resources are available in limited amounts within the earth's crust. study intends to examine if producing biodiesel from Argemone Mexicana seed oil is feasible using crystalline manganese carbonate as a highly effective catalyst[4]. In this study, pure, crystalline, ash-colored manganese carbonate is used for the first time as a heterogeneous catalyst to produce methyl esters from Argemone Mexicana seed oil as a fuel. To produce biodiesel with a 99,99% purity, the transesterification process needs a 1% manganese carbonate catalyst and a 4:1 alcohol to oil ratio at 60 OC. Gas chromatography analysis was used to monitor the methyl esters produced. Additionally, the study will examine the impact of adding Cu nanoparticles to different blends of Argemone Mexicana biodiesel, ranging from 8% to 36%, and compare the emission and performance characteristics to those of pure diesel at various loads and constant speed.[6]

#### BIODIESEL PREPARATION

Argemone Mexicana, also known as prickly poppy, is a plant that has been studied for its potential to produce biodiesel. The production process for biodiesel from Argemone Mexicana involves the following steps:

 Collection and preparation of the plant material: The plant is harvested, and the seeds are separated from the rest of the plant material. The seeds are then cleaned and dried.

Figure 1. Mexicana Plant

Figure 2. Mexicana Seeds

- Oil extraction: The extracted oil is then put through transesterification, a process that turns it into biodiesel and glycerin by reacting with an alcohol (often methanol) and a catalyst (such as sodium hydroxide or potassium hydroxide).[1]
- Transesterification: The extracted oil is then treated with an alcohol (typically methanol) and a catalyst (such as sodium hydroxide or potassium hydroxide) to make biodiesel and glycerin. The reaction takes many hours to complete at a temperature of roughly 60-70°C. [4] [7][8]
- Separation and purification: After allowing the biodiesel and glycerin combination to settle, a centrifuge is used to separate the glycerin from the biodiesel. The residual contaminants are subsequently removed by washing the biodiesel with water.[9]
- Drying: The biodiesel is then dried to remove any residual water, and the quality of the biodiesel is tested to ensure that it meets the necessary specifications for use as a fuel.

Figure 3. Various Blends [B00 to B36]

Overall, the production process for biodiesel from Argemone Mexicana is similar to the process used for other vegetable oils, with the main difference being in the characteristics of the oil itself. The use of Argemone Mexicana for biodiesel manufacture is still in the experimental stage, and more research is needed to determine its potential as a viable source of renewable fuel.

#### ENGINE SETUP

CRDI (Common Rail Direct Injection) and VCR (Variable Compression Ratio) engines are two different types of diesel engines commonly used in automotive applications.[10] Testing Argemone Mexicana biodiesel on these engines would involve conducting experiments to determine the fuel's properties and performance on the engine. To test the Argemone Mexicana biodiesel on a CRDI or VCR engine setup, the following steps can be taken:

- Fuel preparation: The Argemone Mexicana oil would need to be extracted and processed into biodiesel. This can be accomplished by the transesterification process, which involves combining the oil with a catalyst like sodium hydroxide and an alcohol like methanol to create biodiesel and glycerin.
- Fuel characterization: The biodiesel produced from Argemone Mexicana would need to be characterized to determine its properties, such as viscosity, flash point, CN, and density. These properties can be measured using standard testing methods.

Table 1. Properties of Blends

Sr.	Test	Ref. Std. ASTD	Reference		diesel	Mexicana Blends				
31.	description	6751	Unit	Limit	B00%	B8%	B16%	B24%	B30%	B36%
1	Density	D1448	gm/cc	0.800-	0.830	0.831	0.833	0.835	0.836	0.839
2	Calorific	D6751	MJ/kg	34-45	42.50	42.46	42.41	42.30	42.21	42.18

• Engine setup: A CRDI or VCR engine setup would need to be prepared for the tests. This would involve

installing the engine on a test bed and connecting it to various sensors to measure Various aspects of an engine's performance, including torque, power, fuel use, emissions, and exhaust gas temperature.. [10] [2]

Figure 4. Experimental Setup Diagram

- Testing: The Argemone Mexicana biodiesel would be tested on the engine at various speeds and loads. The engine's performance would be monitored, and the data would be recorded and analysed to determine the appropriateness of the fuel.
- Data analysis: The data acquired during the testing will be analysed to assess the performance of the gasoline in terms of power output, fuel efficiency, pollutants, and engine wear. This would aid in establishing whether the fuel was suitable for use in CRDI or VCR engines.

Overall, determining the characteristics and performance of Argemone Mexicana biodiesel on a CRDI or VCR engine setup would include a series of trials. These tests would give important information about the viability of employing Argemone Mexicana biodiesel as a sustainable alternative to fossil fuels.[11][12]

The following parameters are commonly evaluated during the testing of biodiesel:

Power output: The output power of engine would be measured during the tests to determine the fuel's ability to produce power. If the power output of engine is similar or better than that of conventional diesel, it can be considered a good sign.

- Fuel efficiency: The fuel depletion rate of the engine would be measured through the tests to determine the fuel's efficiency. If the fuel consumption rate is similar or better than that of conventional diesel, it can be considered a good sign.[13]
- Emissions: The emissions from the engine, including particulate matter, carbon monoxide, HC, and nitrogen oxides, would be measured during the tests to determine the fuel's impact on the environment. If the emissions are lower than those of conventional diesel, it can be considered a good sign.[14][15]
- Engine wear: The engine's wear would be evaluated after the tests to determine if the fuel had any adverse effects on the engine's components. If the engine wear is similar or less than that of conventional diesel, it can be considered a good sign.

Based on the above parameters, the testing of Argemone Mexicana biodiesel on a CRDI VCR engine setup would provide results indicating the fuel's suitability for use as an alternative to fossil fuels. However, the specific results may vary depending on the test conditions and the quality of the biodiesel.

#### **EXPERIMENTAL RESULTS**

One investigation into the potential of Argemone mexicana oil for biodiesel synthesis was published in the journal Fuel in 2017.[10] The oil was extracted from the seeds of Argemone mexicana by the researchers using a solvent extraction procedure.which they further transesterified to make biodiesel. The research discovered that the biodiesel made from Argemone mexicana oil has qualities that complied with the requirements for biodiesel given by The European Standard (EN) and the American Society for Testing and Materials (ASTM) are two of the most widely used standards in the world. The biodiesel had a high cetane number, low sulfur content, and low viscosity, which are all desirable properties for biodiesel. However, the study also found that the yield of biodiesel from Argemone mexicana oil was relatively low compared to other vegetable oils commonly used for biodiesel production. The researchers suggested that further optimization of the process of transesterification could

Vol. 46

improve The biodiesel yield from Argemone mexicana oil. Overall, while the experimental results of using Argemone mexicana for biodiesel production are promising, further research is needed to fully explore its potential as a biodiesel feedstock.

#### **Break Power**

Break power is the amount of power required to bring a vehicle or a machine to a complete stop from its maximum speed. It is a measure of the braking system's ability to stop the vehicle or machine under maximum operating conditions. In simpler terms, it's the power needed to stop something quickly and safely. Fig. shows demonstrates how the BP (KW) for mixes B00, B08, B16, B24, B30, and B36 varies with load at CR16 and 18. It has been noted that the brake power for CR16 and 18 for blends B08, B24, and B30 is almost identical to natural diesel.[16]

Figure 5: Load VS Break Power

#### **Friction Power**

Friction power is the power that is lost due to the frictional forces between two surfaces in contact that are in relative motion. It is the energy that is converted into heat as a result of the resistance that one surface applies to the other. In simpler terms, it's the power that is consumed by friction when two objects rub against each other, and this power is usually lost in the form of heat. B30, B36, B24, and B16 all have a same IP. Further blending B24 towards pure diesel.

Figure 6: Load VS Friction Power

#### **Indicated Power**

Indicated power is the power developed by an engine cylinder from the combustion of fuel. It is a measure of the power produced inside the engine cylinder by the combustion process. In simpler terms, it's the power output of an engine measured by the pressure generated during the combustion process inside the engine cylinder B30, B36, B24, and B16 all have a same IP. Further blending B08 towards pure diesel.

Figure 7: Load VS Indicated Power

#### Mechanical efficiency

Mechanical efficiency is when expressed as a percentage, mechanical efficiency is the ratio of a machine's output power to its input power. It is a measure of how effectively a machine converts the input power into useful output power, taking into account losses due to friction, heat, and other inefficiencies in the system. The following graphs show that the mechanical efficiency of each blend is the same up to a weight of 6 kg, but as the load grows beyond that, there is a noticeable decline in the mechanical efficiency of blends B16, B24, and B30, although blend B08 is substantially closer to pure diesel in terms of efficiency.

Figure 8: Load VS Mechanical Efficiency

Brake specific fuel consumption (BSFC)

Brake specific fuel consumption (BSFC) is the amount of fuel an engine uses for each unit of power it produces is known as brake specific fuel consumption, or BSFC. Typically, it is expressed in terms of the mass of fuel used per unit of energy produced, such as blends of fuel per kilowatt- hour (g/kWh). BSFC is a gauge of how effectively an engine turns fuel into power. Higher efficiency is directed by a lower BSFC. Implying that the same amount of power is being produced by the engine with less fuel. When compared to pure diesel, it can be seen that BSFC for blends like B08, B16, B20, and B30 is lower, but as load increases, specific fuel consumption for all blends becomes nearly identical. Additionally, blend B24 uses less fuel than pure diesel, as can be seen.

Figure 9: Load VS BSFC

#### **Brake thermal efficiency (BTE)**

Brake thermal efficiency (BTE) is a measure of an engine's ability to transfer the energy in its fuel into useful mechanical energy is called BTE. It is the ratio, stated as a percentage, between the engine's output power and the energy released during fuel combustion, expressed as a percentage. A higher BTE means that more of the energy released by burning fuel is converted into useful mechanical work. Above figure show for CR 16 and 18, the aforementioned figure depicts the fluctuation of brake thermal efficiency vs. load. It has been found that as CR increases, brake thermal efficiency grows as well. B08 shows higher BTE than pure CI for CR 16 and CR 18 mixes.

Figure 10: Load VS Break thermal Eff.

#### Vibration

Vibration refers to a system of items moving repeatedly or oscillatory around a fixed point is said to as vibrating. There are many different types of vibrations, including mechanical, electromagnetic, and acoustic ones, and they can be caused by external forces or internal sources, such as unbalanced or misaligned components. Vibration can have both positive and negative effects. Compression ratio increases say CR16 and CR18 with increasing load all the other blends produce less vibrations than that of pure diesel. B30 being the best blend so far.[17]

Figure 11: Load VS Vibrations

#### Carbon monoxide (CO)

Carbon monoxide (CO) is fatal gas called carbon monoxide (CO) is released into the atmosphere when fossil fuels or other organic materials are burned partially. CO is a colorless and odorless gas that can be harmful to humans and animals when inhaled in large quantities, as it binds to the hemoglobin in blood and reduces the amount of oxygen that can be transported to vital organs. CO emissions can be caused by various causes, such as car engines, authority plants, manufacturing processes, and even residential causes like gas stoves or heaters It displays the CO (% volume) Vs load variation for the blends BOO, B08, B16, B20, B24, and B30 at CR16 and 18. When compared to pure diesel, it has been found that as load increases, CO emissions for the blends B08, B16, and B30 are reduced.

Figure 12: Load VS Carbon Monoxide Emission Hydrocarbons (HC)

Hydrocarbons (HC) are a group of organic compounds that contain only carbon and hydrogen atoms. As a result of incomplete burning of fossil fuels or other organic materials, they may be released into the atmosphere.. HC emissions can have harmful things on human health and the environment, as they can react with other pollutants to form ground-level ozone and other harmful compounds. When equated to pure diesel at CR of CR16 and 18, it is seen that the emission of HC for the blends B08, B16, B20, B24, and B30 increases with an increase in load.

Figure 13: Load VS Hydrocarbon Emission

#### Nitrogen oxides (NOx)

Nitrogen oxides (NOx) are the extremely reactive gases known as nitrogen oxides (NOx) are released into the atmosphere as a result of high-temperature combustion processes, such as those that take place in automotive engines. Power plants, and industrial processes. Due to their ability to contribute to the creation of ground-level ozone and fine particulate matter, which can result in respiratory disorders and other health problems, NOx emissions can have a harmful impact on both human strength and the atmosphere. NOx emissions for blends B08, B16, B24 are more as compared to pure diesel. But as compression ratio increase blend B16 and B24 show lesser emission.

Figure 14: Load VS Nitrogen Oxide Emission Smoke opacity

Smoke opacity is a measure of the degree to which smoke produced by combustion obstructs the passage of light. It is typically measured using a smoke meter, which measures the amount of light that is detect or scattered by the smoke. High smoke opacity can be caused by a variety of factors, such as incomplete combustion, poor fuel quality, or inadequate air-to-fuel ratio. The graph illustrates how smoke opacity varies with load for the blends BOO, BOS, B16, B24, B30, and B36 at CR 16 and 18. It has been noted that smoke opacity rises with load.

Special Issue,

Figure 15 Load VS Smoke Opacity

#### Exhaust gas temperature (EGT)

Exhaust gas temperature (EGT) is the temperature of the gases released by an engine or during a combustion process is known as the exhaust gas temperature (EGT). Important data on the ignition process and engine performance can be obtained through EGT, as it reflects the temperature and energy content of the exhaust gases. High EGT can indicate a high degree of combustion efficiency and/or high power output, but it can also be an indicator of potential engine damage or overheating. The exhaust gas variation for blends and pure diesel at CR 16 is shown in Fig. It demonstrates that, for the equal load, the exhaust gas temperature for blends B24 and B16 is lower at low loads than it is for pure diesel. Figure 23 depicts the difference in exhaust gas temperature between blends and natural CI at CR18; it demonstrates that blends B16 and B24 have lower exhaust gas temperatures than pure diesel.

Figure 16: Load VS Exhaust Gas Temperature

Based on the available literature, the specifications of biodiesel produced from Argemone Mexicana oil generally meet the criteria set by ASTM and EN[18]. The following are some of the typical specifications reported in studies: Density: The density of Argemone Mexicana biodiesel is generally reported to be around 0.87 g/cm3 at 15°C, which is similar to the density of CI fuel. Calorific value: The CV of Argemone Mexicana biodiesel is generally reported to be around 34-45 MJ/Kg. It should be noted that these specifications may vary contingent on the specific methods and conditions of biodiesel production, as well as the quality of the Argemone Mexicana oil used as feedstock.[19]

#### **CONCLUSION**

- The experimental investigation uses Argemone Mexicana biodiesel blends and CuO additives with diesel in one-cylinder, 4-stroke CI Engine with various CR. Running the engine at various compression ratios, such as 16 and 18, while adjusting the load allows for the evaluation of the emission analysis and performance analysis. The performance parameters that are measured are BP, specific fuel consumption, and consume gas temperature. [20] The discharge parameters that are calculate are CO, HC, and NO. The observations made based on the experimental studies are listed below.
- Braking power (KW) variation with load for the mixes BOO, B08, B16, 824, and B30 at CR16 and 18. Braking performance for blends BO8, B16, and B24 is found to be roughly similar to or superior to that of pure diesel for CR16 and 18.
- As the load on an engine increases, the engine brake power also tends to increase. CI fuel is known to provide more heat than most blends, except for B16. However, the efficiency of biodiesel blends is often greater than that of CI fuel due to their earlier ignition, which is facilitated by the presence of oxygen.
- Brake thermal efficiency is affected by various factors such as the composition of the fuel, the engine design, and operating conditions. However, it is generally expected that biodiesel blends, including B16, would have higher thermal

- efficiency than standard diesel fuel due to their earlier combustion and higher oxygen content. Further research and testing would be necessary to determine the exact brake thermal efficiency of a B16 blend under various conditions.
- In relationships of emissions, B16 made from biodiesel derived from causes such as Argemone Mexicana has been shown to discharge expressively less CO, CO2, HC, NOx, and O2 pollutants compared to CI fuel. This makes it a more environmentally-friendly option. [21]
- However, it is generally expected that the exhaust gas temperature of biodiesel blends, including B16 and B24, would be lower than that of standard diesel fuel due to their lower carbon content and higher oxygen content. The exhaust gas temp. is influenced by various features such as the composition of the fuel, the engine design, and working conditions.

The key attention of this paper is to explore the heat and mass transport in oscillatory hydromagnetic Titanium alloy water nanofluid flow within two vertical alternatively non-conducting and conducting walls enclosing Darcy-Brinkman porous medium. Motional induction is considered because it is sufficiently strong in comparison to Ohmic dissipation. Hall phenomenon is considered because the electromotive force induced due to revolving of fluid particle about the magnetic field lines is significant. Suitable physical laws (constitutive and field equations) are used to derive the equations leading the flow model. An analytical approach is followed to extract the solutions of the flow model. The quantities of physical interest such as wall shear stress (WSS), rate of heat transport rate (RHT) and rate of mass transport rate (RMT) at the walls are obtained from the extracted solutions. The physical insight into flow manners is discovered from the graphs and tables generated from the numerical computation of the solutions. It is important to note from the study that the volume concentration of nanofluid and magnetic diffusion produce resistivity in the flow and tends to slow down the fluid flow. Magnetic diffusion weakens the strength of the primarily motional induced magnetic field.

#### INTRODUCTION

Magnetohydrodynamic (MHD) phenomena are used since its origination in various branches of science and engineering such as astrophysics, geophysics, mechanical engineering, plasma aerodynamics, thermal science and biomedical sciences due to numerous applications in these field. MHD phenomenon were firstly observed in the experiment of Faraday [1]. He discovered that the motion of mercury in a glass tube under the influence of a transverse magnetic field, generates a voltage across the tube in a direction mutually perpendicular to the direction of the flow and exerted magnetic field. This phenomenon is termed as a phenomenon of generator. He further noted that the motional induced current interacts with the exerted magnetic field and produces a drag force, which significantly alters the motion of the fluid. This phenomenon is named as a phenomenon of pump. At the beginning MHD, phenomena were used in development of power generation devices, pumps, propulsion of ships and aircrafts, thermonuclear energy generation, etc. (Ferraro and Plumpton [2]). Cowling [3] and Ferraro [4] started to explore implications of the hydromagnetic phenomena is astrophysical problems such as the magnetic field of sunspot and rotation of sun. The classical work of Alfven [5] published in Nature expresses that owing to presence of an imposed magnetic field to a conducting liquid there appears an electromotive force which insist to generate an electric current. The interaction of the generated current and imposed

magnetic field produces a mechanical force, which alters the state of liquid motion. Furthermore, the small disturbance in the state of the liquid gives rise to electromagnetic waves called Alfven waves. Hartmann [6] experimentally explored the hydromagnetic flow manner of conducting liquid between two parallel surfaces and stated that the appearance of magnetic field flattens the velocity in the central part of the channel. The formation of a thin boundary layer took place in the boundary region of the channel due to the appearance of the sufficiently strong magnetic field. Soon after, these pioneer works engineers and scientists started to discover the basic features of hydromagnetic flows and their applications to power generation technology, nuclear engineering, plasma aerodynamics, MHD energy system and targeted drugs delivery [7-11]. The study of hydromagnetic channel/duct flows is actively engaged by the research fraternity after Hartmann [6] due to enormous applications in technological and biological problems like designing of cooling systems with liquid metal, geothermal energy extraction, underground energy transport, blood flow problems, food preservation, etc. Alpher [12] examined that the temperature distribution within the fluid flowing in a channel with infinitely conducting walls due to internal heat source generated due to motion of conducting fluid in a constant imposed magnetic field. The influence of wall conductance on the hydromagnetic channel flow without heat transfer aspect is explored by Chang and Yen [13] while the wall conductance effect on the hydromagnetic channel flow with heat transfer is explained in the article of Snyder [14]. The flow of electrically conducting fluid within a rectangular duct with a combination of non-conducting, conducting and arbitrary conducting walls under an imposed magnetic field is examined by Hunt [15]. Contrary to the flow stabilizing nature of the magnetic field he found that in some of the cases the appearance of the magnetic field also destabilizes the flow of electrically conducting fluid in a duct. The unsteady flow behavior of hydromagnetic flow in a duct is analytically scrutinized by Sloan [16]. He expressed that the motion induced current significantly modify the motion of the fluid. Mazumdar [17], and Nagy and Demendy [18] considered the wall conductance effect on hydromagnetic flows and heat transfer in a rotating channel. These studies confer the dependency of flow velocity, current density and temperature on the joint wall conductance of both walls and dependency of motional generated magnetic field on the separate values of wall conductance constants. The oscillatory hydromagnetic channel flow under different geometrical flow model is excellently discussed by Singh [19], Guria et al. [20], Ansari et al. [21], Beg et al. [22] and Seth et al. [23]. Recently, Venkateswarlu [24] and Singh [25–27] with their collaboration group evaluated the flow nature of oscillatory MHD flow of viscoelastic fluid in a channel. Falade et al. [28] examined the transient MHD oscillatory flow in a vertical channel with porous walls and explored that on increasing the injection at the heated wall, the wall shear stress enhances. Singh et al. [29] characterized the nature of nanofluid flowing within two vertical alternatively magnetized surfaces. They expressed that the motional generated magnetic field gets increased with the volumetric concentration of nanofluid due to the rise in electrical conductivity of the fluid. Dissipative effect is an important phenomenon appearing in hydromagnetic fluid flows. A well-known fact is that the appearance of magnetic field in hydromagnetic flows produce the drag force in the motion similar to the viscosity of the fluid as a result the internal energy of flow system uprise in terms of the heat. This phenomenon is termed as Joule heating. The Joule heating term is ignored by many of the authors from the energy equation due to complexity in the mathematical modelling and solution process. However, this phenomenon significantly affects the rate of heat transport and fluid temperature. Yen [30] considered the viscous and Joule dissipation, and wall electrical conductance impacts to the fully developed hydromagnetic laminar flow within a channel. The results of the study exhibit that the viscous dissipation dominates the Joule heating in the case of the non-conducting walls. However, in the case of the infinitely electrically conducting walls, the influence of the Joule heating is more significant than the viscous dissipation. These facts provoked the academics Seth and Singh [31], Singh et al. [32] and Singh and Kolasani [33] to explore the wall electrical conductivity and energy dissipation effects to the hydromagnetic channel flows under the diverse geometrical flow formations. Some noteworthy research works including the energy dissipative effects are owed to Gopal et al. [34], Atif et al. [35], Poddar et al. [36] and Shah et al. [37]. The significance of motional induction and Hall current phenomena on hydromagnetic flows are clearly visible when the fluid is highly electrically conducting and the strength of the imposed magnetic field is sufficiently large. Kumar et al. [38, 39] and Singh et al. [40, 41] considered these facts in their problem. The hydromagnetic flow through a porous medium is a subject of active research in the recent years due to its exhaustive applications in geothermal power extraction from the earth's interior, water circulation by ion-exchange beds, chemical reactor for economic isolation or mixture purification, the penetration of drugs into human skin, etc. The basis for the characterization of the flow in a porous regime is its permeability and porosity. The permeability exerts the stabilizing force to the flow in porous medium. Brinkman [42] presented a model to characterize fluid flow through a dense cluster of particles, which is one of the popular models proposed to examine the manner of flow in a porous medium. Many scientists [43–48]

$$y_{3} = -y_{0} / 2 :\begin{cases} v_{1} = 0, v_{2} = 0, \\ h_{1} = 0, h_{2} = 0, \\ \theta = \theta_{1}, \\ \phi = \phi_{1}. \end{cases}$$

$$h_{0}$$

$$y_{1} - \frac{1}{\rho_{yy}} \frac{\partial p}{\partial y_{1}}$$

$$y_{3} = y_{0} / 2 :\begin{cases} v_{1} = v_{0} (1 + \varepsilon \cos(n\tau)), v_{2} = 0, \\ \frac{\partial h_{1}}{\partial y_{3}} = 0, \frac{\partial h_{2}}{\partial y_{3}} = 0, \\ \theta = \theta_{r} + \varepsilon(\theta_{r} - \theta_{f}) \cos(n\tau), \\ \phi = \phi_{r} + \varepsilon(\phi_{r} - \phi_{f}) \cos(n\tau). \end{cases}$$

FIGURE 1 Geometrical setup of the flow model.

explored the manner of hydromagnetic flows in porous medium by implementing the Darcy-Brinkman model. Nanofluid plays a vital role in development of nanoscience and nanotechnology. The thermal behavior of nanofluid makes it technologically more efficient in comparison to any other fluids. The dependency of thermal conductivity of the nanofluid to the shape and size of nanoparticles and number of nanoparticles are experimentally proven by Choi and Eastman [49] and Chon and Kihm [50]. This specific thermal nature motivated the research world to examine the flow nature of nanofluid and to discover its applications in engineering and technology. Khan and Alqahtani [51] modeled the hydrodynamic convective nanofluid flow in a channel with permeable wall and expressed that suction causes the higher fluid velocity intensity compared to the injection. Dutta et al. [52] considered the hydromagnetic free convection flow of Cuwater nanofluids in a rhombic enclosure and scrutinized the heat transport and entropy generation. They explored that the nature of Hartmann number is to weaken the rate of entropy generation. In the recent years, the mathematical model for hydromagnetic nanofluid flows within different geometrical setup are developed and explored by many researchers, namely, Mourad et al. [53], Askari et al. [54], Abd-Alla et al. [55], EL-Zahar [56] and Govindarajulu and Subramanyam Reddy [57].

It is ascertained from the aforesaid meticulous literature review that not much literature considered the impacts of motional generated magnetic field and Hall current simultaneously on oscillatory hydromagnetic nanofluid flows. Therefore, the key attention in this paper is to explore the motional indication and Hall current effect to oscillatory hydromagnetic Titanium alloy suspended water nanofluid flow within two vertical alternatively non-conducting and conducting walls enclosing Darcy-Brinkman porous medium and its heat and mass transport nature. An analytical approach called separation of variables is used for extraction the solution from the flow model. It is important to note from the study that the volume concentration of nanofluid and magnetic diffusion produce resistivity in the flow and tends to slow down the fluid flow. Magnetic diffusion weakens the strength of the primarily motional induced magnetic field.

#### FORMULATION OF THE FLOW MODEL

#### Flow description and geometrical setup

The flow problem considers the oscillatory hydromagnetic flow of Titanium alloy suspended water nanofluid within two vertical walls enclosing the Darcy-Brinkman porous medium. The vertical walls are placed symmetrically on either side parallel to  $y_1y_2$ -plane of the cartesian coordinate system. The left vertical wall is stationary and non-conducting, and its temperature and concentration are kept fixed while right wall is oscillatory and conducting, and its temperature and concertation are fluctuating with the same frequency as that of oscillations (please see the geometrical setup of the flow model, Figure 1).

#### Flow assumptions 2.2

A tractable mathematical model is derived by imposing the below mentioned flow assumptions:

- A. The Titanium alloy suspended water is a dilute suspension and keeping the property of incompressible, and electrically and thermally conducting fluid.
- B. The flow medium is supposed to be Darcy-Brinkman porous type and the effective viscosity of the flow medium and nanofluid is same. The equation representing the flow through such medium is expressed as

$$\nabla p = \delta \mu_{nf} \nabla^2 \vec{v} - \frac{\mu_{nf}}{k_p} \vec{v}, \tag{1}$$

where  $\delta$  is effective viscosity term and considered  $\delta = 1$ .

C. The electromotive force induced due to collision and revolving of charged fluid particles about the lines of exerted magnetic field  $h_0$  is significant (Cowling [58]). Hence, the Hall effect is considered. The mathematical representation of the Ohm's law with Hall current is as follows:

$$\vec{j} = \sigma_{nf} \left( \vec{e} + \mu_e(\vec{v} \times \vec{h}) \right) - \frac{Hc}{h_0} \left( \vec{j} \times \vec{h} \right). \tag{2}$$

D. The fluid is supposed to be highly conducting and hence the motional induction is sufficiently strong in comparison to Ohmic dissipation. Thus, the effect of motional induced magnetic field is also considered. The differential equation representing the motional induced magnetic field without Hall current is

$$\frac{\partial \vec{h}}{\partial \tau} = \nabla \times \left( \vec{v} \times \vec{h} \right) + \frac{1}{\sigma_{nf} \mu_{e}} \nabla^{2} \vec{h}, \tag{3}$$

- E. For the unidirectional flow within infinitely extended vertical walls, the flow velocity and motional induced magnetic are considered to be  $\vec{v} \equiv (v_1(y_3), v_2(y_3), 0)$  and  $\vec{h} \equiv (h_1(y_3), h_2(y_3), h_0)$  to uphold the continuity equations  $div \ \vec{v} =$ 0 and  $div \vec{h} = 0$ .
- F. The uniform revolution of flow system about  $y_3$ -axis with an angular velocity  $\vec{\Omega}$  gives rise to a flow altering force  $-2\vec{\Omega} \times \vec{v}$  named as Coriolis force.
- G. The appearance of gravitational force in the flow-field gives rise to the buoyancy forces which significantly affect the flow manner. The buoyancy forces are determined under the Boussinesq approximation and given by

$$\vec{f}_b = \rho_{nf} \vec{g} \left[ \beta_{nf} (\theta - \theta_l) + \beta_{nf}^* (\phi - \phi_l) \right]$$
(4)

#### 2.3 The equations governing the flow

On imposing the above-mentioned flow assumptions and suitable constitutive equations connecting electromagnetic fields, the field equations such as the equation of linear momentum, the equation of motional induced magnetic field, the equation of energy and the equation of mass diffusion in the vector form are expressed as

$$\frac{D\vec{v}}{D\tau} = -\frac{1}{\rho_{nf}} \nabla p + v_{nf} \left( \nabla^2 \vec{v} - \frac{\vec{v}}{k_p} \right) + \frac{\mu_e}{\rho_{nf}} (\vec{h} \cdot \nabla) \vec{h} + 2\vec{v} \times \vec{\Omega} + \rho_{nf} \vec{g} \left[ \beta_{nf} (\theta - \theta_l) + \beta_{nf}^* (\phi - \phi_l) \right], \tag{5}$$

$$\frac{\partial \vec{h}}{\partial \tau} = \nabla \times (\vec{v} \times \vec{h}) + \frac{1}{\sigma_{nf} \mu_e} \nabla^2 \vec{h} - \frac{Hc}{h_0} \nabla \times [(\vec{h} \cdot \nabla) \vec{h}], \tag{6}$$

$$(\rho C_p)_{nf} \frac{D\theta}{D\tau} = k_{nf} \nabla^2 \theta - R(\theta - \theta_l), \tag{7}$$

$$\frac{D\phi}{D\tau} = D_{nf} \nabla^2 \phi - Cr(\phi - \phi_l), \tag{8}$$

where  $\frac{D}{D\tau} \equiv \frac{\partial}{\partial \tau} + (v \cdot \nabla)$ . Resolving the vector Equations (5) to (8) along the coordinate axes by employing the flow assumption (E), these are expressed as

$$\rho_{nf} \frac{\partial v_1}{\partial \tau} = -\frac{\partial p}{\partial y_1} + \mu_{nf} \left( \frac{\partial^2 v_1}{\partial y_2^2} - \frac{v_1}{k_p} \right) + \frac{h_0}{\mu_e} \frac{\partial h_1}{\partial y_3} + 2\rho_{nf} \Omega v_2 + \rho_{nf} g \left[ \beta_{nf} (\theta - \theta_l) + \beta_{nf}^* (\phi - \phi_l) \right], \tag{9}$$

$$\rho_{nf} \frac{\partial v_2}{\partial \tau} = \mu_{nf} \left( \frac{\partial^2 v_2}{\partial y_3^2} - \frac{v_2}{k_p} \right) + \frac{h_0}{\mu_e} \frac{\partial h_2}{\partial y_3} - 2\rho_{nf} \Omega v_1, \tag{10}$$

$$\frac{\partial h_1}{\partial \tau} = h_0 \frac{\partial v_1}{\partial y_3} + \frac{1}{\sigma_{nf} \mu_e} \left( \frac{\partial^2 h_1}{\partial y_3^2} + Hc \frac{\partial^2 h_2}{\partial y_3^2} \right), \tag{11}$$

$$\frac{\partial h_2}{\partial \tau} = h_0 \frac{\partial v_2}{\partial y_3} + \frac{1}{\sigma_{nf} \mu_e} \left( \frac{\partial^2 h_2}{\partial y_3^2} - Hc \frac{\partial^2 h_1}{\partial y_3^2} \right), \tag{12}$$

$$\left(\rho C_p\right)_{nf} \frac{\partial \theta}{\partial \tau} = k_{nf} \frac{\partial^2 \theta}{\partial y_3^2} - R(\theta - \theta_l),\tag{13}$$

$$\frac{\partial \phi}{\partial \tau} = D_{nf} \frac{\partial^2 \phi}{\partial y_3^2} - Cr(\phi - \phi_l). \tag{14}$$

Under the above-described flow assumptions, the boundary conditions (BCs) designated at the contact walls of the symmetric channel are

$$v_{1} = v_{2} = 0, \quad h_{1} = h_{2} = 0, \quad \theta = \theta_{l}, \quad \phi = \phi_{l} \quad \text{at } y_{3} = -y_{0}/2;$$

$$v_{1} = v_{0}(1 + \varepsilon \cos(n\tau)), \quad v_{2} = 0, \quad \frac{\partial h_{1}}{\partial y_{3}} = \frac{\partial h_{2}}{\partial y_{3}} = 0,$$

$$\theta = \theta_{r} + (\theta_{r} - \theta_{l}) \cos(n\tau), \quad \phi = \phi_{r} + (\phi_{r} - \phi_{l}) \cos(n\tau) \text{ at } y_{3} = y_{0}/2.$$
(15)

A simplified flow model can be constructed by writing Equations (9) to (12) into compact form. Writing Equations (9), (10) and (11), (12) into compact form, yield

$$\rho_{nf}\frac{\partial v}{\partial \tau} = -\frac{\partial p}{\partial y_1} + \mu_{nf} \left( \frac{\partial^2 v}{\partial y_3^2} - \frac{v}{k_p} \right) + \frac{h_0}{\mu_e} \frac{\partial h}{\partial y_3} - 2i\rho_{nf}\Omega v + \rho_{nf}g \left[ \beta_{nf}(\theta - \theta_l) + \beta_{nf}^*(\phi - \phi_l) \right], \tag{16}$$

$$\frac{\partial h}{\partial \tau} = h_0 \frac{\partial v}{\partial y_3} + \frac{(1 - iHc)}{\sigma_{nf} \mu_e} \frac{\partial^2 h}{\partial y_3^2}.$$
 (17)

The designated boundary conditions (BCs) for velocity and motional generated magnetic field at contact walls of the symmetric channel in the compacted form are

$$v = 0, \quad h = 0,$$
 at  $y_3 = -y_0/2;$ 

$$v = v_0(1 + \varepsilon \cos(n\tau)), \quad \frac{\partial h}{\partial y_3} = 0, \text{ at } y_3 = y_0/2;$$
(18)

where  $v = v_1 + iv_2$  and  $h = h_1 + ih_2$ .

A similar dimensionless simplified flow model can be constructed from the above modeled equations by employing the following thermophysical characteristics of the nanofluid and dimensionless transformation rules

$$\alpha_{1} = \frac{\mu_{nf}}{\mu_{f}} = \frac{1}{(1-\lambda)^{2.5}}, \quad \alpha_{2} = \frac{\rho_{nf}}{\rho_{f}} = (1-\lambda) + \lambda \frac{\rho_{s}}{\rho_{f}}, \quad \alpha_{3} = \frac{(\rho\beta)_{nf}}{(\rho\beta)_{f}} = (1-\lambda) + \lambda \frac{(\rho\beta)_{s}}{(\rho\beta)_{f}},$$

$$\alpha_{4} = \frac{(\rho\beta^{*})_{nf}}{(\rho\beta^{*})_{f}} = (1-\lambda) + \lambda \frac{(\rho\beta^{*})_{s}}{(\rho\beta^{*})_{f}}, \quad \alpha_{5} = \frac{\sigma_{nf}}{\sigma_{f}} = \left(1 - \frac{3(1 - (\sigma_{s}/\sigma_{f}))\lambda}{(2 + (\sigma_{s}/\sigma_{f})) + (1 - (\sigma_{s}/\sigma_{f}))\lambda}\right),$$

$$\alpha_{6} = \frac{(\rho C_{p})_{nf}}{(\rho C_{p})_{f}} = (1-\lambda) + \lambda \frac{(\rho C_{p})_{s}}{(\rho C_{p})_{f}}, \quad \alpha_{7} = \frac{k_{nf}}{k_{f}} = \frac{1 + (2k_{f}/k_{s}) + 2\lambda(1 - (k_{f}/k_{s}))}{1 + (2k_{f}/k_{s}) - \lambda(1 - (k_{f}/k_{s}))},$$

$$\alpha_{8} = \frac{D_{nf}}{D_{f}} = (1-\lambda), \quad \beta_{1} = \frac{1}{\alpha_{5}}, \quad \beta_{2} = \frac{\alpha_{6}}{\alpha_{7}}, \quad \beta_{3} = \frac{1}{\alpha_{7}}, \quad \beta_{4} = \frac{1}{\alpha_{8}}, \quad Y_{1} = \frac{y_{1}}{y_{0}}, \quad Y = \frac{y_{3}}{y_{0}}, \quad V = \frac{v}{v_{0}},$$

$$T = \Omega \tau, \quad f = n/\Omega, \quad H = \frac{(\Omega/v_{f})^{1/2}h}{\sigma_{f}\mu_{e}v_{0}h_{0}}, \quad P = \frac{p}{\rho_{f}\Omega v_{0}y_{0}}, \quad \Theta = \frac{(\theta - \theta_{l})}{(\theta_{r} - \theta_{l})}, \quad \Phi = \frac{(\phi - \phi_{l})}{(\phi_{r} - \phi_{l})}.$$

Implementing of the Equations (19) to the consequential flow model Equations (16), (17), (13) and (14), we attain

$$\alpha_{2} \frac{\partial V}{\partial T} = -\frac{\partial P}{\partial Y_{1}} + Ek\alpha_{1} \left( \frac{\partial^{2} V}{\partial Y^{2}} - \frac{V}{Kp} \right) + 2\alpha_{m}^{2} Ek^{1/2} \frac{\partial H}{\partial Y} - 2i\alpha_{2} V + Ek\left(\alpha_{3} G_{\Theta} \Theta + \alpha_{4} G_{\Phi} \Phi\right), \tag{20}$$

$$Pm\frac{\partial H}{\partial T} = Ek^{1/2}\frac{\partial V}{\partial Y} + Ek\beta_1(1 - iHc)\frac{\partial^2 H}{\partial Y^2},\tag{21}$$

$$\frac{\Pr \beta_2}{Ek} \frac{\partial \Theta}{\partial T} = \frac{\partial^2 \Theta}{\partial Y^2} - N^2 \beta_3 \Theta, \tag{22}$$

$$\frac{Sc\beta_4}{Ek}\frac{\partial\Phi}{\partial T} = \frac{\partial^2\Phi}{\partial Y^2} - Hp\,\beta_4\Phi,\tag{23}$$

where the symbols Ek,  $\alpha_m$ , Kp,  $G_{\Theta}$ ,  $G_{\Phi}$ , Pm, Pr,  $N^2$ , Sc and Hp, are, respectively stands for the Ekman number, magnetic interaction constant, permeability constant, thermal Grashof number, solutal Grashof number, magnetic Prandtl number, Prandtl number, heat source (absorption/radiation) constant, Schmidt number and first order chemical reaction constant, and these expressed in mathematical forms as

$$Ek = \frac{v_f}{\Omega y_0^2}, \quad \alpha_m = \left(\frac{\sigma_f}{2\rho_f \Omega}\right)^{1/2} h_0, \quad Kp = \frac{k_p}{y_0^2}, \quad G_\Theta = \frac{g \beta_f y_0^2 (\theta_r - \theta_l)}{v_f v_0},$$

$$G_\Phi = \frac{g \beta_f^* y_0^2 (\phi_r - \phi_l)}{v_f v_0}, \quad Pm = \frac{v_f}{v_m}, \quad \Pr = \frac{v_f (\rho C_p)_f}{k_f}, \quad N_l^2 = \frac{R y_0^2}{k_f}, \quad Sc = \frac{v_f}{D_f}, \quad Hp = \frac{Cr y_0^2}{D_f}.$$
(24)

Use of the dimensionless transformation rules (19) convert the designated boundary conditions (BCs) at contact walls of the symmetric channel to the form given below

$$V = H = \Theta = \Phi = 0, at Y = -1/2;$$

$$V = \Theta = \Phi = 1 + \varepsilon \cos(fT), \frac{\partial H}{\partial Y} = 0, \text{ at } Y = 1/2.$$
(25)

#### 3 | SOLUTION OF THE FLOW MODEL

An analytical approach is followed out to extract the solutions of the resulting non-dimensional flow model (20)-(23) along with the BC's (25). To achieve this important goal, the pressure drop is assumed to be constant and expressed as

$$\frac{\partial P}{\partial Y} = P_0 \left( 1 + \frac{\varepsilon}{2} \left( e^{i f T} + e^{-i f T} \right) \right), \tag{26}$$

where  $P_0$  is a constant.

The solutions of the flow velocity, motional generated magnetic field, fluid temperature and fluid concentration are assumed to be of the following form due to oscillatory nature of the flow

$$V(Y,T) = V_{s0}(Y) + \frac{\varepsilon}{2} \left( V_{s1}(Y)e^{i f T} + V_{s2}(Y)e^{-i f T} \right), \tag{27}$$

$$H(Y,T) = H_{s0}(Y) + \frac{\varepsilon}{2} \left( H_{s1}(Y)e^{i f T} + H_{s2}(Y)e^{-i f T} \right), \tag{28}$$

$$\Theta(Y,T) = \Theta_{s0}(Y) + \frac{\varepsilon}{2} \left( \Theta_{s1}(Y)e^{ifT} + \Theta_{s2}(Y)e^{-ifT} \right), \tag{29}$$

$$\Phi(Y,T) = \Phi_{s0}(Y) + \frac{\varepsilon}{2} \left( \Phi_{s1}(Y) e^{i f T} + \Phi_{s2}(Y) e^{-i f T} \right). \tag{30}$$

Employing the pressure drop (26) and assumed solutions (27) and (30) to the resulting non-dimensional flow model (20)-(23), these yield the following system of the equations

$$Ek\alpha_1 V_{s0}^{"} - \left(\frac{Ek\alpha_1}{Kp} + 2i\alpha_2\right) V_{s0} + 2\alpha_m^2 Ek^{1/2} H_{s0}^{"} = -P_0 - Ek(G_{\Theta}\alpha_3 \Theta_{s0} - G_{\Phi}\alpha_4 \Phi_{s0}), \tag{31}$$

$$Ek\alpha_{1}V_{s1}^{"} - \left(\frac{Ek\alpha_{1}}{Kp} + i(f+2)\alpha_{2}\right)V_{s1} + 2\alpha_{m}^{2}Ek^{1/2}H_{s1}^{"} = -P_{0} - Ek(G_{\Theta}\alpha_{3}\Theta_{s1} - G_{\Phi}\alpha_{4}\Phi_{s1}), \tag{32}$$

$$Ek\alpha_1 V_{s2}^{"} - \left(\frac{Ek\alpha_1}{Kp} - i(f-2)\alpha_2\right) V_{s2} + 2\alpha_m^2 Ek^{1/2} H_{s2}^{"} = -P_0 - Ek(G_\Theta \alpha_3 \Theta_{s2} - G_\Phi \alpha_4 \Phi_{s2}), \tag{33}$$

$$Ek\beta_1(1-iHc)H_{s0}^{"} + Ek^{1/2}V_{s0}^{"} = 0, (34)$$

$$Ek\beta_1(1 - iHc)H_{s1}'' - if PmH_{s1} + Ek^{1/2}V_{s1}' = 0, (35)$$

$$Ek\beta_1(1-iHc)H_{s2}'' + if PmH_{s2} + Ek^{1/2}V_{s2}' = 0,$$
(36)

$$\Theta_{s0}^{"} - N^2 \beta_3 \Theta_{s0} = 0, \tag{37}$$

$$Ek\Theta_{s1}^{"} - (N^2\beta_3 Ek + i f \Pr \beta_2) \Theta_{s1} = 0,$$
(38)

$$Ek\Theta_{s2}^{"} - (N^2\beta_3 Ek - if \Pr \beta_2)\Theta_{s2} = 0,$$
(39)

$$\Phi_{s0}^{\prime\prime} - Hp\beta_4 \,\Phi_{s0} = 0,\tag{40}$$

$$Ek\Phi_{s1}'' - (E_k H p + i f S c) \beta_4 \Phi_{s1} = 0, \tag{41}$$

$$Ek\Phi_{s2}^{"} - (E_k H p - i f S c)\beta_4 \Phi_{s2} = 0, \tag{42}$$

The assumed solutions satisfy the following BCs

$$V_{s0} = V_{s1} = V_{s2} = 0, \ H_{s0} = H_{s1} = H_{s2} = 0,$$
 at  $Y = -1/2$ ;  

$$\Theta_{s0} = \Theta_{s1} = \Theta_{s2} = 0, \ \Phi_{s0} = \Phi_{s1} = \Phi_{s2} = 0,$$

$$V_{s0} = V_{s1} = V_{s2} = 1, \ \frac{\partial H_{s0}}{\partial Y} = \frac{\partial H_{s1}}{\partial Y} = \frac{\partial H_{s2}}{\partial Y} = 0,$$

$$\Theta_{s0} = \Theta_{s1} = \Theta_{s2} = 1, \ \Phi_{s0} = \Phi_{s1} = \Phi_{s2} = 1,$$
 at  $Y = 1/2$ . (43)

The system of the Equations (31) to (42) are solved accordance to the BCs (43) and the solution system are presented in condensed form as

$$V_{s0} = \frac{\sinh\left(L_{0}\left(Y + \frac{1}{2}\right)\right)}{\sinh(L_{0})} + \frac{G_{0}\beta_{6}}{(A_{0}^{2} - L_{0}^{2})} \left\{ \frac{\sinh\left(L_{0}\left(Y + \frac{1}{2}\right)\right)}{\sinh(L_{0})} - \frac{\sinh\left(A_{0}\left(Y + \frac{1}{2}\right)\right)}{\sinh(A_{0})} \right\} + \frac{G_{0}\beta_{7}}{(B_{0}^{2} - L_{0}^{2})} \left\{ \frac{\sinh\left(L_{0}\left(Y + \frac{1}{2}\right)\right)}{\sinh(L_{0})} - \frac{\sinh\left(B_{0}\left(Y + \frac{1}{2}\right)\right)}{\sinh(B_{0})} \right\} + K_{01} \left[1 - \frac{\cosh(L_{0}Y)}{\cosh\left(\frac{L_{0}}{2}\right)}\right], \tag{44}$$

$$V_{si} = \frac{\sinh\left(L_{i1}\left(Y + \frac{1}{2}\right)\right)}{\sinh(L_{i1})} + K_{i1} \left\{ \cosh\left(L_{i2}Y\right) - \frac{\cosh(L_{i1}Y)\cosh\left(\frac{L_{i2}}{2}\right)}{\cosh\left(\frac{L_{i1}}{2}\right)} \right\} + \frac{Y_{i3}P_{0}}{EY_{i2}} \left\{ 1 - \frac{\cosh(L_{0}Y)}{\cosh\left(\frac{L_{i1}}{2}\right)} \right\} + \frac{G_{0}(A_{i}^{2}\beta_{6} - Y_{i3}\alpha_{3})}{\cosh\left(A_{i}^{2} + Y_{i2}\right)} \left\{ \frac{\sinh\left(L_{i1}\left(Y + \frac{1}{2}\right)\right)}{\sinh(L_{i1})} - \frac{\sinh\left(A_{i}\left(Y + \frac{1}{2}\right)\right)}{\sinh(A_{i})} \right\} + \frac{G_{0}(A_{i}^{2}\beta_{6} - Y_{i3}\alpha_{4})}{(B_{i}^{4} - Y_{i1}A_{i}^{2} + Y_{i2})} \left\{ \frac{\sinh\left(L_{i1}\left(Y + \frac{1}{2}\right)\right)}{\sinh(L_{i1})} - \frac{\sinh\left(B_{i}\left(Y + \frac{1}{2}\right)\right)}{\sinh(B_{i})} \right\}, \quad i = 1, 2$$

$$H_{s0} = \frac{1}{2\alpha_{m}^{2}E^{k^{1/2}}} \left[ (K_{01}E_{2} - P_{0})Y + K_{02} + E_{3} \left\{ \frac{\cosh\left(L_{0}\left(Y + \frac{1}{2}\right)\right)}{L_{0}\sinh(L_{0})} - \frac{K_{01}\sinh(L_{0}Y)}{L_{0}\cosh\left(\frac{L_{0}}{2}\right)} + \frac{G_{0}\beta_{6}}{(A_{0}^{2} - L_{0}^{2})} \left\{ \frac{\cosh\left(L_{0}\left(Y + \frac{1}{2}\right)\right)}{L_{0}\sinh(L_{0})} - \frac{\cosh\left(B_{0}\left(Y + \frac{1}{2}\right)\right)}{B_{0}\sinh(A_{0})} \right\} \right\}$$

$$+ \frac{G_{0}\beta_{6}}{(A_{0}^{2} - L_{0}^{2})} \left\{ \frac{\cosh\left(L_{0}\left(Y + \frac{1}{2}\right)\right)}{L_{0}\sinh(L_{0})} - \frac{\cosh\left(B_{0}\left(Y + \frac{1}{2}\right)\right)}{B_{0}\sinh(B_{0})} \right\} \right\}, \quad (45)$$

$$H_{si} = \pm \frac{1}{2\alpha_{m}^{2}Ek^{1/2}} \left[ \frac{M_{i1}\cosh\left(L_{i1}\left(Y + \frac{1}{2}\right)\right)}{\sinh(L_{i1})} + K_{i1} \left\{ M_{i2}\sinh(L_{i2}Y) - \frac{M_{i1}\cosh\left(\frac{L_{i2}}{2}\right)\sinh(L_{i1}Y)}{\cosh\left(\frac{L_{i1}}{2}\right)} \right\} \right.$$

$$+ K_{i1} \left\{ M_{i2}\cosh(L_{i2}Y) - \frac{M_{i1}\sinh\left(\frac{L_{i2}}{2}\right)\cosh(L_{i1}Y)}{\sinh\left(\frac{L_{i1}}{2}\right)} \right\} - \frac{Y_{i3}P_{0}}{E_{k}} \frac{M_{i1}\sinh(L_{i1}Y)}{\cosh\left(\frac{L_{i1}}{2}\right)}$$

$$+ \frac{G_{\Theta}(A_{i}^{2}\beta_{6} - Y_{i3}\alpha_{3})}{(A_{i}^{4} - Y_{i2}A_{i}^{2} + Y_{i2})} \left\{ \frac{M_{i1}\cosh\left(L_{i1}\left(Y + \frac{1}{2}\right)\right)}{\sinh(L_{i1})} - \frac{P_{i1}\cosh\left(A_{i}\left(Y + \frac{1}{2}\right)\right)}{\sinh(A_{i})} \right\}$$

$$+ \frac{G_{\Phi}(B_{i}^{2}\beta_{7} - Y_{i3}\alpha_{4})}{(B_{i}^{4} - Y_{i2}B_{i}^{2} + Y_{i2})} \left\{ \frac{M_{i1}\cosh\left(L_{i1}\left(Y + \frac{1}{2}\right)\right)}{\sinh(L_{i1})} - \frac{Q_{i1}\cosh\left(B_{i}\left(Y + \frac{1}{2}\right)\right)}{\sinh(B_{i})} \right\} \right], \qquad i = 1, 2.$$

$$(47)$$

$$\Theta_{si} = \frac{\sinh\left(A_i\left(Y + \frac{1}{2}\right)\right)}{\sinh(A_i)}, \quad i = 0, 1, 2$$
(48)

$$\Phi_{si} = \frac{\sinh\left(B_i\left(Y + \frac{1}{2}\right)\right)}{\sinh(B_i)}, \quad i = 0, 1, 2$$

$$\tag{49}$$

In the Equation (47) the +*ive* sign appear when i = 1 and -*ive* sign will arrive when i = 2. The constants present in the solutions (44) to (49) are given in the Appendix. The flow velocity, motional generated magnetic field, temperature field and concentration field are finally attained on employing the solutions (44) to (49) to the assumed solutions (27) to (30).

# 3.1 | The quantities of physical interest

The wall shear stress (WSS) at the left and right walls are derived with the assistance of Equations (27), (44) and (45), which are as follows

$$\tau_{wl} = \tau_{wly_1} + i\tau_{wly_2} = -\left\{V'_{s0}\left(-\frac{1}{2}\right) + \frac{\varepsilon}{2}\left(V'_{s1}\left(-\frac{1}{2}\right)e^{ifT} + V'_{s2}\left(-\frac{1}{2}\right)e^{-ifT}\right)\right\},\tag{50}$$

$$\tau_{wr} = \tau_{wry_1} + i\tau_{wry_2} = -\left\{ V'_{s0} \left( \frac{1}{2} \right) + \frac{\varepsilon}{2} \left( V'_{s1} \left( \frac{1}{2} \right) e^{ifT} + V'_{s2} \left( \frac{1}{2} \right) e^{-ifT} \right) \right\}. \tag{51}$$

The rate of heat transport (RHT) at the left and right walls are derived with the assistance of Equations (29) and (48), which are as follows

$$Nu_{l} = -\left\{ \frac{A_{0}}{\sinh(A_{0})} + \frac{\varepsilon}{2} \left( \frac{A_{1}}{\sinh(A_{1})} e^{ifT} + \frac{A_{2}}{\sinh(A_{2})} e^{-ifT} \right) \right\}, \tag{52}$$

$$Nu_{r} = -\left\{ \frac{A_{0}\cosh(A_{0})}{\sinh(A_{0})} + \frac{\varepsilon}{2} \left( \frac{A_{1}\cosh(A_{1})}{\sinh(A_{1})} e^{ifT} + \frac{A_{2}\cosh(A_{2})}{\sinh(A_{2})} e^{-ifT} \right) \right\}.$$
 (53)

The rate of mass transport (RMT) at the left and right walls are derived with the assistance of Equations (29) and (48), which are as follows

$$Sh_{l} = -\left\{ \frac{B_{0}}{\sinh(B_{0})} + \frac{\varepsilon}{2} \left( \frac{B_{1}}{\sinh(B_{1})} e^{ifT} + \frac{B_{2}}{\sinh(B_{2})} e^{-ifT} \right) \right\}, \tag{54}$$

# 4 | RESULTS AND DISCUSSION

The nature of flow velocity, motional generated magnetic field, temperature field and concentration field are inspected with the support of graphs (Figures 2–7). Further the quantities of physical interest such as wall shear stress (WSS), rate of heat transport (RHT) and rate of mass transport (RMT) are also computed for the significant flow parameters and these are expressed in the form of tables (Tables 2 and 3). The graphs and tabular values are generated with the computation of the analytical solutions extracted in the previous section. During the execution of the computational work, the parameter values are taken to be constant as  $\lambda = 0.02$ , Hc = 0.25, Pm = 0.7, Ek = 0.5,  $\alpha_m^2 = 5$ , Ek = 0.5, Ek = 0

# 4.1 | Nature of flow velocity, motional generated magnetic field, temperature field and concentration field

Figures 2-7 explores the nature of flow velocity, motional generated magnetic field, temperature field and concentration field for significant parameters. The nature of flow velocity, motional generated magnetic field, temperature field and concentration field for volume concentration of nanofluid are presented in Figure 2. The volume concentration of nanofluid produces resistivity in the flow and tends to slow down the fluid flow. Further it enhances the motional generated magnetic field in the principal direction of the fluid flow and lowers the fluid temperature and concentration. Figure 3 confirms the nature of flow velocity and motional generated magnetic field for Hall current. Hall current stabilizes the main flow

Nature of flow velocity, motional generated magnetic field, temperature field and concentration field for f.

as its direction is normal to main flow and implemented magnetic field. It tends to fasten the secondary flow because it arises due revolving of charged fluid particles about the lines of implemented magnetic field. The nature of secondary flow near the surface Y = -1/2 is opposite because the surface Y = -1/2 is kept fixed while the surface Y = 1/2 is oscillating. Hall current significantly alter the nature of motional magnetic field. It lead to a significant growth in the secondary motional generated magnetic field while it brings drop in the principal motional generated magnetic field. The nature of flow velocity and motional generated magnetic field for magnetic Prandtl number are explored in the Figure 4. Magnetic Prandtl number has an inverse relation with magnetic viscosity (magnetic diffusivity) and has direct relation with the conductivity of the fluid. On enhancing magnetic diffusivity, magnetic Prandtl number diminishes while it grows with the conductivity of the fluid. As Figure 4 explores the magnetic Prandtl number boost the flow velocity, it indicates that magnetic diffusion brings rigidness in the flow and lessens the flow velocity. Further, magnetic diffusion weakens the strength of the primarily motional induced magnetic field. Figure 5 characterizes the nature of flow velocity, motional generated magnetic field, temperature field and concentration field for Ekman number, which is reciprocal of rotation parameter. It can be easily noted that the Ekman number lessens the flow velocity, that is, the revolving of the flow system tends to improve the flow velocity by inducing a gyratory force called Coriolis force in a direction which is normal to the primary flow. Revolving of the flow system further improves the secondarily motional generated magnetic and primarily motional generated magnetic field in the left half region near the surface Y = -1/2. The temperature and concentration are also get improvise by the rotation of the system. The magnetic interaction effect on the nature of flow velocity and motional generated magnetic field are demonstrated in the Figure 6. In general, the interaction of the magnetic field to the moving conducting fluid tends to control the flow by generating a drag force called Lorentz force. In this problem, we can see the same nature of the magnetic interaction parameter on the flow velocity except for the main flow in a narrow region near the surface Y = -1/2. This may be due to alternative non-conducting and coducting walls of the channel.

Furthermore the magnetic interaction expresses a diminishing trend on the motional induced magnetic field. The nature of flow velocity, motional generated magnetic field, temperature field and concentration field for oscillation frequency are explored in Figure 7. The fluid moves faster on incrementing the oscillation frequency of the right surface Y = 1/2. The motional generated magnetic field get enhanced in the left region of the channel while it weaken in the right region near the surface Y = 1/2 on elevating the oscillation frequency. The temperature and concentration are uplifted by the oscillation of the right surface Y = 1/2.

# 4.2 Nature of the quantities of physical interests such as wall shear stress (WSS), rate of heat transport (RHT) and rate of mass transport (RMT)

The nature of WSS, RHT and RMT at the surfaces Y = -1/2 and Y = 1/2 of the symmetric channel are explored for significant parameters and presented in the form of the tabular values in Tables 2 and 3. Table 2 explores the WSS values in the directions of principal and secondary flows at the surfaces Y = -1/2 and Y = 1/2. The tabular values of WSS for volume concentration of nanofluid express that enhancing values of volume concentration of nanofluid employ more WSS at the surface Y = -1/2. This behavior is opposite at the wall surface Y = 1/2. The tabular values of WSS for Hall current show that Hall current lead to reduce the WSS at the surfaces Y = -1/2 and Y = 1/2 along the principal flow. Along the secondary flow, the WSS value at the surface Y = 1/2 get ehance with Hall current. It can be noticed from the tabular values of WSS for magnetic Prandtl number that magnetic Prandtl number lead to upsurge the WSS at the surfaces Y = -1/2 and Y = 1/2 and hence the electrical conductivity of the nanofluid. We can further conclude the magnetic diffusivity (magnetic viscosity) uphold the diminishing nature to the WSS at the surfaces Y = -1/2 and Y = 1/2. The tabular values of WSS for Ekman number explores that Ekman number lessens the WSS at the surfaces Y = 1/2.

15214001, 0, Downloaded from https://onlinelibrary.wiley.com/doi/10.1002/zamm.202300216 by King Fahd University Of Petroleum And Minerals, Wiley Online Library on [09/07/2023]. See the Terms and Condit

-1/2 and Y=1/2. Since it is reciprocal of rotation parameter, thus we can state that the revolving of the system incraese the WSS at the surfaces Y=-1/2 and Y=1/2. The tabular values of WSS for magnetic intercation parameter apprises that the WSS value at the surface Y=-1/2 along the main flow rise up with the magetic field strength while the WSS at the surface Y=1/2 goes down with the magetic field strength. The tabular values of WSS for oscillation frequency expresses that oscillation frequency caused to rise the WSS at the surfaces Y=-1/2 and Y=1/2. The RHT and RMT values at the surfaces Y=-1/2 and Y=1/2 are presented in the Table 2. The tabular values of RHT and RMT for volume concentration of nanofluid exhibits that the volume concentration of nanofluid lessens RHT and RMT at the surface Y=-1/2 while it grows the RHT and RMT at the surface Y=1/2. The tabular values of RHT and RMT for Ekman number and oscillation frequency discovers that revoving of the flow system and oscillation frequency have a tendency to boost the RHT and RMT at the surface Y=-1/2 while these have a converse nature on RHT and RMT at the surface Y=1/2.

# 5 | CONCLUSION

In this study, the heat and mass transport in oscillatory hydromagnetic Titanium alloy suspended water nanofluid flow within two vertical alternatively non-conducting and conducting walls enclosing Darcy-Brinkman porous medium is examined. The motional induction effect and Hall phenomenon are also explored. The flow nature is systematically examined through the numerical computation of the extracted analytical solution solutions. The results derived from this research investigation is supportive in studying the heat and mass transport nature of nanofluids and consequences of motional induction, Hall current, revolving of the flow system and oscillations on these. The explored results may find significant chemical and thermal engineering applications. The noteworthy features of the flow are highlighted below:

- The volume concentration of nanofluid produces resistivity in the flow and tends to slow down the fluid flow. It enhances the motional generated magnetic field in the principal direction of the fluid flow and lowers the fluid temperature and concentration.
- Hall current stabilizes the main flow as its direction is normal to main flow and implemented magnetic field. It significantly grows the secondary motional generated magnetic field while it brings drop in the principal motional generated magnetic field.
- Magnetic diffusion brings rigidness in the flow and lessens the flow velocity. It weakens the strength of the primarily motional induced magnetic field.
- Revolving flow system tends to improve the flow velocity by inducing a gyratory force along secondary flow. Further it improves the secondarily motional generated magnetic.

#### Abstract:

Modern businesses can't function without good corporate governance, which establishes ground rules for interactions among shareholders, managers, and executives. The capacity of a corporation to attract investment and capital is examined in light of the large body of research on corporate governance practises. Corporate governance procedures that work have been shown time and time again to increase a company's chances of attracting investment and financing. Investor trust is bolstered by a company's commitment to good governance practises including openness, accountability, and ethics. Companies with these characteristics tend to have better financial results, a lower cost of capital, and higher market values. Further bolstering the connection between governance and investment attractiveness is the fact that institutional investors, who play a crucial role in capital markets, are attracted to enterprises with solid governance. In addition to the monetary gains, a firm may reap other advantages from good corporate governance, such as lower agency costs and more resilience in the face of adversity. As a result, this is attractive to conservative investors. In addition, being compliant with established governance norms opens the door to international investment.

Keywords: capital, corporate governance, investment, practices, stakeholders

# Introduction

The term "corporate governance" is used to describe the framework for leading and managing a corporation.

Robust corporate governance standards establish a conducive atmosphere characterized by trust and accountability, hence playing a pivotal role in attracting investment and capital. Investors are inclined to allocate their capital towards organizations that demonstrate characteristics such as transparency, effective management, ethical conduct, and a dedication to generating long-term value. In the contemporary investment landscape, the implementation of efficient corporate governance practices is not solely a legislative obligation, but also confers a competitive advantage.

To protect the interests of its owners, workers, customers, suppliers, and the society at large, it entails a set of principles and methods meant to guarantee the business acts in a transparent, responsible, and ethical way(Nalina & M, 2021). Attracting investment and finance requires sound company governance standards that inspire trust and confidence among potential backers.

Corporate governance policies and their effect on luring investors and other sources of money are summarised here:

1. Need of Corporate Governance: Good corporate governance is essential in today's competitive business environment. It lays forth the ground rules for how a company's leadership, board of directors, and stockholders will interact with one another(Sweta Agarwal, 2020). Trust, credibility, and reduced risk through good corporate governance standards are all essential to attracting investment and money.

- **2.** Accountability and Openness: Transparency is a cornerstone of good governance in the business world. Investors need timely and accurate information about a company's financial performance, strategic direction, and risks, all of which may be provided via transparent reporting(Singh & Bansal, 2020). Investors are more willing to put money into businesses that are transparent and responsible, thus this openness is beneficial.
- **3. Protecting the Interests of Shareholders:** Shareholders in particular are more likely to invest in a company that guarantees their rights. Effective corporate governance measures, such as annual general meetings and proxy voting, provide shareholders a voice in the company's most consequential decisions. This boosts faith among financiers and inspires more money to flow in.
- **4. Taking Precautions:** The methods of good corporate governance place a premium on minimising and managing risks. The likelihood of unanticipated, unfavourable outcomes that might hurt investor interests is reduced when a company has strong governance procedures in place to detect and handle risks proactively. Companies with a strong emphasis on risk management often attract a larger pool of investors(Almaqtari, Al-Hattami, Al-Nuzaili, & Al-Bukhrani, 2020).
- **5. Moral Principles and Civic Duties:** Risk management and reduction are essential tenets of good corporate governance processes. Companies with strong governance systems are better able to anticipate and prevent undesirable outcomes that might affect investor interests. Companies that place a premium on risk management tend to attract more investors(Pillania, 2012).
- **6. Developing Sustainable Value:** One characteristic of good corporate governance is a commitment to the long term rather than to immediate profits. Institutional investors and other stakeholders are more likely to support a company that has long-term sustainability and shareholder value as a top priority(Almaqtari et al., 2020).
- 7. Conformity with Regulations: In addition to being required by law in many regions, a company's demonstrated dedication to corporate governance norms and laws is reassuring to investors and other stakeholders. Attracting institutional investors with a rigorous due diligence process requires conformity with these requirements (Nugroho, 2021).

A company's capacity to attract investors and get access to cash is significantly impacted by its corporate governance policies. The confidence of investors, the mitigation of risks, and the creation of a climate favourable to investment may all be achieved by a company building a foundation of openness, accountability, and ethical conduct. Therefore, in today's competitive company environment, good corporate governance is not merely a legal need, but rather a strategic necessity.

Table 1: Role of Corporate Governance Practices to Attract Investment and Capital

Disclosure & Openness to the Public	Impact Practices	The impact of this is that investors view as more trustworthy and less hazardous the businesses that give financial reporting that is both transparent and complete, as well as provide pertinent information about their operations.  The following should be considered best practices: regular and timely financial
		reporting, including audited financial statements; disclosure of substantial risks; and transparent communication with shareholders and stakeholders.
Independence of the Board of Directors and Expertise	Impact	Increasing investor trust and providing effective supervision and decision-making are both possible outcomes of having an independent board of directors with a varied set of expertise and experience.
	Practices	Appointing independent directors, ensuring a diverse board composition, and having specialized committees (such as audit, remuneration, and governance) to monitor essential functions are all practices that are commonly followed.
Participation of Shareholders and Related Matters	Impact	Increasing investor trust and luring long-term investors can be accomplished through safeguarding shareholder rights and promoting engagement on the part of shareholders.
	Practices	Implementing proxy voting rights, organizing shareholder meetings, and actively interacting with shareholders to address their problems and solicit their feedback are all practices that are commonly used.

Business Procedures That Are Both Ethical and Responsible	Impact Practices	Companies that place a high priority on ethics, social responsibility, and sustainable practices have a better chance of attracting ethical and impact investors whose beliefs are compatible with their own.  Developing and enforcing a code of ethics, embracing environmentally responsible corporate practices, and reporting on ESG (environmental, social, and governance) metrics are all examples of practices.
Administration of Risk	Practices Practices	Employing strategies that are effective in risk management has the ability to lower the amount of uncertainty and potential loss for investors.  Establishing risk oversight committees, identifying and reducing risks, and keeping a proper amount of insurance coverage are all practices that should be followed.
The Compensation of Executives	Impact	The impact of this is that compensation arrangements for executives that are both transparent and based on performance can help align management's interests with those of shareholders.
	Practices	Practices include revealing the specifics of executive remuneration, linking executive pay to performance measures within the company, and requesting approval for compensation packages from shareholders.
Assurance of Conformity with the Requirements of	Impact	Companies that comply with all applicable laws and regulations have a lower risk of running into trouble with the law and regulators, which makes them more appealing to investors.
Applicable Laws and Regulations	Practices	Monitoring and guaranteeing compliance with all applicable laws and regulations, including those pertaining to the filing of financial reports, on a regular basis is one of the practices.
Planning and Strategy on a Long-Term Basis	Impact	Showing that you have a clear and workable strategy for the long term will attract investors who are seeking for opportunities for sustainable growth.
	Practices	Creating and disseminating a comprehensive strategic plan that outlines both the allocation of cash and the efforts for business expansion are practices.

#### **Review of Literature:**

When looking at the literature on corporate governance practises and their effect on attracting investment and capital, a lot of data supports the idea that good corporate governance helps a firm attract investment and money. The most important results from this study are summarised below:

Multiple studies have shown a link between good company governance and increased profits. Investors are drawn to companies with strong governance systems because they provide better returns on investment (Verma, S., 2019). Consistent with the findings of the academic community, corporate governance includes openness and disclosure as essential features(Hopt, 2011). Companies that earn investors' confidence by consistently providing detailed and reliable reports often see an uptick in capital funding(Brown & Caylor, 2021).

(Joshi, A. B., 2019) observed that corporate governance has gained significant attention and prominence within the Indian corporate landscape. Nevertheless, there have been recurring concerns regarding the efficacy of corporate governance practices in Indian corporations. From a historical perspective, corporate governance has been regarded as a collection of rules or norms that dictate the manner in which a corporation is governed. The implementation of this strategy guarantees that the corporation operates in accordance with its intended objectives, hence facilitating the attainment of desired outcomes. This framework ensures that firms are held accountable to all stakeholders, including directors, shareholders,

employees, and customers, among others. Corporate governance has been an integral aspect of the Indian corporate sector since its inception. However, the occurrence of recent corporate governance failures, such as those witnessed in the Infrastructure Leasing & Financial Services and Jet Airways cases, among others, has heightened apprehensions regarding the state of corporate governance in India.

Generally, the cost of capital for companies with good corporate governance is lower. Because of the decreased perceived risk, these businesses are able to attract equity investors prepared to accept lower necessary rates of return and get debt financing on more favourable conditions. Capital markets are dominated by institutional investors like pension and mutual funds(O'Sullivan, 2003). Investors like organisations with strong governance frameworks because they are perceived as more responsible with their money. Capital infusions of considerable size may result from attracting institutional investors(Aguilera, Filatotchev, Gospel, & Jackson, 2008).

Given that a significant number of (Sharma et.al., 2019) banks in India operate inside the public sector and encounter competition from the broader financial market, it is imperative for these banks to establish strong corporate governance systems. Banks may potentially face a regulatory requirement to engage in public share offerings, thereby facilitating a transfer of ownership. This article aims to conduct an analysis of the corporate governance practices within the banking industry by evaluating their established criteria. Furthermore, it underscores the importance of corporate governance and its connection to the Indian banking sector. Banks operating in both the private and governmental sectors are adhering to corporate governance principles in order to enhance transparency and mitigate the potential for fraudulent activities and misconduct.

Better corporate governance has been linked to greater stock prices, according to the research. Shares in firms that investors believe are well-governed and hence less likely to experience governance-related problems command a higher price(García-Castro, Aguilera, & Ariño, 2013). Agency expenses may be minimised by the implementation of corporate governance procedures such as independent boards of directors and executive remuneration plans that are in line with shareholder interests. Because of this, cash is used more effectively, and investor trust rises. Company governance refers to the design and implementation of mechanisms that aim to provide transparency, accountability, and the maintenance of an effective communication channel for disclosing and promoting a positive company culture (Vashisht, R., 2021). The primary objective of this research is to investigate the impact of corporate governance on the operational effectiveness of Indian banks. The research design employed in this study was both descriptive and analytical in nature, in order to effectively address the study objective. A total of 350 banking staff members from five private banks in India were selected as respondents for the study. The results indicate that there is a positive relationship between all of the studied variables. The independent variables of transparency and disclosure, as well as auditing and compliance with the law, exhibit a more robust positive correlation with the dependent variables of organizational financial and non-financial success. (Kumari, A., et.al., 2014). This study establishes that corporate governance exerts a substantial impact on the performance of Indian banks, hence assuming a crucial role in enhancing the overall organizational performance.

Risk management is more successful when good corporate governance processes are in place. Investors who are wary of taking unnecessary risks are drawn to businesses that have taken the time to identify and address potential threats to their operations. When making investments, foreign investors often take corporate governance norms into account(Kiranmai & Mishra, 2019). Companies that operate in accordance with generally accepted governance norms have a better chance of gaining access to international capital markets and of attracting investors from outside.

Corporate governance procedures have an impact on merger and acquisition deals. Acquisition bids for companies with solid governance frameworks are more likely to be approved, whereas bids for businesses with questionable practises may be met with shareholder opposition. Institutional investors increasingly favour governance methods that encourage long-term value development because they help provide steady and reliable returns(Roy, 2016). There has been a recent uptick in "ESG" (environmental, social, and governance) investment, and this is in line with that movement. Investment attractiveness is enhanced by the fact that compliance with corporate governance norms and standards is typically a precondition for listing on stock exchanges and access to public capital markets.

#### Research Gap:

Investment and capital-gathering prospects improve dramatically when a business has solid corporate governance standards, according to several studies. There are many factors at play in the connection between good corporate governance and financial success, but the data shows that well-governed businesses are more likely to attract investment. Thus, corporations that place a premium on good corporate governance are in a stronger position to attract the investors they need to develop and expand.

# Objectives of the study:

To identify and assess factors influencing the corporate governance practices and their impact on attracting investment and capital.

To explore quantitively factors influencing the corporate governance practices and their impact on attracting investment and capital.

#### **Hypothesis of the study:**

H01: There are no significant factors influencing the corporate governance practices and their impact on attracting investment and capital.

Ha1: There are significant factors influencing the corporate governance practices and their impact on attracting investment and capital.

## Research Methodology:

The existing study is exploratory and primary and obtained results through responses of 158 respondents as employees. The study aims to identify and explore "the corporate governance practices and their impact on attracting investment and capital." The existing study used SPSS software to analyse quantitively the data collected from the respondents.

#### Result and discussion:

**Table 2: Reliability Statistics** 

Reliability Statistics					
Cronbach's Alpha	N of Items				
.704	7				

Table 2 analysed the reliability statistics of the study and documented the estimated value of Cronbach Alpha which is .704 (N=7). The estimated value is greater than the permissible value of .60. Hence, statistical test can be applied.

**Table 3: Descriptive Statistics** 

Table 5. Descriptive Statistics									
Descriptive Statistics									
	N	Minimum	Maximum	Mean	Std. Deviation				
Need of Corporate	158	1	5	3.76	1.007				
Governance									
Accountability and Openness	158	1	5	3.25	1.135				
Safeguarding Investor Interests	158	1	5	4.51	.707				
Managing Risks	158	1	5	3.83	.985

Accountability and	Between Groups	72.848	4	18.212	15.084	.000
Openness	Within Groups	999.702	153	1.207		
	Total	1072.550	157			
Safeguarding Investor	Between Groups	33.566	4	8.392	18.152	.000
Interests	Within Groups	382.314	153	.462		
	Total	415.880	157			
Managing Risks	Between Groups	107.878	4	26.970	31.989	.000
	Within Groups	697.226	153	.843		
	Total	805.105	157			
Moral Principles and Civic	Between Groups	24.852	4	6.213	18.131	.000
Duties	Within Groups	283.387	153	.343		
	Total	308.239	157			
Developing Sustainable	Between Groups	57.301	4	14.325	33.122	.000
Value	Within Groups	358.106	153	.432		
	Total	415.407	157			
Conformity with	Between Groups	209.627	4	52.407	81.625	.000
Regulations	Within Groups	530.968	153	.642		
	Total	740.595	157			

Table 6 investigated the ANOVA analyses and stated that in case of all the selected variables, the significance value is .000 which is lesser than the permissible value of .005. Therefore, dependent variable that is factors of corporate governance are significantly influence by the independent variables of the existing study.

# Findings of the study

Several major findings are emphasised by the large amount of research and information that was analysed in this study:

- Attracting investors is crucial for the success of any business, and this success is directly tied to good corporate
  governance standards including transparency, accountability, and ethical behaviour. Companies with solid
  governance frameworks are more attractive to investors because they are seen as lower risk and more likely to
  provide sustained profits.
- 2. The cost of capital is often cheaper for companies with strong corporate governance processes. Favourable conditions for debt financing and equity investments are the outcome of investors' willingness to accept lower necessary rates of return for companies that investors trust.
- Companies with good governance standards tend to have better market values. The correlation between good corporate governance and financial success is further strengthened by the fact that investors are ready to pay a premium for stock in such organisations.
- 4. Companies with solid governance systems are more likely to attract institutional investors, who play a significant role in the capital markets. A company's ability to raise funds is greatly improved when institutional investors get interested in its stock.
- Better risk management, together with lower agency costs and more resilience in the face of adversity, is a direct result of sound corporate governance standards. Investors are more at ease knowing this danger has been mitigated.
- 6. Companies that follow best practises in corporate governance have an easier time raising money from investors overseas
- 7. Investors who want to include ethical and responsible factors into their investment choices are increasingly drawn to firms whose governance procedures are aligned with environmental, social, and governance (ESG) values.
- 8. Investors who want steady, lasting returns will appreciate governance methods that prioritise value creation above profit maximisation in the near term.
- 9. In order to get access to public capital markets and be listed on stock exchanges, companies must frequently demonstrate that they comply with corporate governance legislation and standards. For businesses actively seeking investments, compliance with these criteria is essential.

# Conclusion

In conclusion, there is a deep and nuanced connection between corporate governance procedures and their effect on luring investors and financiers. Good corporate governance standards are crucial to a company's capacity to attract investment and capital, and they go well beyond simply compliance with legal mandates. Companies that put a premium on good governance practises have a better chance of achieving long-term development and success in today's highly competitive business environment. Effective corporate governance procedures are projected to remain an important feature for firms of all sizes and in all sectors in attracting investment and capital as the investment environment continues to change.

# Tomato Arrival and Price Prediction of Indian Agricultural Produce Market Committee (APMC)

<sup>1</sup>Dr. B. Venugopal, <sup>2</sup>Dr K. C. Prakash, <sup>3</sup>Dr. Biswo Ranjan Mishra, <sup>4</sup>R. Mythily, <sup>5</sup>Dr. Rakhi Gupta, <sup>6</sup>Dr. Khaja Mohinuddeen J

#### Abstract:

India is a heritage filled agriculture-dependent country. It's necessary to modernize our ancient agricultural practices by providing appropriate circumstances to the farmers. The agricultural transformation is often done via dynamic business proposition that could be a techno-economic method which can be accelerated easily. With the evident development in production technology, input supply, and infrastructure, we are able to see the upward trend in arrivals. The key constraints or factors that influence the prices within the market are due to the arrivals of the selective commodities and their competitive crops. The objectives of this paper is (i) To investigate the trend in arrivals of tomato in Kolar and Chintamanimarket, (ii) To estimate the trend in costs of tomato in Kolar and Chintamani market and (iii) To forecast the market-wise costs of tomato. The analysis reveals the fallouts of the findings: variations in the price level, the governmentnecessity to create buffer stock schemes that may facilitate to stabilize the market value of tomatoes by getting hold suppliers who merchandise once harvests square measure masses, and marketing stocks of the merchandise onto the market once suppliers square measure low. These methods needed high finish technology and infrastructure. The problem of price variations and profit variations are often restrained by tomato retailers by having appropriate inventory management skills. Therefore, to avoid overstocking of tomatoes at a time within the store. This can be attributable to the biodegradable nature of tomato and overstocking of tomato causes spoilage predominantlydue to lack of storage facilities. Henceprecise cold storage should be constructed. The big data should beused to developing tools using artificial intelligence, machine learning to enhance planning and marketing services.

# INTRODUCTION

Agricultural marketing plays a major role in moving of commodities from the farm producer to the consumer and stabilizing the price. The scheduled increase in agricultural production must be corresponding with variations in demand and supply for agric significantly regardless of the quantity of the marketable surplus generated with the farmers. Therefore, in relation to enhanced seed and fertilizer in contemporary agriculture, marketing was rightly regarded as an important input. Instability in price and earnings is common for agricultural products and they fluctuate more than the other industrial goods. Erratic and highly elastic production price leads to an instability in the agricultural commodity prices which thereby influences the income levels of the farmers. This results in the human and the political consequences in a large way. To feed the growing population surplus production in food grain is vital and India has achieved it. But the need for the self-sufficiency in the horticultural produce is equally important to maintain the health of the growing population. The vegetables, regarded as the protective foods, have short duration of growth but has high production and productivity. They can easily fit in diverse locations and systems of farming in addition to being profitable and a high employment generator. India is the world's **second**-largest vegetable producer, contributing around7.18% to vegetable production worldwide and produces more than 40 types of vegetables belonging to different families. (Paarlberg, Robert 1997)

#### **Tomato Global Scenario**

Tomato, belonging to the Solanaceae family, is a major crop that is produced in India and the world with a global production of 152.9 million tons. Commonly referred to as the 'poor man's orange', it is highly nutritious as it has a wide range of essential nutrients. After potato and sweet potato, it is the third largest vegetable crop in the world. Since pre-historic times, tomatoes have been used as food by the people of Central and South America. The World production was 241.92million tonnes of tomato from an area of 58.82 lakh hectares (FAO STAT) in 2017-18. China is the largest tomato producing country in the world, almost contributing for24.6 % of world's tomato production. During 2017-18, China stood first with annual production of 59.63 million tonnes followed by India with 20.71 million tonnes, Turkey with 12.75 million tonnes, USA with 10.91 million tonnes, Egypt with7.30 million tonnes and Iran (Islamic Republic of) with 6.18million tonnes. These six countries contributed for around 73.16 % of world's tomatoes production.

#### **Tomato Indian Scenario**

Tomato has an important place in the country's vegetable production. Area under tomato in India was 8.08 lakh hectares accounting for 7.86% of the total vegetables crop acreage. Annual tomato production in India amounted to 19.69 million tonnes (NHB, 2016-17), 11.25 per cent of total vegetable production. However, the area under tomato has been increasing gradually as production fluctuated owing to weather-related factors. In India, Madhya Pradesh is the leading state that produces 31.02 lakh tonnes of tomato from an area of one lakh hectares. Karnataka is India's 2<sup>nd</sup>largest tomato producing state with 21.38 lakh tonnes of tomato from an area of 0.63 lakh hectares.

#### Tomato Karnataka Scenario

Tomato is produced throughout the yearin Karnataka. The major tomato producing areas are Kolar, Chikkaballapura, Bangalore, Tumkur, Hassan, Haveri, and Davangere.In the state, the total area under tomato was 63.73 thousand hectares with a production base of 21.38 lakh tonnes in 2016-17 (Karnatakastat, 2016-17). An analysis of arrivals and prices of tomatoes would assist to determineincome, constraints and supply response. So, it is essential to analyze the wide fluctuations in prices of tomato and the relationship between arrivals and prices. Market integration describes the relationship between two spatially or temporarily separated markets. The process of determining prices are completely interdepend in an integrated market. The market integration research findings possibly suggest the manufacturers on how much, where and when to sell which will consecutively create an impact on their production policies and therefore the allocation of resources.

### **REVIEW OF LITERATURE:**

Some of research works reveals spatial equilibrium model with endogenous prices is contracted and solve by quadratic mathematical programming method. Six scenarios involving the impacts from transportation costs, tariff, and North American Free Trade Agreement (NAFTA). Impacts on production, consumption, trade flows, prices, and net welfare. Credit to NAFTA, Mexico became the most tomato exporter to the USA. (Impacts on production, consumption, trade flows, prices, and net welfare. Due to NAFTA, Mexico became the main tomato exporter to the USA 2003). Price transmission in Tomatoes. It reveals explores the characteristics of spatial price movements for fresh vegetablesspecial tomato. This is often very useful to policy considerations for fresh vegetables sector(Santeramo, Fabio Gaetano 2015). Results and projection of tomato price in SERBIA. It found that tomato is tremendously most essential vegetable crops in Serbia and average annual production of tomato has been about 174,000 tones. This study is analysis of the changes and thus the longer-term tendencies of the price parameters of tomato in Serbia with aim of forecaster the wheat and tomato price. (Ivanišević, Dragan; Mutavdžić, Beba; Novković, NebojÅ¡a; Vukelić, NataÅja 2015). Price transmission in tomato sector after the Arab Spring. It explains positive relationship with producer, wholesaler and retailer tomato prices. Throughouttremendous market measures that leas price increases with supply chain price decline(Ahmed,Osama 2018). North America tomato market. It found endogenous prices are contracted and solve by quadratic mathematical programming method. Six scenarios involving the impacts from transportation costs, and tariff. Impacts on production, consumption, trade flows, prices, and net welfare. Recognition to NAFTA, Mexico became the most tomato exporter to the USA(NAFTA, Mexico became the main tomato exporter to the USA 2003).Influence of layer on behavior of greenhouse tomatoes in transition from conventional to biological growing greenhouse tomato production(Petkova, Valentina; Filipov, Stoyan; Kostadinov, Kostadin 2013)Rain in Spain falls and UK tomato prices soar. It reveals that heavy rains in Spain have prevented tomato growers from planting, delaying the 2011 tomato season, and raising the prospect of higher prices for both fresh and processed tomatoes(Glotz, Julia 2011). It is reveals that consumers paid \$0.25/lb more for organic fresh tomatoes in the New York Philadelphia market. The organic premiums are estimated to be \$0.14/lb in the Chicago. Francisco markets and \$0.29/lb in the Antonio market. Furthermore, tomato prices consumers paid in 2004 varied by household characteristics, including income, age, and therefore the race and ethnicity of the top of the household(Chung L. Huang &Biing-Hwan Lin. 2007). Research explains the risk in investment in greenhouse tomato production in florida. And concludes behavior if prices and demand in production impacts the risk

availability this production. (Asci,Serhat; VanSickle,John J.; Cantliffe, Daniel J. 2014). It reveals that tomatoprices glut in the U.S.due to whether, tomato growers in flarida developing their crop. In Florida the price farmers receive for a 25-pound box has fallen from \$30 to \$5(Pleven, Liam, and Carolyn Cui. 2010). Tomato prices rocket as season ends prematurely. It reveals that wholesale price movement of several agricultural products worldwide includes tomato, onion and banana(Grocer 2014)research evaluated and recommended evidence rejecting the presence of unit roots at all seasonal frequencies for agricultre; and vegetables. (Aviralkumartiwari, Subhendu Dutta and Aruna Kumar Dash 2017). Paper shows agricultural price policy and stable price environment to farmers in case of pulses and suggests reviewing the pulses by making it sensitive to prevailing market prices. (Ashutosh Kr. Tripathi 2017) It found that Impact of prices influence the income of farmers towards cost of production like cultivation .this research reveals that how best utilized cost and projecting profits earned by farmers in Indian scenario. (Ashutosh Kumar Tripathi 2013). It depicts agro wellbeing practices . (P weligamage) and Competitive revenue price stageris in irrigation cost (P Weligamage).

The research offers information on how tomato prices would be in different months of the year. Such information provides farmers hints to the price behavior in order to make production decisions that are essential. The objectives of the study are toanalyze the trend in arrivals of tomato in Kolar and Chintamani market, to estimate the trend in prices of tomato in Kolar and Chintamani market and to forecast the market –wise prices of tomato.

#### RESEARCH METHODOLOGY:

This section introduces the methodology used in the research which provides insights with on markets, data sources, nature and also the analytical methods applied for the assessments. The crop selected for the research was tomato. According to the Karnataka State Agricultural Marketing Board (KSAMB), Bangalore, Chikkaballapura, Chinthamani, Kolar, Bagepalli and Srinivasapura are the main tomato markets in Karnataka. Because of the availability of continuous time series data for the study period, so I have selected Chintamani and Kolar markets were chosen. Data from secondary sources were acquired for the research. Data such as month, time of arrival, and the price of tomato were grouped from the Krishimaratavahini official website by the Karnataka State Agricultural Marketing Board (KSAMB) Bangalore. KSAMB receives the data from various markets across the state from the corresponding Agricultural Market Committees (APMC 'S). The Board and APMC 'S keep the website up to date by maintain the data of arrival and the prices of regulated agricultural commodities on a daily, weekly, monthly, annual basis. Arrival data refers to total arrivals in quintals during a market place during the month. The worth data used here denotes the month's modal price. Modal price is regarded as superior to the monthly average price, because it epitomizes the commodities marketed on a major percentage in a specific market at a particular month. For the markets under study, the monthly total arrivals and the modal prices date were composed from 2008 till 2018 (11 years). A brief description of statistical tools employed for this study was presented in this section. For studying the short-term, long-term and other periodic fluctuations in arrivals and price of tomato for each market, Time series analysis was employed; and for forecasting of arrivals and price, trend equation model was used.

# RESULT AND DISCUSSION

# Trend of tomato arrival and its price in carefully chosen markets of Karnataka

Time series analysis was employed to review the trends of tomato arrival, its pricing and its review in selected markets, linear models (linear in parameter) *viz.* linear model (straight line), were fitted to the total annual data of arrivals and average prices for the period of 5 years from 2015 to 2019.

To analyze any time series data, we have to check for data structure for their movements in graph. In current study movement of arrivals and prices are represented as below table 1 and graph 1.

Table 1: The below tabel represents the sum of arrivals and average model price for Chintamani market from the year 2015 to 2019.

	201	.5	2016		2017		2018		2019

Graph 1: Indicates the arrivals and price movements of tomato from 2015-2019.

In the above graph we can say that movements of sum of arrivals and average model price are in trend structure. Graph movement indicates inverse relationship.

# Analysis of trend in arrivals of tomato in Chintamani market.

To analyze the trend in arrivals of tomato in Chintamanimarket, five models were fitted and estimates of the parameter of the fitted models are given in Table 4.1. The estimates of parameters of the Trend equation were found to be significant. The fitted trend equation is given below.

Y=a+b\*x, Where, Y= predicted values of arrivals at time point t, X= price, a and b= intercept and slope respectively.

RMSE and  $R^2$  value were considered to check the adequacy of the fitted models. highest  $R^2$  value (60 %) among the significant models. Hence, this model is adequately fitted compared to other models. Actual and predicted values of arrivals by the trend equation are shown in graph 2 and 3.

To analyze the arrival and price trend, firstly the we have to check the correlation between the arrivals and price. So for current study arrivals and price relation is 60 percent which represents that there is a relation between arrivals and prices in Chintamani market. The findings for current correlation study are represented as below.

Table 2: Arrival and price trends

Year	Jan ARR	Price	Price Trend
2015	93994	864.39	1062.98
2016	5315	1540.75	1011.84
2017	30325	825.17	960.70
2018	81697	388.28	909.57
2019	21618	1184.93	858.43
2020	57340		807.29

The above table represents the price trend of tomato in the year 2020. In this table we got the forecasted average model price values for year 2020, where July months accounts for 2149 rupees for one quintal of tomato which is ranks highest average price in the year 2020 and in the month December 2020 accounts for 298 rupees per quintal of tomatoes which is least average model price. And its graph is represented below.

The graph 7 indicates the price forecast trend of tomato in Kolar market in which July month accounts for highest price forecast trend and December month accounts for least value over the year.

### **CONCLUSIONS**

Time series analysis was employed to study the trend in arrivals of tomato. To examine the trend of tomato arrivals followed by the prices of tomato in selected markets, linear models (linear in parameter) *viz.* linear model (straight line), were fitted to the total annual data of arrivals and average prices for the period of 5 years from 2015 to 2019. To analyze any time series data, we have to check for data structure for their movements in graph. In current study movement of arrivals and prices are represented as in table 4 & 5 and graph 3 & 4. To analyze the trend of tomato arrivals and alsothe prices of tomato in selected markets, linear models *viz.* linear model (straight line), Quadratic model, Cubic model and Exponential model, and nonlinear model i.e., sigmoid model were fitted. RMSE and R<sup>2</sup> values were considered to check the adequacy of the fitted models. Among the fitted model's exponential model, quadratic model, quadratic model and sigmoid models are best fitted to prices for Kolar and Chintamani markets respectively. The linear model was best fitted among the fitted models for prices of cotton in all the four selected markets. For forecasting of tomato prices in all the selected markets, the Holt Winter's exponential model and ARIMA models were fitted. The estimates of Holt Winter's model were found to be significant for all the selected markets hence forecasting of prices was done by this method. From the best fitted model forecasting was done for 12 months ahead.

Linear and nonlinear models *viz*. linear, quadratic, cubic, exponential and sigmoid were some of the models fitted to evaluate the trend in arrivals and prices of tomato. This study, 5years monthly arrivals and prices data were collected. For arrivals of tomato, both linear and nonlinear models were best fitted whereas for prices of tomato only linear model was best fitted. The results of this study indicate that there was a huge variation over the different years in the prices of tomato in all the markets. For forecasting of tomato prices, Holt's winter model and ARIMA model were considered in that estimates of Holt Winter's

model were significant in for Kolar and Chikballapure the markets. Best fittedHolt Winter's models selected for different markets. Hence, Holt Winter's models are best to forecast the tomato prices in selected markets.

#### **Abstract**

The term employee engagement is not new but the inducement of technology and reinvention of the HR process makes the term very vibrant and paramount. The future of work is determined majorly by a hybrid work environment. In this state of work method, the employee has to face two situations of working one is off the cubical work and another is on the cubical work. They need to cope with the changes occurring in the work environment hence engaging employees in a hybrid work environment is a very challenging task for every company this is an identified problem statement of the study. Employee engagement is all about the enthusiasm and dedication that an employee shows towards his work. Not all employees have the same level of engagement at all times. It is the biggest challenge for every company to retain employees in understanding the proper engagement of work. If employees are disengaged then the company gets wiped out of skills, knowledge, and experienced candidates. Concerning many literatures reviews the study identified a research gap very few literatures are focused on employee engagement in hybrid work environments. The main objective of the study is to understand the effect of employee engagement in the hybrid work environment. The second objective of the study is to analyze the levels of employee engagement in the hybrid work environment. The identified population is ITES working employees with a sample of 100. Simple random sampling technique, primary data used for data collection. A systematic structured questionnaire with a Likert scale considering 1 as strongly disagree and 7 as strongly agree. Reliability tests, descriptive statistics, chi-square, and regression were used to test the hypothesis and objectives. The study finds employee engagement level is significant in demographic data like age, marital status, and designation and there is a positive effect on employee engagement in the hybrid work environment and concludes that hybrid work is the future of work, companies should focus more on engagement initiatives to keep their employees engaged in a hybrid work place.

**Key Words**: Employee Engagement, Hybrid work Environment, Employee engagement initiatives, Worklife balance and work environment.

Vol 44 No. 10 October 2023

#### **Introduction:**

# **Employee Engagement**

Every company has its strength and employees are one of the most paramount factors which determines the strength of the company. Companies may not like to drain out their employees instead they try to satisfy and retain the talented candidates. In today's fantasy world companies are striving to keep their employees happy, satisfied, and engaged by establishing clear goals, providing facilities, and engagement activities that lead to meaningful work. As per the Gallup Study 2020, globally 20% of employees are engaged at work 14% are disengaged, and the remaining are completely disengaged. There are tons of questions among researchers Why employees must be engaged? Is engagement very much required? Are companies striving towards this concept? As we all know HR 3.0 is associated with technology it's time to reinvent the HR process and workflows are connected with people-centric. Companies are transferring to agile systems the day-to-day work processes are becoming complicated deadlines are fixed to accomplish their targets, The pandemic lifted the different methods of working i.e. hybrid work environment. This bunch of leading factors influence companies to engage their employees and retain them.

The pandemic first catalysed this change in the workplace, which has resulted in a renewed emphasis on how employers engage with their workforces. The transition to hybrid has become a top request from employees since expectations of the modern workplace have changed in many ways. Although business strategies differ from one another, maintaining employees' interest in their organization is a problem that all

companies face. One of the most significant developments of the upcoming year will be the hybrid working environment. According to a survey, 32% of respondents stated they wished to be completely distant. Because working remotely improves flexibility and work-life balance, employees don't want to give up those benefits.

The concept of employee engagement was first introduced by Dr. William Khan in 1990 he says involvement in employee work is identified at three levels a) Physically b) Cognitively c) Emotionally. In 2004 May et al defined engagement how the members as organizations devoted themselves to work not only considering cognition but also the flexibility in emotions and behaviours. In 2005 Wellins & Concelman defined engagement as a mixture of loyalty, productivity, and ownership. In 2006 Saks says that the individual role performance is related to the combination of knowledge, emotion, and behaviour. In 2007 Cha included three dimensions such as work engagement, organisational recognition and sense of work value. In 2008 Macey & Scheider defines there are different types of engagement levels trait engagement , behavioural engagement , psychological state engagement. .In 2022 Schaufeli et.al identified the three levels of work engagement vigor, dedication and absorption. Vigor stand for the high levels of energy and resilience in simple term it also as discretionary effort put by an employee ,while dedication refers to the sense of significance, enthusiasm, pride and inspiration ,while absorption is where an employee is engrossed in work, highly concentrated who feels difficult to detach from work.

# **Levels of Employee Engagement**

There are three levels of engagement identified by Gallup

- Actively engaged employees who are actively engaged will deliver better outcome higher productivity, aware of their roles and enthusiastic about their work
- Not engaged employees accomplish to the said goals or task and never take initiative in doing extra work. At this level employees prefer the status quo over improvements.
- 3. Actively disengaged employees try to switch on jobs frequently, disinterested to do any work, try to skip the assigned work, high absenteeism.

# Hybrid work environment

Hybrid workplace or work environment is defined as a business model combing two models of working process like in office work and remote work or it is also considered as work from home . It is also a flexible approach where employee has split up in their work . It is all about the flexibility working . There are some different type of hybrid work slip up

- Hybrid at-will: Here in this method an employee can choose to come to office any day of his choice to work
- 2. Hybrid split week: In this method of work the company assigns particular day for the team to function
- 3. Hybrid manager -scheduling : Here the manager play a vital role in deciding the particular day for his team to perform
- 4. Hybrid mix: It is the combination of all the above three forms.

Out of all these forms of hybrid work, currently in India we do follow the Hybrid at -will method of working.

#### **Review of Literature**

# **Employee Engagement**

Chandani and Mehta (2016) the paper articulates the importance of employee engagement and how it increases organisation performance. There are two levels of factors which increase employee engagement like organisation level and individual level. Vasani and Pillai (2019) employees are satisfied with the overall companies' performance .the factors identified are compensation, health and safety increment in salary training and career which influences employee engagement . Purushotham and Kaviya (2021) subjects their finding on employee engagement, to retain employees the best way is to engage employees. When employees are engaged it leads to employee satisfaction in return it results to employee retention. Anitha.J (2014) identified few factors which can influence employee engagement to maximum level are team and co-worker relationships ,working environment . Smitha and Sahu (2022) to improve engagement among employees and organisation must encourage different strategies to be implemented, inculcate the sense of belongingness ,positive emotion about their work. Kular and Gatenby (2008) employee engagement is defined in multi-faceted by khan . The employee's perception towards work should provide more meaningful. Singapore and Thailand has 82 % of engaged employees this might be due to the culture, values, political management styles and economy . Gurman and Saks (2010) performance of an employee can be increased in identifying the right performance increment and this can keep employee engaged at work. Some of the employee engagement facilitation which can boost employee performance are like

job design , social and coaching support to employee's leadership style and training .

Desai and Majumdar ( 2011) employee engagement can increase employee productivity engagement levels are said to high when employees are more committed and loyalin manufacturing industry. Smith and Markwick (2009) there are many factors which influences emplovee engagement good quality management, communication, inter cooperation, employee well-being, accessible HR policy are considered to be major factors. Baker(2013) there are two factor influencing employee engagement micro and macro factors. Mansoor and Hassan (2017).the identified factors are communication , team work , collaboration , job role, company management and training and development which has positive impact on employee engagement. Opas, Anurit and kuiyawattananonta (2011) fair salary, good safety, health insurance, training opportunity, work life balance, environmental factors are few factors which has rooted emplovee engagement positively Robinson(2007) feeling valued and feeling involved is quite important to lead employee to engaged. Some of the factors are training and development, career development, performance management , equal opportunities, treatment, pay and benefits, health and safety, co-operation , family friendliness and job satisfaction are key drivers which lead to building block for employee engagement .Laura (2009) states the relationship between the engaged employee and leadership style can improve the organisation effectiveness. The most preferable leadership style expected which can lead engagement is transformational leadership style. Abraham and Susan (2012) there always exist a positive relationship

between job satisfaction and employee engagement. Creativity can encourage high level of job satisfaction leading to employee engagement. Sridevi and markos( 2010) it is identified that employee engagement is stronger predictor for organisation performance. Although there exist a two-way relationship employer and employee. when between employee are highly involved in job there is always a great success to the emplover. Attridge (2009) identified that employee engagement can be improved by creating or bringing a good work place and address the culture ,job design and working conditions. Raya (2009) companies should manage engagement by involving few strategies like managing stress, promote employee wellbeing, facilitating self -management. There are two outcomes of employee engagement one is individual outcome and the other is business outcome. Delina (2020). It has considered three level of engagement vigor, dedication and absorption. When employees are happy with the employee engagement initiatives then employee are completely engaged to their work .Yadav(2020) gamification has to be applied properly in HR management it has the potential to increase employee engagement.

#### Hybrid work and Employee engagement

Yadav (2020) engaging employees in virtual work place is very difficult. The relationship between employer and employee have reduced ,work has become monotonous, non-creative. Even though few employees who are happily working from work feel lack of belongingness for work and organisation. Some companies have come out offering games, interactive sessions, virtual celebration. Pablo and Peeter (2022) identified how hybrid work positively

influences engagement and how it negatively influences. The negative influence of hybrid on employee engagement are no co-ordination among employees, no casual interaction among employees, isolation, weak culture and increased turn over. The hybrid work positive influence employee engagement in having work life balance, coordination between f-f is high and consequently employee motivation and energy are positively affected in hybrid work. Delany(2022) expressed employees are desired to work in flexible. The research survey showed 30% of employees like to work if their company would consider on -site job. Amigoni (2021) to improve employee engagement in the organisation, a better approach can provide solution for future work is hybrid work environment. Caminiti(2022) the identified that most of the employee prefer blend mode of work place remote and office work .This mode of working can increase employee productivity, better work life balance and higher autonomy. Teevan et.al., (2021) also states that most of the employees believe the future of work is hybrid work. Hilberath( 2020) due to change in work employee are preferring hybrid work as new future of work. There are four building blocks to support future work 1. Leadership, culture 2.strucutre and roles 3.ways of working 4.sytems and spaces. Ware and Grantham(2003) new workplace design, new technologies has lead to new way of working process. Flexibility is the most preferable work place.

# Research Gap

After reviewing many literatures, the study has identified there are very less research papers conducted in hybrid work environment. As hybrid work culture is considered as future of

work and trending among IT & ITES companies the study shall cover the identified gap. Many research paper has covered on the engagement levels but on specifically conducted under hybrid work environment. The second gap of the study focuses on ITES working employees because very few engagements study have been conducted under ITES sector.

#### **Research questions**

- 1. Why employee engagement is considered very important?
- 2. Is hybrid considered future of work?
- 3. Engagement levels at hybrid work environment?
- 4. What is the effect of employee engagement in hybrid work place?

#### **Research Objectives**

- To understand the importance of employee engagement in hybrid work place
- 2. To identify the different levels of engagements
- To analyse employee engagement levels in hybrid work environment with respect to demographic details.

# **Hypothesis**

Ho: There is no positive significant difference in employee engagement levels at hybrid work environment based on demographic characteristics.

H1:There is a positive significant difference in employee engagement levels at hybrid work environment based on demographical characteristics.

#### **Research Methodology**

Descriptive research design is used for the study. The population identified are ITES

working employees in north Bangaluru with sample size of 100. Simple random sampling will be considered as it is in hybrid work place. Primary data is used for the study . Data is collected by systematic questionnaire using

Likert scale ranging from 1 to 5 considering 1 as lowest and 5 as highest score. Descriptive statistics , Chi-square test used for the data analysis.

# **Data Analysis and Interpretation**

To know whether the data collected is reliable and to check data consistency the study has run through reliability test using PSPP software .The following is the output

Table 1.1. Reliability test

Case processing summary

Cases	N	Percent
Valid	89	95.7%
Excluded	4	4.3%
Total	93	100.0%

# Reliability Statistics

Cronbach's Alpha	N of items
.93	32

The above reliability test shows that Cronbach's Alpha is .93. Cronbach's Alpha is a measure of internal consistency. The alpha co-efficient of 32 shows that the item have relatively excellent internal consistency of .093.

Table 1.2 Shows the percentage of gender

	Frequency	Percent	Valid percent	Cumulative percent
Valid 1	52	55.9%	56.5%	56.5%
2	40	43.0%	43.5%	100.0%
Missing.	1	1.1%		
Total	93	100.0%		

The table focus the percentage of female and male respondent. The value 1 is coded as female and show 55.9% respondents. The value 2 is coded as Male with 43.5% of respondent. Hence it concludes that the majority of female were the respondents.

Frequency Percent Valid percent Cumulative percent Valid 1 28 30.1% 30.4% 30.4% 46 50.0% 50.0% 80.4% 2 14 3 15.2% 15.2% 95.7% 4 2 2.2% 2.2% 97.8% 5 2 2.2% 2.2% 100.0% Missing. 1 1.1% Total 93 100.0%

Table 1.3 Shows the different set of age groups

The table shows the percentage of age group who respondent. The value 1 is coded as age group between 20-30 representing 30.4% respondent ,the value 2 coded as 31-40 age group which representing 50% respondent .the value 3 coded as 41-50 age group representing 15.2%. Hence the age group 31-40 were the maximum respondent for the study .

Table 1.4 Shows the percentage of marital demographic details

	Frequency	Percent	Valid percent	Cumulative
				percent
Valid 1	26	28.0%	28.3%	28.3%
2	66	71.0%	71.7%	100.0%
Missing.	1	1.1%		
Total	93	100.0%		

The table shows the marital status percentage. The value 1 is coded as unmarried representing 28% respondent and value 2 coded as married representing 71%. The maximum were married employees.

Table 1.5 Shows the percentage of education and designation demographic details

	Frequency	Percent	Valid percent	Cumulative
				percent
Valid 1	56	60.2%	60.9%	60.9%
2	56	38.7%	39.1%	100.0%
Missing.	1	1.1%		
Total	93	100.0%		

	Frequency	Percent	Valid percent	Cumulative
				percent
Valid 1	24	25.8%	26.1%	26.1%
2	19	20.4%	20.7%	46.7%
3	18	19.4%	19.6%	66.3%
4	15	16.1%	16.3%	82.6%
5	14	15.1%	15.2%	97.8%
6	1	1.1%	1.1%	98.9%
7	1	1.1%	1.1%	100.0%
Missing.	1	1.1%		
m . 1	0.0	100.00/		
Total	93	100.0%		

The table shows the education and designation details of respondents .The maximum employees have education qualification as degree and post graduates. Software engineers and Sr. Software engineers are the maximum respondents for the study.

Table 1.6 shows the experience of the respondent

	Frequency	Percent	Valid percent	Cumulative
				percent
Valid 1	33	35.5	35.9	35.9
2	20	21.5	21.7	57.6
3	39	41.9	42.4	100.0
	92	98.9	100.0	
Missing.	1	1.1%		
Total	93	100.0%		

The experience of 20-30 is coded as 1, experience of 30-40 coded as 2 and experience of 40-50 is coded as 3. Thus, from the above table shows that majority of the respondent were from 40-50 and 20-30.

**Table 1.7 Descriptive statistics** 

	N	Mean	Std.Dev	Skewness	S.E.Skew	Range	Min	Max
Gender	92	1.43	.50	.27	.25	1.00	1.00	2.00
Marital status	92	1.96	.86	1.13	.25	4.00	1.00	5.00
Exp	92	1.72	.45	98	.25	1.00	1.00	2.00
Edu	92	2.82	1.51	.40	.25	6.00	1.00	7.00
Position	92	2.07	.89	13	.25	2.00	1.00	3.00
Valid N	93							
Missing N	1							

The above table shows the descriptive statistics of all the demographic information . The population is denoted as N ,the total population is 92 out of 93 with the mean statistics for gender 1.43 ,age 1.96, marital status 1.72 and so on . The standard deviation values fall between the range  $\pm 1$ .

To accept or reject null hypothesis chi-square test is conducted . For testing hypothesis, the demographic details such as gender, age, education qualification , designation and marital status are considered to understand the employee engagement levels in hybrid work environment .

Table 1.8 Chi-square test

Test Statistics						
	Chi – S4.35quare	df	Asymp. Sig			
Gender	1.57	1	.211			
Age	76.70	4	.000			
Marital status	17.39	1	.000			
Exp	6.15	2	.046			
Education	4.35	1	.037			
EElevelsHW	82.43	3	.000			

From the above table it shows that gender is not significant as the value is more that .05 with 95% confidence level. Thus, gender is not majorly increasing employee engagement level in hybrid work environment. The Age factor shows .000 hence it is significant as its value fall below .05 .The age from 31-40 has greater influence on employee engagement levels. The third factor is marital status shows significant value of .000 the test concludes with the data calculated that married employees have greater employee engagement levels in hybrid work environment compared to unmarried employees. Experience of employees and education qualification have no much influence on engagement levels in hybrid work environment. The next demographic factor designation is significant with value less than .05 . The designation like software engineers, Sr. Software engineers , tech lead , Sr. Tech lead and project manager has engagement levels.

Thus, the study concludes the demographic like Age, marital status and designation has a positive significance on employee engagement levels in Hybrid work environment.

#### **Table 1.9 Regression analysis**

To analyse the second hypothesis ,regression analysis test is used to know the impact of employee engagement in hybrid work environment.

Model Summary (EE)						
R	R Square	Adjusted R Square	Std. Error of the estimate			
.88	.77	.77	1.06			

ANOVA (EE)					
Sum of squares df Mean square F Sig					
Regression	154.77	1	154.77	136.81	.000
Residual	98.42	87	1013		
Total	253.19	88			

Coefficients (EE)					
	Unstandardize	ed co-efficient	Standardized	t	Sig
			coefficients		
	В	St. Error	Beta		
(Constant)	.75	.25	.00	3.06	.003
HWE	.74	.06	.78	11.70	.000

The R values shows .78 which is between  $\pm 1$  thus indicating a strong positive linear relationship between EE and HWE .The R square or the variance values is .61 and adjusted R square is 61% of variance on HWE . The ANOVA table indicates it is significant at .000 which is less than .05 of P value . Thus, null hypothesis is rejected and alternative hypothesis is accepted . Thus, there is a significant impact on employee engagement in hybrid work environment.

 $\label{thm:continuous} \textbf{Table 1.10}$  Your Engagement levels towards work in hybrid work environment

	Frequency	Percent	Valid percent	Cumulative percent
actively engaged	19	17.3	20.7	20.7
Engaged	60	54.5	65.2	85.9
Disengaged	13	11.8	14.1	100.0
total	92	83.6	100.0	
Missing system	18	16.4		
Total	110	100.0		

The above question has been asked to the respondent on their engagement levels towards work in hybrid work environment. 54.5% of employee stated they are engaged i.e medium level engagement. 17.3% employees stated that they have higher engagement levels i.e actively engaged . And 11.8% respondents stated they have lower-level engagement levels i.e they are disengaged . The table concludes that most of the respondents

The open-ended question about the factors which can impact engagement levels in hybrid. Majority of the respondent responded that if immediate recognition been given to employee, then they will feel the sense of belongingness and become loyal to organisation resulting better engagements. Immediate rewards should also to be focused in order to motivate employees. leadership is also one of the factors which can impact the engagement levels of employees in hybrid. An appropriate job design should be planned for each employee

#### **Findings**

The Study has identified that employee engagement is much very important in hybrid work environment. As employees are working in blended mode the organisation has to focus and engage them on both the aspects of work mode and retain them . The study found that from the demographic data like age , marital status and designation shows significant influences on engagement in hybrid work

environment and gender ,education qualification and experience has less influence on engagement levels in hybrid work environment . There is also positive impact of employee engagement in hybrid work place.

#### Conclusion

Individual engagement is simply the emotional dedication an individual has to their employer and its objectives. That is what separates an engaged workforce from a disengaged one, and it is for this reason that businesses all over the world are looking for ways to increase employee engagement.

Engagement is crucial for your business since it affects a number of other factors, such as productivity, turnover, customer happiness, and earnings [3]. Compared to workers who don't feel committed at all (or perhaps have a bad attitude toward the organization), those who are invested in their work are more likely to consistently go above and beyond. The study

concludes hybrid work environment has greater impact on engagement levels. Companies should focus more on improving engagement activities in hybrid mode. The future of work is hybrid the companies should implement good strategies to increase engagement levels in future. As the study is confined only to north Bengaluru the findings are based on the limited sample. Further study can be done considering IT employees and ITES across Bengaluru.

# INTRODUCTION

Organization diagonally finds employees to hold their abilities. Recruitment, selection, and training for the replacement of employees incurs loss and it incurs an exorbitant cost for an organization. Employees are considered as valuable resource of an organization employee compensation is one of the important factors of an employee's performance. Each employee is motivated by providing rewards, it is also a need for an organization to reward its employees for creating a successful completion of the task given. Compensation is one of the important key factors for employees to achieve organizational goals. Many employees are motivated by providing promotions, increases in salary, bonuses, and incentives. Other employees are motivated by reward benefits like appreciation, praise, and recognition however it leads to high employee performance. Employees are the real asset to an organization which helps them to achieve organizational objectives. Compensation is what an employee receives in exchange for their contribution to the organization. We can't measure that each individual employee affects in the same way by providing various rewards. Providing various kinds of benefits Life insurance policies, Medical facilities, Maternity leave, Paid leaves, and overtime pay based on that employees get satisfied. Comprehensive compensation management and motivation can be used as veritable instruments to reduce labor turnover, absenteeism, and negligence which in the end will impact the organizational goals and employee's performance in achieving those objective goals.

Reimbursement is considered as the all-inclusive total money linked and many employee benefits are given. A good compensation makes the organization to achieve the organizational goals and the employees' performance. A good Compensation package helps the employees to retain in the organization for a longer period. Compensation inspire the employee's to work excellently and resourcefully and it also helps to sustain in the organization for a longer period.

#### Research Design

Type of Study: Descriptive research

Type of sampling: convenience sampling

# **Objectives**

- To have a better understanding of the organization's rewards and incentive programs.
- To study various reward system issues that affect employee performance.

# KOREA REVIEW OF INTERNATIONAL STUDIES

ISSN - 1226-4741

# Hypothesis

H0 = Compensation and reward system does not have an impact on employees' performance.

H1= Compensation and reward system have an impact on employees' performance

# Chi Square Test

HO: Employees are not provided incentives and bonuses for their performance.

H1: Employees are provided incentives and bonuses which influence their performance.

Chi-square test on Employee's opinion on providing incentives and bonus influence on performance.

Parameters	0	E	(O-E)	(0-E)^2	(O-E)^2/E	
1 970	35	20	15	225	11	
2	39	20	19	361	18	
3	14	20	-6	36	2	
4	3	20	-17	289	14	
5	9	20	-11	121	6	
TOTAL	100	100			52	

Observed frequency (0) = 35+39+14+3+9=100

Expected frequency (E) = 20+20+20+20+20=100

Degrees of freedom (U) = 5-1=4

Tabulated value,  $X^20.05 = 9.49$ 

Calculated value, (0-E)^2/E=52

 $(0-E)^2/E = X^20.05 = 9.49$ 

# Interpretation

The null hypothesis (H 0) is ignored, and the alternative hypothesis (H 1) is accepted because the estimated value is greater than the computed value. Hence, employees are provided with incentives and bonus which influence their performance

# **Findings**

- 1. This study reveals that employees seek an increase in salary and wage levels within the organization so that they work promptly. Due to competency in employees' organizations choose only the best performer and reward them but not the workers who put in the same efforts to achieve the objectives.
- 2. This study says that not every employee is compensated equally, based on the educational qualification and job specification employees are compensated these are the issues employees are facing in the organization.
- 3. The study establishes that many organization has various types of compensation and reward pay structures, which motivates employees to work effectively and efficiently. Due to the effective compensation packages, many employees turn towards their organization and stay loyal to work in their organization for longer periods and leave their previous job.

# KOREA REVIEW OF INTERNATIONAL STUDIES

ISSN - 1226-4741

- 4. Employees should be provided with social security benefits, such as medical benefits, retirement benefits, and paid leave, among other things. This serves as a motivator, causing them to bring more effort into their jobs, resulting in the achievement of corporate goals and successful job results. As a result, it improves employee morale.
- 5. The findings of the research that compensation should be paid fairly relative to the local market so that employees are satisfied and work to achieve the organizational objectives, we all know that compensation is a key element for boosting the performance of employees.
- 6. Effective compensation packages increase employee performance. Providing financial and non-financial benefits to increase employee retention within the organization. Many employees believe that financial bonuses are motivating factors that help them meet their basic needs.
- 7. Not only do compensation and reward system influences employee performance, every employee feels stressed and has a high risk in working. Employees enjoy working in Environments that provide job security, a pleasant working atmosphere, and where their leaders/bosses encourage them to make decisions or provide opportunities for employees to make decisions within the company.
- 8. This study establishes programs for training and growth to help the employees to respond to technological advancements and have the required skills and competencies in the performance of their duties.

# Suggestions

The suggestions are based on the findings of the primary collection of data. It was found that employee performance is negatively affected by the compensation not given in an organization. Compensation is the main key factor of every organization.

- 1. According to the report, the company should evaluate the current incentive schemes to see how successful they are at achieving the company's goals.
- 2. Analyze different incentive schemes and identify appropriate programs for your company. Implementation of the overall bonus scheme, as well as the evaluation of incentives chemes.
- 3. The study suggests that the company's compensation structure be aligned with its corporate strategy.
- 4. It's also critical to recognize and reward employee activity that supports the administration's goals, like innovation, creativity, client facility, productivity, and quality, as well as focusing on incentives that empower employees.
- 5. The study recommends that the organization should improve the existing pay structure, it should be improved so that employees will be paid well and they will retain in organization for longer period and they also contribute their efforts to achieve the organizational goals.
- 6. The study looked at how an organization's compensation and incentive scheme affects employee success.
- 7. How salaries, incentives, bonus and indirect compensation influences the employee to meet the organizational objectives.

# KOREA REVIEW OF INTERNATIONAL STUDIES

ISSN - 1226-4741

8. Therefore further studies should be carried out on how other variables not studied influences employee performance in another sector. Employees work efficiently and by this, their performance also increases, and automatically organizational goals are achieved.

# CONCLUSION

According to the findings, compensation has an impact on employee performance, and employers should create recommendations to examine their pay structure and remuneration in order to meet employee satisfaction, which has an influence on worker performance.

A study also determines that not only reimbursement and reward benefits improve employee performance by providing job security, training and development, and other benefits which satisfy them and motivates them to work effectively.

The report also concludes that workers' working conditions should be strengthened. Because of this employees jump into another organization for better pay and work space. There should be enough space for workers to work and infrastructural facilities should be good. They can function in an atmosphere that allows them to satisfy their family members and live happily together. This will also assist workers in reducing tension as a result of the hard work they do on a regular basis.

Finally, the research concludes that employees should be compensated fairly based on the local market value. And employees should be compensated fairly for the work they do and they should be treated equally, there should be no comparison between employees low or high, and there should be no discrimination in the organization based on caste, creed, color, religion, etc. By this employees will feel free to work in the work environment and boost themselves to give better yield. A friendly environment helps employees to perform better actions to achieve the objectives of an organization, and it also increases employees' performance.

# Happy Campus: How to Make Universities a Better Place to Work and Study in INDIA

Dr. G P Dinesh, Professor, VSK University, Ballari and Dr. DivyaBharathi,
Associate Professor
BITM, Ballari

#### **Abstract**

Campus can be stressful. The transition away from home, the financial and academic pressure, conflicts with peers, and post-graduation planning can all contribute to stress among college students. When managing an increase in responsibilities and changes, many students might forget to contribute intentionally to their own self-care and well-being. Health and happiness go hand in hand. Since the body and mind are so connected, taking care of physical health is helpful for mental health. Making intentional healthy changes to our lifestyle can boost our wellness in meaningful ways. Good friends bring fun in the good times and support in the bad times. They share in your joys, celebrations, hardships, and sorrows, and help keep your happiness quotient and spirits high. Having meaningful connections with others significantly reduces stress, boosts self-confidence and a sense of belonging, and can even improve the immune system and physical health. Friends see, understand, and accept us for who we are. College is a time of immense personal growth. It's also a time where you can make genuine best friends. We all know that the obligations that come with being a college student can be difficult, so it's good to have a helping hand when you're dealing with that exhausting research paper or are having a bad day. We all need someone to lean on from time to time. And, students who make an effort to form relationships in college are more likely to succeed academically and graduate on time. This paper highlights what makes a campus a happy campus and what the universities and Higher Education Institutes should do to make it a better place to study and work.

# A Study of Female MBA Students Buying Behavior of Cosmetic Products in Ballari.

1.Chindananda U MBA Student.

2.Dr.Shaheeeda Banu S Professor, DMS, BITM, Ballari.

#### **ABSTRACT**

The Indian cosmetics industry is growing in terms of product development and marketing. The preference of Indian consumers is changing from the 'merely functional' products to more 'advanced and specialized' cosmetic items. In 2005, sales of cosmetics and toiletries rose by 6% in current value terms in India. Monteiro (2003) also predicts the huge potential for cosmetics in India. The average annual spending of Indian consumers on cosmetics and toiletries in 2005 is just over US\$3. India in cosmetics and toiletries, which saw its value share rising from 27% in 1999 to 31% in 2005 and is likely to continue to surge ahead over the forecast period. The entry of many multinationals into the Indian cosmetics and toiletries industry in 2005 has made it an extremely challenging and dynamic market. Foreign players have focused more on product innovation; re-launches and brand extensions spread across multiple price points, and enhanced product penetration by extending their distribution networks. The leading players have streamlined their ad spend to effect savings that has allowed them revamp their pricing strategies as well as offer free gifts to retain consumers. Understanding behaviour of consumers is a key to the success of business organizations. Marketing personnel are constantly analyzing the patterns of buying behaviour and purchase decisions to predict the future trends. Consumer behaviour can be explained as the analysis of how, when, what and why people buy. Consumer behavior can be understood as: "The decision process and physical activity individuals engage in when evaluating, acquiring, using, or disposing of goods and services." (Loudon and Della Bitta, 1980). Nowadays, this phenomenon, can also be illustrated in the following way: "activities people undertake when obtaining, consuming, and disposing of products and services" (Blakwell, Minard and Engel, 2001). A study by Voss and Parasuraman (2003) suggests that the purchase preference is primarily determined by price than quality during pre-purchase evaluation. Given explicit quality information, price had no effect on pre-purchase or post-consumption quality perceptions. Instead, post consumption quality evaluations had a favorable impact on price evaluations. Another study by Chernev (1997) analyzed the effect of common features on brand choice and the moderating role of attribute importance. It is argued that when brand attributes differ in importance, with the best value on the most important attribute, thus further polarizing brands' choice shares. In contrast, when attributes are similar in their importance, common features are likely to have an opposite effect, equalizing brands share.

**Keywords:** Costmetics, Trends, buying pattern, Students & Quality

#### **Introduction:**

Cosmetics are mixtures of compounds derived from natural products or synthetic compounds. Cosmetics serve many purposes. Those designed for personal care with skin care can be used to

cleanse or protect the body or skin. Cosmetics (make-up) designed to beautify or alter a person's face can be used to hide imperfections, beautify a person's facial features (such as eyebrows and eyelashes), add color to a person's face, or change the entire face to match one's face. Different people, animals or things. People with acne are more likely to develop acne because of the harsh ingredients in cosmetics. Cosmetics can also create body odor.

The Food and Drug Administration (FDA), which regulates cosmetics in the combined States, defines cosmetics as "products intended for use on the human body to cleanse, beautify, increase attractiveness, or alter its appearance without affecting the body." . Body structure or function "" This general term includes any ingredient used as an accessory in cosmetics, and the FDA specifically excludes pure soap from this category. In many periods of Western history, the character of cosmetics will be whitened, cheeks will be blushed, and in many periods like this, people have s poken out against the use of cosmetics.

Despite the change in society's attitude towards cosmetics, many people use cosmetics from time to time to meet their needs.

According to one source, early growth in cosmetics includes:

- Ancient Egyptians used eye shadow
- Ancient Egypt used castor lubricate as a protective balm
- Skin cream made commencing beeswax, olive oil, and rose water, described to the Romans
- November. Century vaseline and lanolin.

The Study includes the products from Lakmé, Loreal, MAC Cosmetics, NYKAA, Estee Lauder, Clinique, Revlon.

Research has shown that consumer behaviour is difficult to predict, even for experts in the field; however, new research methods, such as ethnography, consumer neuroscience, and machine learning<sup>[11]</sup> are shedding new light on how consumers make decisions. In addition, customer relationship management (CRM) databases have become an asset for the analysis of customer behaviour. The extensive data produced by these databases enables detailed examination of behavioural factors that contribute to customer re-purchase intentions, consumer retention, loyalty, and other behavioural intentions such as the willingness to provide positive referrals, become brand advocates, or engage in customer citizenship activities. Databases also assist in market segmentation, especially behavioural segmentation such as developing loyalty segments, which can be used to develop tightly targeted customised marketing strategies on a one-to-one basis. (Also see relationship marketing).

Factors influencing consumer behavior:

Consumer behavior is influenced by many different factors. Understanding your customer is an important factor in go-to-market success.

# 1. Psychological Factors

Human psychology is a major determinant of consumer behavior. These factors are difficult to measure but are powerful enough to influence a buying decision.

#### Literature review:

- 1. **Paruloberoi**(2021):he expressed in his article "consumer behavior towards cosmetic products: A case of Delhi NCR" that the study analyses the buying process and the achieve of media communiqué on import behaviour on consumers and also suggests that the companies must try to increase thier business by providing online portal for shopping.
- 2. **Kim and Kyu-Hye Lee(2021):** has opined in article "Changes in consumers alertness and interest in cosmetic products during the pandemic" that research explored the changes consumer awareness and suggest that epidemiological situations impinge on the consumer awareness of each cosmetic."
- 3. **Junaid, Reshma, Faheem and Jamia**(2020) has opones in article "A Study on the purchase behaviour and cosmetic consumption pattern among young females in Delhi and NCR" that how female consume the product. As the income level of feminine consumer is increasing thier expenditure for products also rises.
- 4. **Aute, Khan and Dagale.** (2015) examined purchasing behavior for cosmetics. The main purpose of the investigate is to check the enumeration profile of consumers and to uncover the factors that affect consumers' decisions. They also covet to learn about purchasing cosmetic samples. They found that most people use cosmetics at home and that TV is the best medium to learn about cosmetics; product quality is considered the nearly all significant part in the customer's decision.
- 5. **Ponanki and Asif perwej** (2014) has expressed in their article "the buying attitudes of consumers of cosmetic products" that the researchers have made an earnest attempt to the marketers to identify different dimensions on what consumers prefers, which make them in deciding marketing mix.

- 6. Vanessa, Hartmann & Ralf Terlutter (2014): has opined in their article "women satisfaction with cosmetic brands: The role of dissatisfaction and hedonic brand benefits" That utilization and epicurean brand benefits both significantly contribute to female consumer's satisfaction with Women consumer.
- 7. Nilesh&Anand(2014):have expressed is there article" consumer buying behavior towards cosmetic product that most of the people take quality as a prefer and important factor for purchasing Cosmetic product and its packaging as a least important factor for purchasing Cosmetic product.
- 8. Sivagami (2016) :examined the decision
  - making behaviors of consumers about the cosmetics industry. The aim of this review is to scrutinize the marketing behaviors of trade for cosmetic products. They also wanted to k now the impact of various media in encouraging consumers to acquire a cosmetic brand. Using the random sampling technique. The sample size is 200.
  - Data were composed through express interviews. Two types are prepared based on basic data and data collection. Percentage investigation is used to investigate the data. He discovered that discounted prices and attractive promotions could create a center of attention to more customers.

#### **Problem Statement:**

The Global and International Apparel Industry is in a growth phase. Too much purchasing p ower has made fashion-

conscious people pay responsiveness to their beauty and health. Also, the selection of herbal and Ayurvedic beauty products allows clients to feel confident in using these products regula rly. Therefore, the Indian and international cosmetics industry sees great growth opportunities in the coming years.

# **Research objectives:**

- 1. Investigation of factors affecting cosmetics purchase among Ballari female MBA students.
- 2. Evaluation of the Effect of Product Quality on the Purchasing Decisions of Ballari Female MBA Students.
- 3. Investigation of the role of affordability of cosmetic products among female MBA students at Ballari.

#### Method:

statistics were collected since the questionnaire distributed to the participants with the principle.

Secondary Data Collection: Secondary data collected from company records and company websites.

# **Sampling Technique:**

Appropriate sampling has been chosen as the sampling technique, and respondents have man y options for completing the questionnaire.

# Sampling criteria for the study:-

• A total of 100 people from Ballari District were selected for the study.

Convenience

• A sample was used to collect responses from participants.

Study Area:-

• Study area is limited to Ballari city, Karnataka.

#### ANALYSIS AND INTERPRETATION

- As per the study, the most influencing factor for consumer while choosing the product of by family and other factors are common influencers. The other factors such as peer group, workplace, advertisement, quality and price are the medium influencers of the customer to choose aproduct.
- As per the response, it shows that what the users of cosmetic project related to stylish, confident, trend and groomed professional. In which the respondents prefer to choose the confident related projection and second preferred projection is both equally with stylish and trend. Lastly least responded is groomed professional which attracts the consumers.
- The consumers most response related to belief has not shown much impact on the promised effects and the following points(very much ,fairly much and fairly little ) are shown most believing factor and other are being at medium believed and the left response belief less.
- The responses from the consumers have proved that they prefer Lakme brand products more than the other brands. The other in order products are equally being chosen by the respondents on an average basis.
- Most of them prefer online marketplaces for buying of the cosmetics as wide variety of
  product availability and various discount related factors arise. And others buy on physical
  retail stores, brand websites and local beauty stores as per their preference.

- The study is related to the decision changing factor or decision to buy the cosmetics and the most influencing factor in buying time is the quality and brand reputation which increases the product demand and its sales of a particular product.
- As per the response, the perception related to the affordability of the cosmetics reveals that the cosmetics are most in affordable manner and respondents doesn't feel them as expensive one to buy to their product list.
- The above table shows that most of the customers prefer most the skincare and hair care related products and study also proves the customers buy more of these kind of products. The fragrances and makeup are the second stage performers in the buying list.
- The study reveals that the customers how commonly tend to try new products related to cosmetics and they are very likely to adopt the new one and majority of others are not likely to try new products.
- The research being conducted by the respondents is to the little extent as it comes to do research before buying the products and majority opt to research sometimes before they usually purchase the product.
- Many of the respondents are being influenced by the sales promotions or discounts while buying the cosmetic products and others are being not so much being influenced by these promotion are discount being provided by the brands.
- The most preferred mode of payment by the respondents while buying the products is throughcash and the left prefer the debit card ,credit card, mobile wallet and other modes of payments .
- As per the result most of the customers find the product quality is more important while it comes to purchase of the cosmetics and hence there is relevance in Importance given to importance of the purchase of cosmetics.

#### FINDINGS, SUGGESTIONS AND CONCLUSION

# **Findings:**

- 1. The factors influencing the buying behavior of female MBA students for cosmetic products in Ballari include brand reputation, product quality, price, packaging, and social influence.
- 2. Product quality is a significant factor that strongly influences the buying decisions of female MBA students for cosmetic products in Ballari. Students prioritize products that offer effective results and meet their expectations.
- 3. Affordability plays a crucial role in the purchasing choices of female MBA students for cosmetic products in Ballari. Students tend to opt for products that fit within their budget constraints.
- 4. The brand reputation of cosmetic products influences female MBA students' buying behavior in Ballari. Students prefer reputable brands known for their quality and reliability.
- 5. Packaging is an important factor that impacts the buying decisions of female MBA students for cosmetic products in Ballari. Attractive and visually appealing packaging can attract students and influence their purchasing choices.
- 6. Peer influence and recommendations from friends significantly affect the buying behavior of female MBA students for cosmetic products in Ballari. Students often rely on the experiences and suggestions of their peers when making purchase decisions.
- 7. Convenience and availability of cosmetic products are important considerations for female MBA students in Ballari. Students are more likely to purchase products that are easily accessible and conveniently located.
- 8. Online reviews and ratings have a considerable impact on the buying decisions of female MBA students for cosmetic products in Ballari. Positive reviews and high ratings increase the likelihood of students choosing a particular product.
- 9. Product ingredients and formulation are significant factors influencing the buying behavior of female MBA students for cosmetic products in Ballari. Students prefer products with natural and safe ingredients.
- 10. Promotional offers, discounts, and loyalty programs play a role in the buying behavior of female MBA students for cosmetic products in Ballari. Students are attracted to special deals and incentives that provide them with value for their money.

# **Suggestions:**

- 1. Cosmetic brands should focus on ensuring high product quality to meet the expectations of female MBA students in Ballari. Conducting regular quality checks and incorporating customer feedback can help improve product performance.
- 2. Brands should offer a range of affordable cosmetic products to cater to the budget constraints of female MBA students in Ballari. Introducing smaller-sized or travel-friendly options can make premium products more accessible.
- 3. Packaging should be visually appealing and innovative to capture the attention of female MBA students in Ballari. Brands should invest in attractive designs and environmentally friendly packaging to enhance the overall product experience.
- 4. Collaborating with influencers and leveraging social media platforms can be an effective strategy for cosmetic brands to reach and engage with female MBA students in Ballari. Influencer marketing campaigns and user-generated content can create a buzz and generate interest in the products.
- 5. Cosmetic brands should ensure the availability of their products in easily accessible locations such as college campuses, shopping centers, and online platforms. Offering convenient purchase options will attract female MBA students in Ballari.
- 6. Providing detailed information about product ingredients and formulation can help build trust and credibility among female MBA students in Ballari. Brands should prioritize transparency and clearly communicate the benefits of using their products.
- 7. Brands should actively engage with their customers by encouraging them to leave reviews and ratings online. Positive reviews and ratings can influence the buying decisions of female MBA students in Ballari.
- 8. Offering personalized product recommendations and customization options can enhance the buying experience for female MBA students in Ballari. Brands can utilize data-driven approaches to understand customer preferences and provide tailored suggestions.
- 9. Regular promotional offers, discounts, and loyalty programs can incentivize female MBA students in Ballari to purchase cosmetic products. Brands should create attractive deals that provide value for money and foster customer loyalty.
- 10. Conducting awareness campaigns and workshops specifically targeted at female MBA students in Ballari can educate them about the importance of skincare and makeup routines. This can help construct brand alertness and persuade

#### **Conclusion:**

The cosmetic industries are vastly growing in this era and most of the consumers prefer the brand and equivalent quality while choosing the product if there may be many other influencing factor while choosing the product but they prefer quality as the important factor. And companies should also increase the packaging , advertising and other important factors to increase its awareness towards the product in the market.

# A STUDY ON CONSUMER SATISFACTION ON LOBICON LTD

Krishna Shiroor<sup>1</sup> MBA Student

Dr. Shaheeda Banu S<sup>2</sup> Professor, DMS, BITM, Ballari drsyedshaheeda@gmail.com

Dr.Christopher Raj D<sup>3</sup> Professor, DMS, BITM, Ballari

#### **ABSTRACT**

Consumer satisfaction is a critical metric that determines the success and longevity of businesses in today's competitive marketplace. Lobicon Ltd, a prominent company in [insert industry], recognizes the importance of understanding and enhancing consumer satisfaction to maintain its market position and foster sustainable growth. This study aims to provide a comprehensive analysis of consumer satisfaction with Lobicon Ltd, shedding light on the factors that influence it and the strategies the company employs to meet and exceed consumer expectations.

These include improving response time to customer inquiries, expanding the product/service portfolio, and increasing engagement on social media platforms. Additionally, the research highlights the importance of fostering a strong sense of brand loyalty and trust among consumers. Commitment to consumer satisfaction is evident through its customer-centric initiatives, such as personalized product recommendations and loyalty programs. These strategies have proven effective in retaining existing customers and attracting new ones. However, the company should continue to adapt to changing consumer preferences and market trends to remain competitive.

**Keywords: Customer satisfaction, Preferences, Competition, Strategies** 

#### INTRODUCTION

The primary activity in secondary industry, known as manufacturing, is the production of commodities for use or sale using manpower, machinery, chemical or biological processes, or formulation. The word may be used to a range of human undertakings, from handicraft to high-tech, but it is most usually applied to industrial design, which requires the extensive conversion of raw materials from primary industries into finished goods. Such finished goods may be sold to other manufacturers for the production of other, more complex products (such as aircraft, household, furniture, sports equipment, or automobiles) or distributed via the tertiary industry to end users and consumers (typically through wholesale, who in turn sell to retailers, who in turn sell to individual CONSUMERS).

#### REVIEW OF LITRETURE

- 1) S.Murali (2016) After-sale services (ASS) are actions that happen after a consumer buys a product and are focused on assisting consumers with the usage and disposal of products. ASS can establish long-lasting bonds with customers and make a substantial impact on their satisfaction. The goal of this study is to determine which SERVQUAL dimensions based on ASS attributes should be given more attention in order to improve the quality of ASS, taking into account the companies that are involved in the production of home appliances. These SERVQUAL dimensions include the level of Consumer Satisfaction (CS), Consumer Retention (CR), and Consumer Loyalty (CL).
- 2) Md. Uzir Hossain Uzir (2020) Investigating the effects of product quality, service quality, and perceived value on consumer satisfaction with the strength of the social media effect was the study's main goal. A systematic questionnaire was created for the study's quantitative research approach in order to gather information from 323 Bangladeshi homes. Utilising social media, a judgemental sample strategy was used to gather data. Utilising SEM-AMOS and SPSS, collected data was examined. The outcome showed that customer satisfaction with the degree of social media usage is positively and significantly impacted by product quality, service quality, and perceived value.
- 3) Ramayah Thurasamy (2021) Due to family structure, increased income levels, and technical connection, consumers are accustomed to using electronic household equipment. Huge consumer bases, rising demand, developing markets, fierce brand rivalry, and shifting consumer behaviour are impressive; nonetheless, consumer happiness and loyalty are not constant and are subject to some change. The impetus for this research is the dearth of comprehensive studies on loyalty and happiness in this situation. The goal of this study was to examine how brand trust and brand loyalty are related to consumer happiness and its predictions.
- 4) Sivanesan Murali (2016) After-sale services (ASSs) are actions that happen after a customer buys a product and are intended to help customers use and dispose of their purchases. ASS can establish long-lasting bonds with customers and make a substantial impact on their satisfaction. This study aims to determine the effects of selected ASS qualities on consumer satisfaction and the impact of ASS on consumer satisfaction. Multiple regression analysis along with the SERVQUAL model is used for this purpose. A case study firm that makes home appliances is taken into consideration, and the SPSS-AMOS 21 was used to examine consumer opinions on the company's ASS operations.

5) Dr. N. Sugundhan (2018) Consumer satisfaction is a fundamental component of marketing expertise and is primarily distinct as the number of consumers, or level of total consumers, whose detailed interaction with a company, its products, or its services exceeds predetermined fulfilment goals.

6) Amira M. Idrees (2020) Energy Consumption has become one of the strategic objectives all over the world which enterprises obligation but it should also be all citizens' obligation. Focusing on individuals' energy consumption, a vital approach for saving energy is a collaboration strategy which aims at sharing the home appliances for best usage. In this research, an approach is proposed for recommending the collaboration plan for adjacent houses in different perspectives; they are sharing appliances and minimizing the consumption rate. The research adopts the mining techniques in order to explore the required associations targeting to build the road map for appliances consumption.

#### STATEMENT OF THE STUDY:

Customer satisfaction is a metric that gauges how satisfied a company's clients are with its products, services, and abilities. A company may decide how to best improve its products and services by using information on customer satisfaction, such as surveys and ratings.

#### **NEEDFORTHESTUDY:**

- This study is taken up to know the level of satisfaction of Consumers. The project title "Consumer satisfaction has been carried out with the above purpose.
- > This study is going to offer some suggestions for betterment of the company.
- As the marketing concept is built on the premises, that marketing first identifies consumer needs and requirements and develop the products or services to satisfy those requirements.
- ➤ However, as in the case of other fields competition is emerging in this field also, it is the responsibility of every successful organization to retain its Consumers by understanding their requirements to removing the dissatisfaction and improving the sales as well as market share.

# **Objectives of the study**

- To know the most influencing factors in decision making to purchase a Lobicon Ltd Products.
- To ascertain the Consumers level of satisfaction with the product of Lobicon.
- To know the problems faced by the Consumer from the Lobicon Ltd.
- To know the Consumer satisfaction with the sound system of Lobicon Ltd.

# **Scope of the Study:**

Through this research we will understand the consumer satisfaction measures at Lobicon company at different Dimensions like satisfying towards products, prices, discounts. This study scope is for theperiodof06 Weeks.

# ResearchMethodology:

An approach to defining the research problem is research methodology. The title, problem statement, significance of the study, goals and objectives, research design, data collection, statistical analysis, and study limitations are all included.

#### **DATACOLLECTION:**

The data is collected using both primary and secondary method.

- A. Primary Data:
- Collection of information through the interview.
- Collection of information through the questionnaire.
- B. Secondary Data:
- The information collected by organizational record.

# **Analysis and Interpretation**

 $\textbf{1.}\ 56\% of the respondents are male candidates and 44\% of the respondents are female candidates.$ 

2.

- 53% of defendants are content with their understanding of mechanics, while 24% believe their knowledge is average and 9% feelit is bad
- **3.** 39% of the respondents are said yes Lobicon deliver, the vehicle on time to the customers, 27% of the respondents are said sometimes and 20% of the respondents are said no
- **4.** 86%oftherespondentsarehavingsuggestionstoimprovethecustomersatisfaction in lobicon and 14%of the respondents are said no.

#### **Findings**

- Of the respondents, 37% learned about Lobicon through electronic media, 24% through word-of-mouth, 21% through friends and family, and the remaining 12% through print media.
- Of the respondents, 38% are persuaded to buy lobicon items by the salespeople, 27% are persuaded by friends, and 26% are persuaded by self-interest.
- | While 22% of respondents are dissatisfied with the financing services at Lobicon, 78% of respondents are.
- 39% of respondents are dissatisfied with the warranty duration offered by the firm, while 61% of respondents are pleased with it.
- 43% of respondents said they were pleased with the deal the firm offered, 17% said they were extremely satisfied, and 34% said they were unsatisfied.

• 38% of respondents felt the customer service personnel' behaviour was good, 24% said it was exceptional, and 27% said it was ordinary.

• 52% of respondents say they are happy with the quality of Lobicon, 27% say they are extremely happy, and 21% say they are not happy.

# **Suggestions**

- The Lobicon Company has to establish sound CRM practices that raise customer satisfaction
- R&D should enhance the current feature, which contributes to higher consumer happiness.
- The business should levels.
- The business advertise all of the benefits it provides.
- The majority of customers express satisfaction with the factors, services, and product design, thus the corporation should not only uphold the current standards but also raise them.
- As a result, Lobicon has to concentrate on factors that would increase customer satisfaction and consequently market share.

#### **Conclusion**:

The most important aspect for clients is their level of satisfaction, both for themselves and the business. As a result, if the consumers are happy with the goods or services, the business will be able to expand and succeed more by producing goods in large quantities and of high quality. According to a poll of "Wavestech" consumers, customer satisfaction may be attained if the customers are happy with a price drop and an extension of the product and service warranty and guarantee duration. Excellent communication exists between the business and its clients. The consumers are given the appropriate instructions on how to utilize.

# **ABSTRACT**

Banking sector performance can be measured easily by assessing the existence of bad loans such as if any asset could unable to provide returns for a specific period of time is known as Non-Performing Asset (NPA). Nowadays, most of the banks are facing with issues like bad loans and increasing frauds in large scale. After second Covid-19 wave across sectors, repayment capacity of borrowers was arising big spike. This study aims at identify reasons, control and reduce on occurring non-performing assets. This research covers the period of 2018 to 2023 by collecting data and information from various primary and secondary sources.

#### INTRODUCTION

A cooperative bank is a type of financial institution whose members also serve as both its owners and customers. It was commonly discovered by others with similar interests from the same local or professional group. It was created to aid 3 in the social advancement of economically disadvantaged groups and to keep them out of the clutches of unscrupulous lenders who grant loans to the needy at high interest rates. The architecture of the co-operative structure is influenced by the concepts of cooperation, mutual help, democratic decision-making, and open membership. The 'one shareholder, one vote' and 'no profit, no loss' ideals are upheld by it. Company's outstanding increased from Rs. 14100 lac to Rs. 17819.28 ac during the reviewed year, registering a growth of 26.38% as opposed to a negative growth of 5.70% during the current year. This is considered very well and clearly demonstrates that they have recovered from the effects of demonetization the previous year.

#### LITERATURE REVIEW

1) Laveena (2016) A bank's NPA level is a good indicator of its success. Any asset in a bank that has a high NPA rating loses value, and it also shows that there have 12 been more loan defaults and that banks' net worth has dropped. The amounts you must establish for provisions rise as NPA levels rise, which reduces total shareholder value and profits.

2) D. Siva Satyanarayana (2016) Non-performing assets are a major concern for Indian banks. Non-performing assets (NPAs) are a sign of a bank's health. A high number of NPAs implies a high rate of loan defaults, which affects a bank's profitability, net worth, and asset value. The primary role of the banking business is to provide credit for economic activities.

- 3) Pro. D.S. Rathore (2016) Assets that generate revenue are known as performing assets, whereas those that do not are known as non-performing assets. a financial arrangement in which the borrower has failed to make any previously agreed-upon interest and principal repayments to the licenced lender for an extended period of time. As a result, the lender receives no revenue from the nonperforming asset in the form of principal or interest payments.
- 4) AniruddhaDurafe (2016) This research studies the cyclical behaviour of both 10 public and private sector banks in India, with a focus on non-performing assets. The goal of this research is to see if non-performing assets in India's public and private banks behave pro-cyclically. The Pearson correlation coefficient data show that gross non-performing assets and economic condition in both public and private sector banks display countercyclical behaviour.
- 5) K. PRASANTH KIRAN (2016) the phrase "nonperforming asset" is crucial for financial organisations. Non-Performing Assets demonstrate the effectiveness of the banks' operations. Non-Performing Assets are sums that the bank does not get 7 paid back for loans it has given.
- 6) Dr.RajeshRathore (2016) Banking and finance have a significant role in economic growth in emerging nations.
- 7) Dr. Raj Kumar Mittal (2017) the effectiveness and stability of the banking business are key factors in the expansion of the budget. NPAs is the most crucial variable used to gauge the soundness of the lending segment. Non-performing assets directly affect the financial success, or profitability, of banks. It indicates the efficacy with which a bank maximises all of its resources, providing as a gauge of asset utilisation and managerial performance.
- 9) Sudin Bag (2017)NPAs are a significant and difficult problem in the banking industry today. It is a very powerful and uncontrollable virus that is seriously harming both the health of the lending business and the economies of the world.
- 10) PayalGoel (2018) the study's goal is to investigate the cyclical nature of NPAs in the Indian banking system. It also aims to discover the root reasons of the nonperforming assets' behaviour. Furthermore, comparisons of banks from the public, private, and foreign sectors have been undertaken.

# **OBJECTIVES OF THE STUDY**

- 1. To understand the concept of Non-Performing Assets in banking sector
- **2.** To find out the reasons of NPA that can be used to control and reduce the NPAs in Karnataka Vikasa credit and multiple purpose co-operative society Ltd.

**3.** To understand the effects of NPAs on the operations of the Karnataka Vikasa credit and multiple purpose co-operative society Ltd

**4.** To find out the relationship between Net Profit and Net NPA's of Karnataka Vikasa credit and multiple purpose co-operative society Ltd.

# NEED OF THE STUDY

Scheduled banks and non-scheduled banks are the two classifications of banks in India. Scheduled banks include private, public, and cooperative institutions; non-scheduled banks include foreign and cooperative institutions. Public sector banks 2 are nationalised banks. In India's financial system, public sector banks play a crucial role. Public sector banks will offer loans and advances to people or individuals as well as for small and medium-sized businesses, as well as for large industries that are for the economic development of our country by mobilising household savings and directing them towards profitable investments as well as by offering credit facilities to its customers at low interest rates.

# DATA AND METHODOLOGY

**Primary Data:** Data that are acquired for the first time are called primary data. At the Karnataka 24 Vikasa Credit and Multiple Purpose Co-operative Society Ltd., meetings and one-on-one interviews with the officers are how the primary data is collected.

**Secondary Data**: The sources of secondary data are published materials such as and annual reports from 2016-2023 of Karnataka Vikasa credit and multiple purpose co-operative society Ltd.

# DATA ANALYSIS AND INTERPRETATION

TABLE1: Classification of Nonperforming assets from 2018-23

Particulars	2018-19	2019-20	2020-21	2021-22	2022-23
Standard	83,596.69	92,606.23	1,14,854.05	1,20,994.30	1,25,889.92
assets					
Sub-	4,826.05	5,336.03	6,465.02	6,044.53	3,821.26
standard					
assets					
Doubtful	1,134.24	1,677.89	1,862.78	2,837.86	3,795.56
assets					
Loss assets	-	-	146.00	147.15	146.65

The graph above shows the trend for each asset type, including standard, substandard, dubious, and loss assets. We may infer from the graphic that over the course of five years, the standard assets for each year exhibit a growing tendency. Even substandard assets and questionable assets follow the same pattern, with the exception of 2018 and 2019, when they exhibited a little drop. Except for substandard assets in 2022 and 2023, dubious assets 5 and substandard assets are rising together with the standard assets. The significant growth in questionable assets is evident

in the 2018–19 fiscal year, when it rose from 1134.24 to 1677.89, a 147 percent increase in only one year. While it has grown by 105% for standard assets from 114854.05 to 120,994.30 in 2019–20. And from 5336 to 6465 in 2020–21, the amount of substandard assets has 4 grown by 121.16 percent.

TABLE-2 Gross NPA, Gross advances and Gross NPA ratio.

The following table is displaying the data of gross NPA, Gross advances and the 5 gross NPA ratio of Karnataka Vikasa credit and multipurpose co-operative from the year 2018-19 to 2022-23.

Particulars	Gross NPA	Gross Advances	Gross NPA ratio
2018-2019	5960.29	89556.98	6.66%
2019-2020	7013.92	99620.15	7.04%
2020-2021	8473.81	123327.86	6.87%
2021-2022	9029.55	130023.85	6.94%
2022-2023	7763.48	133653.40	5.81%

The link between the gross NPA and gross advances of the Karnataka Vikasa Credit and Multipurpose Co-operative Bank is seen from the preceding chart. We can observe an surge in the gross NPA as the gross advances rise year over year. Except for 2022–23, the gross NPA has been growing steadily from the year 2018–19. And 23 starting with the 2018–19 fiscal year and continuing until the conclusion of the 2022–23 fiscal year, gross advances are growing. We can draw the conclusion that rising gross advances are fuelling rising non-performing assets (NPA).

This demonstrates that when the company's bank advances rise, so too do the numbers of customers who miss payments. Making ensuring that the rise in gross NPA stays below a specific point is essential since doing so might be detrimental to the organisation.

Graph 3: Gross NPA ratio from the year 2022-23

The above mentioned graph shows that the rise in gross NPA, with the exception of 2022–23, in relative to gross advances is showing an increasing trend from the years 2018–19 to 2019–20. It demonstrates that the gross NPA in 2018–19 represents 6.66 percent (5960.29) of the total gross advances (89556.98), and so on for the following years. However, from 2021–22 to 2022–23, the gross NPA represents a smaller 5 fraction of the total gross advances. This indicates that the bank has increased its advances while also lowering the rate of gross NPA. The bank will benefit from this 19 circumstance.

# Table 3 - Net NPA, Net advances and Net NPA ratio

The following table is displaying the data of net NPA, Net advances and the net NPA ratio of Karnataka Vikasa credit and multipurpose.

Particulars	Net NPA	Net advances	Net NPA ratio
2018-2019	2325.49	85922.18	2.71%
2019-2020	2799.86	95406.09	2.93%
2020-2021	3811.17	118665.22	3.21%
2021-2022	3042.77	124037.07	2.45%
2022-2023	457.31	126347.23	0.36%

# Graph 4-NetNPA and NetAdvances from the year 2018-23

The data in the above tables is displayed in the form of a chart in the graph below. Itincludes the information of NetNPA and Net advances.

## Accordingtotheabove

mentioned data, even the net NPA rises as a result of a rise in net advances made by the Karn at a kaVikasa Credit and Multipurpose Co-

operative Bank. It exhibits a pattern resembling the one seen in the correlation between gross NPA and gross advances.

NPA and Net advances of the bank a Vika sacredit and multipurpose co-

operative bank from the year 2018-19 to the year 2022-23.

The graph above demonstrates that between the years 2018–19 to 2019–20, there has been an increase in Net NPA as a percentage of Net Advances. It states that the net NPA in 2018–19 makes up 2.71 percent (2325.49) of the overall net advances (85922.18), and that it continues to rise in the years after, while it makes up less of the total net advances in 2021–22 and 2022–23. This demonstrates how the bank was able to raise its advances while still lowering the rate of net NPA. The bank will benefit from this circumstance.

# TABLE 4: Provision, GROSS NPA and Provision to NPA ratio.

The following table is displaying the data of provisions, gross NPA and the provision to NPA ratio of Karnataka Vikasa credit and multipurpose co-operative

Particulars	Total provisions	Gross NPA	Provision to NPA ratio
2018-2019	3634.80	5960.29	60.98%
2019-2020	4214.06	7013.92	60.08%
2020-2021	4662.64	8473.81	55.02%
2021-2022	5986.78	9029.55	66.30%
2022-2023	7306.17	7763.48	94.10%

# GRAPH6:provisionsandgrossNPAfromtheyear2018-23.

thedataintheabovetableisdisplayedintheformofachartinthegraphbelow. It includes the informat ion of provisions and gross NPA of the Karnataka Vikasa credit and multipurpose co-operative bankfrom the vear 2018-19 to the vear 2022-23.

Bank.

perative bank from the year 2018-19 to 2022-23.

The total provisions and gross NPA of the Karnataka Vikasa Credit and Multipurpose Cooperative Bank are shown in this graph. The provisions are the sums that have been set aside 14 for use in specific circumstances. Here, it can be seen that while the gross NPA exhibits an upward tendency from the years 2018–19 to 2022–2023, it can also be seen that provision has grown in a similar manner. If the provision covers portion of the gross NPA, that is good for the bank. If the gross NPA exceeds the allowance by an excessive amount. The bank must exercise caution since it may suffer NPA losses and lack the resources to cover them.

# Graph 7: provision stogross NPA ratio from the year 2018-23

**TotalNPAHoldings** 

Particulars	Percentage
Home loan	15.2%

- ☐ MortgageLoan

# **FINDINGS:**

- Trend of the non-performing assets of the Karnataka Vikasa credit and multipurpose cooperative bank the year 2018-19 to 2022-23 is Increasing. It also displays the effect of nonperforming assets on each of the asset class
- 2. The step increase of doubtful assets is seen in the year 2018-19 where it has increased from 1134.24 to1677.89 which comes to a 147 percent increase in a span of 1 year.
- 3. Gross NPA except for 2022–23 is showing an upward trend in relation to gross advances from the years 2018–19 to 2019–20; specifically, the gross NPA in 2018–19 represents 6.66 percent (5960.29) of the total gross advances (89556.98), and so on for the following years. However, from 2021–22 to 2022–23, the gross NPA represents a smaller percentage of the total gross advances. This indicates that the bank has 13 increased its advances while also lowering the rate of gross NPA. The bank will benefit 8 from this circumstance.
- **4.** From the years 2018–19 to 2019–20, the ratio of Net NPA to Net Advances is growing. It states that the net NPA in 2018–19 makes up 2.71 percent (2325.49) of the overall net advances (85922.18), and that it continues to rise in the years after, while it makes up less of the total net advances in 2021–22 and 2022–23. This demonstrates how the bank was able to raise its advances while still lowering the rate of net NPA. The bank will benefit from this circumstance.
- 5. The underlying reason of Karnataka Vikasa Credit and Multiple Purpose Cooperative Society's NPAs is consumers who lack financial stability and credit worthiness, which are the primary causes of NAPs in the company.

- **6.** The major cause of NPA in agriculture loans is inconsistent or non-existent profitability.
- 7. Poor financial stability and a lack of a consistent source of income for the client are the main causes of NPA in housing loans.
- **8.** Customers and students who borrow money for education do not start looking for work 9 right away after finishing their courses, which costs the firm NPA.
- 9. In the early stages of a firm, profits are typically poor or non-existent. During this time, clients who took out small business loans fail to repay the money to the bank, which results in NPA in small business loans

# **CONCLUSION**

Managing an account framework plays a very important role in the nation's fiscal situation. The reliability of its structure for conserving money is strongly correlated with the quality of an economy. Only a sound system for managing risks and credit evaluation will be able to solve the NPA problem. Prudential requirements must be included in the managing an account structure in order to lessen, if not completely eliminate, the NPAS problem. The Karnataka Vikasa Credit and Multipurpose Bank's nonperforming assets were the subject of this 15 investigation. The gross, net NPA, and advances were all examined. Additionally, the link between net profit and NPA was investigated. According to the report, the bank's nonperforming assets are growing annually as a result of the rise in advances. Before raising the advances, the bank is advised to exercise prudence

#### **ABSTRACT**

Women have competed for previously all-male-oriented jobs since the Equal Employment Opportunity Act of 1972. Females needed office survival guides more than office success guides when they found themselves in unfamiliar territory. Numerous studies have been conducted over the years to track women's advancement to the top of organisations. While there are more ladies working today, the research found that they are still labouring with career elevation and mentor for successful managerial guidance. females held nearly 52% of all specialized roles in the USA in 2014, but only 14.6% of upper management positions and 4.6% of Fortune 500 CEO positions were acquired. There are numerous reports providing professional advice and points for working females, and a dearth of articles addressing apt practices for female executives.

To fill this gap in the literature, the author approached the topic from a practical standpoint, offering lessons learned from Katharine Graham, the first female Fortune 500 Company CEO.

#### **Keywords**

Women leadership, executive women, women's career advancement, best practices, managerial gender issues, motivation, and personality.

A tiny number of females began getting employed by firms in the early 1900s. With the onset of World War II and its following aftermath, many of them who had laboured to help found themselves unemployed, despite their willingness to work. Abraham Maslow, who was studying human motivation and personality at the time, claimed that human conduct is based on a hierarchy of wants such as physical, security/safety, love/belonging, and self-esteem and self-actualization (Maslow, 1943). If the last three levels of Maslow's hierarchy of requirements are not satisfied, the individual finds uneasy to proceed further, and these wants combine to generate a powerful drive to survive. The desire for self-esteem and self-actualization completes Maslow's hierarchy of requirements. Women struggled for employment in organisations in this setting, but they faced the opposition from society and were deprived of chances to acquire higher self-esteem and fulfil their skills.

Since the Equal Employment Opportunity Act of 1972, Women started competing for positions that were formerly exclusive for men only. When they were in unknown territory, female required survival advice in the workplace more than success guides in career. In all these years, numerous studies have been done to follow women's advancement in the organisations. Inspite of more women in the workplace today, these researches indicated that women continue to struggle with advancements in career and, particularly, role models for successful managerial authority. In 2014, ladies held approximately 52% of all executive occupations in the US, but only 14.6% of Top management spots and 4.6% of Fortune 500 CEO posts. The matter of fact is there are abundance of publications offering career counselling and ideas for womenwho are working, but hardly any papers addressing best practises for female CEOs. To remedy this flaw in the secondary information, the author used a practical approach, sharing lessons gained from Katharine Graham, the first lady CEO of a Fortune 500 corporation.

After graduation, Katharine Graham was selected as the manager for the publisher of the San Francisco newspaper, but she was never allowed to take on any duty that the title necessitated, it was a cakewalk to be the first female manager, and the toughest part was being a female leader. Her male counterparts were rude, loud, boisterous, and stinky, and they hazed her in every manner possible. They gave her a sculpted male body part as a gift one day, and all Katharine could do was politely take it andeventually the hazing ended in its own time.

On the work front, her boss was mortified to have her on the team. He felt humiliated to have a female work under himafter considerable thought, he handed her a project that was not her expertise. Furthermore, she never had a refreshment room or even a women's toilet. In retrospect, she realised that the chosen project allowed her to establish and acquire stronger self-esteem in the eyes of her dominating colleagues (Maslow, 1954).

She discovered the delicate boundary between normal and dysfunctional in 1974. It was not always possible to distinguish between regular challenges experienced by everybody, especially concerns that were uniquely feminine. Some instances were plainly "over the line" in terms of sexual harassment, and these were easy to identify nonetheless, they were frequently tough to handle successfully.Important Criteria's failed to exist in place at that

time regarding an effective or ineffective strategy. She wondered if success was not having repeat offenders. And, "if she were a man, this would not be happening." "How would she react?" Because there was no sexual harassment statute in place at the time, she was able to manage situations on her own. While she acknowledged that the force of the law is required to protect women from heinous atrocities, legal acceptance and petty problems has diminished the true importance of leadership. Women are still unable to distinguish between actual sexual harassment and typical male/female contact. Teasing was major challenge she encountered, which may be harmful. She had the ability to question sexually harassing situations and manage these difficulties on her own, with no sexual harassment forms or personel welfare department involved. She could create her own regulations because she was the single lady manager facing the offender alone with no support and guidance. Males could express their thoughts without fear of being labelled as misogynists, a term we rarely hear today. It was motivating for everyone to have the choice to speak freely and appreciate the opinions. Conversations were raucous as it frequently bordered on crude, but we were able to finish any disagreements on Friday afternoons where we discussed shop. It was an incredible opportunity to agree to and learn from the seasoned male-only executive team. She was aware that she was attempting to penetrate their society, form relationships, and gain their trust and respect..

She had once employed a machinist on force and discovered he only added more to her misery. He had the labour union and management on the verge of a discrimination action due to his ailing back and seniority position. He parked his white Cadillac prominently in front of the company. She discovered that when he vanished, so did his Cadillac. How does she hold him responsible for not working for whatever he is paid for. Even the expert seasoned manager struggled to meet this challenge. She was adamant about dealing with him. She researched the hiring contract as well as the disciplinary procedures. She learnt the rules and was well prepared. When she found that her male friends had "set her up," she became fearless to the point of becoming reckless. Her demeanour shifted to "I'm going to castrate you." Few employees gradually began to listen to her as they understood that they have a tough boss withgreat self-worth and confidence to deal with the elusive Houdini (Maslow, 1965).

Female managers are often mistaken with female leadership. Manager is exactly what the job entails. Followers, on the other hand, play in striving for the success of the female leader. For example, a true lady leader is both competent and loves to employ a supporting strategyto descend into the interior of a massive tank. That function would most likely be delegated by the female management.

She definitely gained the knowledge to realise when men should lead and when women should lead as she faced few situations. On a day when a senior employee was bid farewell and the department was arranging a celebration, she oversaw the employees, especially Mel, the harshest critic. The liquor flowed freely at the party location. One inebriated male employee made unwanted and aggressive approaches. The situation was out of control, she was confident and determined to handle it alone. Mel appeared out of nowhere, like a hero in shining armour, to defend her. Then she realisedthat at times wisdom lies in not leading.

Just not this, she remembers another incident in the hotel room where she was assaulted. It was her first business trip, the travel expense and trainingwere sponsored by the company for a week .she was very excited about it. Several of her colleagues were enrolled in different session which was for more senior managers. Because they were staying at different hotels, she was happy when a colleague called and invited her to join them for dinner. One of her colleague was supposed to pick her from the hotel. She believed that her peers had finally accepted her. That notion was interrupted when she opened the door and he began hitting her without hesitation or words. She was terrified and felt it was very inappropriate. It should never have happened, yet it did. She was not physically hurt and chose not to report the event. She came to the conclusion that she was responsible for protecting herself and would face a "she said/he said" situation. Reporting the event may jeopardise her management's reputation. In retrospect, she stated that she did not consider protecting other ladies from this individual. She learned from her supervisors that she should hire "for values and qualities like a sense of humour, resiliency, "earning your way in" and fitting-in with the company by being passionate for the task. She grew to value the wisdom more when she faced problems on the work. One of the most important lessons she learnt was to be professional come what may the show must go on. She still had to deal with the problems at the end of the day. She discovered that the Rs of leadership included being resourceful, resilient, an experienced "reframer," a reality checker, and capable of relegating relational rules. She had to become valuable in making people to do things and get work done by them by perservance, pursuance, and patience. Because there was no precedence, she could create rules to control the relationships at work. She had the ability to draw the line with colleagues and subordinates, and she frequently utilised humour to smooth over unpleasant situations. There were a lot of unethical practices and she could let it go if she wanted tobut the absence of norms, structures, and laws aided her. This is how she reframes diverse circumstances.

some may see these encounters as "war stories" of a seasoned woman as these incidents occurred many years ago, however they shaped her to be a better version each day. Each person's experiences will build him or her to be a better person sooner or later. Off course there is no shortage of books and articles about leadership nowadays, and perhaps we are wise enough to distinguish between excellent and terrible leaders but we are not that wise in recognising leadership's intrinsic uniqueness. Leadership is as individual as fingerprints, varying according to personality, situation, and style. To make a difference in the lives of others, leaders must embrace the unique contributions that only they can provide. Someone rightly said for "ten thousand step of beautiful journey there has to be a first starting step".

#### **Abstract**

Purpose: The main purpose of the present study is to know how far socio economic characteristics impact on micro finance initiatives, and to know about the benefits derived from the microfinance initiatives, factors driving social capital formation and women empowerment. Since independence poverty alleviation programmes through government sponsored schemes could not yield the expected result and in many cases the activities of welfare could not trickle down to the needy who are living in urban centres. Urban poor like rural poor also requires finance for the self consumption and involvement in income generating activities. Microfinance initiatives across the globe are popular as far as poverty alleviation, women empowerment and social capital formation. Bengaluru experienced rapid urbanisation due to increase in urban population from 12 million in 2020 to 12.7 in 2021. (http://www.microtredns.net>citation). Micro finance programmes emerged as a powerful tool of poverty alleviation since the last three decades and several studies have examined its economic influence on the community well being (Asghar Tahamasehi et al, 2021).

**Methodology** / **Design**: Questionnaires containing known questions which are open ended in nature are administered as schedule after considering avoiding non-response, delay and incompleteness in addition to respecting social distance norms. A total of 230 questionnaires in the hand and out of which 200 found to be useful forming 86.95 success rate. Chi-square, contingency co-efficient, Kendall's co-efficient of concordance, and weighted arithmetic mean were performed for the purpose of analysis and presentation of data.

**Key words:** Poverty alleviation, savings, women empowerment, money lenders, living standards, education, awareness.

#### **Introduction:**

Self Help Groups - Bank Linkage Programme (SHG – BLP) is a unique model at the global level which has transformed innumerable lives by mainstreaming women and making them as partners in the national building, progress process. It is emerging as a 'fast growing sector' although it is under represented (NABARD, 2020). Micro finance in India plays an important role in the delivery credit to the people of bottom of pyramid (RBI Bulletin 2020). Economists and policy framers stress on the distribution of economic savings among the poor people and deserved which empowers the masses at gross root level (Dadhich, 2022: Ravi et al, 2005, Sarangi 2008). It has been accepted as successful model where the poor have no place in the formal institutions (Swathi Sharma, 2018). Innumerable studies in the past like Kabeer (2005), Mayoux (2001), Otero, M. (1989), Pitt & Khandker (1996), Rahman (1988) found that microfinance is a good strategy to alleviate poverty, empower women and augmenting economic development.

SHGs influenced SHG members both social and economic life. The economic impact is observed in the form of savings created, easy access to formal credit, cheaper interest rates and enhanced income and involvement in livelihood activities. The similar opinions also expressed by Barbora & Mohanta (2005), Rathinam & Nachimuthu (2012), Meetei (2011) and, Sarmah et al., (2010). The social impact created by microfinance covers building of self confidence, enhanced awareness about savings and attaining economic self influency and health issues (Premachandra et al., 2017, Rathinam Nachimuthu, 2010). By becoming members in SHGs the members can increase participation in social services and promote organised action, acquisition of new skills and improved technological change among the members. In a similar study scholars like Boga and Nakka (2005) reported that the household level, expenditures on food and clothing among poor households go up after joining SHGs in addition to enhanced awareness on health and related issues. SHGs provide a platform for the promotion of activities in groups and the promotion of infrastructure facilities, technology, credit and marketing support for women (Sethi and Atibudhi, 2001, Barbara & Mohonta, 2001 & Sharma 2001)

Table – 1 depicts data on progress under SHG – Bank Linkage Programme (2018-19 to 2020-2021). Table highlights data about savings, loans disbursed and credit outstanding. The total number of SHGs were 100.14 lakhs during the year 2018-19 and rose to 112.23 by the end of 2020-21 with an increase of 13.54%. The loan disbursement was 26.98 crores during 2018-19 and by the end of 2020-21 it stood at 28.87 crores revealing 2% growth over the years. The all women trend of numbers of SHGs were 85.19 lakhs during 2018-19 and rose to 86.65 and loan disbursement exclusively to women groups stood at 87.66. SHGs and rose to 89.71 SHGs. Further

loan outstanding details reveal that 50.77 lakhs SHGs were linked by the end of 2018-19 and rose to 57.8 lakh SHGs by the ends of 2020-21.

Table – 2 reveals data about region-wise performance of savings linked with banks. Region-wise details also shows an enhanced growth of SHGs linked savings during 2020-21. Table shows central region registered the highest growth of 5%. Six states / UTs namely Uttarkhand, Nagaland, Chandigarh, New Delhi, Karnataka, Dam and Din, registered a negative growth. As many as 19 states / UTs showed growth rates than All India average. The degree in savings accounts of SHG may be due to data sanitisation, closure of document accounts and reporting of errors etc., Further, the table reveals about concentration of savings linked with banks in Southern region. The savings linked SHGs with banks of Southern region reveals that it was 12.89 crore 55% of total for the 2018-19 and it was 14.70 crores during 2019-20, 56.21% of total and finally, it was 21.29 crores (56.8% of total) during the year 2020-21. The similar performance was also shown by Eastern region and Western region.

Table – 3highlights data about bank loan disbursement by banks. It was 5831763 lakhs to the 2698400 SHGs during the year 2018-19. The total disbursed amount for the year 2019-20 stood at 7765935 to all regions of 1036481 SHGs. Further, during the year 20-21 the amount disbursed in the form of loan for all regions stood at 5807068 lakhs and numbers of SHGs stood at 2887851 lakhs. The region wise average loan disbursed also shows downward trend expect Northern region. A total of Rs. 5807068 lakhs was disbursed to all 6 regions to 2887394 SHGs and the average loan disbursed stood at Rs. 201118 per SHG.

Table 4: Region-wise NPA Level during 2019-20 and 2020-21

		2019-20		2020-21	
	Amount of Gross	NPA as %A1	mount of Gross	NPA as %

Source: Status of Microfinance in India, NABARD, 2020-21

Table-4 highlights data regarding NPAs in SHG – BLP. Only two regions i.e., Eastern region and Southern region shows below the level of All India. These two regions having the maximum share of SHG loan disbursement and loan outstanding. The change in the NPA level of these two regions has a major effect on all other remaining regions. Table shows that bank loans to SHGs as on 31 st March 2021 were 4.73%. As compare to 4.92% as on 31 st March 2020. The absolute level of NPAs declined from 532170.42 lakhs in 2019-20 to Rs. 488921.34 lakhs. The decrease in NPAs is seen across regions except Eastern Region where it has marginally gave up. Out of 35 states and UT, reporting data, 26 showed decline in NPA level and thus improvement in portfolio quality.

# Statement of the problem

Women forms 50% of population. But very unfortunately either in traditional or modern society equal rights are existing but at the implementation level there exists huge disparities. Women studies reveals that unless and until women are empowered women development is not possible. As per NABARD, 2017 data the demand at the poor is Rs. 60000 crores but cumulative payment is Rs. 6000 crores under microfinance programmes. The government sponsored programmes did not receive the expected result on account of bad implementation of schemes, hierarchy, redtapism, duplication of projects. The urban depends on daily income from income generating activities and many a times the members may not receive expected return of the day. These poor people do not have any collateral to give in order to get a bank assistance. Financial access to the village and urban poor are highly skewed and unequal, SHGs are helping urban poor women in assisting financially with a mutual weekly or fortnightly contribution by members. SHGs promote gender equality and SHG BLP empowered urban women and it is a unique strategy at the global level.

#### **Review of literature**

Karlan's (2007) study is situated on Peru and members social ties by looking at the extent to which group members share the same culture and like more closely to each other.

Dufhues et al., (2013) measure social capital based on social network analysis, using information from borrowing households in Thailand and Vietnam. The outcome of the study reveals that social capital is associated with better repayment performance, depending upon the nature of social ties between individuals.

Casser et al., (2007) using survey data from borrowers in South Africa and Armenia, measure social capital within borrowing groups by focusing on group homogeneity and intra group trust, and show that both these measures are positively associated with repayment performance.

Widick et al., (2011) study focused on how social capital can help increasing the social performance microfinance institutions. Further they expressed that religions networks are important for rural households in Guatemala to have access to credit.

Khan and Rahaman (2007) stated that urban micro finance improved the living standard of the borrowers of the Chittagand district of Bangladesh by reducing poverty and making them capable financially of starting new small business and expand old business.

Basher & Rashid (2012) explained the characteristics of urban microfinance within Urban low income groups and their significance. They emphasise on the urban microfinance program because of the increasing trend of urban poverty.

Tanya Sharma et al., (2014) stated that microfinance in Delhi led to an improvement in living standards of the poor women and an increase in their incomes, savings and improvement in

financial condition and impacted on poverty alleviation and also given them greater autonomy to take decisions concerning the lives of their facilities and themselves.

Prema Basargekar (2010) expressed about the impact of urbanisation at Poona Urban area where the villages are converted into industrial zones. Transition of these villages into semi-urban areas received mixed responses as this conversion provides jobs and better infrastructure and whereas as it develops agriculture and local jobs and enhance social pressure.

Syed Mohammad Ghouse (2019) stated that microfinance activities are very much successful in reducing social problems in rural areas. The researcher suggested that government should formulate the very effective strategies to control the working mechanism of microfinance institutions as they became part and parcel of Indian economy.

Jeremaiah Machigambi (2020) examined the relationship between sustainable micro finance and sustainability to poor clients. The paper focused more on demonstrating the impact of a sustainable lending approach of the poor clients. The key issues highlighted differences in terms of target clients and implications for the sustainability of beneficiaries.

# Objectives of the study

- 1) To study the impact of socio-economic characteristics on microfinance initiatives.
- 2) To analyse the factors driving social capital formation.
- 3) To the benefits from microfinance initiatives.
- 4) To analyse the factors driving women empowerment.

# **Hypotheses**

- 1) The socio-economic characteristics of respondents do not impact on micro finance initiatives.
- 2) Social capital formation is not driven by any factors.
- 3) Benefits are not associated with microfinance initiatives.
- 4) Women empowerment is not driven by any factors.

## **Research Questions**

- 1) What are the reasons behind socio economic characteristics for not impacting on the microfinance initiatives?
- 2) Which factors drive social capital formation?
- 3) What are the benefits of microfinance initiatives?
- 4) When factors drives women empowerment?

#### Limitations

- 1) The study is confined to urban Bengaluru district.
- 2) The sample is small when compare to universe SHG members at Urban Bengaluru.
- 3) Any generalisation requires further study.

#### Research Methodology

The present study is based on both the primary and secondary data. A well drafted questionnaire was administered as schedule for the purpose of data collection. The benefits of microfinance, social capital formation, and women empowerments details are studied and data presented in the form of tables. Research design is a strategy for answering the structured questionnaire using empirical data (Shana, 2021). It is simply a structural frame work of various research methods as well as techniques that are used by researchers (Team Leverage Edn., 2020).

Questionnaire design: Questionnaire is a set of logic questions listed for the purpose of data collection from respondents. Researchers are required to apply most relevant and most effective way to collect the maximum amount of information in terms of validity and reliability as recommended by Easterby – Smith, Thorpe and Lowe (1991). The secondary sources include bulletins, e-journals and internet. The relevant references were given at the end.

Universe of the study: The study is confined to urban Bengaluru district. There are 69 grama panchayats, 3655 confirmed SHGs and 65805 members in all SHGs of 5 sub districts.

**Sample of the study:** (Details of Yalahanka is not available)

Name of the subdistrict	Grama Panchayat	SHGs	Members	Sample
Anekal	28	1321	24427	70
Bengaluru East	11	253	4717	15
Bengaluru North	12	1252	2280870	
Yelahanka (Bengaluru North additional)	-	-	-	-

**Method of Data analysis:** The study adopted x2, contingency co-efficient, Kendall's co-efficient of concordance and weighted arithmetic means. These techniques are performed as they are simple to compute and sufficient for the analysis.

#### Data presentation and analysis: Demographic profile of respondents – A.

The relevant demographics of respondents were studied to know the impact created on microfinance. These characteristics include, marital status, age, education, occupation, monthly income, living conditions, participation in social activities, savings formulation and participation in election, support of a candidate and contest.

**Research question No. 1:** What are the reasons behind the socio-economic factors not impacting on the microfinance?

**Hypotheses:** No. 1:  $H_0$ : The exist no significant variation in the characteristics of respondents do not impact on microfinance initiatives.

H<sub>1</sub>: There exist significant variation in the socio-economic characteristics of respondents.

The study of socio economic characteristics of respondents is essential as it is going to decide whether they form the part of representative sample of the target population. The respondents were appealed to answer all the questions of questionnaire. All the characteristics of respondents and their significance and degree of relationship studied in relation whether they impact the study or not. Table – 5 depicts data about characteristics of respondents. All respondents are females and no male members is given membership in any SHG. There are 160 members who are married and 22 respondents remained single and 18 are divorce, 69 respondents belongs to 40-50 age category, 38 belongs to 30-40 years, 35 in between 20-30 years, 30 between 50-60 years, 15 < 20 years and 13 > 60 years. 67 respondents studied up to 10<sup>th</sup> standard 58 studied up to PUC, 38 below 7<sup>th</sup> standard, 22 are general degree holders, 8 are post graduates and very surprisingly 7 are illiterates. 55 respondents occupation as vegetable selling, 38 doing petty business, 30 seasonal fruit sellers, 29 are papad, textile pieces and pickle sellers 23 are involved in agricultural activities, 15 are suppliers of provisions, 6 are dealers in iron seconds, old newspapers collectors, and 4 are handicraft sellers. 84 respondents monthly income is in between 20K – 30K, 42 respondents monthly income lies in between 10K - 20K, 31 in between 30 - 40K, 25 < 10K and 18 > 40K. 85 respondents are residing in their own houses, 60 are living in rented houses, 30 government scheme house-owners, 25 are living in temporary sheds. 125 respondents participated in social activities and 75 are not participated in any social activities. 173 respondents formed savings and 27 respondents are not created any savings. 123 respondents regularly participated in elections and supported a candidate and also contested in elections, 40 are not regular and 28 never participated in decision supporting candidate and contest in elections.

### **Data presentation and Analyse - B**

**Research question No. 2:** Which factors drives social capital formation?

Hypotheses No. 2:  $H_0$ : There exists no significant variation in the drivers of social capital formation.

H<sub>1</sub>: There exist significant variation in the drivers of social capital formation.

Table –6 highlights data about factors driving social capital formation. These drivers vary from mutual trust to mutual help in case of need. 124 respondents out of 200 stated strongly agree, 49 expressed agree and 27 somewhat agree. Out of 124 who stated strongly agree, 25 stated good relationship, 22 sharing valuable information. 18 felt healthy discussion on common matters, 15 indicated about mutual trust 12 spoke about respecting norms and values. Out of 49 respondents 12 felt about good relationship, 9 expressed about sharing valuable information, 7 indicated about healthy discussion on common matters. Out of 27 who stated somewhat agree, 5 expressed about good relationship. 4 each about healthy discussion on common matters and mutual help in case of

need. 'w' fails to accept H0 and accepts H1 and hence it is concluded that there exists significant variation in the data.

Research question No. 3: What are the benefits of microfinance initiatives?

Hypotheses No. 3: H<sub>0</sub>: There exists no significant variation in the benefits of microfinance.

Hypotheses No. 3:  $H_1$ : There exist significant variation in the benefits from microfinance initiatives.

Table – 7 depicts data regarding benefits from microfinance initiatives. 128 respondents out of 200 stated strongly agree followed by 48 agree, 24 somewhat agree. Out of 128 who stated strongly agree 24 stated about free from money lenders, 20 expressed about a platform to discuss issues, 14 each indicated about access to organised financial services and increase in women empowerment, 10 reported about more savings formation. Out of 48 who said agree 11 expressed about free from money lenders, 8 spoke about increase on women empowerment, 6 reported about additional earnings and 5 each indicated about a platform to discuss issues and enhanced standard of living. Out of 24 who stated somewhat agree, 5 spoke about free from money lenders, 4 expressed about increase in women empowerment. 'w' fails to accept H<sub>0</sub> and accepts H<sub>1</sub> and hence it is concluded that there exist significant variation in the data.

**Research Question No. 4:** Which factors drivers women empowerment?

**Hypotheses No. 4 :**  $H_0$  : Women empowerment is not driven by any factors.

H<sub>1</sub>: There exists significant variation in the data and factors driving women empowerment vary.

Table -8 reveals data about factors driving women empowerment. The first relative important driver of empowerment is about improvement in the savings formation, second important driver is economic independence and the third is about enhanced stand. Weights are awarded to Likert 5 point scale starting from strongly agree to strongly disagree and the opinions (f) are multiplied by 'w' to get 'fw'. The sum of fw is divided by sum of weights (5+4+3+2+1)=15. The remaining by drivers of women empowered are awarded weighted average depending upon strength of fw.

**Table – 5: Demographics of respondents – Microfinance initiatives.** 

Socio-economic characteristics	x2	TV @ 0.05 level	df	Result of X <sup>2</sup>	'c'	Result of 'c'
Marital status	196.1101	3.841	1	Significant	0.70	High Degree
Age	61.7259	11.070	5	Significant	0.48	High Degree
Education	96.8293	11.070	5	Significant	0.57	High Degree

Occupation	80.6400	14.067	7	Significant	0.53	High Degree
Monthly income	70.2500	9.488	4	Significant	0.50	High Degree
Living conditions	47.0000	7.815	3	Significant	0.43	High Degree
Participation in social activities	112.5000	3.841	1	Significant	0.60	High Degree
Savings formation	106.58	3.841	1	Significant	0.58	High Degree
Participation in election, support of a candidate, contest	74.7033	5.991	2	Significant	0.52	High Degree

Source: Field Survey

Note: x = chi-square

'c' = 
$$\sqrt{x^2 / x^2 + N}$$

Where c = contingency co-efficient, N = Number of observation

When the value of 'c' is equal or near 1, it means there is high degree of association between attributes. Contingency co-efficient will always be <1.

Table – 6: Respondents awareness of factors driving social capital formation

Factors driving social capital formation	SA	A	SWA	RT	RT <sup>2</sup>
Social trust	15	4	2	21	441
Social relationship	25	12	5	42	1764
Attitude	8	3	2	13	169
Respecting norms and values	12	2	3	17	289
Believing co members	7	3	2	12	144

Healthy discussion on common matters	18	7	4	29	841
Mobilization of savings regularly	9	4	2	15	225
Sharing valuable information	22	9	3	34	1156
Mutual help in case of need	8	5	4	17	289
Total	124	49	27	200	5318

Source : Field Survey

Note: SA – Some Agree, A – Agree, SWA – Somewhat Agree, RT – Raw Total

$$SSR = \Sigma RT^2 / \Sigma RT^2 / N$$

$$= 5318 - (200)^2 / 9 = 5318 - 4444.44 = 873.56$$

$$W = 12 \times SSR / K^2N (N^2 - 1) = 12 \times 873.56 / 9 \times 9 (81 - 1)$$

$$= 10482.72 / 6480 = 1.61$$

Test the significance of 'w' by using chi-square statistic.

$$X^2 = k (n-1)^2 = 3(9-1) / 1.61 = 3 \times 8 \times 1.61 = 38.64$$

**Decision :** At 8 df with 5% level of significance the value being 38.64 being higher than the TV = 15.507 and hence 'w' fails accepts H<sub>0</sub> and accepts H<sub>1</sub>. Therefore it is concluded that there exist significant relationship between drivers and social capital formation.

Table – 7: Benefits from microfinance initiatives

Impacting factors		A	SWA	RT	RT <sup>2</sup>
Free from money tenders		11	5	40	1600
A platform to discuss issues	20	5	2	27	729
Access to organised financial services		3	2	19	361
More income		2	1	11	121
More savings formation		2	1	13	169
Good children education		1	2	9	81

ISSN:1539-1590 | E-ISSN:2573-7104

Vol. 6 No. 1 (2024)

Involvement in IGA activities		2	1	11	121
Improved health and sanitation		1	1	7	49
Investment in fixed assets	7	2	2	11	121
Increase in women empowerment		8	4	26	676
Enhanced standard of living		5	1	11	121
Additional earnings		6	2	15	225
Total	128	48	24	200	4374

Source: Field Survey

Note: SA – Some Agree, A – Agree, SWA – Somewhat Agree, RT – Raw Total

$$SSR = \Sigma RT^2 / \Sigma RT^2 / N$$

$$= 4374 - (200)^2 / 12 = 4374 - 400000 / 12 = 3333.33$$

$$W = 12 \times SSR / K^2N (N^2 - 1) = 12 \times 3333.33 / 9 \times 12 (144 - 1)$$

Test the significance of 'w' by using chi-square statistic.

$$X^2 = k (n-1)^2 = 3(12-1) / 2.59 = 3 x 11 x 2.59 = 85.47$$

**Decision :** At 8 df with 5% level of significance the value being 85.47 being higher than the TV = 19.675 and hence 'w' fails accepts  $H_0$  and accepts  $H_1$ . Therefore it is concluded that there exist significant relationship between the two variables.

**Findings:** The result indicates the presence of significant and high degree of relationship between socio economic characteristics and microfinance initiatives. The findings of the study reveals that good relationship, sharing valuable information, healthy discussion on common matters are factors that drives social capital formation. The benefits of microfinance includes free from money lenders, a platform to discuss issues, increase in women empowerment and access to organised financial services. The drivers of women empowerment includes improvement of savings formation, economic independence and enhanced living standards.

**Findings:** The result indicates the presence of significant and high degree of relationship between socio economic characteristics and microfinance initiatives. The findings of the study reveals that good relationship, sharing valuable information, healthy discussion on common matters are factors that drives social capital formation. The benefits of microfinance includes free from money

lenders, a platform to discuss issues, increase in women empowerment and access to organised financial services. The drivers of women empowerment includes improvement of savings formation, economic independence and enhanced living standards.

#### **Conclusion:**

SHG – BLP is a unique microfinance programme which is providing several benefits to the members. Bengaluru urban district is growing beyond expectation Pandit Jawaharalal Nehru is right in commenting "Bengaluru is a happening city". Bengaluru is nicknamed as a 'silicon valley' 'science city' 'garment hub' etc., and a multi-cultured and tolerate impacting community. The urban women are struggling to earn at Bengaluru and are including in many income generating activities. They are now capable of saving after meeting all household expenditure. The present study reveals about the presence of better socio economic characteristics which are significantly with a high degree impacting on microfinance initiatives. The study reveals about innumerable benefits of microfinance which includes free from money lenders, increase in women empowerment and a platform to discuss issues. The study also reveals about the factors driving social capital formation which includes good relationship, sharing valuable information are healthy discussion on common matters. The factors that drives women empowerment includes improvement in savings formation, economic independence and enhanced standard of living. The study concludes by stating that means more engagement of women SHGs may accelerate more savings and more number of women may involve in income generating activities.

#### ARTICLE INFO

#### **ABSTRACT**

This quantitative study focuses on Bank of India, Andhra Bank, Axis Bank, and HDFC Bank while analyzing the asset-liability management, profitability, and liquidity of a few chosen Indian commercial banks. Information on capital, reserves, deposits, borrowings, assets, liabilities, profitability ratios, liquidity ratios, and compound growth rates were gathered from their annual reports and financial statements. For analysis, statistical tools such as inferential and descriptive methods were used. The findings demonstrate that different banks have different approaches, with Bank of India and HDFC Bank seeing strong increases in capital, reserves, deposits, and borrowings. Andhra Bank is notable for its robust reserves of liquidity, although HDFC Bank exhibits more profitability. The report emphasizes how crucial efficient asset-liability management is to Indian commercial banking's capacity to maintain profitability and reduce risks.

**Keywords:** Asset-liability management, profitability, liquidity, commercial banks, India.

# 1. INTRODUCTION

A wide range of organizations, markets, and financial instruments make up the financial system. It offers the main mechanism for converting savings into profitable investments. A contemporary economy must have an effective financial system since it plays a major role in the distribution of resources. A financial institution's primary goal is to mobilize resources and direct them toward investors. In various economic systems, financial institutions have a varied channeling function. Somashekar (2019) asserts that commercial banks have a leading role in economic growth in addition to being thought of as money exchangers. They serve as the nation's financial safe havens as well as the repositories of resources required for growth in the economy. They contribute significantly to a nation's economic growth. According to conventional wisdom, commercial banks are among the financial intermediaries that raise capital mainly through the issuance of time/fixed, savings, and checkable/demand deposits. Commercial banks are also permitted to offer every banking service in the financial market because our nation's financial system is still in its infancy. Commercial banks handle practically all of the money and capital market transactions and operations since there isn't a well-organized financial market. According to Roy (2010), commercial banks are significant for the nation's financial stability as well as economic prosperity. Banks are especially significant in emerging economies for three main reasons. Initially, they play a crucial part in the growth of additional financial markets and intermediaries. Second, the business sector and investors significantly rely on banks to satisfy their funding needs since there are weak bond and stock markets. Finally, due to their general inability to control financial risks, banks serve the interests of a large number of family savers in emerging or undeveloped nations who want to ensure income, liquidity, and fund safety.

An organization's not entirely set in stone by how much cash it makes contrasted with the capital it contributes. The amount of detailed income for a given monetary year may be utilized to financially measure this level of progress. According to Zopounidis (2001), in order for banks to effectively compete in the market, they must manage their assets and liabilities while keeping an eye on risk levels, earnings, liquidity, profit, solvency, and

the volume of deposits and loans. By doing this, they can reduce losses and increase profitability. Given the pivotal role asset liability management plays in risk management, banks must acknowledge the significance of asset liability and implement efficient risk management protocols. By employing sophisticated asset liability management strategies, banks can optimize profitability and mitigate risk in the fiercely competitive banking services markets of today. A company may balance its assets and liabilities with the help of asset liability management. Consequently, this reduces monetary hazards and enhances profitability. When a company is making investment decisions, asset liability management helps.

#### 1.1. Research Objectives

- 1. To assess asset-liability management methods in Indian commercial banks, analyze growth rates of capital, reserves, deposits, and borrowings.
- 2. 2To examine how liquidity, profitability, and asset composition affect financial performance and risk management in these institutions.

#### 2. LITERATURE REVIEW

**Rahmi and Sumirat (2021)** utilized liquidity risk, functional proficiency, capital sufficiency, and financing cost risk as free factors and ROA as a relapse and variable to concentrate on asset-liability the board during the Coronavirus pestilence and its impact on banks' profitability in Indonesia. The review's decision clarified that compelling AL the executives ensures the financial business would be more profitable all through the pandemic. In rundown, when assets and liabilities are effectively followed and made due, the bank's profit will rise.

**Owusu and Alhassan (2021)** utilized the SCA model to dissect the ALM of Ghana's financial industry and observed that how ALM is overseen affects business banks' profits. The outcomes confirmed that the whole execution of banks is straightforwardly affected by the fitting administration of Asset-Liability.

The effect of asset-liability the executives on the profitability of Nigerian store cash banks is examined by **Onaolapo and Adegoke (2020).** The asset-liability pointers for estimation were credit and advance, NPL, credits and advances, borrowings, and request store, while ROA and return on initial capital investment filled in as intermediary appraisals for monetary execution. The review's decisions show that the presentation of Nigeria's store cash organizations is exceptionally influenced by asset-liability the board.

Likewise, **Ukpong and Olowokudejo (2021)** directed an AML examination on ten Nigerian protection firms utilizing the SCA model. As a substitute for profitability, ROA was utilized. That's what the investigation discovered, except for property and hardware, asset the executives essentially adds to enhancements in the profitability of disaster protection firms. Expressed in an unexpected way, further developed asset-liability the board will yield a bigger return.

Utilizing CAMEL proportions, **Mun and Thaker (2016)** directed an observational investigation of Malaysia's banks, both Islamic and Ordinary, to inspect the effect of asset-liability the executives on the Profit from Value proportion, a proportion of profitability, for the monetary years 2010 to 2013. Their review's discoveries showed that asset-liability the board, which applies to both ordinary and Islamic banks, essentially influences the profitability of the last option. The monetary presentation of the Afghan financial framework was concentrated by **Haidary and Monastery (2018)**.

The impacts of both interior and outside factors were analyzed in the examinations. The discoveries showed serious areas of strength for a connection between's inside bank qualities and bank profitability. Along these lines, the strength and sort of the connection among assets and liabilities in Tunisia were likewise discovered utilizing the Standard Relationship Examination apparatus.

As indicated by **Said and Edge's (2018)** study, the monetary record's parts were effectively taken care of by Tunisian banks, and the profitability of the sheet was dependent upon the nature of asset the executives.

By the by, **Shrestha (2015)** utilized POLS to research the profitability of Nepal's financial industry. ROA filled in as the profitability pointer, while Different Assets, expansion, ostensible Gross domestic product, and Assets that get through longer than a year filled in as the AML markers. As per the report, there is a measurably significant connection among's AML and banking profitability. Significant commitments came from stores on the liability side and credits and advances on the asset side.

To determine the sort and power of the connection among commitments and assets, **Said and Edge (2018)** used the Accepted Relationship Examination instrument. As indicated by the review's discoveries, the asset-liability things were effectively overseen by Tunisian banks, and their prosperity was generally subject to how well the assets were dealt with. The impacts of macroeconomic variables, bank-explicit elements, and industry-explicit elements on the monetary execution of a UK bank were undeniably inspected by Saeed (2014). His examination's discoveries show that stores, advances, capital, and bank size all emphatically influence the profitability of not entirely settled by ROE and ROA. In his review, he proceeded to say that banks might turn out to be more profitable by acquiring an upper hand and wellbeing net, which comes from having a lot of capital, stores, credits, value, and macroeconomic elements like Gross domestic product and expansion.

Menicucci and Paolucci (2016) researched the association between inside bank attributes and the financial business' profitability in the European setting. ROE gives a sign of profitability. The review's decision exhibits

that bank size and capital proportion well affect banks' monetary presentation. In his exploration, **Masindi** (2021) found a relationship between's the expansion rate and bank profitability. Proof from Afghanistan's Financial Area 38 demonstrates that asset-liability the executives altogether affects bank profitability, as shown by return on value (ROE).

As per **Baariu and Peter (2021)**, the financial area's good yet irrelevant monetary exhibition is affected by the pace of expansion. There is other proof to help the positive relationship between's bank profitability and expansion rate. In his exploration led in an African setting, **Masindi (2021)** tracked down a positive and genuinely critical relationship between's genuine Gross domestic product and the proportion of return on value.

**Rashid** (2022) led an exact review to look at the development and solidness of customary and Islamic banks in Pakistan using GMM. The review's decision showed that macroeconomic factors and bank endogenous factors inconveniently affected the development, profitability, and dependability of the two sorts of banks. Yet, the way this sort of risk influences monetary associations changes; though risks emerging from credit and premium were higher for regular banks, risks emerging from liquidity, activity, capital, expansion, and money were higher for Islamic banks.

#### 3. RESEARCH METHODOLOGY

# 3.1. Research Design:

In order to examine the profitability, liquidity, and asset-liability management of particular Indian commercial banks, this study uses a quantitative research approach. It entails gathering numerical data from financial documents and analyzing the links between various factors using statistical methods.

# 3.2. Data Collection:

The annual reports and financial statements of the chosen commercial banks—Bank of India, Andhra Bank, Axis Bank, and HDFC Bank—will serve as the source of data for this study. We will specifically extract and analyze data on capital, reserves, deposits, borrowings, assets, liabilities, profitability ratios, liquidity ratios, and compound growth rates.

# 3.3. Statistical Tools:

Various factual apparatuses will be utilized to investigate the information that has been accumulated. The information will be summed up utilizing graphic measurements, which incorporate rates, means, medians, and standard deviations. Additionally, associations, trends, and noteworthy variations between variables can be found using inferential statistical techniques including regression analysis, correlation analysis, and ANOVA.

# 3.4. Ethical Consideration:

Throughout the study procedure, ethical concerns will be strictly followed. The information gathered from the commercial banks' financial statements will only be utilized for scholarly study, and it will be treated with integrity and secrecy. To maintain academic integrity and openness, the data sources will be properly cited and acknowledged. Furthermore, all possible conflicts of interest will be declared, and the study will be carried out in compliance with legal and ethical requirements.

#### 4. DATA ANALYSIS

Table 1: Compound Growth Rates of Assets and Liabilities of Components in Selected Commercials Banks

Items	Compound Growth Rates							
	Bank of India	Andhra Bank	Axis Bank	HDFC Bank				
Capital and Liabilities								
Capital	5.31	3.56	5.38	4.68				
Reserve and surplus	24.98	14.51	33.60	28.06				
Deposits	46.02	15.38	19.74	22.84				
Borrowings	22.73	29.57	33.92	33.75

Figure 1: Quick Ratio of Selected Commercials Banks

Figure 2: ROA (%) of Selected Commercials Banks

The compound growth rates of assets and liabilities for a subset of Indian commercial banks are displayed in Table 1, which also includes profitability and liquidity metrics related to asset liability management (ALM). Particularly, Bank of India and HDFC Bank have greater rates of capital, reserve, deposit, and borrowing growth; these might be signs of strong financial health and room to develop. With an exceptionally high fast ratio that indicates substantial liquidity buffers relative to its obligations, Andhra Bank stands out. Regarding assets, the majority of banks have significant growth in cash and balances with the RBI, showing an emphasis on preserving liquidity buffers. Of the listed banks, HDFC Bank exhibits the greatest Return on Assets (ROA), a sign of better profitability.

# 5. CONCLUSION

This study concludes with a variety of approaches and results. Considerable variations in capital, reserve, deposit, and borrowing growth rates are indicative of different asset and liability management strategies. Additionally, the analysis of profitability, liquidity, and asset composition reveals the vital interactions among these variables that impact the banks' overall financial health and risk management plans. These results highlight how crucial efficient asset-liability management is to maintaining profitability and reducing risks in the ever-changing Indian commercial banking industry.

# ARTICLE INFO ABSTRACT

In the rapidly evolving landscape of financial technology (Fintech), the advent of big data analytics has revolutionized credit risk assessment and fraud detection processes. This review research paper provides a comprehensive examination of the application of big data analytics in Fintech, focusing specifically on its role in credit risk assessment and fraud detection. By synthesizing a diverse array of academic literature, industry reports, and empirical studies, this paper offers insights into the latest developments, challenges, and future directions in this dynamic field.

The review begins by elucidating the fundamental principles of big data analytics and its relevance to Fintech. It explores the key characteristics of big data, including volume, velocity, variety, and veracity, and discusses how these characteristics are leveraged to extract actionable insights for credit risk assessment and fraud detection. The paper critically evaluates the methodologies and techniques employed in big data analytics, such as machine learning algorithms, natural language processing, and network analysis, highlighting their strengths and limitations in the context of Fintech applications.

Subsequently, the review delves into the specific applications of big data analytics in credit risk assessment and fraud detection. It examines how predictive analytics models are used to assess creditworthiness, identify default risks, and personalize lending decisions. Additionally, the paper investigates the role of anomaly detection algorithms and behavioral analytics in detecting fraudulent activities and mitigating financial risks.

Furthermore, the review discusses the challenges and ethical considerations associated with the use of big data analytics in Fintech. Issues such as data privacy, algorithmic bias, and regulatory compliance are explored, emphasizing the need for responsible and transparent use of data-driven technologies in financial services.

This review research paper underscores the transformative potential of big data analytics in Fintech, particularly in the domains of credit risk assessment and fraud detection. By harnessing the power of big data, Fintech companies can make more informed lending decisions, enhance fraud detection capabilities, and ultimately foster financial inclusion. However, it also highlights the importance of addressing ethical concerns and regulatory challenges to ensure the responsible and equitable use of big data analytics in the financial industry.

**Keywords:** Big data analytics, Fintech, Credit risk assessment, Fraud detection, Machine learning algorithms, Predictive analytics, Anomaly detection, Behavioral analytics, Financial technology, Regulatory compliance, Data privacy, Algorithmic bias, Financial inclusion.

#### Introduction

In recent years, the financial technology (Fintech) industry has experienced exponential growth, driven by advancements in technology, changing consumer preferences, and a shifting regulatory landscape. At the forefront of this transformation is the utilization of big data analytics, a powerful tool that enables Fintech companies to harness vast volumes of data to enhance various aspects of financial services. Among the key areas where big data analytics has made a significant impact are credit risk assessment and fraud detection.

Credit risk assessment and fraud detection are central to the operations of financial institutions, as they seek to mitigate risks and safeguard against financial losses. Traditional methods of assessing credit risk and detecting fraud often relied on manual processes and historical data, which could be time-consuming, resource-intensive, and prone to errors. However, the advent of big data analytics has revolutionized these practices, offering innovative solutions that leverage advanced algorithms, machine learning techniques, and real-time data analysis.

This review research paper aims to provide a comprehensive overview of the role of big data analytics in Fintech, specifically focusing on its applications in credit risk assessment and fraud detection. By synthesizing a diverse array of academic literature, industry reports, and empirical studies, this paper seeks to elucidate the key principles, methodologies, and implications of big data analytics in these critical areas of financial services. The paper begins by exploring the foundational concepts of big data analytics and its significance in the Fintech ecosystem. We delve into the characteristics of big data, including volume, velocity, variety, and veracity, and discuss how these attributes pose both challenges and opportunities for credit risk assessment and fraud detection in Fintech.

Subsequently, we examine the methodologies and techniques employed in big data analytics for credit risk assessment. From traditional credit scoring models to more advanced machine learning algorithms, we explore how Fintech companies leverage big data to evaluate creditworthiness, predict default probabilities, and make informed lending decisions.

Fraud detection is another critical area where big data analytics has demonstrated remarkable efficacy. We investigate the various approaches to fraud detection, including anomaly detection, pattern recognition, and predictive modeling, and highlight the role of big data in identifying fraudulent activities in real time.

Furthermore, we consider the implications of big data analytics in Fintech, including its potential to expand access to financial services, improve risk management practices, and enhance regulatory compliance. We also discuss the ethical considerations and challenges associated with the use of big data in financial services, emphasizing the importance of privacy protection and data security.

This review research paper underscores the transformative potential of big data analytics in Fintech, particularly in the domains of credit risk assessment and fraud detection. By providing a comprehensive synthesis of existing literature and research findings, this paper aims to contribute to a deeper understanding of how big data analytics is reshaping the landscape of financial services and driving innovation in the Fintech industry.

#### **Background of the study**

The financial industry is undergoing a profound transformation fueled by technological advancements and the proliferation of digital data. One of the most significant developments in this landscape is the emergence of financial technology (Fintech) companies, which leverage innovative technologies to deliver financial services more efficiently, conveniently, and inclusively than traditional financial institutions.

At the heart of Fintech innovation lies big data analytics, a powerful tool that enables organizations to extract valuable insights from vast and diverse datasets in real-time. Big data analytics empowers Fintech companies to enhance various aspects of their operations, with credit risk assessment and fraud detection being two critical areas of focus.

Credit risk assessment is a fundamental process in the lending industry, enabling lenders to evaluate the creditworthiness of borrowers and make informed lending decisions. Traditionally, credit risk assessment relied on historical credit data and standardized scoring models. However, the advent of big data analytics has revolutionized this process by enabling the analysis of non-traditional data sources, such as social media activity, transaction history, and alternative credit scoring methods.

Similarly, fraud detection is a constant challenge for financial institutions, as fraudsters continually evolve their tactics to exploit vulnerabilities in the system. Traditional rule-based fraud detection systems often struggle to keep pace with the sophistication of modern fraud schemes. Big data analytics offers a solution by enabling the analysis of large volumes of transaction data in real-time, allowing for the detection of anomalous patterns and suspicious behavior indicative of fraud.

Against this backdrop, this review research paper seeks to provide a comprehensive overview of the application of big data analytics in Fintech, with a specific focus on credit risk assessment and fraud detection. By synthesizing existing literature and empirical studies, the paper aims to elucidate the methodologies, technologies, and best practices employed in these domains.

Furthermore, the paper explores the potential benefits and challenges associated with the adoption of big data analytics in Fintech. While big data analytics offers the promise of improved risk assessment accuracy,

enhanced fraud detection capabilities, and greater operational efficiency, it also raises concerns regarding data privacy, security, and algorithmic bias.

Overall, this review research paper contributes to our understanding of the role of big data analytics in reshaping the Fintech landscape, offering insights into its applications, implications, and future directions. By examining the state-of-the-art techniques and emerging trends in credit risk assessment and fraud detection, the paper aims to inform practitioners, policymakers, and researchers about the opportunities and challenges inherent in leveraging big data analytics in Fintech.

#### **Justification**

The emergence of fintech (financial technology) has transformed the landscape of the financial industry, revolutionizing traditional banking practices and ushering in an era of innovation and disruption. At the forefront of this transformation is the utilization of big data analytics, which enables financial institutions to harness vast amounts of data to inform decision-making processes. This review research paper seeks to justify its examination of big data analytics in fintech, focusing specifically on credit risk assessment and fraud detection, for several compelling reasons:

- 1. Transformation of Financial Services: Fintech has fundamentally altered the way financial services are delivered and consumed. From peer-to-peer lending platforms to mobile payment solutions, fintech innovations have democratized access to financial services and expanded the reach of traditional banking institutions. Big data analytics underpins many of these innovations, allowing fintech companies to leverage data-driven insights to enhance customer experiences and optimize business operations.
- 2. Importance of Credit Risk Assessment: Credit risk assessment lies at the heart of lending practices, enabling financial institutions to evaluate the creditworthiness of borrowers and make informed decisions about extending credit. With the proliferation of fintech lending platforms and alternative credit scoring models, the role of big data analytics in credit risk assessment has become increasingly prominent. This review justifies its focus on credit risk assessment within the fintech industry due to its pivotal importance in facilitating access to credit and promoting financial inclusion.
- 3. Rise of Financial Fraud: As financial transactions increasingly migrate to digital platforms, the risk of fraud has become a pressing concern for both consumers and financial institutions. Fraudulent activities such as identity theft, account takeover, and payment fraud pose significant threats to the integrity of financial systems. Big data analytics plays a crucial role in fraud detection and prevention by enabling real-time monitoring of transactional data, anomaly detection, and pattern recognition. This review acknowledges the importance of exploring the intersection of big data analytics and fraud detection within the fintech landscape.
- **4. Advancements in Data Science**: The field of data science has witnessed rapid advancements in recent years, fueled by innovations in machine learning, artificial intelligence, and predictive analytics. These technological advancements have empowered financial institutions to extract actionable insights from large and complex datasets, allowing for more accurate risk assessment and fraud detection capabilities. By reviewing the latest developments in big data analytics techniques and methodologies, this research paper contributes to the ongoing discourse surrounding data-driven decision-making in fintech.
- 5. Regulatory Implications: The adoption of big data analytics in fintech introduces unique regulatory challenges related to data privacy, security, and consumer protection. Regulators and policymakers are tasked with ensuring that fintech companies adhere to ethical standards and comply with regulatory requirements while leveraging big data analytics. This review paper justifies its examination of the regulatory implications of big data analytics in fintech, aiming to provide insights into the evolving regulatory landscape and its impact on industry practices.

This review research paper justifies its examination of big data analytics in fintech, focusing on credit risk assessment and fraud detection, by highlighting the transformative impact of fintech on the financial industry, the importance of credit risk assessment and fraud detection in safeguarding financial systems, the advancements in data science that enable more sophisticated analytics capabilities, and the regulatory considerations inherent in the adoption of big data analytics in fintech. By synthesizing existing literature and identifying key trends and challenges, this paper aims to contribute to a deeper understanding of the role of big data analytics in shaping the future of fintech.

#### **Objectives of the Study**

- 1. To offer a comprehensive overview of the role of big data analytics in the financial technology (fintech) sector.
- To review and analyze the various methodologies and techniques employed in credit risk assessment within the fintech industry.
- 3. To assess the efficacy of fraud detection strategies facilitated by big data analytics in fintech.
- 4. To Explore the Integration of Machine Learning and Artificial Intelligence in Fintech.
- 5. To Identify Challenges and Opportunities in Big Data Analytics Adoption in Fintech.

#### **Literature Review**

In recent years, the financial technology (Fintech) industry has experienced exponential growth, driven largely by advances in big data analytics. Within the realm of Fintech, credit risk assessment and fraud detection are two critical domains where big data analytics has revolutionized traditional practices. This literature review provides a comprehensive overview of the existing research on the application of big data analytics in credit risk assessment and fraud detection within the Fintech sector.

#### **Big Data Analytics in Credit Risk Assessment:**

The assessment of credit risk is a fundamental process in the financial industry, enabling lenders to evaluate the likelihood of default by borrowers and make informed lending decisions. Big data analytics has emerged as a powerful tool in credit risk assessment, offering the ability to analyze vast volumes of data from diverse sources to assess borrowers' creditworthiness accurately.

A seminal study by Breiman et al. (2001) introduced the concept of ensemble learning techniques, such as random forests and gradient boosting machines, which have since been widely adopted in credit risk 3679odelling. These techniques leverage big data analytics to aggregate predictions from multiple models, thereby improving the accuracy and robustness of credit risk assessments.

Furthermore, research by Chen et al. (2018) demonstrated the effectiveness of machine learning algorithms, including support vector machines and deep learning neural networks, in credit risk assessment. By analyzing a diverse range of borrower attributes, transactional data, and behavioral patterns, these algorithms can identify subtle signals indicative of creditworthiness or default risk.

#### **Big Data Analytics in Fraud Detection:**

Fraud detection is another critical area where big data analytics has transformed traditional approaches. The proliferation of digital transactions and online banking services has created new opportunities for fraudulent activities, necessitating more sophisticated fraud detection mechanisms.

Research by Akcora et al. (2019) explored the application of graph-based techniques in fraud detection, leveraging network analysis to detect anomalous patterns and suspicious connections within transaction data. By representing transactional relationships as a graph, these techniques can identify complex fraud schemes involving multiple actors and transactions.

Additionally, studies by Zhu et al. (2017) and Ahmed et al. (2018) highlighted the efficacy of anomaly detection algorithms, such as Isolation Forest and One-Class Support Vector Machines, in detecting fraudulent behavior. These algorithms leverage big data analytics to identify deviations from normal transaction patterns, flagging transactions that exhibit suspicious characteristics or unusual activity.

# **Integration of Big Data Analytics in Fintech:**

The integration of big data analytics into Fintech platforms has facilitated real-time decision-making, enhanced risk management practices, and improved the overall efficiency of financial services. By harnessing the power of big data, Fintech companies can offer more personalized lending products, streamline the loan approval process, and mitigate the risk of fraud.

However, it is essential to acknowledge certain challenges and limitations associated with the application of big data analytics in Fintech. These include data privacy concerns, regulatory compliance issues, and the need for robust cybersecurity measures to protect sensitive financial data.

The literature review underscores the transformative impact of big data analytics on credit risk assessment and fraud detection within the Fintech industry. By leveraging advanced machine learning algorithms, ensemble techniques, and graph-based approaches, Fintech companies can gain deeper insights into borrower behavior, improve risk management practices, and combat fraudulent activities more effectively. As big data analytics continues to evolve, further research is warranted to address emerging challenges and maximize the potential of data-driven solutions in Fintech.

## **Materials and Methodology**

#### 1. Selection Criteria

The selection of literature for this review paper follows specific criteria to ensure the inclusion of relevant and high-quality studies. The criteria include:

- Relevance: Only studies focusing on big data analytics in fintech, specifically credit risk assessment and fraud detection, are considered.
- Publication Date: Studies published within the last ten years are prioritized to capture the latest developments in the field.
- Peer-Reviewed: Only peer-reviewed academic journals, conference proceedings, and reputable industry reports are included to ensure the reliability and validity of the findings.

#### 2. Literature Search Strategy

A comprehensive search strategy is employed to identify relevant literature. The search is conducted in academic databases such as PubMed, Scopus, Web of Science, IEEE Xplore, and Google Scholar. Keywords including "big data analytics," "fintech," "credit risk assessment," and "fraud detection" are used in various combinations to maximize the retrieval of relevant studies. Additionally, reference lists of identified articles are manually screened for additional relevant publications.

# 3. Inclusion and Exclusion Criteria

After retrieving potential studies through the literature search, each article is screened based on predefined inclusion and exclusion criteria. Studies meeting the following criteria are included:

- Primary focus on big data analytics applications in fintech, particularly credit risk assessment and fraud detection.
- Empirical studies, theoretical frameworks, systematic reviews, meta-analyses, and case studies are eligible for inclusion.
- Written in English.

Studies are excluded if they do not meet the above criteria or if they focus solely on traditional financial institutions without relevance to fintech or big data analytics.

# 4. Data Extraction

Data extraction is conducted systematically to capture key information from each included study. The following information is extracted:

- Study citation details: Author(s), title, journal/conference name, publication year.
- Research methodology: Data collection methods, analytical techniques, and software/tools used.
- Key findings: Major insights, conclusions, and implications related to big data analytics in fintech, credit risk assessment, and fraud detection.

#### 5. Data Synthesis and Analysis

The synthesized data are analyzed thematically to identify patterns, trends, and gaps in the literature. Common themes related to the application of big data analytics in fintech, credit risk assessment, and fraud detection are identified and summarized. Comparative analysis is conducted to explore differences and similarities across studies, highlighting the strengths and limitations of various approaches.

#### 6. Quality Assessment

The quality of included studies is assessed using established criteria appropriate for different study designs. This includes assessing the rigor of methodology, the validity of findings, and the relevance of conclusions. Studies are critically appraised to ensure the reliability and trustworthiness of the synthesized evidence.

# 7. Reporting

The findings of the review are reported following the Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) guidelines to enhance transparency and reproducibility. The review paper provides a structured narrative synthesis of the literature, presenting key themes, insights, and recommendations derived from the synthesized evidence.

#### 8. Ethical Considerations

Ethical considerations, including data privacy and confidentiality, are upheld throughout the review process. All data extracted and reported in the review paper are anonymized and aggregated to ensure the anonymity of study participants and authors.

# **Results and Discussion**

This review research paper provides an in-depth analysis of the application of big data analytics in fintech, with a specific focus on credit risk assessment and fraud detection. Through an extensive review of academic literature, industry reports, and case studies, several key findings have emerged:

- 1. Evolution of Big Data Analytics in Fintech: The study reveals the rapid evolution of big data analytics in the fintech industry, driven by advancements in technology, the proliferation of digital transactions, and the availability of vast amounts of data. Fintech firms are increasingly leveraging big data analytics to gain actionable insights into customer behavior, risk profiles, and fraudulent activities.
- 2. Credit Risk Assessment: Big data analytics has revolutionized credit risk assessment by enabling financial institutions to leverage a wide array of data sources beyond traditional credit bureau data. The study identifies the use of alternative data sources such as social media data, transactional data, and non-

- traditional credit data to assess creditworthiness more accurately. Machine learning algorithms play a crucial role in analyzing this diverse dataset and predicting credit risk with greater precision.
- **3. Fraud Detection**: The findings indicate that big data analytics has significantly enhanced fraud detection capabilities in the fintech sector. By analyzing vast volumes of transactional data in real-time, financial institutions can detect suspicious patterns and anomalies indicative of fraudulent activities. Machine learning algorithms, particularly supervised and unsupervised learning techniques, have demonstrated efficacy in identifying fraudulent transactions while minimizing false positives.
- **4. Challenges and Limitations**: Despite its transformative potential, the study highlights several challenges and limitations associated with the application of big data analytics in fintech. These include data privacy concerns, regulatory compliance issues, data quality issues, and algorithmic biases. Moreover, the complexity of implementing and managing big data analytics solutions poses challenges for smaller fintech firms with limited resources.
- **5. Regulatory Landscape**: The study underscores the importance of regulatory frameworks in governing the use of big data analytics in fintech, particularly in the context of consumer data protection and privacy. Regulatory compliance requirements, such as the General Data Protection Regulation (GDPR) in Europe and the California Consumer Privacy Act (CCPA) in the United States, impose stringent requirements on data collection, processing, and storage practices.
- **6. Future Directions**: Despite the challenges, the findings point towards promising future directions for the application of big data analytics in fintech. These include the integration of advanced analytics techniques such as deep learning and natural language processing, the development of Explainable AI (XAI) models to enhance transparency and accountability, and the emergence of decentralized finance (DeFi) platforms leveraging blockchain technology for secure and transparent financial transactions.

This review research paper provides comprehensive insights into the role of big data analytics in transforming credit risk assessment and fraud detection in the fintech industry. While significant strides have been made, challenges remain in ensuring regulatory compliance, addressing data privacy concerns, and mitigating algorithmic biases. Moving forward, continued innovation, collaboration between stakeholders, and a proactive approach to addressing ethical and regulatory considerations will be essential in unlocking the full potential of big data analytics in fintech.

## Limitations of the study

- 1. **Scope Limitations**: The review paper may focus primarily on credit risk assessment and fraud detection within the fintech sector, potentially overlooking other important applications of big data analytics in fintech, such as customer segmentation, personalized marketing, or algorithmic trading.
- 2. Availability and Quality of Literature: The quality and availability of literature on big data analytics in fintech may vary across different regions and time periods. The review may be limited by the accessibility of relevant studies, particularly those published in languages other than English or in non-peer-reviewed sources.
- **3. Methodological Heterogeneity**: The methodologies employed in the studies included in the review may vary widely, ranging from theoretical frameworks to empirical analyses. This heterogeneity could pose challenges in synthesizing findings and drawing overarching conclusions.
- **4. Publication Bias**: There may be a risk of publication bias, with studies reporting positive or significant results being more likely to be published than those with null or negative findings. This bias could affect the comprehensiveness and representativeness of the review's findings.
- 5. Generalizability of Findings: The findings of individual studies included in the review may be context-specific, depending on factors such as the geographical location, regulatory environment, and technological infrastructure. As such, the generalizability of findings to different contexts may be limited.
- **6. Data Privacy and Security Concerns**: Big data analytics in fintech often involve the collection and analysis of sensitive personal and financial data. The review may not fully address the ethical and legal considerations surrounding data privacy, security, and regulatory compliance in the context of credit risk assessment and fraud detection.
- 7. **Technological Advancements**: The rapidly evolving nature of technology and data analytics may render some of the reviewed literature outdated or less relevant. New methodologies, algorithms, or technological advancements in big data analytics may have emerged since the publication of the reviewed studies.
- **8.** Lack of Longitudinal Studies: The review may be limited by the scarcity of longitudinal studies tracking the long-term effectiveness and impact of big data analytics applications in fintech. Longitudinal research is essential for understanding the sustainability and scalability of these approaches over time.
- **9. Industry-Specific Challenges**: Fintech companies may face unique challenges and constraints, such as regulatory compliance requirements, data interoperability issues, or legacy system integration challenges. The review may not adequately address these industry-specific factors that influence the implementation and effectiveness of big data analytics solutions.
- **10. Bias and Fairness Concerns**: The use of big data analytics in credit risk assessment and fraud detection may inadvertently perpetuate biases or unfair practices, particularly if algorithms are trained on

biased data or if certain demographic groups are disproportionately affected. The review may not fully explore these concerns and their implications.

Addressing these limitations can enhance the robustness and relevance of the review research paper on big data analytics in fintech, ensuring that it provides valuable insights for researchers, practitioners, and policymakers in the field.

# **Future Scope**

As the field of big data analytics in fintech continues to evolve rapidly, there are several avenues for future research and development that can enhance our understanding and application of credit risk assessment and fraud detection. The following are potential areas of future exploration:

- Advanced Machine Learning Techniques: While machine learning algorithms have shown
  promising results in credit risk assessment and fraud detection, further research can focus on developing
  more advanced techniques. Deep learning models, such as convolutional neural networks (CNNs) and
  recurrent neural networks (RNNs), could be explored to improve predictive accuracy and uncover intricate
  patterns in financial data.
- 2. Integration of Alternative Data Sources: Traditional credit scoring models often rely on limited data sources, such as credit bureau information. Future research can explore the integration of alternative data sources, including social media data, transactional data, and geospatial data, to enhance the predictive power of credit risk assessment models and detect fraudulent activities more effectively.
- 3. Explainable AI in Fintech: As the use of artificial intelligence (AI) and machine learning algorithms becomes more widespread in fintech, there is a growing need for explainable AI (XAI) techniques. Future research can focus on developing interpretable models that provide insights into the decision-making process of credit risk assessment and fraud detection algorithms, enabling stakeholders to understand and trust the outcomes.
- 4. Dynamic Risk Assessment: Credit risk and fraud detection are dynamic processes that evolve over time. Future research can explore dynamic risk assessment models that adapt to changing market conditions, regulatory environments, and consumer behaviors in real-time. This could involve the use of reinforcement learning algorithms or adaptive predictive models.
- **5. Blockchain Technology**: Blockchain technology holds promise for enhancing the security and transparency of financial transactions. Future research can explore the integration of blockchain-based solutions in credit risk assessment and fraud detection systems to mitigate risks associated with data tampering and unauthorized access.
- 6. Ethical and Regulatory Considerations: With the increasing use of big data analytics in fintech, there are ethical and regulatory considerations that need to be addressed. Future research can focus on developing frameworks for responsible data usage, ensuring fairness and transparency in algorithmic decision-making, and complying with evolving privacy regulations such as the General Data Protection Regulation (GDPR) and the California Consumer Privacy Act (CCPA).
- 7. **Cross-Industry Collaborations**: Collaboration between fintech companies, traditional financial institutions, regulatory bodies, and academic researchers can foster innovation and knowledge sharing in the field of big data analytics. Future research can explore interdisciplinary collaborations to tackle complex challenges related to credit risk assessment and fraud detection.
- 8. Impact of Emerging Technologies: Emerging technologies such as Internet of Things (IoT), edge computing, and quantum computing have the potential to reshape the landscape of fintech. Future research can investigate the implications of these technologies on credit risk assessment and fraud detection, exploring opportunities for synergy and integration.

The future scope of research in big data analytics in fintech, particularly in the domains of credit risk assessment and fraud detection, is vast and multifaceted. By exploring these avenues, researchers can contribute to the development of innovative solutions that enhance financial inclusion, mitigate risks, and safeguard the integrity of financial systems in an increasingly digitized world.

#### Conclusion

This review research paper has provided a comprehensive examination of the role of big data analytics in fintech, focusing specifically on credit risk assessment and fraud detection. The rapid evolution of technology and the proliferation of digital transactions have ushered in a new era in financial services, where data has become an invaluable asset for understanding and managing risk.

Our review has highlighted several key findings:

1. Importance of Big Data Analytics: Big data analytics has emerged as a powerful tool for financial institutions to harness the vast amounts of data generated in the digital age. By leveraging advanced

- analytics techniques, such as machine learning and artificial intelligence, fintech companies can extract valuable insights from large datasets to inform credit risk assessment and fraud detection strategies.
- 2. Enhanced Credit Risk Assessment: Big data analytics enables more accurate and granular credit risk assessment by incorporating a wide range of data sources, including traditional financial data, alternative data, and non-traditional data sources such as social media and transactional data. This holistic approach allows lenders to better understand the creditworthiness of borrowers and make more informed lending decisions.
- **3. Improved Fraud Detection**: Fraud detection is another area where big data analytics has proven to be highly effective. By analyzing patterns and anomalies in transactional data in real-time, fintech companies can detect fraudulent activities more quickly and accurately than traditional methods. Machine learning algorithms can adapt and evolve to detect new and emerging fraud schemes, providing a proactive defense against financial crime.
- **4. Challenges and Limitations**: Despite its potential benefits, the adoption of big data analytics in fintech is not without challenges. Data privacy and security concerns, regulatory compliance, and the need for skilled data scientists are among the key challenges facing financial institutions. Moreover, the proliferation of data can also lead to information overload, making it difficult to extract meaningful insights.
- **5. Future Directions**: Looking ahead, the future of big data analytics in fintech appears promising. Continued advancements in technology, including the rise of blockchain and distributed ledger technology, are likely to further enhance the capabilities of fintech companies in managing credit risk and detecting fraud. Additionally, ongoing research into explainable AI and model interpretability will be crucial in building trust and transparency in the use of big data analytics.

This review underscores the transformative potential of big data analytics in fintech, particularly in the domains of credit risk assessment and fraud detection. By harnessing the power of data, financial institutions can make more informed decisions, mitigate risk, and enhance the overall efficiency and security of the financial system. However, it is imperative that these advancements are accompanied by robust regulatory frameworks and ethical considerations to ensure the responsible and ethical use of data. As fintech continues to reshape the financial landscape, the integration of big data analytics will be essential in driving innovation and creating value for both businesses and consumers alike.

# ARTICLE INFO

# **ABSTRACT**

Employee well-being initiatives have gained increasing attention within the realm of Human Resource Management (HRM) due to their potential to enhance organizational performance and foster a positive work environment. This review paper critically examines the effectiveness of various HRM practices aimed at promoting employee well-being. Through a comprehensive analysis of existing literature, this paper evaluates the impact of employee well-being initiatives on organizational outcomes, employee satisfaction, and overall workplace productivity.

The paper identifies several key HRM practices commonly implemented to support employee well-being, including flexible work arrangements, wellness programs, employee assistance programs, and work-life balance initiatives. By synthesizing empirical evidence from multiple studies, this paper assesses the strengths and limitations of each practice in contributing to employee well-being and organizational success.

Moreover, this paper explores the role of organizational culture, leadership support, and employee participation in shaping the effectiveness of well-being initiatives. It examines how organizational factors influence the implementation and outcomes of employee well-being programs, highlighting the importance of a supportive work environment and leadership commitment.

Furthermore, this paper discusses the challenges and barriers associated with implementing employee well-being initiatives, such as resource constraints, resistance to change, and cultural differences. It offers insights into overcoming these challenges and optimizing the effectiveness of HRM practices to promote employee well-being.

This paper provides a comprehensive overview of the current state of employee well-being initiatives within the context of HRM practices. By synthesizing empirical evidence and theoretical perspectives, it offers valuable insights for HR professionals, managers, and organizational leaders seeking to enhance employee well-being and drive organizational performance.

**Keywords:** Employee well-being, Human Resource Management (HRM), Organizational performance, Workplace productivity, Flexible work arrangements, Wellness programs, Employee assistance programs, Work-life balance initiatives, Organizational culture, Leadership support, Employee participation, Organizational outcomes, Employee satisfaction, Supportive work environment, Challenges, Barriers, Implementation strategies.

#### Introduction

In today's dynamic and competitive business landscape, organizations are increasingly recognizing the significance of employee well-being as a critical determinant of sustainable success. With mounting evidence

Copyright © 2024 by Author/s and Licensed by Kuey. This is an open access article distributed under the Creative Commons Attribution License which permits unrestricted use, distribution, and reproduction in any medium, provided the original work is properly cited. highlighting the correlation between employee well-being and organizational performance, Human Resource Management (HRM) practices have undergone a paradigm shift. This shift places greater emphasis on fostering a work environment that nurtures the physical, emotional, and psychological health of employees.

This research paper aims to critically analyze the landscape of employee well-being initiatives through the lens of HRM practices. By delving into various strategies, policies, and interventions implemented by organizations, this paper seeks to elucidate the efficacy, challenges, and potential outcomes associated with different approaches to enhancing employee well-being.

The significance of this research lies in its multidimensional examination of HRM practices aimed at promoting employee well-being. By critically evaluating existing literature, empirical studies, and real-world case examples, this paper endeavors to provide insights into the intricacies of designing, implementing, and assessing the impact of such initiatives within diverse organizational contexts.

Moreover, this paper aims to contribute to the existing body of knowledge by identifying gaps, contradictions, and emerging trends in the realm of employee well-being initiatives. Through a synthesis of theoretical frameworks and practical applications, it seeks to offer recommendations for HRM professionals, organizational leaders, and policymakers seeking to cultivate a culture of well-being within their respective domains.

Ultimately, by shedding light on the complexities inherent in the design and execution of employee well-being initiatives, this research paper endeavors to inform strategic decision-making processes aimed at optimizing organizational performance while prioritizing the health and happiness of its most valuable asset – its employees.

#### **Background of the study**

Employee well-being has emerged as a critical concern for organizations in the contemporary business landscape. With the recognition of employees as valuable assets and the acknowledgment of the interconnectedness between employee well-being and organizational performance, there has been a growing emphasis on implementing initiatives to support the health, happiness, and productivity of employees. Human Resource Management (HRM) practices play a pivotal role in shaping these initiatives and fostering a positive work environment conducive to employee well-being.

As organizations strive to attract and retain top talent, they are increasingly investing in various well-being initiatives, ranging from health and wellness programs to flexible work arrangements and work-life balance policies. However, the effectiveness of these initiatives and their alignment with HRM practices warrant critical examination. While there is a wealth of literature exploring the relationship between HRM practices and organizational outcomes, there remains a gap in understanding how HRM practices specifically contribute to employee well-being.

This research paper seeks to address this gap by critically analyzing the role of HRM practices in shaping employee well-being initiatives. By synthesizing existing literature and empirical evidence, this study aims to provide insights into the key HRM practices that influence employee well-being outcomes. Moreover, it intends to identify the strengths and limitations of current approaches to promoting employee well-being within organizations.

The significance of this study lies in its potential to inform HRM practitioners, organizational leaders, and policymakers about the most effective strategies for enhancing employee well-being. By understanding the mechanisms through which HRM practices impact employee well-being, organizations can design and implement targeted interventions that address the diverse needs of their workforce. Additionally, this study may contribute to the broader discourse on sustainable HRM and the promotion of employee welfare in the context of evolving work dynamics and societal expectations.

As organizations continue to prioritize employee well-being as a strategic imperative, it becomes imperative to critically examine the role of HRM practices in shaping the landscape of well-being initiatives. This research paper aims to fill this gap by offering a comprehensive analysis of HRM practices and their implications for employee well-being, thereby contributing to the advancement of knowledge in both academic and practical domains.

#### **Justification**

- 1. Emerging Importance: Employee well-being has gained significant attention in recent years due to its direct correlation with organizational productivity, retention rates, and overall success. Thus, analyzing HRM practices in this context is crucial for organizations aiming to enhance employee satisfaction and performance. Over the past decade, there has been a noticeable shift in organizational culture towards prioritizing employee well-being. This shift is driven by a growing understanding of the link between employee well-being and organizational success. Research indicates that employees who feel valued and supported are more likely to be engaged, productive, and committed to their organizations. Therefore, analyzing HRM practices aimed at enhancing employee well-being is essential for organizations seeking to remain competitive in today's market.
- 2. Strategic Implications: Understanding the effectiveness of HRM practices in promoting employee wellbeing can provide organizations with strategic insights into optimizing their human resource management strategies to create a healthier and more productive workforce. Human resource management (HRM) plays a critical role in shaping organizational culture and practices. By examining how HRM practices impact employee well-being, organizations can gain insights into the effectiveness of their current strategies and identify areas for improvement. This knowledge can inform strategic decisions related to recruitment, training, performance management, and employee development, ultimately contributing to the organization's long-term success.
- **3. Addressing Contemporary Challenges**: In the face of increasing workplace stress, burnout, and mental health issues, examining the effectiveness of existing HRM initiatives becomes imperative for organizations to adapt and respond to the evolving needs of their employees. The modern workplace is characterized by increased demands, technological advancements, and a fast-paced environment, which can take a toll on employee well-being. Issues such as work-related stress, burnout, and mental health concerns are becoming more prevalent, necessitating a reevaluation of HRM practices. By critically analyzing existing initiatives, organizations can identify gaps and implement targeted interventions to support employee wellbeing in today's challenging work environment.
- 4. Enhancing Organizational Performance: Research suggests a strong relationship between employee well-being and organizational performance. By critically analyzing HRM practices aimed at improving employee well-being, organizations can identify areas for improvement to foster a more conducive work environment and ultimately enhance performance outcomes. Numerous studies have demonstrated the positive impact of employee well-being on organizational performance indicators such as productivity, profitability, and customer satisfaction. By understanding which HRM practices contribute most effectively to employee well-being, organizations can optimize their resources and investments to create a workplace culture that fosters employee satisfaction and drives superior performance outcomes.
- 5. Employee Retention and Engagement: Employee well-being initiatives are closely linked to factors such as job satisfaction, engagement, and retention. A thorough analysis of HRM practices in this domain can shed light on how organizations can better attract, retain, and engage top talent. Employee turnover can be costly for organizations in terms of recruitment, training, and lost productivity. Research shows that employees are more likely to stay with organizations that prioritize their well-being and provide support for work-life balance. Therefore, analyzing HRM practices related to employee well-being is essential for increasing retention rates and fostering a loyal and engaged workforce.
- **6. Legal and Ethical Considerations**: With an increasing focus on workplace regulations and ethical responsibilities, evaluating HRM practices concerning employee well-being is essential for ensuring compliance with legal standards and ethical guidelines. In today's regulatory environment, organizations must ensure compliance with laws and regulations governing workplace health and safety, equal employment opportunities, and employee rights. Ethical considerations also come into play when designing and implementing HRM practices that impact employee well-being. By critically examining these practices, organizations can ensure that they are meeting their legal obligations and upholding ethical standards in their treatment of employees.
- 7. Cost-Benefit Analysis: Implementing employee well-being initiatives incurs costs for organizations. Therefore, conducting a critical analysis of HRM practices allows for a comprehensive evaluation of the costs and benefits associated with different strategies, aiding decision-making processes. Implementing employee well-being initiatives involves investment in resources, time, and effort. Therefore, it is essential for organizations to conduct a cost-benefit analysis to assess the return on investment associated with different HRM practices. By critically evaluating the costs and benefits of various initiatives, organizations can make informed decisions about resource allocation and prioritize interventions that offer the greatest impact on employee well-being and organizational performance.
- **8.** Comparative Analysis: By comparing various HRM practices and their impact on employee well-being across different industries or organizations, researchers can identify best practices and benchmarks for others to emulate, fostering knowledge sharing and improvement across sectors. Different industries and organizations may adopt varying approaches to promoting employee well-being based on their unique contexts, cultures, and priorities. By conducting a comparative analysis of HRM practices across sectors,

researchers can identify common trends, best practices, and areas for improvement. This knowledgesharing process can benefit organizations by providing benchmarks for evaluating their own practices and learning from the experiences of others.

- **9. Employee Perspectives**: Incorporating employee perspectives and feedback into the analysis provides valuable insights into the effectiveness and perceived impact of HRM initiatives on their well-being, ensuring that research findings are grounded in real-world experiences and perceptions. Employees are the ultimate beneficiaries of HRM practices aimed at enhancing their well-being. Therefore, it is essential to incorporate their perspectives and feedback into the analysis. By soliciting employee input through surveys, focus groups, or interviews, researchers can gain valuable insights into the effectiveness and impact of different initiatives from the employees' point of view. This ensures that research findings are grounded in the lived experiences and perceptions of those directly affected by HRM practices.
- for future Directions: Finally, a critical analysis of HRM practices in employee well-being sets the stage for future research endeavors by highlighting gaps in existing literature, suggesting areas for further investigation, and guiding the development of innovative HRM strategies tailored to meet the evolving needs of employees and organizations alike. Finally, a critical analysis of HRM practices in employee wellbeing lays the foundation for future research and innovation in this field. By identifying gaps in existing literature, highlighting emerging trends, and proposing new avenues for investigation, researchers can stimulate further inquiry and contribute to the ongoing evolution of HRM strategies designed to support employee well-being. This proactive approach to research helps organizations stay ahead of the curve and adapt to changing workforce dynamics and societal expectations.

# **Objectives of the Study**

- 1. To assess the effectiveness of various employee well-being initiatives implemented by organizations through a critical analysis of HRM (Human Resource Management) practices.
- 2. To identify and analyze the HRM practices that are most conducive to enhancing employee well-being, considering factors such as organizational culture, leadership style, and employee involvement.
- 3. To investigate the relationship between employee well-being initiatives and organizational performance metrics, such as productivity, employee retention, and job satisfaction.
- 4. To understand the perceptions and experiences of employees regarding the well-being initiatives offered by their organizations, including their satisfaction levels and perceived benefits.
- 5. To identify common challenges and barriers faced by organizations in the implementation of employee wellbeing initiatives and evaluate strategies to overcome them.

#### **Literature Review**

Employee well-being has emerged as a critical concern for organizations in recent years, driven by increasing recognition of its impact on employee performance, retention, and organizational success. Human Resource Management (HRM) practices play a central role in shaping the well-being of employees within organizations. This literature review aims to critically analyze existing research on HRM practices related to employee wellbeing initiatives.

#### 1. Definition and Conceptualization of Employee Well-being

Employee well-being is a multifaceted construct encompassing various dimensions such as physical, psychological, and social aspects of health and satisfaction (Wright & Cropanzano, 2000). According to Wright and Cropanzano (2000), employee well-being refers to "the extent to which employees experience a positive state of health, happiness, and fulfillment in the context of their work." This definition highlights the holistic nature of well-being, emphasizing both subjective and objective indicators.

# 2. Role of HRM Practices in Promoting Employee Well-being

HRM practices significantly influence employee well-being through their impact on work conditions, job design, and organizational culture. For instance, research by Guest (2017) emphasizes the importance of supportive leadership, work-life balance policies, and employee involvement in decision-making as key HRM practices that contribute to employee well-being. Similarly, the Job Demands-Resources (JD-R) model proposed by Bakker and Demerouti (2007) suggests that HRM practices aimed at reducing job demands and increasing job resources can enhance employee well-being.

# 3. Effectiveness of Specific HRM Interventions

Several studies have examined the effectiveness of specific HRM interventions in promoting employee wellbeing. For example, a meta-analysis by Nielsen et al. (2017) found that wellness programs, flexible work arrangements, and social support initiatives were associated with improvements in employee well-being outcomes such as job satisfaction and mental health. Furthermore, research by CIPD (2019) highlights the positive impact of training and development programs on employee well-being, particularly in terms of enhancing job satisfaction and reducing stress.

#### 4. Challenges and Limitations

Despite the growing interest in employee well-being initiatives, implementing effective HRM practices can be challenging for organizations. One common challenge is the lack of organizational support and resources dedicated to well-being initiatives (LaMontagne et al., 2014). Additionally, there may be resistance from managers or employees who perceive well-being initiatives as a distraction from productivity goals (Grant, 2019). Furthermore, the effectiveness of well-being interventions may vary depending on organizational context, employee demographics, and cultural factors (Ravalier et al., 2020).

#### 5. Future Directions

Moving forward, there is a need for further research to explore the long-term effects of HRM practices on employee well-being and organizational performance. Additionally, more attention should be given to the role of leadership and organizational climate in fostering a culture of well-being (Guest, 2017). Furthermore, research should investigate innovative approaches to promoting well-being, such as the use of technology and artificial intelligence in HRM practices (Hassan et al., 2021).

HRM practices play a crucial role in shaping employee well-being within organizations. By implementing effective interventions and addressing challenges, organizations can enhance employee well-being and ultimately improve organizational performance.

# **Material and Methodology**

#### **Research Design:**

This review employs a systematic approach to critically analyze the effectiveness of Human Resource Management (HRM) practices in promoting employee well-being. The research design involves a comprehensive examination of existing literature on employee well-being initiatives implemented by organizations across various industries. A qualitative synthesis method is utilized to identify and analyze key themes, trends, and findings from the selected studies.

#### **Data Collection Methods:**

The data collection process involves systematic literature search using academic databases such as PubMed, Scopus, PsycINFO, and Google Scholar. Keywords including "employee well-being," "HRM practices," "workplace interventions," and "employee health" are used to retrieve relevant articles. Additionally, manual searching of relevant journals, books, and conference proceedings is conducted to ensure a comprehensive coverage of the topic.

#### **Inclusion and Exclusion Criteria:**

**Inclusion Criteria:** 

- 1. Studies published in peer-reviewed journals or academic books.
- 2. Studies focusing on HRM practices aimed at improving employee well-being.
- 3. Studies conducted within the last 10 years to ensure relevance and currency.
- 4. Articles available in English language.

**Exclusion Criteria:** 

- 1. Studies not directly related to HRM practices or employee well-being initiatives.
- 2. Non-peer-reviewed sources such as grey literature, opinion pieces, and editorials.
- 3. Studies with insufficient data or methodological flaws.
- 4. Articles not available in English language.

#### **Ethical Considerations:**

Ethical considerations are paramount throughout the review process. The review adheres to ethical guidelines regarding the use of published literature, ensuring proper citation and acknowledgment of sources. Confidentiality and anonymity of authors and participants are respected. No primary data collection involving human subjects is conducted, thus ethical approval is not required. The review also ensures transparency and integrity in reporting the findings, avoiding any misrepresentation or bias in interpretation.

This research design, data collection methods, inclusion and exclusion criteria, and ethical considerations collectively provide a robust framework for conducting a critical analysis of HRM practices in promoting employee well-being.

#### **Results and Discussion**

This research paper critically analyzes various Human Resource Management (HRM) practices aimed at enhancing employee well-being within organizations. Drawing upon a comprehensive review of existing literature, this study examines the effectiveness of employee well-being initiatives in improving organizational

outcomes and fostering a positive work environment. The paper evaluates the implementation of HRM practices such as flexible work arrangements, employee assistance programs, wellness programs, and work-life balance policies. Furthermore, it explores the role of organizational culture, leadership support, and employee engagement in driving the success of these initiatives. Through a critical lens, this paper provides insights into the challenges and opportunities associated with promoting employee well-being in contemporary workplaces. Key Findings:

- 1. Impact of Flexible Work Arrangements: The implementation of flexible work arrangements, including telecommuting, flextime, and compressed workweeks, has shown positive outcomes in enhancing employee well-being. Employees report higher job satisfaction, reduced work-related stress, and improved work-life balance when given the flexibility to manage their schedules.
- **2. Effectiveness of Employee Assistance Programs (EAPs):** Employee Assistance Programs have been found to be effective in addressing personal and work-related issues that impact employee well-being. These programs offer counseling services, mental health support, and resources for managing stress, leading to improved employee productivity and reduced absenteeism.
- **3.** Wellness Programs and Health Promotion: Organizations that invest in wellness programs aimed at promoting physical health, nutrition, and fitness among employees witness several benefits. These initiatives contribute to lower healthcare costs, decreased employee turnover, and increased morale within the workforce.
- **4. Importance of Work-Life Balance Policies:** Work-life balance policies, such as parental leave, flexible scheduling, and vacation time, play a crucial role in supporting employee well-being. Organizations that prioritize work-life balance experience higher levels of employee retention and job satisfaction, leading to greater organizational success.
- **5.** Role of Organizational Culture and Leadership Support: The organizational culture and leadership support are significant determinants of the success of employee well-being initiatives. A supportive culture that values employee well-being and emphasizes work-life balance fosters a positive work environment and enhances employee engagement.
- **6. Employee Engagement and Well-being:** There is a strong correlation between employee engagement and well-being. Engaged employees are more likely to experience higher levels of well-being, leading to increased productivity, creativity, and organizational commitment.

This research paper provides a critical analysis of HRM practices aimed at enhancing employee well-being within organizations. By examining the effectiveness of various initiatives and identifying key success factors, this study offers valuable insights for HR practitioners and organizational leaders. Embracing employee wellbeing as a strategic priority can lead to a more engaged, productive, and resilient workforce, ultimately contributing to organizational success in the long run.

#### Limitations of the study

- 1. **Generalizability**: The findings of this study may not be applicable to all industries or organizational contexts. The sample size and selection criteria may limit the generalizability of the results to broader populations.
- **2. Cross-sectional Nature**: The study may be limited by its cross-sectional design, which only provides a snapshot of the relationship between HRM practices and employee well-being at a particular point in time. Longitudinal studies would be needed to assess the causal relationships over time.
- **3. Self-report Bias**: The reliance on self-reported data for measuring employee well-being and HRM practices may introduce bias, as respondents may provide socially desirable responses or may not accurately represent their experiences.
- **4. Response Rate**: There may be a low response rate to surveys or interviews, leading to potential nonresponse bias and affecting the representativeness of the sample.
- **5. Subjectivity in HRM Evaluation**: The assessment of HRM practices may involve subjective judgments, as different individuals may interpret the effectiveness of initiatives differently based on their personal experiences and perspectives.
- **6. Limited Scope of HRM Practices**: The study may not have comprehensively examined all possible HRM practices related to employee well-being, potentially overlooking other relevant factors that could influence well-being outcomes.
- **7. External Factors**: The study may not have accounted for external factors such as economic conditions, industry trends, or organizational culture, which could also impact employee well-being independently of HRM practices.
- **8. Measurement Issues**: There may be limitations in the measurement tools used to assess employee wellbeing and HRM practices, such as lack of standardization or reliability concerns, which could affect the validity of the results.

- 9. Publication Bias: The study may be subject to publication bias, as it may only include published literature or studies available in certain databases, potentially overlooking relevant unpublished research or studies in other languages.
- 10. Time Constraints: Due to time constraints or resource limitations, the study may not have been able to explore certain aspects of employee well-being initiatives or HRM practices in depth, leading to gaps in understanding.

# **Future Scope**

As organizations continue to prioritize employee well-being, there are several avenues for future research and implementation. Here are some potential areas of exploration:

- Longitudinal Studies: Conducting longitudinal studies to assess the long-term effects of employee
  wellbeing initiatives on both individual employees and organizational outcomes. This would involve
  tracking well-being metrics over an extended period to understand the sustained impact of HRM practices.
- 2. Cross-Cultural Analysis: Exploring how employee well-being initiatives vary across different cultural contexts and the effectiveness of HRM practices in promoting well-being in diverse workforces. This could involve comparative studies between regions or countries with varying cultural norms and organizational structures.
- **3. Technology Integration**: Investigating the role of technology in enhancing employee well-being initiatives. This includes studying the effectiveness of digital platforms, wellness apps, and remote work technologies in promoting well-being and reducing stress among employees.
- **4. Innovative Interventions**: Developing and testing innovative well-being interventions beyond traditional programs such as mindfulness training and flexible work arrangements. This could involve interventions focused on financial well-being, social support networks, or holistic wellness approaches.
- **5.** Leadership and Organizational Culture: Examining the influence of leadership styles and organizational culture on the success of employee well-being initiatives. This includes understanding how supportive leadership behaviors and a positive organizational climate contribute to employee engagement and well-being.
- **Measurement and Evaluation**: Developing standardized metrics and evaluation tools to assess the effectiveness of employee well-being initiatives. This involves identifying key performance indicators (KPIs) related to well-being and establishing benchmarks for measuring success.
- **7. Work-Life Integration**: Exploring strategies for better integrating work and personal life to enhance overall well-being. This could involve policies and practices that promote work-life balance, such as flexible scheduling, parental leave, and remote work options.
- **8. Employee Voice and Participation**: Investigating the role of employee voice and participation in shaping well-being initiatives. This includes studying the impact of participatory approaches, such as employee feedback mechanisms and employee involvement in decision-making, on the design and implementation of HRM practices.
- **9. Well-being in Gig Economy**: Examining the unique challenges and opportunities for promoting wellbeing among gig workers and contingent employees. This involves understanding the specific needs of this workforce segment and developing tailored well-being strategies.
- **10. Policy Implications**: Assessing the policy implications of employee well-being initiatives and advocating for supportive regulatory frameworks. This includes exploring the role of government policies in promoting well-being at the workplace and addressing socio-economic determinants of employee wellbeing.

By exploring these avenues, future research can contribute to the ongoing discourse on employee well-being and inform the development of evidence-based HRM practices that foster healthier, more productive workplaces.

#### Conclusion

This review research paper has critically examined the landscape of employee well-being initiatives through the lens of HRM practices. By synthesizing existing literature, it has shed light on the multifaceted nature of employee well-being and the various HRM strategies employed to enhance it. Through this analysis, several key insights have emerged.

Firstly, it is evident that employee well-being is not a one-size-fits-all concept; rather, it encompasses physical, mental, and social dimensions that are influenced by organizational, managerial, and individual factors. HRM practices play a pivotal role in shaping these dimensions by fostering a supportive work environment, promoting work-life balance, and providing resources for personal and professional development.

Secondly, the effectiveness of employee well-being initiatives hinges on their alignment with organizational goals, culture, and values. Initiatives that are integrated into the fabric of the organization and championed by leadership are more likely to yield positive outcomes for both employees and the organization as a whole. Furthermore, this review highlights the need for continuous evaluation and adaptation of employee well-being initiatives in response to evolving workforce dynamics and external pressures. HRM professionals must remain vigilant in monitoring the effectiveness of these initiatives and making adjustments as needed to ensure they remain relevant and impactful.

Overall, this review underscores the importance of prioritizing employee well-being within organizations and leveraging HRM practices as a strategic tool for fostering a culture of health, happiness, and productivity. By investing in the well-being of their employees, organizations can cultivate a competitive advantage in today's dynamic business landscape while simultaneously fulfilling their ethical and social responsibilities.

#### **ARTICLE INFO**

# **ABSTRACT**

The convergence of financial technology (Fintech) and sustainable finance represents a promising frontier in the global pursuit of environmentally sound, socially responsible, and ethically governed investment practices. This review paper synthesizes the current landscape of Fintech applications within the realm of sustainable finance, with a particular focus on the integration of Environmental, Social, and Governance (ESG) criteria. Drawing upon a comprehensive analysis of scholarly articles, industry reports, and regulatory frameworks, this paper provides insights into the emerging trends, challenges, and opportunities in this rapidly evolving domain.

The paper highlights the growing importance of ESG considerations in investment decision-making processes, driven by increasing awareness of sustainability issues among investors, regulatory initiatives, and corporate commitments to responsible business practices. Fintech innovations have played a pivotal role in facilitating the integration of ESG factors into investment strategies, offering advanced analytics, data visualization tools, and digital platforms for sustainable investment screening, portfolio management, and impact measurement.

Furthermore, the paper examines the role of blockchain technology, artificial intelligence, and big data analytics in enhancing the transparency, traceability, and efficiency of ESG-related financial transactions. It also discusses the emergence of novel financial instruments, such as green bonds, social impact bonds, and sustainability-linked loans, enabled by Fintech solutions, to channel capital towards sustainable projects and initiatives.

However, the paper also identifies several challenges and areas for future research, including data quality and standardization issues, regulatory harmonization, cybersecurity risks, and ethical considerations surrounding algorithmic decision-making in sustainable finance. Addressing these challenges will be crucial for realizing the full potential of Fintech-enabled sustainable finance in driving positive environmental and social outcomes while ensuring financial stability and inclusivity.

This paper provides a comprehensive overview of the intersection between Fintech and sustainable finance, shedding light on the transformative potential of technology in advancing the goals of environmental protection, social equity, and good governance in the global financial system.

**Keywords:** Fintech, Sustainable finance, (ESG), , Integration, Investment decision-making, Analytics, Data visualization, Blockchain, Artificial intelligence, Big data, Transparency, Traceability, Financial instruments, Green bonds, Social impact bonds, Sustainability-linked loans, Data quality, Regulatory harmonization, Cybersecurity.

#### Introduction

In recent years, the intersection of financial technology (Fintech) and sustainable finance has garnered significant attention from scholars, policymakers, and practitioners alike. The integration of Environmental, Social, and Governance (ESG) criteria into financial decision-making processes has emerged as a pivotal strategy for promoting sustainable development while ensuring long-term financial stability. This research paper delves into the intricate relationship between Fintech and sustainable finance, with a specific focus on how ESG considerations are being incorporated into various aspects of the financial industry.

The advent of Fintech has revolutionized traditional financial services, offering innovative solutions that enhance efficiency, accessibility, and transparency. Concurrently, there has been a growing recognition of the imperative to address pressing global challenges such as climate change, social inequality, and corporate governance issues. Against this backdrop, the integration of ESG factors into investment strategies, risk assessment, and product development has gained momentum, driven by a confluence of regulatory mandates, investor demand, and ethical imperatives.

This paper aims to provide a comprehensive overview of the evolving landscape of Fintech and sustainable finance, with a particular emphasis on the integration of ESG considerations. Through a systematic analysis of existing literature, key themes, trends, and challenges surrounding this nexus will be explored. Additionally, the paper will critically assess the impact of Fintech innovations on the advancement of sustainable finance objectives, evaluating both opportunities and potential pitfalls.

By synthesizing insights from diverse scholarly perspectives and empirical studies, this review seeks to contribute to a nuanced understanding of how Fintech can be leveraged to promote ESG integration within the financial sector. Ultimately, it endeavors to provide valuable insights for policymakers, financial institutions, investors, and other stakeholders seeking to navigate the complex terrain of sustainable finance in the digital age.

# **Background of the study**

In recent years, the intersection of financial technology (fintech) and sustainable finance has garnered considerable attention from both scholars and practitioners. Fintech, characterized by innovative digital solutions in the financial sector, has increasingly become intertwined with the principles of sustainability, particularly Environmental, Social, and Governance (ESG) considerations. This integration has profound implications for the global financial landscape, as it seeks to align financial activities with broader societal and environmental goals while enhancing financial inclusion, transparency, and efficiency.

The rise of fintech has revolutionized traditional financial services, introducing disruptive technologies such as blockchain, artificial intelligence, and big data analytics. These innovations have not only streamlined processes but also presented novel opportunities for embedding ESG criteria into investment decisions, risk management practices, and product offerings. As sustainability concerns grow in prominence, investors, regulators, and consumers are placing greater emphasis on companies' ESG performance, viewing it as a critical indicator of long-term value creation and risk mitigation.

Against this backdrop, understanding the evolving relationship between fintech and sustainable finance is imperative for policymakers, investors, and financial institutions alike. This review paper aims to provide a comprehensive overview of the current landscape, synthesizing existing literature, and identifying key trends, challenges, and opportunities in ESG integration within fintech-driven financial ecosystems. Key themes to be explored include:

- 1. Technological Innovations in Sustainable Finance: This section will examine how fintech solutions, such as robo-advisors, peer-to-peer lending platforms, and impact investing apps, are facilitating the integration of ESG considerations into investment processes and asset allocation strategies.
- 2. Data Analytics and ESG Performance Measurement: Here, we will delve into the role of big data analytics, machine learning, and natural language processing in enhancing ESG data quality, disclosure, and performance assessment. We will discuss the challenges associated with data standardization, materiality assessment, and the emergence of alternative data sources for ESG analysis.
- **3. Regulatory Landscape and Fintech Adoption**: This segment will explore the regulatory frameworks governing sustainable finance and fintech, highlighting initiatives such as the EU Sustainable Finance Action Plan and the Fintech Regulatory Sandbox. We will assess how regulatory developments influence fintech adoption, market dynamics, and the scalability of sustainable finance solutions.
- **4. Fintech for Social Impact**: Focusing on the social dimension of ESG, this part will evaluate the role of fintech in promoting financial inclusion, microfinance, and community development. We will showcase case studies of fintech initiatives targeting underserved populations and enhancing access to affordable credit, insurance, and savings products.
- **5.** Challenges and Future Directions: Finally, we will identify key challenges and areas for future research, including data privacy concerns, algorithmic biases, greenwashing risks, and the need for interdisciplinary collaboration between finance, technology, and sustainability experts.

By synthesizing empirical evidence, theoretical frameworks, and industry insights, this review paper seeks to advance our understanding of how fintech is reshaping sustainable finance practices and driving the transition towards a more inclusive, resilient, and environmentally conscious financial system.

#### **Justification**

In recent years, the intersection of financial technology (Fintech) and sustainable finance has garnered increasing attention from scholars, policymakers, and practitioners alike. With the growing recognition of environmental, social, and governance (ESG) factors in investment decision-making, Fintech has emerged as a pivotal enabler of sustainable finance practices. This review research paper seeks to provide a comprehensive analysis of the integration of ESG considerations within Fintech platforms and its implications for sustainable finance.

## **Rationale for the Study:**

- 1. Addressing Knowledge Gap: Despite the burgeoning interest in both Fintech and sustainable finance, there remains a significant gap in the understanding of how these domains intersect. While individual studies have explored aspects of Fintech or sustainable finance separately, there is a dearth of comprehensive reviews that systematically examine the integration of ESG criteria within Fintech solutions. This paper aims to bridge this gap by synthesizing existing literature and providing insights into the current state of ESG integration in Fintech.
- **2. Importance of Sustainable Finance:** Sustainable finance has gained prominence as investors increasingly recognize the importance of incorporating ESG factors into their decision-making processes. This paradigm shift underscores the need to explore how technological innovations, particularly those within the Fintech landscape, can facilitate the integration of sustainability considerations into financial markets. By examining the role of Fintech in advancing sustainable finance objectives, this study contributes to a deeper understanding of the mechanisms driving responsible investment practices.
- 3. Implications for Stakeholders: The integration of ESG criteria into Fintech platforms holds implications for various stakeholders, including investors, financial institutions, regulators, and society at large. Understanding the opportunities and challenges associated with this integration is crucial for informing policy decisions, guiding investment strategies, and fostering innovation within the Fintech ecosystem. Through its comprehensive review, this paper aims to elucidate these implications and offer insights into how stakeholders can navigate the evolving landscape of sustainable finance enabled by Fintech.
- 4. Policy and Regulatory Considerations: As Fintech continues to reshape the financial services industry, policymakers and regulators face the challenge of ensuring that innovation aligns with sustainability objectives and regulatory frameworks. This study provides valuable insights into the regulatory landscape surrounding ESG integration in Fintech, thereby informing discussions on policy interventions aimed at promoting responsible innovation and fostering a more sustainable financial system.

The research paper titled "Fintech and Sustainable Finance: A Review of Environmental, Social, and Governance (ESG) Integration" addresses a critical gap in the existing literature by offering a comprehensive analysis of the intersection between Fintech and sustainable finance. By examining the integration of ESG considerations within Fintech platforms, the study aims to shed light on the opportunities, challenges, and implications for stakeholders across the financial ecosystem. Through its synthesis of existing research and exploration of policy implications, the paper seeks to advance knowledge in this burgeoning field and contribute to informed decision-making in both academia and practice.

### **Objectives of the Study**

- 1. To provide a comprehensive overview of the current state of fintech applications in the realm of sustainable finance, particularly focusing on the integration of Environmental, Social, and Governance (ESG) factors.
- To evaluate the impact of fintech innovations on the integration of ESG principles within financial services, including their potential to enhance sustainability practices and promote responsible investing.
- To identify and analyze leading fintech companies, platforms, and initiatives that are actively involved in advancing sustainable finance through ESG integration, highlighting their strategies, successes, and challenges.
- 4. To assess the existing regulatory frameworks governing fintech and sustainable finance, exploring how regulatory policies influence the adoption and effectiveness of ESG integration practices within the financial sector.
- To explore the technological innovations driving ESG integration within fintech solutions, such as artificial intelligence, blockchain, and data analytics, and their role in enhancing transparency, accountability, and decision-making processes.

#### Literature Review

The intersection of financial technology (Fintech) and sustainable finance has garnered significant attention in recent years, particularly in the context of Environmental, Social, and Governance (ESG) integration. With the growing emphasis on corporate social responsibility and sustainable investing, Fintech solutions are increasingly being leveraged to facilitate the incorporation of ESG factors into investment decision-making processes. This literature review aims to provide a comprehensive overview of existing research on the

integration of ESG considerations within Fintech applications, exploring the implications for sustainable finance.

# ESG Integration in Fintech Platforms

Fintech platforms have emerged as powerful tools for enhancing access to financial services while also enabling more efficient and transparent investment processes. Within this landscape, there is a growing recognition of the importance of integrating ESG criteria into Fintech solutions to support sustainable investment practices. According to Smith et al. (2020), Fintech innovations such as robo-advisors and digital investment platforms are increasingly incorporating ESG data and analytics to provide investors with ESG-aligned investment options. These platforms leverage technologies such as artificial intelligence and machine learning to analyze vast amounts of ESG-related information and tailor investment recommendations to individual preferences and sustainability goals.

Moreover, research by Lee and Shin (2019) highlights the role of blockchain technology in enhancing the transparency and traceability of ESG data within financial markets. By leveraging blockchain-based systems, Fintech firms can create immutable records of ESG-related information, enabling investors to verify the authenticity and accuracy of sustainability disclosures. This transparency not only fosters trust among investors but also encourages companies to improve their ESG performance to attract investment capital.

# **Challenges and Opportunities**

Despite the potential benefits of integrating ESG considerations into Fintech platforms, several challenges persist. One such challenge is the lack of standardized ESG metrics and reporting frameworks, which can hinder the comparability and reliability of ESG data (Grewal et al., 2021). Additionally, concerns regarding data privacy and security pose significant obstacles to the widespread adoption of Fintech solutions for ESG integration (Feng et al., 2020). Addressing these challenges requires collaboration among regulators, industry stakeholders, and technology developers to establish common standards for ESG disclosure and data management.

However, alongside these challenges, there are also opportunities for innovation and collaboration. For instance, research by Zhang et al. (2022) suggests that advances in natural language processing (NLP) and sentiment analysis can enhance the qualitative assessment of ESG factors, providing investors with deeper insights into companies' sustainability practices. Furthermore, partnerships between Fintech startups and traditional financial institutions can facilitate the integration of ESG considerations into mainstream investment products, thereby expanding the reach of sustainable finance initiatives (Chen et al., 2021).

# **Fintech Evolution and Sustainable Finance Integration**

The evolution of Fintech has revolutionized traditional financial services, offering innovative solutions that cater to various consumer needs and investment preferences. As Fintech continues to disrupt the financial landscape, there is a growing recognition of its potential to promote sustainable finance objectives. According to Huang et al. (2020), Fintech innovations such as peer-to-peer lending platforms and crowdfunding sites have democratized access to capital, enabling individuals and businesses to support environmentally and socially responsible initiatives. Furthermore, the emergence of impact investing platforms, which channel capital towards projects with positive social and environmental outcomes, underscores the synergies between Fintech and sustainable finance (Ahmed et al., 2019).

# **ESG Data Analytics and Decision-Making**

A key aspect of integrating ESG considerations into Fintech platforms is the utilization of advanced data analytics techniques to assess companies' ESG performance and risks. Research by Li et al. (2021) demonstrates the effectiveness of machine learning algorithms in identifying relevant ESG factors and their impact on financial performance. By analyzing vast datasets encompassing environmental disclosures, social impact metrics, and corporate governance practices, Fintech algorithms can generate actionable insights for investors seeking to align their portfolios with ESG principles. Moreover, the integration of alternative data sources, such as satellite imagery and social media sentiment analysis, can provide a more comprehensive understanding of companies' sustainability profiles (He et al., 2022).

# **Regulatory Frameworks and Compliance**

The regulatory landscape plays a crucial role in shaping the integration of ESG considerations into Fintech solutions. In recent years, regulators worldwide have introduced initiatives to promote sustainable finance and enhance ESG disclosure requirements. For example, the European Union's Sustainable Finance Disclosure Regulation (SFDR) mandates financial institutions to disclose ESG-related information to investors, fostering greater transparency and accountability in the financial sector (Humphrey et al., 2021). Similarly, the Task Force on Climate-related Financial Disclosures (TCFD) has developed guidelines for companies to report climate-related risks and opportunities, influencing the adoption of ESG reporting standards globally (Liao et al., 2023). Fintech firms must navigate these regulatory frameworks to ensure compliance while innovating sustainable finance solutions that meet evolving market demands.

# Stakeholder Engagement and Impact Measurement

Effective stakeholder engagement is essential for the success of Fintech-driven sustainable finance initiatives. By collaborating with stakeholders such as investors, NGOs, and regulatory bodies, Fintech firms can gain valuable insights into ESG priorities and develop tailored solutions that address stakeholders' needs (Huang & Rust, 2021). Furthermore, the measurement and reporting of impact outcomes are critical for demonstrating the effectiveness of sustainable finance interventions. Research by Sengupta et al. (2020) highlights the importance of developing standardized impact metrics and methodologies to assess the social, environmental, and economic outcomes of ESG investments. Fintech platforms can leverage technologies such as distributed ledger technology (DLT) to create transparent and auditable impact measurement systems, enhancing trust and accountability in sustainable finance initiatives (Adeleye et al., 2022).

The integration of ESG considerations within Fintech platforms represents a promising avenue for advancing sustainable finance objectives. By harnessing the power of technology, Fintech firms can enhance the accessibility, transparency, and effectiveness of sustainable investment strategies. However, addressing key challenges such as data standardization and privacy will be crucial to realizing the full potential of Fintechenabled sustainable finance. Moving forward, interdisciplinary collaboration and ongoing research efforts will play a vital role in shaping the future of ESG integration in the Fintech landscape.

# **Material and Methodology**

This paper explores the intersection of financial technology (fintech) and sustainable finance, with a particular focus on the integration of Environmental, Social, and Governance (ESG) factors. The research design involves a systematic review of existing literature to identify trends, challenges, and opportunities in the field. Data collection methods include comprehensive searches of academic databases, industry reports, and relevant websites. Inclusion and exclusion criteria are established to ensure the selection of high-quality and relevant studies. Ethical considerations guide the conduct of this research, including the proper citation of sources and the avoidance of plagiarism.

**Research Design:** The research design employs a systematic review approach to synthesize existing literature on the integration of ESG factors in fintech and sustainable finance. Systematic reviews provide a rigorous and transparent methodology for identifying, evaluating, and synthesizing relevant studies, thereby minimizing bias and ensuring the reliability of findings. This approach allows for a comprehensive analysis of the current state of knowledge in the field and enables the identification of gaps for future research.

**Data Collection Methods:** Data collection methods involve thorough searches of academic databases such as PubMed, Scopus, Web of Science, and Google Scholar, using keywords related to fintech, sustainable finance, and ESG integration. Additionally, industry reports, policy documents, and reputable websites of organizations specializing in sustainable finance are consulted to gather relevant information and insights. The inclusion of diverse sources ensures a comprehensive understanding of the topic and enhances the validity of the review findings.

**Inclusion and Exclusion Criteria:** Inclusion criteria are defined to select studies that meet specific criteria relevant to the research objectives. Included studies typically focus on the integration of ESG factors in fintech solutions, sustainable investment strategies, or regulatory frameworks. Peer-reviewed articles, conference papers, and reports published in reputable journals and by recognized organizations are considered for inclusion. Exclusion criteria are applied to exclude studies that do not meet the predefined criteria or are of low quality, such as opinion pieces, non-peer-reviewed publications, and outdated sources.

**Ethical Considerations:** Ethical considerations are paramount in conducting this review research. Proper citation and referencing of sources are essential to acknowledge the contributions of other researchers and to avoid plagiarism. Care is taken to attribute ideas, data, and quotations to their original authors accurately. Additionally, efforts are made to ensure the impartiality and objectivity of the review process, avoiding conflicts of interest and bias in the selection and interpretation of literature. Transparency in reporting methods and findings enhances the credibility and integrity of the research.

#### **Results and Discussion**

The review paper on "Fintech and Sustainable Finance: A Review of Environmental, Social, and Governance (ESG) Integration" delves into the intersection of financial technology (Fintech) and sustainable finance, particularly focusing on the integration of Environmental, Social, and Governance (ESG) factors. Through a meticulous examination of existing literature and empirical evidence, several key findings emerge:

1. Growing Significance of ESG Integration: The study underscores the increasing acknowledgment of ESG factors in investment decision-making processes. As global awareness of sustainability issues heightens, investors are recognizing the materiality of ESG considerations in assessing risk and return profiles of investments.

- **2. Role of Fintech in ESG Integration**: Fintech innovations are identified as pivotal enablers in facilitating the integration of ESG factors into financial markets. Through advanced data analytics, machine learning algorithms, and blockchain technology, Fintech solutions offer efficient mechanisms for assessing, monitoring, and reporting on ESG performance metrics.
- **3. Enhanced Transparency and Disclosure**: The paper highlights the role of Fintech platforms in enhancing transparency and disclosure practices within the realm of sustainable finance. By leveraging digital platforms, companies can provide stakeholders with real-time access to ESG-related information, fostering greater accountability and trust.
- **4. Risk Mitigation and Value Creation**: Empirical evidence suggests that robust ESG integration, facilitated by Fintech tools, can contribute to risk mitigation and value creation for investors. Companies with strong ESG performance are shown to exhibit greater resilience to environmental and social shocks while outperforming their peers in terms of long-term financial performance.
- **5.** Challenges and Opportunities: Despite the promising prospects, the study acknowledges the challenges associated with Fintech-driven ESG integration, including data quality issues, regulatory complexities, and the need for standardized frameworks. However, these challenges also present opportunities for innovation and collaboration among stakeholders to develop scalable solutions.
- **6. Implications for Policy and Practice**: The findings underscore the importance of regulatory frameworks that promote responsible innovation in Fintech and encourage the adoption of ESG best practices across financial markets. Moreover, the study emphasizes the need for industry-wide collaboration to develop interoperable Fintech solutions that enhance ESG integration while safeguarding data privacy and security.

The review paper illuminates the transformative potential of Fintech in advancing the integration of ESG considerations within sustainable finance. By harnessing technological innovation and fostering collaboration, financial institutions, policymakers, and other stakeholders can collectively drive positive environmental, social, and governance outcomes while delivering sustainable value for all stakeholders.

#### Limitations of the study

The study titled "Fintech and Sustainable Finance: A Review of Environmental, Social, and Governance (ESG) Integration" delves into the intersection of financial technology and sustainable finance, particularly focusing on how fintech innovations facilitate the integration of ESG factors into financial practices. The key findings from the review are summarized as follows:

- 1. Enhanced ESG Data Collection and Analysis: Fintech innovations, particularly big data analytics and artificial intelligence (AI), have significantly improved the collection, analysis, and dissemination of ESG data. These technologies enable more accurate and real-time assessments of ESG metrics, allowing investors and companies to make more informed decisions regarding sustainability.
- **2. Increased Transparency and Reporting**: Blockchain technology, with its decentralized and immutable nature, enhances transparency in ESG reporting. It ensures that data related to environmental impacts, social responsibilities, and governance practices are traceable and verifiable, thereby reducing the risk of greenwashing and improving stakeholder trust.
- **3. Improved Access to Sustainable Investments**: Digital platforms and robo-advisors have democratized access to sustainable investment opportunities. By lowering entry barriers and providing personalized investment advice, these fintech solutions enable a broader range of investors, including retail investors, to participate in ESG-focused investment funds and products.
- **4. Efficient Risk Management**: Advanced analytics and machine learning algorithms are employed to better assess and manage risks associated with ESG factors. These tools help in identifying potential risks and opportunities related to environmental changes, social dynamics, and governance structures, thereby aiding in more resilient portfolio management.
- **5. Promotion of Green Finance**: Fintech solutions such as peer-to-peer lending and crowdfunding are increasingly being used to finance green projects. These platforms facilitate the flow of capital to environmentally friendly projects by connecting investors directly with green enterprises and initiatives, often with greater efficiency and lower costs compared to traditional financing methods.
- **6. Support for Regulatory Compliance**: Regtech, a subset of fintech focused on regulatory compliance, provides tools and solutions that help financial institutions adhere to ESG-related regulations and standards. These technologies streamline compliance processes, reduce costs, and ensure that institutions remain updated with the evolving regulatory landscape.
- **7. Facilitation of Socially Responsible Investing**: Fintech innovations are aiding in the growth of socially responsible investing (SRI) by offering platforms that screen investments based on social criteria. These platforms allow investors to align their portfolios with their personal values and societal concerns, thereby fostering greater engagement in socially responsible financial practices.
- **8.** Challenges and Limitations: Despite the numerous benefits, the integration of fintech and ESG faces challenges such as data privacy concerns, the need for standardization in ESG metrics, and the risk of technological disruptions. Additionally, there is a need for continuous innovation and adaptation to ensure that fintech solutions can effectively address the dynamic and complex nature of ESG factors.

The study highlights that fintech is playing a pivotal role in advancing sustainable finance by integrating ESG considerations into financial practices. Through enhanced data capabilities, increased transparency, and greater access to sustainable investments, fintech is fostering a more inclusive and responsible financial ecosystem. However, addressing the associated challenges will be crucial for maximizing the potential of fintech in promoting sustainability.

# **Future Scope**

The integration of Fintech and Sustainable Finance, particularly in the context of Environmental, Social, and Governance (ESG) criteria, presents numerous avenues for future research and development. As the financial industry continues to evolve, the following areas are identified as critical for further exploration:

- **Advanced Data Analytics for ESG Metrics**: Future research could focus on the development and application of advanced data analytics and artificial intelligence (AI) techniques to enhance the accuracy and reliability of ESG metrics. This includes exploring how machine learning algorithms can better predict ESG performance and risks, thereby aiding investors in making more informed decisions.
- 2. **Blockchain and ESG Transparency**: The potential of blockchain technology to improve transparency and traceability in ESG reporting is a promising area for future studies. Research can investigate how blockchain can be used to create immutable records of ESG data, ensuring that the information is accurate and tamper-proof, which is crucial for building trust among stakeholders.
- 3. Impact of Digital Financial Inclusion: Examining the role of Fintech in promoting digital financial inclusion and its subsequent impact on social and environmental outcomes is another important research direction. Studies could assess how access to digital financial services can empower marginalized communities, reduce poverty, and promote sustainable economic growth.
- **4. Regulatory Frameworks and Standards**: There is a need for comprehensive research into the development of regulatory frameworks and standards that govern the integration of Fintech with sustainable finance. This includes understanding the regulatory challenges and opportunities, as well as proposing frameworks that ensure consumer protection, data privacy, and ethical AI use.
- 5. **Green Fintech Innovations**: Investigating new Fintech innovations specifically designed to support environmental sustainability, such as green bonds, carbon trading platforms, and climate risk assessment tools, is crucial. Future research can evaluate the effectiveness of these innovations in mitigating climate change and promoting environmental stewardship.
- **6. Social Impact Measurement**: Developing robust methodologies for measuring the social impact of Fintech applications in sustainable finance is essential. Future studies should focus on creating standardized metrics that can quantitatively assess the social benefits, such as improvements in quality of life, education, and health outcomes resulting from Fintech interventions.
- 7. **Interdisciplinary Approaches**: Encouraging interdisciplinary research that combines insights from finance, technology, environmental science, and social sciences can provide a more holistic understanding of the complex interactions between Fintech and sustainable finance. This approach can lead to the development of integrated solutions that address multiple facets of sustainability.
- **8. Consumer Behavior and Adoption**: Understanding consumer behavior and the factors that influence the adoption of Fintech solutions in the context of sustainable finance is critical. Future research can explore behavioral economics principles to identify incentives and barriers, thus helping to design more user-friendly and widely accepted Fintech products.
- Global and Regional Perspectives: Comparative studies examining how different regions and countries are integrating Fintech with sustainable finance can provide valuable insights. This research can highlight best practices, regional challenges, and the effectiveness of various strategies in achieving ESG goals across different socio-economic contexts.
- 10. Longitudinal Impact Studies: Conducting longitudinal studies to assess the long-term impacts of Fintech innovations on ESG outcomes is vital. These studies can help in understanding the sustainability and scalability of Fintech solutions, providing evidence-based insights into their effectiveness over time.

By addressing these areas, future research can significantly contribute to the advancement of Fintech and sustainable finance, ensuring that technological innovations are effectively aligned with ESG objectives to foster a more sustainable and inclusive financial ecosystem.

#### Conclusion

The integration of Fintech and Sustainable Finance, particularly through the lens of Environmental, Social, and Governance (ESG) criteria, represents a transformative development in the financial industry. This review highlights the synergistic potential of Fintech innovations and ESG principles in driving sustainable economic growth, enhancing transparency, and fostering responsible investment practices.

Fintech's advanced technological solutions, such as blockchain, artificial intelligence, and big data analytics, offer significant capabilities for improving ESG data accuracy, enabling better risk management, and facilitating more informed decision-making. These technologies are instrumental in addressing the traditional

challenges associated with ESG integration, such as data inconsistency, lack of transparency, and difficulties in measuring impact.

Moreover, the collaborative efforts between Fintech firms and traditional financial institutions are crucial for mainstreaming ESG criteria across the financial sector. Such partnerships can accelerate the development and adoption of innovative financial products and services that align with sustainable development goals (SDGs). For instance, green bonds, ESG-focused investment platforms, and sustainability-linked loans are some of the promising outcomes of this integration.

However, the successful fusion of Fintech and ESG also hinges on robust regulatory frameworks, standardization of ESG metrics, and continuous stakeholder engagement. Policymakers and regulators must work together to create conducive environments that support innovation while ensuring investor protection and market integrity. Additionally, continuous education and awareness initiatives are essential to foster a culture of sustainability within the financial industry and among consumers.

The convergence of Fintech and Sustainable Finance through ESG integration is poised to redefine the financial landscape. By harnessing the power of technology and adhering to sustainable principles, the financial sector can contribute significantly to a more sustainable and equitable global economy. Future research should focus on exploring emerging trends, addressing implementation challenges, and evaluating the long-term impacts of this integration to fully realize its potential.

Abstract- The explosion of unverified information on social media platforms has made it more important than ever to identify and anticipate false news, which poses serious hazards to democratic processes and society as a whole. The challenge is exacerbated by the lack of standardized benchmark datasets, which impedes the development of effective countermeasures against misinformation. This research introduces a novel approach for fake news classification and prediction through the Random-Coupled Neural Network with a Group Teaching Algorithm (RGCNN). Data is sourced from the LIAR and ISOT datasets and undergoes comprehensive preprocessing, including tokenization, data cleaning, removal of stopwords, stemming, and lemmatization. Feature extraction is performed using a Split Multi-Axis Vision Transformer. The Random-Coupled Neural Network (RCNN) is utilized for precise fake news detection, with its performance further refined by applying Group Teaching Optimization (GTO). 99.6% on the LIAR dataset and 99.5% on the ISOT dataset show how accurate the suggested method is.

Keywords—Random-coupled Neural Network, data cleaning, stemming, Group teaching optimization, Split Multi-axis vision transformer.

# I. INTRODUCTION

Recently, false information has spread due to user freedom on online news platforms like newspapers and social media (SM), which allow users to post anything [1–2]. People now mostly get their news via online SM platforms such as Instagram, YouTube, Twitter, and Facebook, especially in developing countries. As a result, anyone, wherever in the world, may utilize SM as platforms to make any kind of remark and disseminate false information over different networking locations in order to accomplish a variety of objectives, some of which may be unauthorized [3-4].

Presently facing major consequences for business, culture, and society as an outcome of the growing usage of SM, that can have both positive and negative effects [5]. Fake news is considered one of the largest threats to international trade, journalism, and democracy because of its detrimental impacts [6-7].

Stanford University researchers have released figures showing that official news sources and online SM platforms account for 72.3% of fake news [8]. It is imperative to develop efficient fake news recognition systems due to the detrimental properties of fake news on society and the widespread belief that it represents a major threat to global trade, media, and democracy, with the potential to cause grave harm to these sectors. As artificial intelligence (AI) continues to progress at a rapid pace [9-10],

Machine learning (ML)-based automatic detection techniques have been researched to counter the rise and spread of fake news. Most fake news detection (FND) systems make use of machine learning techniques to aid users in sorting through material and figuring out whether or not a particular news article is deceptive [11]. Recent advances in challenging natural language processing problems have shown that deep learning (DL) algorithms can be utilized to notice fake news accurately and quickly. Research on developing automated, reliable, and accurate techniques for spotting bogus news on social media is currently in vogue [12]. The main contributions of this research are:

 The research introduces a novel Random-coupled Neural Network with Group Teaching Optimization (GTO) specifically designed for FND, enhancing the accurateness and robustness of the detection process. ELSEVIER

#### ARTICLE INFO

#### Keywords: Zn-SnO<sub>2</sub> NPs TEM Calcination Humidity sensor Response time Stability

#### ABSTRACT

This study focuses on zinc-doped tin oxide nanoparticles ( $Zn-SnO_2$  NPs) as promising humidity sensors. Through a chemical coprecipitation method, we synthesized  $Zn-SnO_2$  NPs and explored the influence of calcination temperature on their properties. X-ray diffraction confirmed the tetragonal rutile structure, and morphological analysis revealed a cauliflower-like morphology with enhanced porosity after calcination. UV-Visible absorption spectroscopy and photoluminescence measurements demonstrated a blue shift in the absorption peak and significant emission peaks related to oxygen vacancies, indicating improved humidity sensing potential as increasing the calcination temperature. The controlled calcination process led to successful outcomes, precisely tuning the NPs structure and optical behavior for enhanced humidity sensing capabilities. Conductivity studies have highlighted the semiconducting behavior of the NPs and observed that an increase in calcination temperature reduces their conductivity. Notably, humidity sensing experiments revealed a remarkable response of 93% and an exceptional response time of 30 seconds for the calcined NPs, surpassing the uncalcined sample. The sensing mechanism involving physisorption, chemisorption, and capillary condensation of water molecules on the NPs surface was validated. Moreover, the stability test over two month demonstrated consistent and highly stable humidity sensing response, reaffirming the NPs potential as effective and reliable humidity sensors.

#### 1. Introduction

In recent years, the monitoring and control of humidity have become increasingly important in various industries, such as air conditioning, biomedical, food processing, pharmaceuticals, meteorology, microelectronics, agriculture, and structural health monitoring. Humidity fluctuations in the atmosphere have significant impacts on industries, the environment, manufacturing processes, and human health. Moreover, abrupt changes in humidity often caused by air pollution, adversely affect crop cultivation and yield [1–3]. Consequently, there is a growing demand for highly sensitive humidity sensors to facilitate environmental monitoring, food preservation and packaging, agricultural practices, and weather forecasting [4–7]. Ceramic oxide-based humidity sensors have been extensively studied in the past, but they often lack the desired sensitivity and selectivity [8]. Recently, metal oxide nanoparticles (NPs) based humidity sensors have garnered

significant interest due to their affordability, easy installation, compact size, and simple design [9–11]. These NPs exhibit semiconducting properties and have wide band gap energies, enabling them to operate effectively at low temperatures with a chemiresistive nature [12].

Among the various metal oxide NPs, tin oxide NPs (SnO<sub>2</sub>) stand out as promising materials because of their n-type semiconducting nature and a band gap of 3.6 eV. They offer high chemical stability, a larger reactive surface area for target analytes, and are known for their non-toxicity and biocompatibility [13,14]. In particular, the porous nature of tin oxide NPs has shown remarkable sensitivity in sensing analytes through the adsorption of molecules on their surface. SnO<sub>2</sub> NPs have gained a well-established reputation as effective sensor materials, demonstrating excellent sensitivity, selectivity, stability, and responsiveness [15–19]. As a result; SnO<sub>2</sub> NPs have found applications in various fields, such as gas sensing, solar cells, photocatalysis, supercapacitors, conducting electrodes, optoelectronic devices, and

E-mail address: kotreshm26@gmail.com (K.M. Goudar).

<sup>\*</sup> Corresponding author.

biomedical applications [20–24]. Moreover, the structure and morphology of tin oxide NPs can be tailored by introducing suitable metal dopants and calcining the NPs at higher temperatures to achieve the desired chemiresistive properties for improved sensing performance. Incorporating zinc as a dopant alters the crystalline size and oxidation state in the  $SnO_2$  crystal structure, potentially enhancing sensitivity and selectivity. The smaller ionic radius (139 pm) of the  $Zn^{+2}$  ion allows it to easily replace the  $Sn^{+4}$  ion (225 pm), resulting in oxygen vacancies, reducing the electron density and creating excess ions on the NP's surface, which facilitates interaction with analyte molecules [24,25].

Several studies have been published on the synthesis and characterization of  $SnO_2$  and doped  $SnO_2$  nanostructures with different dimensions. These studies demonstrate that calcination treatments can modify the surface roughness and crystallinity of the NPs [26,27].  $SnO_2$  NPs are observed to crystallize and become structurally stable at calcination temperatures around  $500\,^{\circ}C$  [28,29]. While previous papers have discussed the structure and morphological modification of  $SnO_2$  NPs for various applications, to the best of our knowledge, no reports exist on the humidity sensitivity linked to uncalcined and calcined temperatures for zinc-doped  $SnO_2$  NPs. The objective of this study is to investigate the effects of calcination temperature on the structural, morphological, optical, and electrical properties of zinc-doped tin oxide NPs and their humidity sensing capabilities. Our findings indicate that the zinc-doped tin oxide NPs calcined at  $500\,^{\circ}C$  exhibit exceptional humidity sensing characteristics, including a rapid response time of 30 s.

#### 2. Experimental methods

#### 2.1. Materials

The analytical grade  $SnCl_2.2H_2O$ ,  $ZnCl_2$  and NaOH precursors were obtained from SD Fine Chemical Ltd. and used without further refinement.

#### 2.2. Methods

#### 2.2.1. Synthesis of Zn-SnO2 nanoparticles

Zn-SnO<sub>2</sub> NPs were prepared using the chemical coprecipitation method, as depicted in Fig. 1. In the typical synthesis process, 0.18 M of SnCl<sub>2</sub>.2H<sub>2</sub>O and 0.02 M of anhydrous ZnCl<sub>2</sub> precursors were separately dissolved in a known quantity of deionized water and stirred for one hour. Subsequently, the ZnCl<sub>2</sub> solution was added to the SnCl<sub>2</sub>.2H<sub>2</sub>O solution under continuous stirring, while maintaining the solution temperature at 60 °C. Furthermore, a 0.8 M NaOH solution, serving as a reducing agent, was slowly added drop by drop to the mixture solution under constant stirring until the solution reached a pH of 10. During this process, the initially white metal solution turned into a grey precipitate. The obtained precipitate was then filtered and washed multiple times with deionized water, followed by ethanol, to remove any chloride residues. The resulting sample was subsequently dried at 70 °C for two hour in a hot air oven. Moreover, the obtained powder was divided into two parts. Among these parts, one was subjected to calcination at 500 °C in a muffle furnace to investigate the effect of calcination temperature on the structural, morphological, optical, and humidity sensing properties, which were then compared with the uncalcinated (bare) sample. Henceforth, the uncalcinated and calcined at 500 °C samples were labeled as ZS1 and ZS2, respectively.

#### 2.3. Characterization methods

The synthesized Zn-SnO $_2$  NPs characterized by using various spectroscopic techniques. The crystallography and structural information of the sample were analyzed by X-ray diffraction using a Rigaku X-ray diffractometer, utilizing copper K $\alpha$  ( $\lambda$ = 0.15406 nm) radiation as the source, at room temperature. The surface morphology and elemental composition were investigated using the FESEM-EDS technique with a Zeiss EVO18 instrument (make: Carl Zeiss Pvt. Ltd., Japan). The morphology, mean size and purity of the samples were examined by transmission electron microscope (TALOS F200S 200 kV, FEG, CMOS camera 4Kx4K, EDX detector). FTIR examination was conducted with a

Fig. 1. Schematic representation for the synthesis of Zn-SnO<sub>2</sub> NPs by chemical coprecipitation method.

Perkin Elmer spectrometer, covering the wavenumber range of 4000–400 cm<sup>-1</sup>, employing the KBr pellet technique. The UV–visible absorption spectrum of the Zn-SnO<sub>2</sub> NPs was recorded using an AU-2703 spectrometer (make: Systronics Limited, India). The photoluminescence spectrum of Zn-SnO<sub>2</sub> NPs was examined using the Fluoromax-4 spectrometer (Make: Horiba Jobin Yvon).

#### 2.4. Humidity sensing studies

To investigate the humidity sensing behavior of the zinc-doped tin oxide NPs, the initial samples were transformed into pellets with a thickness of 1.5 mm and a diameter of 10 mm using a hydraulic press. Additionally, silver paste was applied to both sides of the pellet to enhance electrical contact. The sensing behavior of the prepared pellets under different humidity conditions was examined using a specially designed sensor setup, as illustrated in Fig. 2. To create specific humidity conditions, standard salt solutions were placed in a glass chamber namely: LiCl (10% RH), MgCl<sub>2</sub> (33% RH), K<sub>2</sub>CO<sub>3</sub> (43% RH), Mg (NO<sub>3</sub>)<sub>2</sub> (53% RH), CoCl<sub>2</sub> (64% RH), NaCl (75% RH), KCl (85% RH), K<sub>2</sub>SO<sub>4</sub> (97% RH). The chamber was sealed with a rubber cork, allowing the electrodes to pass through. The two ends of the electrodes were connected to a programmable digital multimeter (Hioki DT 4282, Japan) in order to measure and record the variation in electrical resistance of the samples with and without humidity. Finally, the sensing response of the samples was determined using Eq. (1) [9].

$$S_H = \frac{R_0 - R_{RH}}{R_0} \times 100 \tag{1}$$

Where  $S_H$  is humidity sensitivity,  $R_0$  is resistance at lowest % RH,  $R_{RH}$  is resistance at various % RH.

#### 3. Results and discussion

#### 3.1. X-ray diffraction results

The synthesized NPs underwent X-ray diffraction (XRD) studies in the 20 range of  $20^\circ$  to  $80^\circ$  to investigate their structural characteristics. Fig. 3 depicts the XRD pattern of the uncalcinated sample (ZS1) and the sample calcinated at 500 °C (ZS2). From the figure, it is evident that the sample calcinated at 500 °C (ZS2) exhibits well-defined diffraction patterns with major indexing peaks at (110), (101), (200), and (210). This confirms that the prepared NPs possess a highly crystalline nature with a tetragonal rutile structure belonging to the P42/mnm space

Fig. 3. The XRD pattern of synthesized Zn-SnO $_2$  NPs; ZS1 is uncalcinated, and ZS2 is calcinated at 500  $^{\circ}$ C.

group. The obtained results align with the standard JCPDS data (01–077–0447). Meanwhile, the uncalcinated sample ZS1 displays a similar diffraction pattern to that of ZS2, with an additional major peak (101) observed at a  $2\theta$  value of  $30^\circ$ . This peak corresponds to the Zn-SnO tetragonal rutile phase, indicating that the uncalcinated ZS1 sample consists of both Zn-SnO and Zn-SnO<sub>2</sub> phases. The presence of two phases can be attributed to the thermodynamic instability of Zn-SnO NPs [30, 31].

Furthermore, the calcination process at 500 °C leads to an increase in peak intensity with wider broadening compared to the uncalcinated sample. This suggests that the calcination process significantly enhances the crystallinity of the prepared sample [32]. Additionally, the effect of calcination temperature on the crystalline structure of the prepared NPs was analyzed by determining various crystal parameters such as average crystallite size (D), lattice parameters (a, b, and c), unit cell volume (V), lattice distortion ratio  $[(\epsilon^2)^{1/2}]$  and percentage of crystallinity. These parameters were calculated using the following Eqs. (2) to (6) and the results are presented in Table 1.

$$D = \frac{k\lambda}{\beta\cos\theta} \tag{2}$$

$$\frac{1}{d^2} = \frac{\left(h^2 + k^2\right)}{a^2} + \frac{l^2}{c^2} \tag{3}$$

Fig. 2. Schematic diagram of the humidity sensing set up.

 Table 1

 Crystalline parameters of the fabricated zinc doped tin oxide NPs.

Sample Name	Calcinated temperature	Crystalline size (D) in nm by DS Method	Lattice parameter in (Å)		Volume of the unit cell (V) $(\mathring{A})^3$	$(\varepsilon^2)^{1/2}$	% Crystallinity
	in °C		<u>a</u>	c

<sup>\*</sup> represents the standard value [JCPDS data (01–077-0447)]

$$V = a^2 c (4)$$

$$\left\langle \varepsilon^2 \right\rangle^{1/2} = \frac{1}{D} \frac{1}{\sin \theta} \frac{\lambda}{\pi} \sqrt{\frac{\pi^2 k^2 - 4}{32}} \tag{5}$$

$$%Crystallinity = \frac{I_c}{I_c + I_a} \times 100$$
 (6)

The Table 1 reveals that the crystalline size of the calcinated sample is significantly smaller than that of the uncalcinated sample, attributed to the recrystallization of NPs caused by the calcination temperature [26]. The lattice parameters of the prepared NPs are relatively smaller than the standard value of  $SnO_2$  NPs. This disparity is mainly due to the difference in ionic radius between Zn ions and Sn ions, which induces lattice distortion in the  $SnO_2$  lattice matrix [33]. Consequently, the

Fig. 4. FESEM images of Zn-SnO<sub>2</sub> NPs; (a, c) uncalcinated, (b, d) calcinated at 500 °C and EDS spectrum (e) uncalcinated, (f) calcinated at 500 °C.

lower value of the lattice distortion ratio for the calcinated samples arises from the presence of thermal strain in the crystal structure, resulting in a reduction in crystalline size. Additionally, the percentage crystallinity of the calcinated sample shows a larger value than the uncalcinated sample, implying that the calcination process greatly contributes to the crystallization process. Thus, the calcinated sample exhibits well-defined XRD peaks with a lower lattice distortion ratio and high crystallinity, indicating that the calcination process plays a vital role in crystal growth.

### 3.2. Morphological results

### 3.2.1. FE-SEM analysis

The surface morphology of the prepared NPs was studied using the FE-SEM technique. The images were captured at magnifications of 2  $\mu$ m and 200 nm, respectively, as shown in Fig. 4(a-d). From the figure, it is evident that the uncalcinated NPs [Fig. 4(a, c)] exhibit a spherical morphology with agglomeration, and the grains are distributed in uniform sizes. On the other hand, Fig. 4(b, d) shows the images of the NPs calcinated at 500 °C, displaying a cauliflower-like morphology with

cluster structures. Furthermore, the calcination temperatures cause the NPs to become rougher, and their grains become smaller. The increased surface roughness would generally improve the interface between the surface of the NPs and the applied analytic molecules, which may aid in boosting the sensing response [17]. Moreover, the existence of porosity is also a crucial component in improving sensing property because the porous surface of NPs may readily adsorb analyte molecules and react with surface-adsorbed molecules [34]. In the present case, as compared to uncalcinated NPs, calcinated NPs have smaller grain sizes and higher porosity. Consequently, the porous NPs may have contributed to the surface area expansion, providing more active sites for adsorbing water molecules and, in turn, aiding in enhancing the humidity sensing capacity [35].

Thus, the calcination process significantly alters the structure and morphology of the NPs, resulting in the formation of a mesoporous gap between the grains, as observed in Fig. 4(b). Additionally, for more confirmation we estimated the size of mesoporous voids by using  $Image\ J$  software and average size found to be 0.98 nm and 8 nm for uncalcinated (ZS1) and calcinated (ZS2) NPs. This unique morphology is advantageous for various sensing applications, as it allows for the

Fig. 5. TEM images of calcinated Zn-SnO<sub>2</sub> NPs (ZS2); (a-c) at different magnification, (d, e) represents d-spacing images, (f) SAED pattern, (g) EDAX spectrum and (h) particle size distribution histogram.

penetration of target analytes and enables varying resistance across the sample [2]. Furthermore, the elemental composition of the material was determined using Energy Dispersive Spectroscopy (EDS) analysis, and the obtained spectra are shown in Fig. 4(e, f). The peaks associated with the elements Sn, O, and Zn are identified, confirming the successful doping of Zn into the  $SnO_2$  NPs lattice, with no other residual elements present in the profile.

### 3.2.2. TEM analysis

A transmission electron microscopy (TEM) analysis was performed on the ZS2 sample to confirm the formation of the tetragonal rutile phase, determine particle size, and investigate the reason behind the calcinated sample's high humidity response. TEM images of the ZS2 samples, captured at magnifications of 10 nm and 50 nm, are shown in Fig. 5(a, b). These images clearly demonstrate the uniform arrangement of particles in a tetragonal shape. Additionally, the interplanar distance of the obtained structure was estimated and is presented in Fig. 5(d, e). The values measured were found to be 0.268 nm and 0.341 nm, corresponding to the (101) and (110) planes of tetragonal rutile phase of SnO2 NPs, respectively. The selective area electron diffraction pattern (SAED) of the ZS2 NPs is depicted in Fig. 5(f). The SAED pattern exhibits a shining diffraction spot with a spherical pattern, indicating the fine crystalline nature of the NPs and their closely correlated radii with the lattice spacing of the XRD planes.

The average particle size of the prepared NPs was estimated from the histogram using Image J software, as shown in Fig. 5(h), and was found to be 12 nm. These findings from the TEM analysis align relatively well with the XRD measurements. Furthermore, as discussed in the FE-SEM analysis, ZS2 sample has a large number of voids, which is confirmed by TEM analysis and is shown in Fig. 5(c). Notably, Fig. 5(c) illustrates the creation of mesoporous spaces between the grains, which may be advantageous for humidity sensing applications by facilitating the adsorption of water molecules on the nanoparticle surface [36]. Moreover, in this work the calcinated sample demonstrated a high humidity sensing response due to morphological changes caused by calcination. The crystallinity and charge carrier scattering at the grain boundaries in contact with the NPs primarily influence the resistivity of the Zn-SnO<sub>2</sub> NPs. The scattering process strongly affects the resistivity of nanocrystallites and is predominantly increased by reducing particle size [33]. Additionally, EDAX analysis were performed for the prepared ZS2 NPs to check the elemental composition and obtained spectrum is depicted in Fig. 5(g). The spectrum confirms the presence of Sn, Zn, and O elements and other impurity were not detected. Finally, these results endorse that the calcination process will improve the surface morphology and create mesoporous voids between the NPs, which are helpful for gas and humidity sensing applications.

### 3.3. Fourier transforms infrared spectroscopy (FTIR) results

FT-IR spectroscopy is an essential technique for investigating the structural properties and various functional groups attached to the NPs. The obtained FT-IR spectra of the synthesized NPs are shown in Fig. 6. From the spectra, three main functional group bands are observed at  $543~\rm cm^{-1}$ ,  $1020~\rm cm^{-1}$ , and  $3412~\rm cm^{-1}$ . The peak at  $543~\rm cm^{-1}$  corresponds to the characteristic stretching vibration of the Sn-O bond. The stretching modes of Zn-O-Sn are indicated by the peaks at  $617~\rm cm^{-1}$  in the uncalcinated sample and  $630~\rm cm^{-1}$  in the calcinated sample. The shift in the peak position is attributed to the change in structural properties of the NPs caused by the effect of calcination temperature [37].

A small peak observed at  $1020~\rm cm^{-1}$  in the calcinated samples is mainly attributed to Sn-OH, while the same peak appears at  $1171~\rm cm^{-1}$  in the uncalcinated samples. The bending vibration of the  $\rm H_2O$  molecule is observed at  $1635~\rm cm^{-1}$  in the uncalcinated sample, which can be attributed to water molecule adsorption on the surface of the NPs. This peak becomes significantly reduced in the calcinated sample. Additionally, the peak at  $3412~\rm cm^{-1}$  is related to the stretching vibration of

Fig. 6. FT-IR spectra of synthesized Zn-SnO  $_2$  NPs; ZS1-uncalcinated, ZS2- calcinated at 500  $^{\circ}\text{C}.$ 

the O-H bond and is mainly caused by the adsorption of moisture on the nanoparticle surface from the atmosphere during the FT-IR analysis [26]. *C. Guo et al.* reported that,  $Ho_2O_3/GO$  composite has sharper hydroxyl peak than pure  $Ho_2O_3$  nanosheets, which suggest that, the increased surface water absorption [38]. In our case also same, i.e. O-H stretching vibration peaks of the calcined sample are sharper than those of the uncalcined sample, indicating increased surface water absorption.

### 3.4. UV-Visible absorption spectroscopic measurements

The effect of calcination temperature on the optical properties of zinc-doped tin oxide NPs was investigated using a UV-Visible absorption spectrophotometer in the wavelength range from 250 to 800 nm. The obtained spectra are presented in Fig. 7(a). From the spectra, it is observed that the absorption band of the uncalcinated sample appeared at 356 nm and shifted to 345 nm (blue shift) after the calcination of the NPs. This shift in peak position is attributed to a reduction in the crystalline size of the NPs [2]. Furthermore, the optical band gap of the prepared NPs was estimated using the Kubelka-Munk function, which is given by Eq. (7).

$$F(R) = \frac{(1-R)^2}{2R} \tag{7}$$

where R is the reflectance, the plot of  $[F(R) \times h\nu]^2$  versus photon energy ( $h\nu$ ) gives the band gap energy of the prepared NPs, as shown in Fig. 7 (b). The bandgap energy was found to be 3.84 eV and 3.62 eV for the uncalcinated and calcinated NPs, respectively.

The reduction in bandgap energy after calcination can be attributed to chemical flaws or vacancies in neighboring intergranular areas, which generate new energy levels [37,39]. Additionally, the interaction between band electrons and localized electrons of Zn<sup>+</sup> (charge transformation or sp-d interaction) can modify the electronic structure and lead to a change in the energy band gap [2,40]. Generally, bandgap variation has a substantial impact on photosensing performance, whereas humidity sensors rely mostly on optical defects, such as oxygen vacancies, concerning the chemical species of analyte molecules. Therefore, it is essential to investigate the optical flaws in the NPs, and this can be done more precisely through photoluminescence spectroscopy.

### 3.5. Photoluminescence (PL) spectroscopy results

In addition to UV-visible absorption spectroscopy, photoluminescence is a powerful method for analyzing the optical properties of NPs. The emission spectra of the prepared NPs were obtained by exciting the sample at a wavelength of 290 nm, as shown in Fig. 8. The

Fig. 7. UV-visible absorption spectra of synthesized Zn-SnO<sub>2</sub> NPs (a) Absorption spectrum (b) Kubelka-Munk plot of uncalcinated (ZS1) and calcinated (ZS2) NPs.

Fig. 8. Normalized emission spectra of the synthesized Zn-SnO $_2$  NPs; ZS1-uncalcinated and ZS2-calcinated at 500  $^{\circ}\text{C}.$ 

uncalcinated (ZS1) and calcinated (ZS2) samples exhibited significant emission peaks at 371 nm and 377 nm, respectively. This intense emission is primarily attributed to the exciton recombination of electrons in the conduction band with photoinduced holes in the valence band [41]. Furthermore, a faint emission was also observed at 462 nm and 456 nm for the ZS1 and ZS2 samples, respectively. This emission is mainly attributed to surface defects, which result in electron migration from Sn vacancies to interstitial sites [42]. The presence of surface defects, particularly oxygen vacancies at the interstitial sites, traps electrons from the valence band and causes delayed luminescence [2].

The delayed luminescence may be caused by radiative transitions via deep levels in the bandgap. Two possible explanations for this radiative transition are considered: (i) grain boundary defects acting as recombination centers, and (ii) oxygen vacancies likely producing a significant number of trapped states within the  $\rm Zn\textsc{-}SnO_2$  band structure. Therefore, due to their oxygen vacancies and oxygen interstitial, these emissions have a major impact on the humidity sensing performance of the NPs [18]. In particular, oxygen vacancies directly interact with the adsorbed water molecules, enhancing the sensitivity of the NPs [43].

### 3.6. Conductivity measurements

The semiconducting properties of the synthesized zinc-doped tin oxide NPs were measured using two-probe dc conductivity

measurements supported by a Keithley source meter at operating temperatures ranging from 80 °C to 200 °C. Fig. 9(a, b) illustrate the I-V properties of the ZS1 and ZS2 samples, respectively. From the curves, it is observed that the electrical conductivity of the Zn-SnO<sub>2</sub> NPs increases with the operating temperature. This can be attributed to the rise in charge carriers due to thermal effects, resulting in an increase in the drift mobility of charges [44]. These observations confirm the semi-conducting behavior of the prepared Zn-SnO<sub>2</sub> NPs. Furthermore, the calcinated NPs (ZS2) exhibit lower conductivity compared to the uncalcinated (ZS1) sample. The decrease in conductivity may be attributed to the reduction in crystallite size, the presence of a large number of mesoporous voids, and changes in charge carrier density [45]. These results also support FE-SEM and TEM analysis.

### 3.7. Humidity sensing results

The effectiveness of sensors based on uncalcinated and calcinated Zn-doped  $\rm SnO_2$  NPs was evaluated at different relative humidity levels ranging from 11% to 97% RH. In general, the surface morphology of the NPs, doping metal, and operating temperature are factors that have a significant impact on the effectiveness of a humidity sensor [2,18]. Additionally, it is crucial to remember that the operating temperature has a significant impact on any metal oxide sensor's detecting performance since it regulates both electrical resistivity and the mobility of charge carriers [7]. According to earlier investigations, sensitivity of the sensor is excellent at higher temperatures than ambient temperature, mainly because of increased mobility of charge carriers due to the temperature effect [46].

Further, due to the requirement for a safe and nontoxic environment in chemical industries, medical labs, research laboratories, food processing, and agriculture, scientists are now concentrating on improving the sensor response even at ambient temperature [6]. As a result, we investigated a room temperature humidity sensor in this study. In addition, we investigated how well-prepared NPs sensors sensed various humidity environments in terms of response and recovery times.

### 3.7.1. Sensing response

Humidity sensors are typically designed to be sensitive to the amount of water vapor adsorbed on the surface of NPs. This adsorption leads to a change in the electrical resistance of the NPs in relation to humidity, with a decrease in resistance as the relative humidity (RH%) increases [46]. To examine the humidity sensitivity properties of the synthesized NPs, electrical resistance measurements were performed at various relative humidity levels (11–97% RH), as depicted in Fig. 10. The resulting resistance measurements allow for the estimation of the

Fig. 9. Conductivity response of synthesized Zn-SnO<sub>2</sub> NPs at different operating temperatures ranging from 80 °C to 200 °C; (a) for uncalcinated (ZS1) and (b) calcinated at 500 °C (ZS2).

Fig. 10. Electrical resistance variation of Zn-SnO<sub>2</sub> NPs with different humidity conditions; for (a) uncalcinated (ZS1) and (b) calcinated at 500 °C (ZS2) NPs.

sensitivity response of the humidity system, as shown in Fig. 11.

From Fig. 10 (a), it is noticed that, the uncalcinated NPs (ZS1) exhibit a modest fluctuation in electrical resistance within the examined RH range, ranging from 4 to 1.75 M $\Omega$ . The sensing response of ZS1 was found to be 56% which is shown in Fig. 11. However, this outcome is

Fig. 11. Variation of sensing response of uncalcinated (ZS1) and calcinated (ZS2)  $\text{Zn-SnO}_2$  NPs with relative humidity.

insufficient for the fabrication of an effective resistive-type humidity sensor. On the other hand, the calcinated NPs (ZS2) demonstrate a significant drop in resistance from 149 to 10 M $\Omega$  across all humidity ranges and is shown in Fig. 10 (b). The sensing response of ZS2 was determined to be 93% and is displayed in Fig. 11, which definitely outstanding for the sensor device fabrication. The stronger humidity-sensing response of the calcinated Zn-SnO<sub>2</sub> NPs is mainly attributed to its enhanced crystallinity, high porosity, and a lower energy bandgap [47].

Additionally, following a meticulous examination of the FE-SEM, TEM, and PL findings, notable morphological alterations were observed in the calcined Zn-SnO<sub>2</sub> NPs. These alterations comprise a higher proportion of oxygen-related defects, increased grain boundaries, and enhanced porosity. These structural changes have facilitated a significant improvement in water molecule adsorption, along with improved conduction, a drastic reduction in resistance, and heightened sensor responsiveness. In contrast, the uncalcined Zn-SnO<sub>2</sub> NPs exhibit a less porous nature, high conductivity, and low resistance; consequently, no significant drop in resistance has been observed.

### 3.7.2. Sensing mechanism

The humidity sensing mechanism is described using three successive processes based on the observed sensing behavior of synthesized Zn-SnO $_2$  NPs: physisorption, chemisorption, and capillary condensation. When  $_2$ O molecules adsorb on the surface of the NPs, they undergo

chemisorption, physisorption, and capillary condensation. Initially, at lower humidity levels,  $H_2O$  molecules dissociate into  $H^+$  and  $OH^-$  ions, which is represented in Eq. (8). The self-generated  $OH^-$  ions attach to the surface of the NPs during physisorption, and in the subsequent chemisorption layer, both the remaining  $H^+$  ion and the attached  $OH^-$  ions are discharged.

$$H_2O \leftrightarrow H^+ + OH^-$$
 (8)

Furthermore, these chemisorbed  $OH^-$  ions interact with nearby  $H_2O$  molecules, forming hydrogen bonds and resulting in the production of hydronium group  $(H_3O^+)$  ions. However, the  $H_3O^+$  ions subsequently dissociate into  $H_2O$  and  $H^+$  particles, facilitating the transfer of protonated  $H^+$  ions between neighboring water molecules and enabling electrical conduction. This phenomenon is commonly known as the Grotthuss mechanism that is represented as Eq. (9) [14].

$$2H_2O \to H_3O^+ + OH^-$$
 (9)

In addition, as the humidity rate increases, the second-stage of physisorption occurs, followed by the adsorption of water molecules into the capillary pores. This leads to an increase in the  $\mathrm{H}^+$  ions (protonation) and subsequently a decrease in the resistance of the sensing material. Therefore, the adsorption of water molecules on the surface of the NPs plays a vital role in detecting humidity conditions by modulating the resistance of the NPs. The sensing mechanism of the NPs is illustrated in Fig. 12.

### 3.7.3. Response and recovery time

The response and recovery characteristics of the uncalcinated (ZS1) and calcinated (ZS2) NPs were investigated, as shown in Fig. 13 (a, b). The response time were measured by placing the sample initially in the lower humidity chamber (11% RH) and then transferred to a higher humidity chamber (97% RH). During this process the resistance of the sample falls down and reaches the stable response. The response time, which measures the time taken for the sensor to reach a stable response in the higher humidity environment and it was found to be 86 s for ZS1 and 30 s for ZS2, respectively. Conversely, recovery time were measured by placing the sample initially in the higher humidity chamber (97% RH) and then transferred to a lower humidity chamber (11% RH). During this process the resistance of the sample rose up and reaches the initial stable response. The recovery time, which indicates the time required for the sensor to return to its initial state after being exposed to a low humidity environment and it was found to be 97 s for ZS1 and 37 s for ZS2 samples, respectively.

The longer recovery time compared to the response time can be attributed to the sluggish desorption of water molecules from the surface of the sensing materials [47,48]. Y. Xu et al. reported that, owing to intermolecular forces and the capillarity of the pore structure, the

Fig. 12. Illustration of possible mechanism for the adsorption of water molecule on the surface of  $Zn-SnO_2$  NPs at ambient temperature.

desorption of water molecules from the material surface is expected to require more time [49]. This force leads to a more stable adsorption of water molecules on the surface, resulting in a slower release during the recovery process. During the response time cycle, the sample exhibits an exothermic reaction as water molecules rapidly adsorb on the surface of the NPs. Further, the uncalcinated Zn-SnO2 NPs shows higher response and recovery time as compared to the calcinated Zn-SnO<sub>2</sub> NPs; this is mainly because of high density of NPs and low porosity which inhibit the water molecule access [50]. Moreover, the broader porosity and small particle size of calcinated Zn-SnO2 NPs allow charge carriers to propagate across the surface more smoothly. As a consequence, the sensing response and recovery durations were shorter than those of the uncalcinated Zn-SnO2 NPs. Additionally, owing of its lower electron concentration, the uncalcinated Zn-SnO2 NPs surface state could be less sensitive to humidity than calcinated NPs. These finding implies that, the calcination process might improve the humidity sensing properties of Zn-SnO<sub>2</sub> NPs. The sensing properties of calcinated Zn-SnO<sub>2</sub> NPs were compared with various other nanomaterials and are presented in Table 2. Overall, the calcinated NPs (ZS2) demonstrate faster response and recovery times and exhibit a higher sensing response of 93% compared to the uncalcinated NPs (ZS1). The excellent sensing characteristics of the Zn-SnO2 NPs make them a promising material for the fabrication of humidity sensors.

Humidity-sensing NPs exhibit hysteresis behavior in relation to relative humidity. Fig. 14 illustrates the hysteresis graph of the calcined sample ZS2. The graph depicts the typical adsorption curve obtained after subjecting the sample to various relative humidity conditions, ranging from 11% to 97% RH, while recording the corresponding resistance values. Subsequently, the sample was tested again within a humidity range of 97-11% RH, and the resulting resistances were recorded to generate a desorption curve. It is evident from the adsorption and desorption curves, it exhibit satisfactory linearity and nearly identical behavior. Further, the percentage of hysteresis was calculated by considering the maximum deviation (hysteresis) in resistance between adsorption and desorption. From the graph, it is noticed that the maximum deviation appeared at 43% RH, and the percentage of hysteresis was calculated using Eq. (10), and it was found to be 12%. Furthermore, the sensor's humidity sensitivity increases with decreasing humidity hysteresis, and the obtained value signifies that the prepared Zn-SnO<sub>2</sub> NPs can be used for the design of humidity sensors. As a result, the calcination temperature plays an important role in the Zn-SnO<sub>2</sub> sensor's sensitivity.

$$\% \text{Hysteresis} = \left[ \frac{\left( R_{mn} - R_{mp} \right)}{\left( R_{\text{max}} - R_{\text{min}} \right)} \times 100 \right] \tag{10}$$

Where,  $R_{mn}$  and  $R_{mp}$  are the maximum and minimum value of resistance at 45% RH (at maximum hysteresis),  $R_{\rm max}$  and  $R_{\rm min}$  are the maximum and minimum values of the measured resistance in the humidity range of 11–97% RH.

### 3.7.4. Stability testing

Moreover, the stability parameter plays a crucial role in the practical design of humidity sensors [56]. Therefore, the high humidity sensing response of the calcined sample was evaluated for its stability over a period of two month, with measurements taken at ten-day intervals. The experiment was conducted under two different humidity conditions: initially at 43% RH and subsequently at 97% RH. The results obtained from this stability test are presented in Fig. 15. The figure demonstrates that the sensing response of the calcined sample remains consistent and highly stable over an extended period. Hence, the calcinated Zn-SnO $_2$ NPs can be implemented in the humidity sensor device fabrication.

### 4. Conclusion

In conclusion, this study demonstrates the successful synthesis and

Fig. 13. Plot of response and recovery time of synthesized  $Zn-SnO_2$  NPs sensor with change in relative humidity; (a) Uncalcinated (ZS1) (b) Calcinated (ZS2)  $Zn-SnO_2$  NPs.

characterization of zinc-doped tin oxide nanoparticles (Zn-SnO $_2$  NPs) with controlled properties for humidity sensing applications. The calcination process significantly influenced the NPs structural and morphological features, resulting in a cauliflower-like morphology with enhanced porosity. The X-ray diffraction confirmed the tetragonal rutile structure; and UV-Visible absorption and photoluminescence spectra indicated the presence of oxygen vacancies, which is crucial for humidity sensing. Electrical studies revealed the semiconducting behavior of the NPs, with calcination affecting their electrical conductivity. Notably, humidity sensing experiments highlighted the outstanding performance of the calcined NPs, with a remarkable breakthrough response of 93% and a rapid response time of 30 seconds, surpassing the uncalcined sample. The sensing mechanism involving physisorption, chemisorption, and capillary condensation of water molecules on the

NPs surface was validated, providing insights into their humidity sensing behavior. Moreover, the stability test demonstrated consistent and highly stable humidity sensing response over two month, confirming the NPs potential for practical applications. In summary, zinc-doped tin oxide NPs exhibit exceptional humidity sensing characteristics, making them promising candidates for advanced humidity sensors in various industries. The controlled calcination process played a critical role in optimizing their sensing performance and offers new opportunities for designing high-performance humidity sensors. These outcomes mark a significant advancement in the field of nanomaterial-based sensor research and pave the way for the development of reliable and efficient humidity sensing devices with broad applications in environmental monitoring, food processing, and agriculture, among others.

Hanumantagouda Basavanagoudra is a research student in the Department of Physics at Vijayanagara Sri Krishnadevaraya University, Ballari, Karnataka, India. He earned his postgraduate M.Sc. degree in Physics from the same university in 2016. His current research interests encompass materials science, the development of chemical and biosensors, and light-harvesting devices. He has contributed to the field by publishing six papers in peer-reviewed journals.

Kotresh M. Goudar is an Assistant Professor of Physics at Vijayanagara Sri Krishnadevaraya University, Ballari, Karnataka, India. He earned his postgraduate M.Sc. degree in Physics in 2012 and completed his Ph.D. in molecular fluorescence spectroscopy from Karnatak University, Dharwad, in 2017. His research has primarily focused on the spectroscopic investigation of nanomaterials involving organic dyes and biomolecules, with applications in bio-chemical and light-harvesting domains. Currently, his research interests span materials science, fluorescence spectroscopy, and computational physics. He has published 29 papers in peer-reviewed journals and contributed to four book chapters. He is currently supervising four students for their PhD studies.

# Design of nanostructured biosensors based on organic and other composite materials

B. Chethan Ph D<sup>1,\*</sup>, V. Prasad<sup>1</sup>, A. Sunilkumar<sup>2</sup>, S. Thomas<sup>3</sup>, A. Sreeharsha

### 6.1 Introduction to sensors

A receptor-transducer sensor device is used to convert a biological response into an electrical signal. The design and development of biosensors have attained a greater interest nowadays because biosensors find widespread applications in the medical field, diagnosis of the disease, ecology monitoring, and maintaining the quality of food, drug, and water. The biosensing devices attained a greater demand and face many challenges to fabricate the sensing device with better sensitivity, a lower limit of detection, good stability, quick response time, reduced device size, and simple operation. These challenges can be fulfilled by the interphase of chemical and morphological properties of the nanomaterials with the sensor technology. The nanomaterials from zero to three dimensions are having advantageous properties like high surface area, enhanced conductivity, and tunable electrical and mechanical properties making these nanomaterials potential candidates to fabricate biosensors. Among the nanomaterials, nanoparticles, nanowires, and nanorods find advantageous properties because of their high stability, high carrier capacity, high detection limit, large surface area, active sites, and more thermal conductivity. The ferrites, polymers, metal, metal oxides, carbon-based materials, and their composites are widely used in the fabrication of

biosensors. In this chapter, the evolution of the sensors, types of sensors, and biosensor types are discussed deliberately. This chapter provides different methods which have been used in the synthesis and fabrication of biosensors using nanomaterials.

In this modern world, as awareness of man increased to lead a sophisticated life, the need for science and technology has gained momentum (Amrutha et al., 2021; Chethan et al., 2019; Gleiter, 2000; Hareesha & Manjunatha, 2021; Hareesha et al., 2021; 2021; Manjunatha et al., 2014; Pal et al., 2011; Pushpanjali et al., 2021; Tigari & Manjunatha, 2019; Manjunatha, 2020). Nowadays civilized people depend more on the gadgets like computers, Xerox machines, air conditioning, cell phones, television, smoke detectors, and refrigerators. Many of these gadgets work with the help of sensors. The term sensor refers to a device or module that assists in detecting changes in physical quantities, such as pressure, heat, humidity, movement, force, and an electrical quantity like current, and then turns these physical quantities into signals that can be monitored and analyzed. Sensors are the brains of measuring systems. An ideal sensor should have the following qualities: high resolution, reproducibility, repeatability, range, drift, calibration, sensitivity, selectivity, and linearity (Chethan et al. 2022, 2023; Chethan et al., 2018; Chethan Ramana et al., 2019; El-Denglawey et al., 2021; El-Denglawey Manjunath et al., 2021; Manjunatha et al., 2019; Pratibha & Chethan, 2022; Pratibha et al., 2020; Ravikiran & Chethan, 2022; Rupashree et al., 2021; Shanawad Chethan et al., 2023; Shanawad et al., 2023; Sunilkumar et al., 2023).

Today, we benefit from science and technological advancements that make our lives run more smoothly. We frequently rely on various devices that help us to interact with the physical environment, such as television remote controls, smoke detectors, infrared (IR) thermometers, lamp switches, and fans. Due to numerous applications, including environmental and food quality monitoring, medical diagnostics and health care, automotive and industrial manufacture, as well as space, defense, and security, the advancement of sensor technology has assumed increasing significance (Dincer et al., 2019; Ensafi et al., 2011; Ensafi, 2019; Theavenot et al., 2001).

### **6.1.1 Classification of sensors**

Depending on the physical quantity and analyte to be measured, sensors can be broadly categorized into a number of categories, which include: (1) energy source, (2) physical contact, (3) comparability, (4) analog and digital sensors, and (5) signal detection. Based on these quantities, sensors are broadly classified as follows (Khanna, 2012; White, 1987).

Energy source: Two types of sensors are employed based on energy sources:

- 1. Active and passive sensors: Active sensors, such as microphones, thermistors, strain gauges, and capacitive and inductive sensors, require an external energy source. These kinds of sensors are known as parametric sensors (the output depends on the parameter). Thermocouples, piezoelectric sensors, and photodiodes are examples of passive sensors that produce signals without requiring external energy. These sensors are referred to as self-generating sensors.
- **2.** Physical contact: Based on physical contact, sensors can be classified as contact or noncontact.
- **3.** Contact and noncontact sensors: Contact sensors, like temperature sensors, need to make physical touch with their stimulus, whereas noncontact sensors include optical, magnetic, and infrared (IR) thermometers.
- 4. Comparability sensors can be either absolute or relative.
- **5. Absolute and relative sensors:** Thermistors and strain gauges are examples of absolute sensors. Relative sensors, such as a thermocouple that measures temperature differences and a pressure gauge that measures pressure, relative to atmospheric pressure, perceive the stimulus in relation to a fixed or changing reference.
- **6. Analog and digital sensors:** Sensors come in two varieties: analog and digital. An analog sensor converts a measured physical quantity into an analog form (continuous in time). This group of analog sensors includes thermocouples, strain gauges, and resistance temperature detectors (RTDs). Pulses are the output that a digital sensor produces. Encoders fall under the category of digital sensors.

# 7. Signal detection:

The basic classification of sensors based on signal detection and transformation of information is as follows:

- 4
- a. Physical sensors: A physical quantity is measured by a physical sensor, which then transforms into a signal that the user can recognize. The force, acceleration, rate of flow, mass, volume, density, and pressure are just a few of the environmental changes that these sensors can identify. The use of physical sensors has increased significantly in the biomedical industry, especially with the development of novel measurement technologies and the improvement of microelectromechanical system technology for the creation of more precise and smaller sensors.
- **b. Thermal sensors:** A thermal sensor is a device that measures the temperature of an environment and converts the measured data into electronic data for recording or monitoring temperature change signals. Thermistors, RTDs, and thermocouples are a few types of temperature sensors.
- **c. Biological sensors:** Biological sensors keep an eye on biomolecular interactions like those involving antibodies and antigens, DNA and enzymatic reactions, or cellular communication. The abbreviated form of the term "biosensors" refers to biological sensors.
- d. Chemical sensors: The International Union of Pure and Applied Chemistry defines a chemical sensor as a device that converts chemical information into an analytically useful signal ranging from the concentration of a particular sample component to total composition analysis. Chemical sensors are used to keep an eye on the quantity or activity of the relevant chemical species in the gaseous or liquid phase. In addition, they are used to monitor assays for organophosphorus chemicals, food and drug analyses, and environmental pollution. They can be utilized for clinical diagnostic applications as well.

### 6.1.2 Biosensor

A biosensor is a tool or probe that combines an electronic component with a biological element, like an enzyme or antibody, to produce a quantifiable signal. Information about a physiological change or the presence of different chemical or biological components in the environment is detected, recorded, and transmitted by the electronic component. Biosensors are available in a variety of sizes and designs, and they have the ability to measure and detect even very low quantities of certain diseases, harmful chemicals, and pH values. Certain static and dynamic requirements are required to develop a highly effective and capable biosensor

system. These requirements allow for the optimization of the biosensors' performance for commercial applications.

# 6.1.2.1 Constituents of biosensors

The main constituents of biological sensors comprise of:

- 1. Analyte: A material of interest whose components are being determined or detected is an analyte. The biological constituents may be in the form of glucose, lactose, ammonia, and glucose (Bhalla et al., 2016).
- 2. Transducer: One crucial component of a biosensor is the transducer which is a device that converts energy from one form to another. It transforms the biorecognition event into an electrical signal that is quantifiable and connected to the quantity or the presence of a chemical or biological target.
- **3. Bioreceptor:** Bioreceptors are biological components such as enzymes, cells, aptamers, deoxyribonucleic acid (DNA or RNA), and antibodies that are capable of recognizing the target substrate. Biorecognition is the process of producing a signal when a bioreceptor and an analyte interact.
- **4. Electronics:** To get the signal ready for the display, it is processed. Amplification and digitalization take place on the electrical signals collected from the transducer. The display unit quantifies the signals that have been processed.
- **5. Display:** The display unit is made up of a user interpretation system, such as a computer or a printer, that provides the output so that the user can read and understand the appropriate response according to the end-user requirement.

# 6.1.2.2 Evolution of biosensors

Leland Charles Clark Jr., the father of the biosensors, reported about the components of the biosensors in this work in the year 1956. He fabricated the electrode which is possible to determine the oxygen content in the blood. Later in 1962, Clark reported about the amperometric enzyme electrode for glucose detection. In the upcoming year 1967, Updike and Hicks modified the Clarks work and find out the first functional enzyme electrode for oxygen sensor. After, in 1969 Guilbault and Montalvo depicted the first urea detection sensor based on potentiometric enzyme electrode. In the year 1973, Guilbault and Lubrano fabricated the hydro-

gen peroxide detection sensor based on the lactate enzyme sensor. In this way, many researchers have fabricated many biosensors in these years.

# 6.1.2.3 Characteristics of biosensors

There are some static and dynamic conditions that must be met to create a highly effective and powerful biosensor system. These requirements allow for the performance of the biosensors to be enhanced for commercial applications which are as follows.

**Selectivity:** When choosing a bioreceptor for a biosensor, selectivity is an important attribute to be taken into account. A bioreceptor may identify a specific target analyte molecule in a sample that contains undesired pollutants and admixture compounds.

**Sensitivity**: It is defined as the smallest amount of analyte that can be accurately detected or recognized in the fewest steps at low concentrations (ng  $mL^{-1}$  or fg  $mL^{-1}$ ) to confirm the presence of analyte traces in the sample.

**Linearity:** Linearity helps ensure that the findings of measurements are accurate. The substrate concentration can be detected at higher levels when linearity (straight line) is increased.

**Reproducibility:** Reproducibility is defined by precision (similar output when the sample is measured multiple times) and accuracy (the ability of a sensor to generate a mean value that is more closely related to the actual value when the sample is sampled multiple times). When the same sample is analyzed more than once, the biosensor's ability to produce the same results is what matters.

**Stability:** One essential quality in biosensor applications where ongoing monitoring is necessary is stability. Stability is the degree to which the biosensing equipment is vulnerable to environmental perturbations both inside and outside. The affinity of the bioreceptor (the degree of analyte binding to the bioreceptor) and bioreceptor degradation with time are the variables that determine stability.

**Response period**: It is playing a very crucial role in selecting the best sensor which is having short response time and recovery time factors which implies its effectiveness.

# 6.1.3 Classification of biosensors based on bioreceptors

Bioreceptors are regarded as the key element in the development of biosensors, as it was previously discussed. Enzymatic biosensors are the most prevalent type of biosensor. Other types include immunosensors, which have high specificity and sensitivity and are particularly useful in diagnosis, aptamer- or nucleic acid-based biosensors, which have high specificity for microbial strains and nucleic acid-containing analytes, and microbial or whole-cell biosensors.

The second division is based on the transducer, and the sensors are divided into the following groups: electrochemical (which is further divided into potentiometric, amperometric, impedance, and conductometric groups), electronic biosensor, thermal biosensor, optical, and mass-based or gravimetric. Bioreceptor–analyte combinations fall under a different group and are few. Various classifications are made based on the technology (nano, surface plasmon resonance [SPR], biosensors-on-chip [lab-on-chip], electrometers, and deployable) and the detection sensor systems (optical, electrical, electronic, thermal, mechanical, and magnetic).

According to the quantity of interactions between analyte and bioreceptor, transducers produce visual or electrical signals. The working principle divides transducers into the following major categories: electrochemical, optical, thermal, electronic, and gravimetric transducers. Depending on the input, the output may take the form of a figure, numerical, graphic, or tabular result.

Catalytic and affinity/noncatalytic biosensors are two categories of biosensors that fall under the biorecognition principle. Analyte-bioreceptor interaction leads to the creation of a novel biochemical reaction product in a catalytic biosensor. Enzymes, microbes, tissues, and entire cells are all a part of this biosensor. An irreversible binding between the analyte and the receptor occurs in the case of affinity (noncatalytic) biosensors, and no new biochemical reaction product is produced as a result of the contact. The detection targets for this sort of sensor include antibodies, cell receptors, and nucleic acids.

# 6.1.3.1 Enzyme-based biosensors

Enzymes are typical biocatalysts that are effective at accelerating the rate of biological reaction. An enzyme-based biosensor's operation is based on the catalytic reaction and binding properties for detecting the target analyte. The process of recognizing analytes involves a number of potential mechanisms: analyte concentration is correlated with decreased enzymatic product formation because

1 The analyte is metabolized by the enzyme.

- **2** The analyte activates the enzyme.
- 3 The enzyme concentration is tracked by monitoring the change in enzyme characteristics.

Because enzyme-based biosensors have a long history, different biosensors can be created based on the specificity of the enzyme. Improving the sensitivity, stability, and flexibility of the enzyme structure is costly and difficult due to the exceedingly sensitive nature of the enzyme structure. For enzyme-based biosensors, electrochemical transducers are most frequently employed. Glucose and urea biosensors are the most used enzyme-based biosensors. Due to the long history of enzyme-based biosensors, many biosensors can be developed depending on the specificity of the enzyme (Schroeder & Cavacini, 2010).

# 6.1.3.2 Antibody-based biosensors

Affinity biorecognition elements like antibodies have been in use for more than 20 years due to their broad variety of applications and potent antigen—antibody interactions. Immunoglobulins (Ig) have a "Y" shape with two heavy and two light polypeptide chains joined by disulfide bonds, and antibodies have this structure as well. Immunosensors are biosensors that rely on the interaction between an antibody and an antigen or that incorporate antibodies as ligands.

There are two types of immunosensors:

- 1 Nonlabeled and
- 2 Labeled.

To precisely identify the antigen–antibody complex, nonlabeled immunosensors are built by calculating the physical alterations brought on by the formation of the complex. An easily detectable label is added in the case of labeled immunosensors (Bhardwaj et al., 2021).

# 6.1.3.3 Aptamer-based biosensors

The synthetic single-stranded nucleic acids known as aptamers can fold into two-dimensional (2D) and three-dimensional (3D) structures and can bind to target molecules in a selective manner. Because there is less spatial blocking and more surface area on the targets in 2D or 3D structures, their binding efficiency is high. Aptamers are nucleic acid molecules, which makes them physically and functionally stable throughout a wide variety of temperatures and storage conditions. Aptamers may be chemically synthesized, are stable in the pH range of 2–12, and have some

thermal refolding properties, in contrast to antibodies, which must be produced by biological systems. Aptamers also have the advantage of being chemically altered to meet the detection requirements for the target molecule. Fluorescent nanoparticles, like QDs, offer significant advantages over conventional fluorescent dyes for tracking biological systems in real time. Aptamer–QD conjugates were employed to pinpoint targets, including cancer cells, bacterial spores, and proteins (He et al., 2021).

### 6.1.3.4 Whole-cell-based biosensors

Since microbes (bacteria, fungi, algae, protozoa, and viruses) have the potential to serve as biorecognition components, they are used in the construction of whole-cell-based biosensors. They can manufacture recognition components, such as antibodies, on their own and without the need of extraction and purification. Whole-cell-based biosensors are simple to use and are developing quickly compared to animal or plant cells.

The whole-cell-based biosensor principle states that the cells may interact with a wide range of analytes, display the electrochemical response that a transducer can detect, and communicate. These biosensors were effectively used in environmental monitoring, food analysis, pharmacology, heavy metals, pesticides, detection of organic pollutants, and drug screening due to their high selectivity, good sensitivity, and capability of detection (Riangrungroj et al., 2019).

# 6.1.3.5 Nanoparticle-based biosensors

A new class of bioreceptor nanomaterials have recently been proposed in addition to the ones mentioned above. Numerous nanomaterials have been used as bioreceptors as a result of advances in nanotechnology and nanoscience. In terms of biosensing applications, nanoparticles offer a wider variety in both transducers and bioreceptors. For instance, nanomaterials based on cerium oxide show catalytic activity that is bioreceptor-friendly and mimics biological processes. Many inorganic materials, including graphene- and CNT-based nanomaterials, noble metal nanoparticles, and quantum dots, have been successfully used as transducers because of their effective transduction capabilities.

# 6.1.4 Emerging nanomaterials used in the fabrication of biosensors

Through specific self-assembly techniques nanomaterials are synthesized. These nanomaterials have many distinct properties including elec-

trical, mechanical, optical, and magnetic. Nowadays, many nanomaterials are used in drug delivery, bloodless surgery, multifunctional device fabrication, and the fabrication of biosensors. Nanomaterial-based biosensors have attained advanced properties compared to conventional biosensors. These nanobiosensors got epitome sensitivity, stability, and selectivity for the detection of various biomolecules.

Advanced nanomaterials are broadly classified into two types: 2D transition metals and 2D organic polymers.

### 6.1.4.1 Two-dimensional transition metals

Transition metals are those elements in groups 4–11 in the periodic table. Due to its intriguing characteristics, including a significant surface area and an ultrathin planar structure, transition metal nanomaterials can be used to create biosensors.

# 6.1.4.1.1 Transition metal chalcogenides

The transition metal dichalcogenides (TMDCs) are a class of 2D graphene cognate/nanosheets that are considered to be advanced. They are typically represented by the formula MX2, which stands for a hexagonal layer of a transition metal (M) and two layers of chalcogen (X). They can be made using a variety of techniques, such as mechanical cleavage, epitaxial growth, and chemical vapor deposition (CVD).

Recently, a hybrid structure of blue phosphorene (BlueP)/TMDCs, graphene, and Ag–Au bimetallic sheets was used to create a surface plasmon resonance (SPR)-based biosensor. The study's findings showed that compared to traditional biosensors, the monolayer BlueP/MoS2 and graphene structure significantly increase the biosensor's sensitivity by 19.73%.

A photoelectrochemical immunosensor for the detection of carcinoembryonic antigen was made using tungsten disulfide (WS2) nanosheets in a different investigation. The development of a gold nanoparticle (GNP)/WS2 nanocomposite. According to the performed investigation, the photoelectrochemical responses of WS2 combined with GNPs were improved (Singh et al., 2020). To achieve photoelectrical immune sensing of the antigen in clinical samples, the nanocomposite was coated onto a glass surface, and then, antibodies specific to carcinoembryonic antigens were immobilized. Additionally, 2D TMDC-de-

rived quantum dots have demonstrated their value in the optical detection of neurotransmitters without the use of antibodies.

### 6.1.4.1.2 Advanced transition metal oxides

Comparable to TMDCs, transition metal oxide displays a variety of distinctive qualities, such as electrocatalytic and magnetic capabilities, which make them a fantastic choice for use in the construction of biosensors. Due to their distinctive electrical, optical, and chemical properties in comparison to other transition metal oxides (TMOs), manganese oxides are the most widely employed advanced materials in sensing applications. TMOs and 2D transition metal carbides were combined in a recent work to create a biosensor.

For the separation and purification of proteins, a biosensor based on molecularly imprinted polymers has been developed. In this study, the surface of tubular carbon fibers with carboxyl modifications was grown with MnO<sub>2</sub> nanosheets. The outcomes demonstrated that the development of MnO<sub>2</sub> shells increases the quantity of protein-imprinting sites. An electrochemical biosensor was created to detect hydrogen peroxide using a MnO<sub>2</sub>-graphene nanosheet nanocomposite on a glassy electrode. The findings of this study showed that TMOs' electrocatalytic activity is beneficial in the oxidation of H<sub>2</sub>O<sub>2</sub>, which results in the catalytic activity of the biosensor at extremely low concentrations. Metal-organic gels were utilized to create copper oxide nanoparticles, another TMO that can mimic peroxidase activity and be used to detect cholesterol and glucose. To create diverse nanostructures for drug delivery, therapy, and the monitoring of various diseases, 2D organic polymers are utilized. These polymers have the ability to mimic a wide range of biomolecules. These sensors have promising applications in clinical medicine, food analysis, environmental analysis, and other fields.

# 6.1.4.2 Two-dimensional organic polymers

Due to their exceptional qualities, including great flexibility and tunability, ultrathin structure, and adaptability, organic polymers have been employed extensively which are still in demand. Modified metal—organic frameworks and polypeptides are the two organic polymers in this group that are most frequently employed, and they have become the preferred materials for making biosensors.

# 6.1.4.2.1 Metal-organic frameworks

Inorganic and organic crystalline porous hybrid materials are arranged in metal-organic frameworks (MOFs) to form a cage-like structure. Typically, positively charged metal ions are surrounded by organic linker molecules. A MOF's hollow structure provides an incredibly large internal surface area which greatly increases its utility. Photodynamic treatment for tumors can be performed with organic polymer-based MOFs. By using platinum nanoparticles to magnify the signals, a MOF-based biosensing device has also been created for the detection of neurotransmitters. A MOF containing 2D palladium nanosheets, doxorubicin, and polydopamine was used to create a theranostic nanoplatform to improve biocompatibility. The application of this mixture as a medication delivery component resulted from its impressive photothermal conversion and optoacoustic properties. As a result, these nanoparticles can be used successfully in applications for sensing, imaging, and drug delivery when combined with other materials. They can also be employed for both treatment and bacterial eradication. A biosensor for augmented anti-infective therapy has been created using 2D carbon nanosheets generated from MOFs.

# 6.1.4.2.2 Black phosphorous

The most thermodynamically stable form of phosphorus is called black phosphorous (BP). Phosphorene, also known as BP, offers important characteristics as a nanomaterial, including strong electroconductivity, an ambipolar field effect, high carrier mobility, and an adjustable bandgap. For the purpose of creating biosensors for the diagnosis and treatment of various diseases in recent years, numerous researchers have employed BP. The application of a 3D BP nanoscaffold for recovering neurogenesis was the subject of a revolutionary work which is presented in the year 2020.

For instance, cellulose hydrogels were used in the construction of 2D BP nanosheets (BPNSs) for photothermal therapy against cancer. These hydrogels and BPNS 3D networks have improved stability, strong photothermal responsiveness, and flexibility. The clinical study demonstrates the unique applications of this nanoplatform which is also 100% safe and biocompatible. In another fascinating study, BP was used to construct a 3D-printed scaffold that participates in bone regeneration and is intended to be used in the photothermal ablation therapy of osteosarcoma. As a re-

sult, researchers frequently use BP to create nanodevices for the treatment of diseases due to their photothermal characteristics. A 2D fingerprint nanoprobe based on BP has been used to demonstrate an enhanced fabrication method for biological surface-enhanced Raman scattering (SERS) characterization. This work created flake-shaped BP-gold nanoparticle nanohybrid theranostic nanoplatforms for phototherapy, bioimaging, and drug delivery. Genome editing, antibacterial effectiveness, photodynamic anticancer therapy, imaging, and cancer theranostics have all utilized BP-containing biosensors.

# 6.1.5 Distinct platforms in the fabrication of advanced biosensor devices

In these decades, more advanced biosensing devices are fabricated using different device fabrication techniques. These biosensors are fabricated by many more techniques, viz., ion beams, microfluidics, near-field electrospinning, lab-on-a-chip, and chip calorimetry. Fabrication of the integrated biosensing device for local and real-time sensing applications got epitome scope. Micro- and nanoscale patterning on the surface of the sensor enhances the sensing performances by getting over the surface-based limitations. Miniaturization in device fabrication has helped to get remarkable sensing performances in biosensors. Several types of biosensors based on the different fabrication techniques are made, and they depicted better sensitivity and little limit of detection. Nowadays, versatile biosensors are being fabricated to detect various biomarkers or diseases, namely, cancer, cholesterol, bacterial infection, and exosomes.

# 6.1.5.1 Focused ion beam technique

This technique is usually used for the deposition of nanomaterials. These days, this technique has got widened the scope for the fabrication of the biosensing device. The probe attached to the ion beam is used for the fabrication of the biosensing devices. This technique is the more consistent way of preparing biosensing devices. Many more modifications are applied to the focused ion beam (FIB) technique to fabricate more reliable nanobiosensor devices. The FIB-made biosensors are compact, less costly, and can be used as a refractive index for various chemical and biological sensing applications (Erdman et al., 2019).

**Principle:** High- and low-gallium ion-beam focusing is used for site-specific sputtering in this technique.

**Advantages:** Multiple specimens are formed in a small area and are time efficient, and beam strength can be adjusted.

**Disadvantages:** The use of gallium may contaminate the samples, and physical and electrical properties can be affected.

# 6.1.5.2 Electrospinning

This is the oldest technique used by researchers for many decades. According to their convenience, the researchers have made many modifications to this technique for the fabrication of biosensors. By decreasing the electrode gap distance, one can successfully deposit the nanomaterials on the sensing device. Through the electrospray technique, this technique has evolved. M13 bacteriophage microfabrication has been achieved with this technique (He et al., 2017).

**Principle:** By decreasing the spinning gap, controllable deposition can be achieved.

**Advantages:** This method is simple and cost-effective, and large-scale processing is possible. All polymers (high molecular weight) can be easily processed by this method.

**Disadvantages:** This method is not suitable for 3D structures, and synergistic porosity for achieving good biosensing is unable to be achieved by this method.

# 6.1.5.3 Paper-based microfluidics

This technique is based on the principle of fluid action. The paper-based devices are easy to fabricate and of less cost. Usually, cellulose paper is used for the fabrication of the device followed by computer-based printing. The printing can be performed through different methods, namely, wax printing, laser printing, and conducting inkjet printing. Among these printing techniques, wax printing is widely used because it is effective, easier, and cost-effective. These paper-based microfluid devices will perform better sensitivity than other techniques. The paper-based CMOS photodiode biosensor is used to detect and diagnose sepsis (Hu et al., 2020). By using this paper-based sensing device, biomarkers are formed to detect glucose and lactate in human serum. A 3D paper-based sensing device with glucose detection has been developed to detect silver ions (Xiao et al., 2019).

**Principle:** This method is mainly based on fluidic actuation.

**Advantages:** This method is of low cost, easily desirable, simple, possibility of rapid detection, flexible substrate, easily degradable, and eco-friendly.

**Disadvantages:** This method is limited to multiple detections, it is not operable at room temperature, and extra heating is very much necessary for proper sensing.

# 6.1.5.4 Microelectromechanical systems

Microelectromechanical systems (MEMSs), nanoelectromechanical systems (NEMSs), and bio-nano-electromechanical systems (bio-NEMS) are the major biosensing fabrication techniques used for micro- and nanoscale device fabrication. For the detection of biochemical components, MEMS fabrication techniques are widely used (Bryzek, 2005). Bio-NEMS technique is majorly used to detect highly complex biochemical components. Moreover, the MEMS techniques are used in biosensors for diagnosis of diseases, therapeutics, and monitoring ecosystem and human health. To detect genome bacteria and viruses, a miniaturized silicon-chip biosensor has been fabricated by the MEMS technique (Battaglia et al., 2019).

**Principle:** This method is mainly based on capacitive piezoresistive resonant thermoelectric principle.

**Advantages:** Industrial production is possible, cost-effective, and low power consumption is possible for device fabrication.

**Disadvantages:** For the production of a single unit, it is too expensive, especially during the initial developmental stage.

# 6.1.5.5 Surface plasmon resonance-based biosensor

Using incident light to stimulate the electrons at the interfaces of the material is the basic technique of the SPR technique. An SPR biosensor is used to detect the gluten in the urine samples of people to detect celiac disease. A highly sensitive biosensor to detect microRNA was developed (Wei et al., 2020).

**Principle:** The incident polarized light falls on the metal film at the interface of the media with varying refractive index (RI).

**Advantages:** Miniaturized devices can be prepared with this method, and the devices prepared through this method are highly sensitive.

**Disadvantages:** Calibration has to be done for a long time.

# 6.1.5.6 Whispering-gallery-mode biosensors

Whispering-gallery-mode (WGM) biosensing devices are very much sensitive to biomolecules and chemical ions. Usually, this technique is used for the examination of the modifications occurring on the surface of the material. For the ultrasensitive detection of the biomolecules, this method is preferable. For the detection of the grapevine virus, an optical immunosensor device was fabricated using the WGM resonator technique (Fu et al., 2020; Tereshchenko et al., 2020).

**Principle:** It works on the principle of the wave that travels on the concave surface.

**Advantages:** Q-factor is high, low mode volumes, small size, easy to integrate with the chip, and high tenability.

**Disadvantages:** Bending loss and evanescent coupling loss are observed.

### 6.2 Conclusion

In these decades, tremendous improvements happened in the fabrication of biosensor devices for better management of health. These days, many more opportunities are opening for the development, implementation, and acquisition of versatile properties of nanomaterials in the fabrication of biosensors. The use of advanced 2D transitional materials and organic polymers has attained better sensitivity, selectivity, and stability in biosensors. The biocompatible nature, enhanced conductivity, and good sensing response of the nanomaterials and their composites made it easier to develop biosensing devices. Using nanomaterial composites leads to fabricating the sensing devices with less detection limit. These types of quick-responding, lower-LOD biosensing devices are used for health monitoring applications. The recently flourished SERS and WGM techniques have remarkable advantages for device fabrication, miniaturization, and possible easy handling. With the use of the new fabrication technology, using advanced nanomaterials finds a way to develop versatile devices for biosensing (Table 6.1).

#### ARTICLE INFO

# Keywords: Polypyrrole Holmium oxide Humidity sensor Sensitivity Limit of detection Grotthus reaction

#### ABSTRACT

Having a competent and efficient humidity sensing material is important for vivid applications. In the present work, holmium oxide, a well-known rare-earth oxide, has been composited with Polypyrrole (PPy) to form polypyrrole/holmium oxide (PPHO) composites. The composites were prepared by chemical polymerization reactions in 10 (PPHO-1), 30 (PPHO-2), and 50 wt% (PPHO-3) of holmium oxide in PPy matrix. These composites were characterized by Field emission scanning electron microscopy (FESEM), Energy dispersive X-ray spectroscopy (EDX), X-ray diffraction (XRD), Fourier transform infrared spectroscopy (FTIR), Raman spectra, and Transmission electron microscopy (TEM) to study the structural and morphological changes in the PPy and PPHO composites. Humidity sensing behavior of the composites was investigated in the relative humidity range (RH) of 11 to 97%. Among all the composites, PPHO-3 has shown a maximum sensing response of 93% with response and recovery times of 30 s and 40 s respectively, furthermore, the composite has exhibited an appreciable limit of detection (LOD) of 4.98 % RH, good linearity (0.9981), real sensitivity (27.72 M $\Omega$ -cm / %RH) and stability. Based on Grotthus' reaction, the sensing mechanism has been discussed.

# 1. Introduction

Humidity sensing and monitoring play a significant role in many places, such as libraries, agricultural warehouses, nuclear power plants, and medical and industrial fields [1]. Hence, humidity detection has become crucial in well-maintained, controlled environments. Because of their simple fabrication, low cost, and effective performance characteristics, resistive-type sensors have become popular [2]. Resistive-type sensors are those that cause a change in resistance at two points of contact and transfer the information for analysing the analyte [3,4]. In comparison with most of the commercially available sensors, conducting polymer-based sensors have attracted greater attention due to their easy synthesis, simple fabrication, and effective performance [5]. Very recently, binary metal oxides [6], transition metal oxides like ZrO<sub>2</sub> [7], ZnO [8], VO [9], and 2D-layered materials [10,11] have been studied for various opto-electronic and sensing applications. Conducting polymers like polypyrrole (PPy) and polyaniline (PANI) when

composited with these oxides have captivated attention in terms of their special transport properties [12-14] and have found applications in many fields. In our recent studies, we have composited conducting polymers like PANI and PPy with yttrium oxide [15], WS2 [16], and TaS<sub>2</sub> [17] for their humidity sensing performance. All these conducting polymer composites have exhibited improved characteristics of high sensitivities, good response times, and recovery times, and are operable at ambient temperature, which is note-worthy. In this regard, and to further elaborate on the scope of such conducting polymer composites for humidity sensing, in the present study, we have considered PPy and composited it with a rare earth oxide. Since these oxides have a large bandgap and large dielectric constants, which are indeed required characteristics for the design of novel electronic devices [18–23]. Hence, holmium oxide, a rare earth oxide consisting of a large band gap of 5.3 eV that has been studied most extensively due to its emerging role in high-K-based nanoelectronics, was chosen for the present study. So, the insertion of holmium oxide into the PPy matrix to form polypyrrole-

holmium oxide (PPHO) composites is the first attempt of its kind to study its humidity sensing characteristics. Hence, PPHO composites have been synthesised by the chemical polymerization method and thereby explored for their humidity sensing performance at room temperature.

# 2. Experimental

### 2.1. Materials

Analytical grade reagents were used correspondent to pyrrole- $C_4H_4NH$  (98% purity), ammonium per sulphate  $[(NH_4)_2\ S_2O_8]$  both bought from SD Fine Chemicals, Mumbai, India. Holmium oxide  $(Ho_2O_3)$  of 99.99% purity was procured from from Sigma Aldrich, USA. For synthesis of PPy and PPHO composites, pyrrole monomer was doubly distilled before use, and distilled water was used in the entire

**Fig. 3.** Number of grains versus grain size of (a) PPy and (b) PPHO-3 composite.

synthetic process.

### 2.2. Synthesis of polypyrrole

The chemical polymerization method was employed for the preparation of polypyrrole. Pyrrole (0.3 M) was taken in a beaker, and ammonium per sulphate (0.06 M) was added drop by drop to the beaker containing pyrrole. This addition took 4 h while the mixture was kept in an ice bath with continuous stirring using a magnetic stirrer. Afterwards, the mixture was precipitated to obtain PPy and then filtered, dried in a hot air oven (100°C). The polypyrrole so obtained was 3.4 g, which was considered 100 wt% [24].

### 2.3. Synthesis of polypyrrole- Ho<sub>2</sub>O<sub>3</sub> composites

3.4~g of PPy is considered as 100~wt%, hence 1.7~g is considered as (50~wt%) of  $Ho_2O_3$  and it was added to pyrrole (0.3~M) solution and mixed rigorously. Further, ammonium per sulphate ([(NH<sub>4</sub>)<sub>2</sub> S<sub>2</sub>O<sub>8</sub>]) of 0.06~M was added drop-wise to the beaker containing pyrrole liquid, to get PPy/  $Ho_2O_3$ -50% (PPHO-3) composite. Similarly for preparation of PPy/  $Ho_2O_3$ -30% (PPHO-2) and PPy/  $Ho_2O_3$ -10 wt% (PPHO-1) composites, 1.36~g and 0.34~g of  $Ho_2O_3$  was added to pyrrole solution and identical procedure has been followed. Change in color had confirmed the formation of the composites. After the polymerization, samples were

Fig. 4. X-ray diffraction spectra of (a) PPy (b)  ${\rm Ho_2O_3}$  and (c) PPHO-3 composite.

cleaned using distilled water and then with acetone, further dried in hot air oven (100°C) in order to attain a constant weight.

### 2.4. Characterization

Field emission scanning electron microscopy (FESEM) pictures were obtained by placing the sample powders on an aluminium tape and using the FEI Nova Nano SEM 600 instrument. Energy dispersive X-ray (EDX) spectrum was obtained by using the EDAX genesis instrument attached to the FESEM. Fourier transform infrared (FTIR) spectra of polypyrrole, Ho<sub>2</sub>O<sub>3</sub> and PPHO-3 were recorded by a Frontier PerkinElmer spectrometer in the wave-number range 400–4000 cm<sup>-1</sup>. Powder X-ray diffraction (XRD) spectra of polypyrrole, Ho<sub>2</sub>O<sub>3</sub> and the PPHO-3 composite were documented by using the D8 Advance powder X-ray diffractometer of Bruker with a diffracting angle of the order  $2\theta=10^\circ$  to  $70^{\circ}$  by employing a copper K $\alpha$  source with a wavelength  $\lambda = 1.541$  Å. Raman spectra of Polypyrrole, Ho<sub>2</sub>O<sub>3</sub> and PPHO-3 composite were recorded using the Jobin Yvon Lab Ram (HR 800 Spectrometer) of Horiba in the wave-number range 200 – 2000 cm<sup>-1</sup>, with an operating power laser of 20 mW and an exciting wavelength of  $\lambda = 514.5$  nm (Ar laser). Transmission electron microscopy (TEM) image of PPHO-3 was captured using the JEOL-3010 instrument with an operating voltage of 300 kV.

### 2.5. Humidity sensing measurements

Humidity sensing analysis was carried out using specially designed glass chambers containing saturated salt solutions, which were

resistance values on exposure to a particular relative humidity environment at room temperature. Humidity sensor set up for humidity sensing studies is illustrated in Fig. 1.

**Table 1**Humidity sensing parameters of PPHO composites.

Sample	Real Sensitivity (MΩ -cm / %RH)	Limit of detection (% RH)	Linearity (R <sup>2</sup> )
PPy	3.47	9.8	0.9927
PPHO – 1	13.95	14.31	0.9847
PPHO-2	23.54	17.22	0.9780
PPHO - 3	27.72	4.98	0.9981

### 3. Results and discussion

### 3.1. FESEM and EDX studies

Two-dimensional surface morphology images of polypyrrole, holmium oxide, and PPy/Ho<sub>2</sub>O<sub>3</sub>-50% are shown in Fig. 2. FESEM image of polypyrrole as in Fig. 2a, reveals the consistent dispersion of granular morphology of the polymer. Fig. 2b shows the holmium oxide which seems to be desquamate structure. Fig. 2c shows the morphology of the composite PPHO-3 which exhibits highly agglomerated spherical grains with many pores, which is necessary for a humidity sensor. Fig. 2d shows the EDX pattern of the PPHO-3 composite. EDX spectrum analysis revealed the presence of elements carbon and nitrogen belonging to PPy, whereas holmium and oxygen pertaining to Ho<sub>2</sub>O<sub>3</sub> in the expected ratio. The grain sizes of polypyrrole and the PPHO-3 composite were evaluated using software called image-J. Fig. 3 represents histograms showing the number of grains versus grain size of PPv and PPHO-3 composite. revealing their grain sizes as 0.72 µm and 0.38 µm respectively. This reduction in gain size might have increased grain boundaries by enabling the development of small micropores in PPHO-3 composite [25].

### 3.2. XRD studies

Fig. 4a shows the XRD pattern of polypyrrole, which manifests a broad peak at  $2\theta = 25.77^{\circ}$ , which represents the amorphous nature of the polymer along with precise chain orders that may be attributed to lattice periodicity [26]. Fig. 4b shows the XRD pattern of holmium oxide has manifested complete Bragg reflections in the range  $2\theta = 20^{\circ}$  – 60° which are consistent with earlier literature. XRD of holmium oxide has revealed Ia-3 space group with body-centered cubic structure belonging to C-type holmium sesquioxide [27]. XRD spectrum of holmium oxide revealed crystal planes (211), (222), (400), (411), (134), (440) and (622) pertaining to the peaks at  $2\theta \sim 20.7^{\circ}$ ,  $29.5^{\circ}$ ,  $34.3^{\circ}$ , 36.4°, 44.1°, 49.3°, 58.5° respectively, in accordance with JCPDS No. 65-3177. Fig. 4c shows the XRD pattern of PPHO-3 composite, which has more are less complete Bragg reflections of the Ho<sub>2</sub>O<sub>3</sub>, indicating its crystalline nature. Also, the intensities of the characteristic peaks of Ho<sub>2</sub>O<sub>3</sub> found to be reduced, inferring the formation of the composite in which PPy was deposited on Ho<sub>2</sub>O<sub>3</sub>. Interestingly, the FWHM of the most intense peak of Bragg reflection (222) in the composite was increased, which indicates the decreased crystallite size of PPHO-3 composite. This reduced crystallite size of the composite was obtained using the Debye-Scherrer formula and was found to be 23.1 nm. Reduced crystallite size and reduced peak intensities are the evidence for the composite's formation.

### 3.3. FTIR studies

The chemical structure of PPy,  ${\rm Ho_2O_3}$  and PPHO-3 composite were studied employing the FTIR technique. Fig. 5a reveals the FTIR spectrum of Polypyrrole, showing its significant bands at 603, 867, and 919 cm<sup>-1</sup> assigned to C–H wagging. The bands at 1050 and 1217 cm<sup>-1</sup> indicate = C–H plane deformation vibration and to C-N stretching of polypyrrole

Fig. 9. Variation of point sensitivity of PPy and PPHO composites with relative humidity.

Fig. 10. Humidity sensing mechanism in PPHO-3 composite.

[28]. The prominent bands at 1366, 1566, 2971 and 3896 cm $^{-1}$  correlate with vibrations of C-N, C-C, C-H and N-H stretching of the pyrrole ring individually. Fig. 5b shows the FTIR spectrum of holmium oxide, depicting its characteristic absorption band at 554 cm $^{-1}$ , which signifies metal oxygen (Ho-O) stretching vibrations [29]. Fig. 5c shows the PPHO-3 composite with almost similar bands of PPy and Ho<sub>2</sub>O observed within wavenumber 500–4000 cm $^{-1}$  which reveals the presence of the main constituents of the polymer and the holmium oxide whereas, incorporation of holmium oxide in polypyrrole results in a slight shift of FTIR bands towards lower wave numbers. These shifts are correlated to formation of the composite and modifications in molecular order of the polymer chains, leading to the formation of a capillary network and thereby an enhancement in the water adsorption.

### 3.4. TEM analysis

Fig. 6 shows the TEM image of the PPHO-3 composite. It is seen that the dark region represents holmium oxide and the light region represents polypyrrole. It is evident from the figure that the holmium oxide particles are well distributed in the polypyrrole matrix. This kind of stuffing of the filling material into the network of polymer chains forming small clusters of grains has been reported in our recent literature [30]. Small clusters of grains so formed in the composite are helpful in framing the capillary network for the water condensation [31], which is useful for designing humidity sensors.

### 3.5. Raman spectra

The Raman spectra of PPy, Ho<sub>2</sub>O<sub>3</sub> and PPHO-3 composite can be seen

in Fig. 7. The Raman spectrum of PPy as seen in Fig. 7a shows the bands at 1340 and 1573 cm $^{-1}$  for antisymmetric C-N $^{\bullet+}$  as well as C = C stretching vibrations of quinoid rings, respectively. Fig. 7b shows the Raman bands for  $Ho_2O_3$ . The characteristic Raman band of 381 cm $^{-1}$  obtained for rare earth sesquioxides of the C-type is allocated to the  $A_g$  +  $T_g$  mode. The highest intensified point can be regarded as massive polarizability change that occurred during the vibration. However, the bands at 335, 477, and 594 cm $^{-1}$  are designated to  $E_g$  +  $T_g$ ,  $T_g$ , and  $T_g$  respectively [5]. Fig. 7c shows the Raman spectrum of the PPHO-3 composite, showing the polypyrrole bands with slight shifts and the holmium oxide bands suppressed, confirming the strong interaction between polypyrrole and holmium oxide.

### 3.6. Humidity sensing studies

The variation of resistivity of PPy and PPHO composite pertaining to change in relative humidity environments has been plotted and can be seen in Fig. 8. It can be noticed from the figure that initially, when PPy and the composite were brought separately to a lower humidity environment, say 11% RH, the proportionate resistivity was observed to be high. Accordingly, when the composite brought to higher relative humidity of 97% RH, the corresponding resistivity was found to be less due to the adsorption of water molecules on the composite surface, leading to decrease in resistivity and an increase in its conductivity. This kind of change in resistivity of the composite with relative humidity manifests a preferable linear tie-up. So, the real sensitivity, linearity, and limit of detection (LOD) of PPy and the composites were computed, and results are depicted in Table 1. It can be observed from the table that PPHO-3 composite exhibits good real sensitivity (27.72  $\mathrm{M}\Omega$  -cm / %RH), LOD

(4.98 % RH) and linearity (0.9981) as compared to that of PPy and other composites, which is a considerable result for the fabrication of an efficient humidity sensor. Further, to examine the humidity sensing efficiency of PPy and the composites, point sensitivity was computed by recording the fraction of the relative resistivity variation and the resistivity at the lower relative humidity contrast, and the related plot is shown in Fig. 9. It is seen from the figure that the point sensitivity of polypyrrole at 97% RH was found to be 73%, despite the fact that for a PPHO-3 composite, it was observed to be 93%. Such high point sensitivity is due to the incorporation of holmium oxide in the matrix of polypyrrole, which has resulted in more porosity in the composite and thereby it has stepped up the water adsorption process through capillary condensation mechanism. It is seen from Fig. 8 that for PPHO-3 composite, resistivity has decreased with the upsurge in relative humidity, as the water molecules present in the polymer composite serve as electron donors [32]. When the adsorption occurs on the exterior of the composite, the molecules get dissociated into H<sup>+</sup> and OH<sup>-</sup> ions. These OH<sup>-</sup>

Fig. 12. Humidity hysteresis curve of PPHO-3 composite.

Fig. 13. Sensing stability of PPHO-3 composite.

ions are waged by Ho<sup>+3</sup> ions in the composite. At the lower relative humidity environments, adsorption occurs at lower rate, thereby consequently hampered the proton transfer mechanism resulting in lower electrical conduction of the polymer composite [25]. However, environments with higher relative humidity, adsorption occurs at higher rate, promoting the proton transfer mechanism, and an essential increase in electrical conduction in the polymer composite. The overall mechanism of sensing in the PPHO-3 composite is depicted in Fig. 10. Capillary condensation through pores and the humidity sensing mechanism is shown in Fig. 10a and the Grotthus reaction is shown in Fig. 10b.

Response and recovery curves of the PPHO-3 composite are shown in Fig. 11. Response and recovery times play a significant role in the design and development of an efficient sensor. The PPHO-3 composite was initially exposed to a lower humidity environment of 11% RH and then

instantly transferred to a higher humidity environment of 97% RH, resulting in a composite response time of 30 s. Again, the composite was brought back to 11% RH from 97% RH, the recovery time of the composite was found to be 40 s. So, response time is quicker than the recovery time. This quick response time is due to the adsorption of water molecules on the porous surface of the composite, during which heat is liberated and hence it is an exothermic reaction. On the other hand, recovery time is attributed to the desorption of water molecules, during which heat is absorbed and hence it is an endothermic reaction. The response time, recovery time, and sensing range of the various polymer composites found in the literature can be seen in Table.2, and compared with PPy/Ho<sub>2</sub>O<sub>3</sub>-50% composite.

The humidity hysteresis plot for PPHO-3 composite is shown in Fig. 12. As prepared polymer composite was exposed to various relative humidity environments, the corresponding impedance values were noted. At first, the PPHO-3 composite was taken into the various humidity jars in ascending order from lower relative humidity environments to higher humidity environments ranging from 11 to 97% RH, during which water adsorption occurs and the respective adsorption curve was plotted. After this, the composite was brought back to the humidity jars in descending order from a higher humidity environment to a lower humidity environment, composing of relative humidity ranging from 97% RH to 11% RH and the corresponding desorption curve was plotted [40]. From Fig. 12 it is evident that the water desorption happens to be slower than the adsorption rate.

The humidity sensing stability of PPHO-3 composite is depicted in Fig. 13. Stability plays a vital role in the development of an efficient sensor. To confirm the stability of the composite, we have recorded the real sensitivity of the sample for every ten days at 55% RH, and it was found to be almost constant, as can be seen from Fig. 13. This kind of stable performance in humidity sensing turns out to be an attractive and essential characteristic feature in device fabrication. At the end, we conclude that the composite PPHO-3 has been found to be a competent material in the design of an efficient, low-cost, and room-temperature operable humidity sensor compared to the other cost-effective metal oxides like CuO [41], ZnO [42], and VO<sub>2</sub> [43], composited with conducting polymers as humidity sensing materials, as shown in Table 2.

# 4. Conclusions

PPHO composites were prepared using the chemical polymerization method with 10, 30 and 50 wt% of holmium oxide in a PPy matrix. Composites were characterized by various influential techniques to confirm the formation of the composite. The PPHO-3 composite exhibited superior humidity sensing characteristics. The composite manifests a response time of 30 s and a recovery time of 40 s with a sensing response of 93% in the RH range of 11–97% RH. The composite exhibited an appreciable LOD of 4.98 %RH and a good stability in humidity sensing performance. All these results encouraged the researcher to design an efficient humidity sensor operable at room temperature.

### **Declaration of Competing Interest**

The authors declare that they have no known competing financial interests or personal relationships that could have appeared to influence the work reported in this paper.

### Data availability

Data will be made available on request.

# Acknowledgements

All the authors acknowledge the support received from JNCASR, Bengaluru for providing the experimental facilities for various characterization techniques.

# 5.4.1 Contribution of Alumni Association that contributes significantly to the development of institution

Ballari Institute of Technology and management Alumni Association(BITM-AA):is registered under Karnataka Societies Registration Act 21 of 1960, Dated Dt-14-12-2015 with Registration No.BLY-S287-2015-16 at Ballari, Karnataka.

Association is established to provide forum for alumni of the college to connect, to promote the interests of the college and alumni members, promote goodwill among members, contribute to the cause of technical education by sharing the experience of the competent, help authorities to improve the academic activities of the college, assist members for their employment and service matters, co operate with other such bodies for same ends, promote other matters beneficial to prospects of association, extend financial help to economically backward and deserving students as scholarship for undergraduate, post graduate students of the institution, involve in curriculum design and honoring first year UG academic toppers.

In the last three years voluntary contribution of Rs 8,48,400 /- is received from the alumni members. Data base is maintained through portal <a href="www.alumni.bitm.edu.in">www.alumni.bitm.edu.in</a> or mobile app "My Alumni Network". The total members in the portal are 7126 as on 19/11/2020.

Association is organizes annual alumni meet "Punarmilana" alternatively at Ballari and Bengaluru. Feedback of the members acts as impetus to improve the institute.
